Three days later, a similar painful swelling appeared in the adductors of the left hind limb, and then another in the posterior pelvic muscles. The dog died on the fourth day of observation.

Post-mortem, purulent inflammation of the inter-muscular connective tissue of the muscles of the fore-quarters, the lumbar and pelvic muscles, and the vasti muscles, was found. An abscess was also present in the prostrate, and small metastatic centres in the kidneys.

From the condition of the lesions Balla considers that the primary abscess was that situated in the prostate, and that the others were metastases from it. Similar cases are not rare in the human subject, but have not hitherto been described in animals.—*Berliner Tier. Woch.*

FIVE CASES OF TRICUSPID STENOSIS IN THE OX.

Jöhnk, of Berne, records (*Münch. Tierärztliche Wochenschrift*) five cases of cows affected with tricuspid stenosis. In each case the diagnosis was based upon venous obstruction, and an especially remarkable feature of the series was that icterus of the conjunctiva was a constant symptom in all. One case recovered, the others were slaughtered. Each of the four cases slaughtered, upon post-mortem examination, showed fibrinous new growths, which had become partially organised, upon the tricuspid valves. A further noteworthy feature of the post-mortem examinations was that each case showed lesions of the liver—nutmeg liver, distomatosis, or chronic interstitial inflamma-

tion. From this fact, and the constant presence of icterus observed during life, Jöhnk concludes that the endocarditis was the sequel of the hepatic affection.—*Berliner Tier. Woch.*

W. R. C.

THE UTILIZATION OF THE ZEBRA AND ITS HYBRIDS.

[A short report by H. WATKINS-PITCHFORD, Government Bacteriologist (Natal).]

This subject has frequently been considered in the past, especially in Natal, but hitherto no adequate or systematic endeavour has been made, under proper conditions, to develop the project or to prove its great potentialities.

The advisability of taking some steps to utilize the great equine asset that we possess in the zebra has frequently been urged upon the late Natal Government. The practically unlimited numbers of zebra available, their ready domestication under proper system, their immunity to disease, and the promise reasonably to be entertained of their hybrids exceeding greatly in value the parent stock, has seemed to render the question in the past one of much economic promise.

Some eight years ago the late Natal Government decided to undertake preliminary observations on the point, and an adequate sum was placed upon the draft estimates of the writer's department. Financial considerations, however, led to the reluctant withdrawal of the item at the last moment, since which time no official steps have been taken beyond one or two preliminary observations made by myself in Zululand, and much correspondence between the late Natal Colonial Secretary's Department and the Agricultural Department, magistrates, and those interested in the project.

The writer would now respectfully urge upon the consideration of the Government the undertaking of such adequate preliminary observations as will suffice to demonstrate the great use which can be made of the zebra and its hybrids as a transport animal, and one which will not only take the place of the mule but will promise to possess an immunity to indigenous diseases, rendering it available for service in all parts of the Union.

The writer is also confident this possibility can be shown without any great difficulty or expense, and that the outcome of such observations will be of far-reaching interest and profit to South Africa.

Objections to any system of zebra domestication are generally based upon the difficulty of securing a sufficient number of animals or the intractability of the zebra when caught. Both these objections may be lightly dismissed. Attempts to catch the zebra by twos or threes by lassoing or riding them down have nearly always proved unsatisfactory, as the Natal records show, while the attempts to drive into enclosures have been generally unsuccessful by reason of the small number of men engaged in driving, etc. Where, however, bomas or catching-kraals are properly constructed and ample native assistance is secured, no fear need be apprehended as to success in driving.

The intractable nature of the zebra has often been urged against its utility, but the objection does not bear close investigation. (It is, of course, to the Burchell's zebra not the mountain zebra that the present remarks are intended to apply). All the evidence available goes to prove the ease with which recently captured zebra have been rendered amenable generally within a few days of capture (providing this latter has been properly effected).

As regards their reliability to retain their domestication no difficulty exists. Young zebras in Natal have been outspanned and grazed upon the same veld upon which they ran wild shortly before, without any difficulty being experienced in straying, inspanning, etc. In a case reported by a Natal magistrate of a stampede of a troop of wild zebra, together with several recently tamed animals used for decoys, these latter bolted back to their stables while the wild troop went in another direction. Such instances could be multiplied were it necessary to prove that domestication is both easily and permanently effected.

Docility and steadiness in harness with high courage in moving dead weight are claimed for this animal by all possessing an experience of the properly-broken Burchell zebra. The magistracy of U'ombo, Zululand, is situated upon the top of a hill—described by the Public Works authorities of Natal as the steepest grade road in the Province. The magistrate at U'ombo wrote last year (in reply to some query of mine) - "They (the zebra span) came up here again the other day, eight of them, and the majority not nearly full grown, with 3000lb. on the wagon; then, again, they are so wonderfully amenable," etc. Pace and endurance on ordinary corn food—great hardihood, and total immunity to tsetse and horse-sickness are also among the good qualities of this undeveloped equine. The only thing requisite is size (the average Burchell zebra is about 14 hands), and on this point the writer is confident—given the care and selection in mating observed in horse-mule production—the outcome would as regards size be all that could be reasonably looked for.

The Burchell zebra crosses readily with other equines, a fact which renders possible the production of a hybrid of almost any desired stamp, and there is no reason why zebra mules produced by appropriate mating should not only rival in size but exceed in other qualities the best horse mules now imported into South Africa.

Difficulties of mating, sometimes experienced by breeders in the past, would not exist under the system of artificial insemination, while the rate of reproduction would be able to be profitably regulated by this means.

The ease with which the zebra breeds in captivity would—under adequate management—provide numbers of animals of approved type suitable for stud purposes, and it is anticipated that after one or two successful drives on an adequate scale the occasion for further captures would be infrequent—at least until the scheme developed large dimensions.

Preliminary observations would be directed to establishing the most successful lines of mating both with the horse and the ass—on both male and female side—and to determining exactly the degree of immunity possessed by such hybrids, and whether any lapse of natural immunity occurred in zebra removed from their natural habitat.

Such preliminary experiments—though of essential importance to the ultimate successful working of the scheme on scientific lines—could be carried out at a moderate cost.

The writer would suggest—in the event of the project securing the favourable notice of Government—that such preliminary work be undertaken in Natal, this Province—by reason of its climatic conditions—being well suited for the purpose. With slight alterations and unimportant additions of a temporary nature, the buildings and paddocks of the laboratory at Pietermaritzburg would be found well adapted to the purposes of this inquiry, and extensive ground could, it is believed, be secured by the courtesy of the Pietermaritzburg Corporation, should the necessity for any such extensions become at any time apparent as a temporary measure.

The above scheme has been put forward in skeleton and with the intent to draw attention to the existence

of a latent South African asset which is believed to be of great magnitude. The writer has already in another place sought to bring the scheme to the notice of the Defence authorities, particularly in connection with the establishment of a first line of transport capable of being employed in operations in districts dangerous for horse-sickness or deadly to ordinary equines from the existence of "fly belts."—*South African Agricultural Journal*.

A NEW VIEW OF THE BACTERIOLOGY OF LEPROSY.

By T. S. B. WILLIAMS, Capt. I.M.S.

[Extracts from a lecture delivered at the London School of Tropical Medicine].

The view which I wish to advance is that the lepra parasite is not an acid-fast bacillus belonging to the fission fungi, but that it is a very pleomorphic streptothrix, which, in addition to changes in form, exhibits marked changes in its staining reactions in regard to the quality known as "acid-fastness." This being the main point of my lecture, it will conduce to a clearer exposition of the subject if I may be allowed to refer very briefly to some of the principal features of the Streptotrichæ. I would especially refer those interested in this group of organisms to the Milroy Lectures of 1910 by Mr. Foulerton of the Middlesex Hospital, which give a most interesting and clear account of this group of organisms, based on original researches extending over many years. The following description of the Streptotrichæ is taken from those lectures:

The typical life-history of a streptothrix may be said to consist of:

1. Branching mycelium.
2. Isolated rod segments.
3. Spherical spores.

Development may be studied in one of the quickly growing saprophytic species. One starts with the spore; from this two or three threads sprout and elongate, so that at an early stage of development one has a typical ray fungus consisting of three mycelial threads, usually of unequal length, and radiating out from the position occupied by the central spore. From these primary threads lateral branches in turn sprout out, and soon there is developed a densely tangled mass of mycelium representing the fully developed stage of the organism.

The next stage is transverse segmentation. The branching mycelium, which hitherto has been apparently homogeneous in structure throughout its length, now presents transverse segments produced by an obvious process of degeneration extending across the mycelium.

Following this is a stage of fragmentation. The degenerated portions of mycelium disappear, and a conglomeration of separate rod segments represents the original system of branching mycelium. Generally speaking, these rods are morphologically identical with bacilli, except that here and there a rod with the remains of a lateral branch attached to it may be seen.

With, or soon after, the occurrence of segmentation a special kind of spore formation may be observed. In a typical instance special spore-bearing organs are developed: fine aerial hyphæ, which, erecting themselves from the growth of mycelium, often cause a powdery appearance on the surface. Spores are produced in these aerial hyphæ. It seems probable, also, that under certain conditions these spores may be produced along the length of the mycelium, as well as in the special hyphæ. From these spores fresh filaments grow out.

The bacteria or fission fungi are defined as unicellular organisms, which reproduce themselves by a process of

transverse fission or spore formation. In the one case the parent cell produces two new cells by clean transverse fission; in the other case a single endogenous spore is produced, so that a single cell succeeds a single cell.

□ In the hyphomycetes, or mould fungi, we have a more complex kind of organism, in which sporulation is a function of specialised spore-bearing organs of various types, the simplest, perhaps, of which is represented by the aeral hyphae of the *Streptotrichae*.

The stage of full development of the streptothrix is represented by a system of branching homogeneous mycelium. . . . As to the nature of what have been described as the spherical spores, there can be no doubt, and it is probable that the rod segments also have to be considered as being in a sense spore bodies; that is to say, it is probable that these rod segments represent a more resistant form which is capable of producing a new mycelium directly, and by means of which, in case of disease, the infection commonly is transported from one part of the body of the host to another. The fully-developed mycelium obviously, because of its bulk, would not pass easily from one part to another, except by steady invasion along continuous tissues; and there are reasons for believing that, when living as a parasite, under many of the conditions applying in case of disease, a streptothrix does not readily undergo complete sporulation, with the development of spherical spores. But, under parasitic conditions segmentation and fragmentation of the mycelium occur freely; isolated rod segments will be carried from part to part readily enough, and by the examination of sections through recently established secondary foci of infection it has been found possible to obtain evidence microscopically of the early sprouting of branching mycelium directly from rod segments, and not from spherical spores.

The history of the *Streptotrichae* is further complicated by the fact that there is strong evidence that, under parasitic conditions of existence, the rod segments may be capable of reproducing themselves directly as rod segments, and thus simulating true bacilli.

It will be realized, then, how very complicated is the life-history of this group of organisms, and one may be led into many errors unless one keeps these facts constantly in mind.

I have been engaged on a study of this question for several years. Prior to 1908 I had accepted the ordinary teaching that leprosy was due to an acid-fast bacillus belonging to the fission fungi. I had been getting results which, although considered useless at the moment, were producing an effect on my mind, and about the end of 1908 I became imbued with strong impressions regarding the morphology of the lepra organism. From a survey of my own results, together with a consideration of the work of Rost and Deycke, I became of opinion that leprosy was most probably caused by some species of streptothrix, and that the acid-fast bacillary masses, which were so well known, were merely phases of such a streptothrix, and that, moreover, they represented a resting and resistant stage of the organism. Since the beginning of 1909 I have grown from lepers in Persia and India apparently different organisms, which, in my own opinion, and in that also of others who have seen my work, I have been able to connect up into one organism—namely, the *Streptothrix leproides*. I have grown the following phases of the organism:

- (a) A non-acid-fast streptothrix in the mycelial stage, and producing acid-fast rods.
- (b) A non-acid-fast diphtheroid bacillus, producing also acid-fast rods. This is really a streptothrix.
- (c) An acid-fast bacillus, which is but the broken down stage of a streptothrix, and
- (d) An acid-fast mycelium.

ANIMAL EXPERIMENTS.

My animal experiments have been made with the organism in its acid-fast bacillary form. In this form, when injected subcutaneously into guinea-pigs in large doses. I have produced lesions somewhat resembling leprosy, with large numbers of coccobacilli appearing in the connective tissue cells. Moreover, Major Rost, with his organism, has produced all the clinical features of tubercular leprosy in a monkey, and in the nodules acid-fast bacilli were found, situated as in leprosy. I made a few experiments with the organism in its non-acid-fast mycelial form, but in view of the results obtained by Kedrowsky, I see that I did not allow anything like sufficient time for these experiments. — *The British Medical Journal*.

A New Cell Proliferant: Its Clinical Application in the Treatment of Ulcers.

[Extract from a preliminary note by
Dr. CHARLES J. MACALISTER, M.D., F.R.C.P.]

My attention had been directed to the fact that the *Symphytum*, or common Comfrey, had been much recommended by the ancient writers in medicine as a vulnerary and as a dressing for sores and ulcers of various kinds. From the days of Saxon leechdom* (c. 1000) to the end of the seventeenth century there were few authors who did not refer to it, and it was sometimes spoken of as being the "chief vulnerary herbal." I can find no reference to Comfrey in any books on materia medica or therapeutics of relatively recent date; Pereira, for instance, does not refer to it, and it was never an official remedy so far as I can discover. To this day, however, it has a traditional reputation among country folk, both in England and in Ireland, as a domestic herbaceous "simple" for applying to sores, and I was much interested during the past summer, when visiting a farm at Tarvin in Cheshire, to find that its owner always keeps a bed of Comfrey growing in order that he may provide the villagers with it when occasion arises.

Through the kindness of Professor Harvey Gibson I was provided with a large quantity of the root, some of which was handed over to Dr. Titherley and Mr. Coppin, of the Chemical Department of the University of Liverpool, and while they were making a careful chemical analysis of it, which took a considerable time, I proceeded to dress the only ulcer which was then available to me with a strong infusion made from the powdered root. This case was an exceedingly unpromising one, because it was a "rodent" of about two years' duration, not a simple ulcer. After being dressed with the mucilaginous infusion for about a week the surface cleaned, and a distinct growth of epithelium could be seen taking place from some of the marginal points. Later on the upper margin flattened somewhat on its inner aspect, the undermining vanished, and after growing here and breaking down there for a time, the epithelium became stronger and closed in to a considerable extent.

By this time Dr. Titherley reported to me that he had obtained a definite, so far unidentified, crystalline body from the root, and he was able to give me sufficient to experiment with. Since it was very sparingly soluble in water, quite a large amount of solution was made, which was now used as a dressing for the ulcer instead of the infusion. With this application the skinning-over process in the course of a month was all but completed.

*Dr. Edward E. Nicholson (Neuilly) furnished references.

In his preliminary examination Dr. Titherley established the facts that the root contained:—1. Gums. 2. Sugars, including a reducing sugar. 3. Resins. 4. A protocatechuic derivative or derivatives. 5. A substance giving an intense yellow solution with sodium hydrate (not investigated further.) 6. A crystalline solid, very rich in nitrogen and melting at 226°C.

Since from clinical observations this latter body appeared to be the physiologically active constituent of the root, Mr. Coppin was asked to devote his attention to its investigation; but Dr. Titherley and he found that the root contained about 0.8 per cent. of it, and by estimating its carbon, hydrogen, and nitrogen contents he showed that it possessed the same empirical formula as allantoin, which it greatly resembled in its chemical properties.

ALLANTOIN.

Some allantoin was now prepared from uric acid, and the product from the root was proved conclusively to be an identical substance by chemical methods. For example, allantoinic acid and other derivatives were prepared both from the chemically made allantoin and from that obtained from the root; their melting points were the same, and so forth.

Regarding the chemical physiology of allantoin or the part which it plays in human metabolism very little is known, but some interesting facts have been recorded which may throw light upon its action as a cell proliferant and may point to its having a function to perform in the bodily chemistry, apart from any possibility of its being a product of purin metabolism, in which light it has generally been regarded. It is present both in animals and plants. It was first discovered in the former, and received its name from the fact that it was found in the fetal allantoinic fluid. Later on it was identified in the urine of pregnant women. Recently its presence has been demonstrated in very small amounts as a normal constituent of the urines of healthy people, but that it is not an end product of human metabolism, which means that it is probably not derived from the oxidation of uric acid to which it is closely allied, has been shown by a good many observers, as pointed out by Dr. Ackroyd in a paper published in the *Bio-Chemical Journal* for March, 1911. This is an important observation, and is based upon the works of Schittenhelm, Wiener, Minkowski, Poduschka, and Wieschowski, who have shown that when allantoin is given to man it can be recovered to a considerable extent in the urine, and the author himself concludes "that the whole quantity of allantoin excreted by man on a milk and vegetable diet may be derived directly from that contained in the food." It will be noted that I am speaking of the relation of allantoin to human metabolism only. In the dog, cat, and rabbit, on the other hand, it appears to be a normal end product of metabolism.

If these facts are reliable the allantoin in human urine is mainly derived from vegetable foods, as pointed out by Dr. Ackroyd, and in the healthy individual it appears to pass practically unchanged through the economy, the amount eliminated representing about the amount which had been ingested.

Our knowledge of the distribution of Allantoin in the vegetable Kingdom is not very extensive, but it is a very suggestive and interesting fact that such analyses as have been made indicate that it is generally found in parts which are related to growth either active or potential. For instance, in 1881-82 Schultz and J. Barberi found it in the buds of certain plants and in the bark of branches of trees, and Ackroyd refers to its identification in the embryos of wheat separated in the process of milling, and in beet juice by Richards on and Crampton (1886); he has himself demonstrated its presence in bread, French beans, and green peas, whereas it is

absent from bananas and rhubarb. Now this is a suggestive circumstance taken in conjunction with the fact that it is a characteristic component of the fetal allantoin secretion, and related therefore to an important structure connected with the fetal circulation, a structure along which the vessels pass which convey the fetal blood to and from its intimate relationship with the maternal blood.

Whenever we find any substances constantly in certain parts of plants or animals it is quite reasonable to suppose that they may be in some way related to and necessary for the particular tissues which have selected them, and although the allantoin in the human embryo might be regarded as a fetal waste product, I think we may feel justified in assuming that, in the economies of Nature, it has a function to perform, perhaps in relation to cell multiplication, especially as it is not at once eliminated through the maternal circulation. The same suggestion is raised by the fact that it is also present in milk, the food of the rapidly growing young organism, and in the parts of some plants in which active cell multiplication takes place.

[Notes are given of successful treatment of several cases by Dr. Macalister and other practitioners].

Dr. WM. BRAMWELL, M.A., M.D., B.CH., Liverpool, writing on the subject, says:—

"I have on more than one occasion cured old ulcers which have resisted other treatment, by the simple extract from the root applied on lint to saturation. After a few hours this dressing, in favourable cases, sets quite hard, and can only be removed by the lengthy application of water, which is often more tedious and painful than the average patient, who has been in the habit of applying some simple dressing, cares to endure. This hard setting acts, in some measure, like strapping, drawing the edges of the ulcer towards one another, but probably much more evenly and accurately than the most skilful strapping could effect. This looks as though the cure is wrought similarly to healing under the seal." —B. M. J.

Plucking Live Geese.

It is a vexed question as to whether or not the plucking of live geese constitutes an act of cruelty. Two Irish courts have recently had their say on the point, viz., the Limerick Petty Sessions Court and the King's Bench Division. At Limerick last September a Caherconlish man was summoned by the Society for the Prevention of Cruelty to Animals for alleged cruelty to nineteen geese by plucking them alive. The evidence given by the complainant was to the effect that defendant was a professional plucker, and made his living by plucking geese and selling the feathers, and that he paid the owner 4d. a "pluck" for the right to pluck nineteen geese which were then alive. All the feathers except the wing feathers were plucked, and this, in the complainant's opinion, caused the geese pain, and also left them unprotected against the weather.

For the defence it was contended that the plucking of geese was a common custom in the country, and that no unnecessary pain was inflicted. The magistrates, with one exception, dismissed the case on the merits, believing that the plucking was not cruelty; that it was necessary to prevent vermin, and also that it improved the condition of the birds.

An appeal to the King's Bench came on for hearing the other day, and resulted in the court deciding to make "no rule," on the ground that there was not sufficient evidence before them.

Cruelty to a Horse at Llanfair.

A young agricultural labourer, named John Ellis Williams, employed at Garthgynan Farm, Llanfair, was charged with an act of horrible cruelty to a horse. The case came before Dr. J. Medwyn Hughes, and the Mayor (Mr. T. J. Roberts), and aroused considerable interest. The defendant was taken into custody under a warrant.

Inspector Francis Graham, of the N.S.P.C., prosecuted. In consequence of information received he visited Garthgynan Farm, where a statement was made to him by the tenant, Mrs. J. Morris. A dead horse lay in the stable—a bay gelding between three and four years of age, a valuable animal, in a good condition. It lay on its near side, and witness could see four punctured wounds on its body, which, in his opinion, could be caused by a manure gaff, such as the one now produced. Subsequently he saw the accused, and charged him with cruelly beating the horse with a manure hook. He replied "I did do so. I was vexed with the horse, and lost my temper." Witness asked him "had you any drink, or were you drunk," and he replied, "I had a glass or two, and I am sorry I illtreated the horse." A thick leather strap which the horse had worn on the back had been penetrated through, and there were smaller holes in the saddle, showing that considerable violence had been used.

Mr. J. H. Wynne, veterinary surgeon, Denbigh, said he examined the horse on the 16th inst., and found it in a distressed condition, and showing all the symptoms of septic poisoning. There was a considerable swelling on the near side from the centre of the back right on to the hind quarters. Over this swollen area there were a

number of punctured wounds—23 in all—some very deep, some less so, and others only just having gone through the skin. One of the wounds had been plugged, and on the removal of the plug, a quantity of gas escaped, followed by a frothy foetid discharge. He told Mr. D. Morris that the horse could not possibly live. Later, P.C. Henry Jones examined the horse. Witness did what he could for the animal and left. The horse died the same evening.

Replying to the Chairman, witness said the horse died from septic poisoning following the wounds, some of which were more than a finger deep. He had measured the distances between some of the wounds, and these corresponded exactly with the distance between the teeth of the manure gaff now produced.

Prisoner had nothing to say when questioned by the Bench.

The Clerk then read a letter from Mr. John Morris, stating that the defendant had been in his employ for three years, looking after the horses as head man. No trouble had been experienced with him up to this incident.

The Chairman said that the Bench considered the case a very serious one. They had given full weight to the employer's letter, and upon that had decided not to send the defendant to prison, otherwise they would have had no hesitation in doing so. It was a cruel, cowardly, and inhuman act—the act really of a madman. Defendant ought to be thoroughly ashamed of himself. He would be fined £3 and costs, and consider himself lucky at that.

The leniency of the verdict caused great surprise in court.—*North Wales Times.*

A Question of Warranty: Sidebone.

At the monthly sitting of the Dover County Court at the Town Hall, on Wednesday, Jan. 24th, before His Honour Judge Shortt, Frederick R. Marx, baker and confectioner, of Dover, v. Marsh, horse dealer, of Deal.

This was an action for damages for an alleged breach of a verbal warranty in regard to the sale of a horse, or alternatively for alleged fraudulent misrepresentation. Mr. Ernest Chitty appeared for the plaintiff, and Mr. Leslie Watts defended.

Plaintiff said he was a baker and confectioner in business at 140 Buckland Avenue. On Tuesday, Nov. 21, defendant came and offered to sell him a brown cob mare that he had brought with him. Witness rode behind the horse with the defendant to the top of Crabble Hill, and although he did not know much about horses it appeared to be a very decent animal. When they returned he told the defendant he wanted the horse to take bread round in a van, which he showed him. Defendant, in the presence of witness' man, said "This is just the horse you want. It is perfectly sound and quite fit for your work." He also said it had been working in a mineral water van all the summer. He paid the defendant £7 in hard cash, and he gave him his pony, value £5. He would not have bought the horse if the defendant had not made the statements he did about the horse. The next day the horse was very lame, and on the following day it was worse still, and could scarcely get along. On Friday it was left in the stable, and on Saturday he called in a veterinary surgeon. In consequence of what he said, witness went on Sunday to see the defendant about the horse. Defendant offered to send down another horse, and this he did on Sunday evening, but it proved useless. He wired to the defendant, asking him to take both horses back. This defendant did not do, and on the 28th November witness sent the animals back to Deal by a Mr. Hudson. Defendant refused to take the first horse in, and he said to witness, who was also present, "You've been had, and now you're crying about it. I've often been had." Witness told him he had warranted the horse to be sound, and defendant replied that he had given no written warranty. On the Wednesday witness had the horse inspected by Inspector Freeman, of the R.S.P.C.A., with the result that arrangements were made for the disposal of the animal to the knackers, who offered 13s. for it. At present the horse was in a meadow till the knackers were ready. From 13s. would have to be deducted the 4s. for the man Hudson for taking the horse to Deal.

Cross-examined: He admitted £12 was not a big price for a horse, and he did not expect to get a first-class animal. The defendant gave his warranty of his own free will. Although the amount of the purchase money was small it did not surprise him that the seller should have said the horse was perfectly sound. He was confident that the defendant gave this verbal warranty. He denied the defendant said he had had the horse only three days, and that it was a little shaky on the fore feet. He did not work it hard on the rounds; the journey was only about three miles.

Frank Brown, in the employ of the plaintiff, said he saw the defendant and the horse on 21st November, and he was present at the bargaining. The defendant said the horse was sound and fit for the work, and also that it would improve by working. The price was afterwards fixed at £12. On Wednesday he accompanied Mr. Marx with the horse on the rounds, and it appeared very stiff. Defendant said nothing about the horse being "shaky" on its fore feet. They went to Liverpool Street from the shop out as far as the "Orange Tree," Maxton, and back again. The next day the horse was worse still, and on Saturday it was seen by Mr. Clyde, the veterinary surgeon. On the Sunday evening the defendant sent

another horse, but when this was tried on Monday it was found to be quite useless.

Cross-examined: Defendant said the first horse would improve because baker's work was lighter than it had been previously doing.

Mr. Watts: But how could it improve if it were perfectly sound?—It could by rest.

Did you not understand there was something the matter with the horse if Mr. Marsh said it would improve?—Not at all.

George Hudson, of 37 George Street, said he was engaged by Mr. Marx on November 28th to take two horses to the defendant at Deal. On the way he found he was stopped by the County Police, who called his attention to condition of the brown cob.

Mr. Watts objected to this evidence.

Witness, continuing, said Mr. Marx went by train and accompanied him on arriving at Deal to Mr. Marsh. Mr. Marx told him the cob was no good and that he must take it back. Defendant's boy ran the horse up and down and it went very lame, but defendant said he could not see it. Defendant said to Mr. Marx, "You've been 'had.' I've often been 'had.'" When Mr. Marx said he had warranted the horse, defendant said "Where's your warranty?"

Cross-examined: He did not think it unlikely that after defendant said he could not see that the horse was lame, he would say "You've been 'had.'"

His Honour: How I wish the law would insist on a written warranty! (Laughter.)

Mr. Chitty: It would reduce litigation, your Honour.

Mr. Clyde, veterinary surgeon, of Dover, stated that he examined the brown cob and found it to be suffering from ossification of the feet, which were contracted. It was useless for a trotting job, for which Mr. Marx required it. If it were given a good rest and then smartly whipped up it would give a good account of itself for the time being. If it were shod in a certain manner the lameness could be alleviated to a certain extent. At the time he saw it on the Saturday it was quite incapable of going to work.

Cross-examined: The horse had sidebones, and if Mr. Richardson (another veterinary surgeon) said there were none, he should still say there were. It could be made workably sound by being shod in a particular manner.

His Honour: Would it be fit for Mr. Marx's work?—No, for walking only.

By Mr. Watts: A perfectly sound horse was not sold for £12.

By Mr. Chitty: He had seen plenty of horses at that price which would have been fit for the plaintiff's work.

Inspector J. Freeman, R.S.P.C.A., said he examined the cob at Deal with Mr. Marx on 29th November. She was lame on both fore feet, and suffering from ringbone and sidebone. The animal was incurably lame, and he advised it to be destroyed. It was fit for no work.

Cross-examined: He had had forty-five years' experience and had passed three severe examinations. He would not say any veterinary surgeon was wrong; everyone was entitled to his own opinion.

This concluded plaintiff's case.

Defendant, giving evidence, denied saying anything about the horse being sound. Plaintiff said "Is it all right, Marsh," and witness said "All its faults you can see for yourself. It is a bit shaky on the fore feet, but that will very likely improve with your work." He told plaintiff he had had the animal only a few days. He denied giving a verbal warranty, and nothing was said about one. He had never heard of a perfectly sound £12 horse. When Mr. Marx came to see him, witness made no remark about his having been "had."

Cross-examined: He had had the horse only three days when he sold it, and he did not know much about it. He did not consider the lending of the second horse to the plaintiff amounted to an admission, because Mr.

Marx came to him on the Sunday and said he must have a horse for the morning as both his horses were lame.

John Hamilton, of Deal, who said he was with the defendant at the time of the sale of the horse, gave corroborative evidence.

Cross-examined: Marsh told the plaintiff the horse would do for his work, and that it had been all right during the time he had had it.

Mr. Richardson, veterinary surgeon, said he examined the horse on Wednesday, November 29th. It was lame on the off fore leg, and both fore tendons were contracted. He saw no evidence of sidebone or ringbone, and what he could not understand was that neither Mr. Clyde nor Mr. Freeman noticed that the horse had been shod in leathers. It was over at the knees, and the heels were contracted.

Cross-examined: There was no such thing as ossification of the fore or hind feet; he had never heard the term in that connection before.

His Honour said that if the line of defence was that no warranty was given the evidence of this witness was not material.

Mr. Watts submitted that if His Honour decided a warranty was given, this evidence would be material.

Mr. Richardson, in reply to further questions, said the horse could have been made workably sound by proper treatment.

Arthur Bushell, employed by the defendant, denied the words "You've been 'had'" were used by the defendant.

Cross-examined: He did not hear what was going on when he was trotting the horse up and down.

Mr. Watts submitted that defendant's story was borne out by the probabilities of the case.

Mr. Chitty contended that the defence as to the question of a warranty was overwhelming. He submitted that the evidence for the prosecution was contradictory, and that the fact of the defendant lending another horse as a substitute amounted to an admission.

His Honour, in giving judgment, said in all cases of this kind it was much more satisfactory to have a written warranty. He considered the plaintiff had failed to prove beyond reasonable doubt that the defendant did give a warranty. Weighing one side with the other he felt there was a slight preponderance on the plaintiff's side, but it was not enough. He held that reasonable doubt did exist in this case, and he would give judgment for the defendant.—*The Dover Express*.

What of the Horse?

To the Editor of *The Nottingham Guardian*.

Sir,—The complaints of injustice to owners and users of horses are isolated ones only as far as publicity is concerned. The horse in the past has always proved its supremacy in utility, combined with cost and upkeep, as a user of the King's highway. It has, however, to meet rivals and competitors, and undoubtedly the foremost is the motor vehicle. The point I wish to mark is that of fair competition. We have seen, and do see now, the growth of the motor vehicle, fed with alterations in laws, concessions in regard to the streets and highways and in other ways, all of which are perfectly in order so far as these new arrangements do not trespass on the rights of other users of the roads. There is not the slightest doubt but what they do, and whereas motor vehicles have organisation behind them to assert their requirements and attain their desires, the horse has not.

There is nothing surprising in this. Had not the motor vehicle organisation behind it from the first it would have progressed less, very much less, and the horse owner and user would not have had his rights imperilled, and as organisation to-day is necessary to suc-

cessfully meet organisation, the only logical conclusion possible is that for their rights, for their liberties, and for their security, horse owners and horse users, and in a word, all interested in the horse must organise, must combine, must co-operate. It is with these facts considered that I have formed an opinion on the question. If it is true, as I am told, there are societies and organisations in existence for the purpose I have mentioned, it would seem they exist in name only. What is wanted is a society which will embrace every horse owner, user, and well-wisher, that can have authority and power, representing as it would by far the greatest users of the roads.

To attempt to stay or retard true progress would be as futile as it would be wrong, and any efforts which I, with the help of others, may and are making are not antagonistic to the real progress of efficient means of transport. We live in a day of speed, but speed at any price is not progress. In the reports of the companies controlling motor propelled vehicles in the large centres of the world we see a tremendous amount of capital returning nothing to its owners, except greater speed in transportation to them and the community generally. And this at the expense in road alteration and numerous other ways which encroach upon the rights of, and put difficulties in the way of means of transport which gives a return on capital. There can be no sentiment in the horse; he pays and has done since he was created. Therefore to put difficulties in his way, to endeavour to assist his substitute is not only unfair but dangerous.—I am, sir, etc.,

G. H. KEEBLE.

John's Disease—Departmental Committee to be asked for.

At the meeting of the Council of the Central and Associated Chambers of Agriculture on Tuesday, January 30th, at the Surveyors' Institution, Westminster, Sir Luke White, M.P., presiding:—

Prof. PENBERTHY moved the adoption of the report of the Cattle Diseases Committee, which recommended that a deputation from the committee should wait upon the Board of Agriculture to ask for the appointment of a Departmental Committee to inquire into the nature of John's disease. He said that this disease was recognised under various local names, and it was to be feared that it was greatly on the increase. It was an affection of the lining membrane of the intestines, caused by a micro-organism, and its symptoms were diarrhoea and wasting. The cattle affected contaminated the pastures. So far science had discovered no cure for it, or any real practical measure for its prevention. As a rule the disease was fatal to the animal attacked. Sometimes it affected only one animal on a farm, and at other times a farmer might lose as many as twenty or thirty cattle.

Mr. T. LATHAM, who seconded, said that sheep were liable to the disease as well as cattle.

The report was adopted.—*The Times*.

"When Doctors Differ."

Mr. Plowden, the Marylebone magistrate, commenting on the divergence of opinion between two veterinary surgeons, said that most people, whether they had had any training or not, could tell if a horse was lame, and an ordinary man in the street could do it generally with success, but there were two skilled persons, one of whom said the horse was very lame, while the other said it was not. After his long experiences of the differences of veterinary surgeons he was quite expecting that one day one veterinary surgeon would come and say, "This is a horse," and another would say, "It isn't." (Laughter). That was about the only thing left in which they could not differ.—*Evening Express*, Liverpool.

Workmens' Compensation—A Referred Case.

At Tiverton County Court on Saturday a somewhat unusual case came before Judge Beresford, an agreement under the Workmen's Compensation Act having been referred to his Honour by the Registrar, who did not consider the compensation agreed to therein adequate, although the parties and their solicitors concurred. The agreement was made between John Blackmore, a Talaton labourer, (father of Jonas Blackmore), and Mr. S. H. Down, a Bampton veterinary surgeon.

Mr. Tweed, solicitor for Blackmore, stated that after a long correspondence with the insurance company his client agreed to accept £10 rather than have the expense and trouble of litigation.

His Honour thought he had no power to order a bigger sum.

Mr. Clutson, for Mr. Down, said Blackmore was incapacitated for seven weeks, but during that time was paid full wages. He, however, claimed a lump sum from his employer for disfigurement, having lost one ear. The company offered £10 and £2 2s. costs, and this was accepted and embodied in an agreement.

Judge Beresford: £10 seems a very small sum as compensation for the loss of an ear, and I would suggest that the Insurance Company increase the sum to £20.

Mr. Clutson said the judge's representation should be placed before the company, and if they agreed, the case would have to be brought before the Registrar.

The Control of the Milk Supply.

At a meeting in December in Cupar, the Fife Local Authority had under consideration the scheme of the Association of Veterinary Officers of Health with reference to tuberculosis, the object of which is to put the control of the milk supply into the hands of a central authority, preferably the Board of Agriculture. Mr. E. E. Morrison, Bonnytown, moved that the Committee give their general approval to the scheme of the Veterinary Officers. They should employ veterinary surgeons, he said, more than they did at present. They had men coming into their byres and inspecting their premises who knew little about cows, and it would be much better if they had veterinary surgeons. Mr. Morrison's motion was adopted.—*N.B.A.*

Goat-Keeping in Ireland.

A conference took place at the Castle, Dublin, in December, organised by the Department of Agriculture, and presided over by Her Excellency the Countess of Aberdeen, to consider the Department's scheme for the improvement of goats in Ireland, and to facilitate their being kept by small-holders.

It was decided at the Conference to establish an Irish Goat Society to work in connection with the British Goat Society in England, and to form local associations, under the direction of the head society, to encourage goat-rearing and create a supply of milk amongst cottagers who rarely have an opportunity of tasting it.—*Live Stock Journal.*

Patent Medicines and the Press.

The scandalous way in which the entire British Press—with two or three honourable exceptions—boycotted the British Medical Association's publication "Secret Remedies" in 1909 is a standing record of the complete power of the nostrum vendors and their advertisements and of the ignoble cowardice of newspaper proprietors. The special "quackery" number of *The British Medical Journal* some six months ago met with a similar fate.

There is need for many more torchbearers before truth can be properly revealed to the multitude. Of those who have kept the flame alight hitherto, honourable mention is especially due to Dr. Henry Sewill, whose addresses and contributions to *Vanity Fair* have long been means of enlightenment both to the public and the medical profession. Dr. Sewill has long agitated for a Royal Commission as the best way to unsettle the conspiracy of silence of the Press as a whole.—*The Hospital.*

The Uses of Izal.

Messrs. Newton, Chambers & Co., Ltd. (Thorncliffe, Sheffield) will gladly send their series of handbooks on disinfection to readers of this journal on receipt of a postcard. *Medical Izal* contains reprints from the principal medical journals, of papers dealing with the use of Izal in the treatment of phthisis, puerperal sepsis, tropical dysentery, enteric fever, cholera, and tinea favosa capitis. *Practical disinfection* deals with the domestic uses of Izal. *The Veterinary Handbook* is full of useful information for owners of horses, dogs, cats, poultry, etc. The last of the series, *Izal in the Dairy*, apart from its purpose as an advertisement is a really useful handbook at a time when the conditions of milk production are claiming so much attention.

ARMY VETERINARY SERVICE.

Extract from *London Gazette*.

WAR OFFICE, WHITEHALL, Jan. 26.

REGULAR FORCES. ARMY VETERINARY CORPS.

Brevet-Maj. A. G. Todd, A.V.C., to be Dep. Assistant Director-General, *vice* Capt. H. E. Gibbs, who has resigned that appointment. Dated Jan. 17.

Capt. H. M. L. Conyngham to be Major. Dated Jan. 6.

TERRITORIAL FORCE. ARMY VETERINARY CORPS.

Lieut. J. L. C. Jones to be Captain. Dated Aug. 18, 1911.

The undermentioned officers arrived from India in Transport "Dongola" on Jan. 17th, and have been posted for duty:

Major E. E. Martin to Woolwich; Major A. C. Todd to War Office to take up appointment of Deputy Assistant Director-General, A.V.S.

Captains J. S. Nimmo to Aldershot; W. H. Simpson to Leeds.

The following officers embarked for India in Transport "Dongola" on Jan. 27:

Captains F. S. Probyn and A. Leaning.

His Excellency the Earl of Aberdeen, K.T., G.C.M.G., G.C.V.O., Lord Lieutenant, held his first Levée of the season at Dublin on Tuesday. In the list of those present are:

Prof. Mettam, President Royal College of Veterinary Surgeons, presented by Sir Christopher Nixon, Bart.

Lieut.-Col. J. Moore, F.R.C.V.S., presented by the Commander of the Forces.

No fewer than forty-two candidates applied for the post of Medical Officer of Health for the county borough of Wigan.

CORRESPONDENCE.

OUR CONVENIENTLY SHORT MEMORIES.

Sir,

The perusal of the report of last Council meeting as it appears in *The Veterinary Record* cannot fail to strike most of us as a remarkable illustration of the shortness of the human memory.

The report states that Mr. Barrett suggested that for the sake of modifying opposition it might be judicious to restrict the annual fee to half-a-guinea. This apparently innocent and pertinent remark raised quite a storm, one member said—"The question of the annual fee as proposed in the Bill was thoroughly discussed . . . and it was *practically unanimously* settled that it should be one guinea. I think there were only about three dissentients." Another—"Is it open to a member of this Council . . . to suggest that the Council should go back upon its *practically unanimous* decision that the Bill should stand as it is?" *Practically unanimous*—how does this accord with the facts?

The report of a Council meeting which appeared in *The Record* of 10th April, 1909, showed that on an amendment proposed by Mr. Dollar, that for the words "a fee of one guinea" the words "such fee not less than 10/6 nor exceeding one guinea as the Council shall from time to time direct," should be substituted, a lengthy wrangle took place, after which vote was taken and was thus reported: "The amendment moved by Mr. Dollar, seconded by Prof. Williams was then put, and the President declared it lost, stating that nine voted for and ten against. An appeal was then made to him that the vote should be taken again, as another count made the voting equal. The vote was then taken again, and resulted in a tie, ten voting for and ten against. The President: Without hesitation I give my casting vote against the amendment."

Practically unanimous!—Yours, etc.,

J. R. U. DEWAR.

Edinburgh, Jan. 25.

"WHISTLING."

Sir,

The case described by Mr. Spreull is a very interesting one. Instances of this nature explain some, at least, of the marked differences of opinion that occur with reference to the soundness of a horse's wind. At the same time if the animal in question was examined in the ordinary manner he would probably have been condemned as a "whistler." In examining horses we seldom expend the amount of time mentioned by Mr. Spreull in this case; probably had the horse been subjected to a severe test at the first examination, it would have been found that the abnormal sound would have disappeared. We frequently find that well-bred hunters when very fresh may whistle in an intermittent manner when cantered in a circle, but when permitted to extend themselves no abnormal sound can be detected.

But there is an important matter to consider in connection with such cases, although one veterinary surgeon may be of opinion that a horse showing the above peculiarity in respiration is sound, another may hold the contrary opinion. Again the purchaser must be informed that the horse whistles in the manner mentioned. If the animal is sold shortly after purchase, it is quite possible that on being subjected to examination, he may be rejected as a whistler. It is a common experience that such animals do become whistlers in a variable period, while *per contra*, others may continue sound for life.

At the same time, a horse that showed the peculiarity of respiration described by Mr. Spreull might be a risky purchase for a man who intended to sell him at a profit.

Even for stud purposes there would be considerable risk, as if the horse was entered for a show few veterinary surgeons would be fond of who would devote the time required to find out the idiosyncrasies of the animal. Moreover, it is seldom possible, or even desirable, to subject a stud horse

to so severe a test as that described by Mr. Spreull, and few owners would permit a stallion to be galloped "to a stand-still." The probability is that the animal would be tested in the ordinary manner and rejected, although after-events might prove that he was sound.

The subject of whistling is in reality a most important one, although it is treated of very lightly in text books. As compared with roaring there are some points worthy of consideration. Except in intermittent cases, there is no difficulty in detecting roaring, all that is required is the faculty of hearing; and the abnormal sound can be heard by the layman as well as by the professional.

But with whistling it is a different matter: here great discrimination is necessary not only in detecting the sound in slight cases, but also in differentiating it from certain peculiarities of respiration which may be perfectly normal.

Again, whistling in many cases requires a severe test before the abnormal sound is manifested, while in the case of roaring but little exertion is necessary. Pages might be written on the peculiarities displayed by whistlers; some horses whistle only while ridden in a circle, others when galloped in a straight line; some whistle most distinctly at the commencement of their work, others after being subjected to severe exertion only, while others again only display the abnormal sound after being pulled up.

Again, there are sounds which cannot be described as either whistling or roaring, and these often give rise to considerable differences of opinion as to whether they should be regarded as causes of unsoundness.

Some practitioners indeed claim to possess such remarkable powers of diagnosis that they pretend to differentiate these sounds from those known to be abnormal, and even venture to locate the origin of such.

In conclusion, I venture to put the following queries in the hope of gaining information.

(a) What is "thick wind?" The term is often used, but it would be interesting to know what condition it really refers to, and how it is to be differentiated from the harsh blowing of horses that are out of condition.

(b) What is the necessity for performing the new operation for roaring on stud horses and mares intended for breeding purposes, that are roarers?

A question was recently asked on this subject as to whether such animals if cured (?) should be considered as sound. As these animals are not worked or subjected to exertion, why operate on them at all, unless, of course, it is considered proper to render them apparently more valuable in the sale ring.

Why is roaring objected to in animals for stud purposes? Surely it is because the disease is regarded as hereditary. Does the operation do away with the hereditary tendency of the disease? If it is a nervous affection (and there is much evidence to support this view), then I fail to see how stripping the ventricles can have any effect on the nervous lesions on which the disease depends.

It would be as rational to hold that because an animal suffering from navicular disease goes sound after neurectomy has been performed, that such animal should be regarded as sound for stud purposes.

From an ethical point of view, both operations should be condemned in the case of stud animals, but more especially that for roaring, as it effectually conceals the existence of the disease from the veterinary examiner.

As to the propriety of operating on roarers the property of dealers, whose object is to sell the animals as sound, it is quite possible that opinions will differ. If those unfortunate sequels to the operation which have lately been discovered become more frequent, and operators get more numerous, then it is likely that in future when examining horses we shall ask for a special guarantee from the sellers that the operation has not been performed.

Of course some practitioners may not regard the matter in the above light, being comforted by the thought—

"For the jingle of the guinea
Helps the hurt that honour feels."

—Yours, etc.,

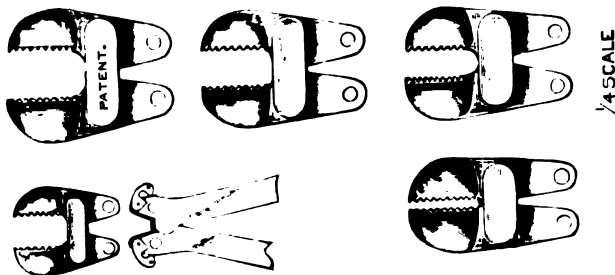

E. WALLIS HOARE.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

PRACTICES FOR DISPOSAL

IN large Midland City. Genuine mixed practice returning £850 per annum, and shoeing business returning £750. Accountants certify profit of £650 per ann. Capital required about £1250.

WESTERN COUNTY. Receipts about £600 per annum. In present hands nearly 50 years. Advancing age sole reason for sale.

PURCHASERS ARE REQUESTED to call, or write stating their requirements, as we have numerous Practices on our Register which have not been advertised. *No charge* is made to purchasers.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

WEST OF ENGLAND. Town practice held nearly 20 years by present incumbent. Receipts: 1910 £1172. Contracts produce £251. Good house containing 5 bedrooms, 3 recept. etc. garden, stabling. Working expenses light. Premium £1500.

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended.

SURREY. Rapidly increasing, well-established practice returning about £1000 per annum. Small house with stabling, kennels, etc. Capital required, including valuation, will be about £1300. The practice is well-known to us and can be thoroughly recommended to a suitable man.

HIGH-CLASS mixed practice returning about £650 per annum. Good premises would be let on lease or sold if preferred. Premium £600.

PROSPECTUS, containing "*Hints to Vendors*" and "*Hints to Purchasers*," post free on application.

To Vendors.

WE make *no charge* unless a Sale is effected. If you have a genuine Practice you wish to sell quickly and without publicity we shall be please to place particulars on our Register.

Professional Advertisements.

These will be received up to Thursday morning.
Five lines or under 2/6 (exclusive of heading): for two insertions 4/-; for three 5/-; after three 1/- each.
Each line above five—first insertion 6d: after first 3d.
Average—seven words in a line.

These Advertisements will not be inserted unless prepaid, and if replies are to be received at this office an extra sixpence must be included.

Lincolnshire V.M.A.

THE Thirtieth Annual Meeting will be held at "The George" Hotel, Grantham, on Thursday, Feb. 15, chair to be taken by the President, Mr. W. W. Grasby, M.R.C.V.S., of Daventry, at 2-30 o'clock. Agenda—Routine business: Annual Report and Balance Sheet: Election of Officers: Members are invited to bring forward Clinical cases for discussion, also to exhibit Specimens. Dinner at 5 o'clock.

C. W. TOWNSEND, Hon. Sec. & Treasurer.

Wanted

PRACTICE in good-class country district, returning about £1000, must bear strict investigation. Address 3202 V.R., 20 Fulham Road, London, S.W.

As Assistant

UNQUALIFIED assistant disengaged, age 37, long experience country practice. Address, 4202 V.R. 20 Fulham Road, London, S.W.

Qualified Assistant Wanted

IN Manchester practice. State age, experience, and salary, to live out. Address, 2202 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

FINAL year student wishes to see practice. Services for board. Address, 1202 V.R., 20 Fulham Road, London, S.W.

Assistant Wanted

M.R.C.V.S. practical and steady, for mixed practice: permanency for good man. Sign bond. Reply stating age, height, terms required living in or out, with references. Address, 5202 V.R., 20 Fulham Rd., S.W.

Partner Wanted

Wanted a thoroughly reliable, practical, qualified (married man preferred) as partner in an extensive country practice. Full particulars in strict confidence. Only bona fide applicants with capital at command will be entertained. Address, 4201 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

THOROUGHLY reliable and practical veterinary surgeon, age 32, with small capital, desires management, with view to succession, or would purchase practice if terms could be arranged. Address, with full particulars, 7202 V.R., 20 Fulham Road, London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,

73 Victoria Mansions,
South Lambeth Road, S.W.

T. FENN-ADDISON, M.R.C.V.S.,

LOCUM TENENS, (or Assistant)

Horton Road, Gloucester

Moderate terms. Excellent references from well-known practitioners.

As Assistant

M.R.C.V.S. requires berth in busy canine practice. Good references: steady: moderate salary in return for good experience. Address, 6202 V.R. 20 Fulham Road, London, S.W.

As Assistant or Manager

M.R.C.V.S. (23) qualified 1910, desires post as assistant or manager of branch. Served pupilage. Experience in city and country practice. Excellent references. Address, 8202 V.R., 20 Fulham Road, London, S.W.

Pupil Wanted

VACANCY occurs in extensive mixed practice for gentlemanly youth as pupil, or would take C or D student for three or four months. Address, 9202 V.R. 20 Fulham Road, London, S.W.

As Locum or Assistant

CLASS D student seeks situation as locum or assistant At liberty until May. Good all-round man. Excellent references. Address, 2021 V.R., 20 Fulham Road, London, S.W.

Wanted

POSITION with veterinary surgeon by man of superior ability, good worker, etc. References. Address, 2022 V.R., 20 Fulham Road, London, S.W.

For Immediate Disposal

GENUINE old established town and country practice in Yorkshire, increasing yearly. Suitable house at low rent, stable and kennels attached. Returns for the last 4 years over £300 per annum. Good introduction given. Address, 2023 V.R., 20 Fulham Road, S.W.

Assistant Wanted

QUALIFIED, for a Northern town practice: Sign usual bond, must be sober, reliable, and not afraid of work. State if married or single, age, and salary required. Address, 2024 V.R., 20 Fulham Road, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

Locum Tenens

REALLY reliable and experienced M.R.C.V.S., either town or country, undertakes above duty. At liberty now. Long or short periods. Exceptional references, Terms moderate. Address, 2025 V.R. 20 Fulham Rd. S.W.

Books for Sale

"BREEDING Racehorses by the Figure System," by Bruce Lowe, Catalogued 31/6, take 20/- "Modern Farrier," by George Skevington, 1838, dedicated to the Berkeley Hunt, interesting old manual, fully illustrated, take 10/- or 27/6 the pair. Address, 2026 V.R. 20 Fulham Road, London, S.W.

PRACTICES & PARTNERSHIPS for Sale. Messrs. Peacock and Hadley, Veterinary Transfer Agents, 19 Craven Street, Strand, W.C., will be pleased to forward to intending purchasers, stating their requirements, full particulars of any suitable investment that may be on their books. No charge to purchasers or for inquiries.

As Assistant

M.R.C.V.S. qualified 1910, desires assistantship in good mixed practice, experienced. Can furnish good references. Address, 1023 V.R., 20 Fulham Road, London, S.W.

Wanted

GOOD practitioner, M.R.C.V.S. to have early succession Market town in one of the best districts in the Eastern Counties. Capital will be a second consideration. Abstainer. Reference required. Good operator (standing). Address, 1024 V.R. 20 Fulham Road, S.W.

Assistant Wanted

FOR town practice, state age, references, and salary required. Address, 1021 V.R. 20 Fulham Road, London, S.W.

As Manager or Assistant

M.R.C.V.S. seeks situation; well up in cattle and horse practice, not afraid of work, age 25. Address, 1025 V.R., 20 Fulham Road, S.W.

As Assistant

M.R.C.V.S. requires situation as assistant. Excellent references, experience in town and country practice Address, 4016 V.R., 20 Fulham Road, London, S.W.

As Assistant or Locum

VETERINARY surgeon desires post in genuine country practice. Thoroughly experienced and reliable, not afraid of any work, 34, good horseman. Permanency; interview if possible: excellent references. Address, 1401 V.R., 20 Fulham Road, London, S.W.

For Disposal

MIXED town and country practice with C.C. appointment in rapidly growing town in North Ireland, doing about £360. Introduction and every assistance given; nearest opposition 10 miles. Price, £150. Address, 4015 V.R., 20 Fulham Rd., London, S.W.

To Veterinary Surgeons

ADVERTISER, age 21, would be pleased to hear from V.S., who would take him to see practice, would do horse, etc., board in return. No previous practical experience, but very anxious. Pecuniary position will not allow premium. Address, D. H. Ransom, 27 Market Place, New Malden, Surrey.

To Veterinary Surgeons

M.R.C.V.S., 1912, desires assistantship, has seen practice in town and country. Address, Box 70, c/o Eason & Son, Dublin.

For Sale

IN South-West of Scotland, an old established, easily worked practice. Hunting and other sport in district; modern house with good yard accommodation. Price, £300. Address, 4019 V.R. 20 Fulham Rd., London, S.W.

For Disposal

TOWN and country practice, in present hands many years, owner retiring. Moderate premium: introduction and assistance given. Welsh language not essential. Address, Campbell, Maesygelly, Rhayader, Radnorshire.

As Assistant

M.R.C.V.S. desires situation. Excellent references; experience in town and country practice. Address, 2016 V.R., 20 Fulham Road, London, S.W.

As Locum

EXPERIENCED M.R.C.V.S., will act as locum, town or country practice. Free end of March. Address, J. B. Taylor, M.R.C.V.S., Shawlands House, by Larkhall, Lanarkshire.

As Assistant

UNQUALIFIED, town and country experience, good references as locum and assistant. Married, age 39. Relative coming into the practice reason for leaving present post. Address, 4017 V.R., 20 Fulham Rd., S.W.

FOALING SEASON. Agents required in unrepresented districts for the Imperial Accident Insurance Co., Ltd. Est. 1878. Horses Insured against Death from Accident or Disease, Mares for Foaling and Loss of Foals; Farmers' Liability for Accidents to Labourers, Servants, and Workmen's Compensation. Claims paid £500,000. Address Agency Manager, 17 Pall Mall East, London, S.W.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

THE FARRIERS' JOURNAL.

A Monthly Magazine for Horse Shoers.
The only paper devoted to the interest of the Shocing Smith.

Price 2d., by post 2½d.

"MAGNUM" PESSARIES.

(HEWLETT'S)

"Magnum" Pessaries are prepared with a medicated non-oily base which is both effective as a Uterine Antiseptic and of special benefit in Parturition both in Cows and Mares.

A "Magnum" Pessary should be inserted directly after parturition in order to maintain the Uterus in a healthy state. It can be inserted with the greatest ease and will keep the parts in a thoroughly antiseptic condition for a lengthy period.

Alkaline "Magnum" Pessaries have recently been recommended to neutralise excessive acidity of Vaginal secretion.

"Magnum" Pessaries are supplied according to various formulæ as below, and Veterinary Surgeons' own formulæ can be made up as required.

		Doz.	12 doz.	Doz.
"Magnum" Pessaries,		4/6	@	4/-

VOL. XXIV.

JOHNE'S DISEASE.

Recently the Central and Associated Chambers of Agriculture decided to ask the Board of Agriculture to appoint a Departmental Committee to enquire into Johne's disease. Certainly the time seems ripe for the formation of such a Committee. It might result in the institution of experimental work—perhaps to prove as valuable as that undertaken a comparatively short time ago upon epizootic abortion—and it would certainly increase our knowledge of the disease and its incidence in this country. So few years have elapsed since the condition was first recognised as existing here that we have still much to learn regarding its prevalence and rate of increase. It seems to be spreading, but it is possible that its frequent detection in hitherto unsuspected localities—in which it may have existed for a long time—may account for some of this apparent increase. A Departmental Committee could at least answer the question whether the disease is now, or is likely to become, sufficiently widespread to warrant legislation against it. At present, considering its mortality and the futility of treatment, it certainly seems that legislation might save the country from heavy losses in the future.

SKIN STERILIZATION.

Our French contemporary, *La Semaine Veterinaire*, in the course of some editorial remarks upon the simplicity and efficacy of the method of sterilising the skin for operation with tincture of iodine, raises an interesting question. Is not the alcohol in the agent at least as potent a factor in obtaining success as the iodine? Very probably it is. The theoretical principle of the method is to flood the skin with some germicide capable of penetrating the microscopic clefts and spaces within the epidermis, which previous washing with soap and water would tend to occlude. Many substances would probably serve the purpose as well as preparations of iodine; as some are known to do. Our contemporary mentions the old veterinary dressing of tincture of aloes as possibly destined to revival; and the same might be said of other tinctures formerly used as dressings, such as myrrh. Petrol and benzine, again, have both been found efficient substitutes for tincture of iodine. Many other agents, especially tinctures, would probably be just as useful, while free from the liability of tincture of iodine, unless very fresh, to form the objectionable hydriodic acid. There is room for further work here; for the new method of skin sterilisation has so much to commend it, in veterinary practice especially, that we should learn more of the various agents which may be utilised in it.

STREPTOCOCCAL INFECTION IN SHEEP.

Six times within four years, in the carcasses of sheep sent for investigation to the bacteriological institute of the Königsberg Chamber of Agriculture, a disease has been demonstrated, a constant feature of which was that streptococci could be cultivated in great numbers from all the organs. J. Wiemann now publishes (*Zeitschr. für Infektionskrankh. u.s.w. der Haust.*) an account of this disease.

The affected sheep show, as an especially striking symptom, an exceedingly soporose condition, lying or standing apathetically. They lose flesh rapidly, and the appetite almost completely fails. The pulse is quickened, but the temperature is not particularly elevated, and the respirations, so long as the lungs are not affected, are calm. Then symptoms set in from the seat of the primary affection, through which the disease can manifest itself in three different forms, viz., as endometritis with consecutive peritonitis, as catarrh of the upper air passages, and as enteritis.

As a rule the disease appears first amongst the ewes, often a short time after lambing, and then spreads to the other sheep. The first cases take a very acute course, and are fatal in a few days. In these cases the pathologico-anatomical appearances are very insignificant. But when the disease is of longer standing in a flock, its course gradually becomes subacute, and now the respiratory cases become more frequent. The animals die in from 7 to 14 days, and show severe fibrinous pleurisy and pericarditis upon post-mortem examination.

In lambs the disease is almost always acute or peracute. The animals often die in from 6 to 24 hours, especially the lambs of affected mothers.

The disease is endemic in character, and is often confined to single compartments of the shed. When the shed is abandoned, and the diseased animals separated from the healthy ones, the disease disappears. It must, therefore, be transmitted to the sheep, in the first place, from the floor of the shed, but a direct transmission from sheep to sheep can also occur.

Probably the favourite portal of entry of the virus to the organism is the physiologically hyperæmic genital tract after parturition. But the germ can penetrate by other mucous membranes, especially those of the oral and nasal cavities and of the intestines, and also by wounds of the external skin.

The pathogenic germ, a streptococcus, is present in all the affected organs, in the secretions and excretions, and is especially numerous and easy to demonstrate in the blood.—*Berliner Tier. Woch.*

BILATERAL INTERCOMMUNICATION OF THE LYMPHATIC SYSTEM.

H. Baum discusses (*Deutsche Tierarztl. Woch.*) the question of whether lymph-vessels pass over the median line to communicate with those on the other side of the body. Despite the great practical importance that pertains to this subject, it has hitherto been almost unstudied in animals. Baum, having carried out extensive injections of the lymphatics, concludes as follows;—In the ox, there are lymphatic vessels which pass over the median line, and open into the lymphatic glands of the other half of the body. This especially applies to the lymph vessels of the medially situated portions of the outer skin, the point of the tongue, the hard palate and the gums, the lower lip, the thyroids, the trachea, and œsophagus, the lungs, the thymus, the kidneys, the longus colli, and the vasa efferentia of the mammary lymphatic glands.—*Berliner Tier. Woch.*

LARGE ROUND-CELLED SARCOMA (PRIMARY) IN AN OX'S LUNG.

Primary sarcomata in the lungs of animals are rare. Franz Halász, however, records (*Allatorvosi Lapok*) finding a fungus-like neoplasm arising from the lung of an ox upon a peduncle 4-10th inch long by 1 1-5th inch broad. The neoplasm itself was 3 1-5th inches broad, and was rugged; the pleura covering it was smooth, shining, and transparent. The sectioned surface of the neoplasm was grey-red sprinkled with black-red spots; it was soft in consistence, and was easily lacerated. Microscopically it was found that the neoplasm was encased in a capsule of connective tissue, from which septa of connective tissue proceeded, dividing the neoplasm itself into "islands." In the septa were large roundish connective tissue cells, and also smaller round cells with round nuclei.

The starting-point of the sarcoma in this case was the interlobular connective tissue of the lung; and, as the tumour originated superficially in the vicinity of the pleura, it was able to extend outwards on account of the lack of resistance against it.—*Berliner Tier. Woch.*

THE TREATMENT OF FOLLICULAR MANGE.

J. Miller reports favourably upon the treatment recommended by Gmeiner, of Giessen, for follicular mange. He describes its lines as follows. At the commencement of the treatment, the hair is removed from the affected parts and their surroundings as completely as possible. The whole body is then cleansed in a bath of $\frac{1}{2}$ to 1 per cent. watery solution of sulphurated potash. A few drops of the following mixture are then applied to the affected parts with either the finger or a soft brush—

Ol. Carui	
Spiritus	aa. 10 parts.
Ol. Ricini	150 "

This is rubbed in gently but firmly; and each affected place should be rubbed for at least three minutes, so that the Ol. carni may penetrate as deeply as possible into the skin. Generally this

treatment is carried out once daily, but in extensive cases it may be done twice daily.

Miller reports 31 cures, and says that in slight cases the disease can be overcome in a few weeks. Severe cases, such as those of the pustular form of the disease, in which the pustules can be broken and pressed out, require a longer treatment. Cases in which there is great thickening of the skin, indicating a deep situation of the parasites, resist even the above treatment.—(*Berliner Tier. Woch.*)

W. R. C.

606 AND GLANDERS IN EXPERIMENTAL ANIMALS.

Infective glanders material obtained from a 3-day glycerine agar culture, was introduced intra-peritoneally in guinea pigs and rabbits, and subcutaneously in cats.

Three different methods were adopted for the 606, viz., Alkaline solution for intravenous, suspension in liquid paraffin for subcutaneous, and neutral suspension for intra-muscular.

Fifty-two animals were used, and the following results were noted:

1. Injection of 606 affected the development of the disease,
2. In case of acute glanders it is possible to sterilise the affected animal by means of blood from another animal that has died.
3. The destruction of the glanders bacilli is probably due to two factors; the chemical action of 606 and the action of bodies formed under the influence of the effect of 606.
4. The best way of introducing 606 is intravenous injection in alkaline solution in dose of 0.1 per kilo of the animal's live weight.—*Revue Russe.*

DIAGNOSIS OF GLANDERS IN DEAD MEAT.

In the slaughterhouse at Leyden, where many horses imported from England are killed, the inspector uses the agglutination and deviation of the complement as a test, and is able to arrive at a conclusion in 8 hours, while the length of time necessary for cultural experiment is too long to be practical.—*Centralblatt für Bacteriologie,*

STAINING MICROBES IN SECTIONS.

Useful as the methods of Gram and Ehrlich are, for many reasons the following technique may be adopted with good results.

Not only can the organisms be well studied, but the lesions they induce are also rendered clear. Technique:

1. Stain for 3—5 minutes with Grüber's polychrome blue. Wash with distilled water.
2. Differentiate for some seconds with watery solution of Tannin in ether 10%. Wash. Dehydrate rapidly in absolute alcohol.
3. Stain each section for 3—5 minutes in a solution of Eosin 1:2000: Aurantia 1:1000 aa. Wash. Dehydrate quickly.
4. Clear quickly in Olive oil or Xylol.
5. Mount in Canada balsam. The protoplasm, according to its character, will stain red or yellow, or in a distinct combination of these two

tints. Nuclei and bacilli will be blue. Red corpuscles a bright orange yellow, and fibrin a pale rose.

The following solution is a good preparative for the above method;

Alcohol 5%	Grm. 100.
Sublimato	" 10.
Acid Picric	" 5.

After two days in this, place in Acetone pur. grm. 100, Tinct. Iodine grm. 10, for two days: then:—

Acetone pur.	6 hours.
Alcohol abs.	24—36 "
Alcohol Xylol	6 "
Xylol	6 "
Xylol parafin	6 "
Parafin 45	6—12 "

The method is quite new and has not hitherto been published, but has proved highly satisfactory in practice.—*La Clin. Vét.*

F. E. P.

NODULAR DISEASE OF THE INTESTINES OF CATTLE.

By WALTER JOWETT, F.R.C.V.S., D.V.H. (Capetown).

[ABSTRACT].

Nodular disease of the intestine of the sheep ("knopziekte," as it is popularly termed), is quite well known to those interested in sheep-farming in South Africa, but, as far as one can judge by perusal of the literature relating to the diseases of animals in this country, little attention appears to have been paid, so far, to an almost identical nodular disease of the intestine of cattle, which is met with quite frequently, at any rate in Capetown and the neighbouring districts in the Cape Province. There is no doubt that the "knopziekte" of sheep is widely spread throughout South Africa, being met with, in all probability, wherever sheep-farming is carried on at all extensively; whether the closely related nodular disease of the intestine of the bovine animal is equally prevalent, one is not yet in a position to state with any considerable degree of certainty; as already mentioned, it is common enough in the Cape Peninsula, and it is hoped that by calling attention to the subject one may as a result gain some idea as to the prevalence of the disease elsewhere in the Union.

IDENTITY OF THE PARASITE.

The nodular disease of the intestines of bovines was first described by Drechsler of Munich in 1876. Sauke afterwards confirmed the findings of Drechsler. Oster-tag states that he has frequently seen the sub-mucous nodules in the intestines of cattle slaughtered at the Berlin abattoir.

As to the identity of the larva, the causal agent of this diseased condition, there has been much diversity of opinion, it being, of course, impossible to determine the species of a given parasite of this nature by the mere examination of larval specimens alone, and, as already pointed out, it is only such immature worms which are present in the sub-mucous nodules. The determination of the species, then, rests on the result of examination of adult and sexually mature worms—the males especially—which are present in the *intestinal contents* of the host; these, however, are not invariably present in the lumen of the gut of the ox concurrently with the presence of the larva-containing nodules in its intestinal wall. Moreover, it is somewhat difficult at times to

isolate worms so minute as are those now under consideration from the large mass of material contained in the bovine intestine. The adult parasite occurring in the intestinal contents, even when fully developed, measures only 15 to 20 millimetres in length (roughly about three-quarters to four-fifths of an inch), whilst the larval worm in the nodule is only one-twelfth of an inch long. Strose, and some of the earlier writers who studied this condition, regarded the small nematode present in the nodules as an ankylostome (*A. bovis*), Von Ratz being one of the first to consider it as representing the larval stage of a different species of parasite, namely, an oesophagostome. More recently Marotel has studied the question of the identity of the parasite afresh in France, and, as a result of his researches, he has definitely shown that the nematode present in the nodules is, in reality, a larval oesophagostomum. This investigator finds that the particular species concerned in the case of cattle in France is the *Oesophagostomum radiatum*. According to Marotel, the young nematode passes through at least three successive stages:

- (1) A strongyliform larva with a small mouth;
- (2) An ankylostomiform larva with an ellipsoid and monodentated mouth; and
- (3) An oesophagostomiform larva with an elliptical and cuticular enlargement in the cervico-ventral region.

Says Marotel in this connection: "Each nodule encloses a young oesophagostome of variable shape and development. The length of the worm does not exceed 3 millimetres in the case of the ox (this measurement, of course, refers only to the worm found in the nodule). As long as they measure less than 4 or 5 millimetres, these larvae correspond to three types: those of 1 millimetre resemble strongyles (strongyliform larvae); those of 2 millimetres remind one of ankylostomes (ankylostomiform larvae); those of 3 millimetres are comparable to oesophagostomes (oesophagostomiform larvae). Finally, the individuals which exceed 4 or 5 millimetres are perfect, but still immature oesophagostomes; in order to reach the adult state, to copulate, and to reproduce, they are obliged to quit the nodules and to gain the lumen of the intestine."

The evolution of the oesophagostome, then, comprises two parts, the one which is effected in the interior of the intestinal nodules, and the other which is passed in a free state in the intestinal cavity: the first is of variable length, in accordance with the species involved.

Here one may state that the larva found in the intestinal nodules of the South African cattle is, as far as one can judge, identical with the parasite depicted by Marotel as present in similar nodules in the intestinal walls of cattle in France, and, as far as this investigation is concerned, the present writer regards the parasite responsible for the diseased condition here dealt with as an oesophagostome. Whether the species involved in South Africa is *O. inflatum* or *O. radiatum* one is not yet prepared to affirm, more extended study of adult specimens being necessary to decide this point. However, so far, the author inclines to the view that it may be the species last referred to (*O. radiatum*), but one hopes to study this question further as the opportunity to do so presents itself.

SYMPTOMS.

With regard to the symptoms exhibited by cattle, the subjects of the nodular intestinal disease much depends upon (1) whether the infection is a heavy one or otherwise, (2) whether it is recent or of some standing, and (3) the degree of resistance which the host is able to offer against the harmful effect of the parasitic invasion. Says Marotel in this connection—"Clinically it (*i.e.*, the nodular intestinal disease) reveals itself by the appearance of a chronic enteritis, watery diarrhoea, progressive wasting, anaemia, and cachexia; it terminates usually

in three or four months by death in coma, and its gravity is such that in certain cases the mortality reaches the startling figure of 50 per cent." From this description it is apparent that the disease, at any rate as met with in France, is of considerable economic importance. The present writer, however, is inclined to think that the nodular disease of the intestines of bovines encountered at the Cape is somewhat less grave than the picture drawn by the French investigator above quoted. It is not unusual, when conducting post-mortem examinations on cattle slaughtered for food purposes, or on those which have succumbed to some rapidly fatal disease other than the one here dealt with, to find nodules quite numerous present along the course of the intestinal tract, and yet such animals may be in quite good condition, and they may have shown no very obvious symptoms of illness prior to death. On the other hand, there can be little doubt but that where the parasitic invasion is a heavy one, or when it occurs in an animal not in very robust condition, diarrhoea and symptoms of chronic intestinal irritation will be apparent, attended ultimately with more or less anaemia and wasting, and occasionally, perhaps, by death. Such termination, however, is probably not of very frequent occurrence, at any rate in the case of cattle at the Cape.

Obviously, a heavy invasion by the parasite referred to cannot do otherwise than impair the health of the host to a more or less appreciable extent, and to interfere with its nutrition and well-being. It seems justifiable to ascribe some of the diarrhoeas of cattle, often seemingly of obscure origin, to this cause. Moreover, it is well recognised that the lesions excited by the parasite may form the starting points of other diseases; the nodules may, in fact, form the portals of entry for various micro-organisms normally occurring in the intestinal tube, and which, though harmless under ordinary conditions—that is so long as they remain in this position (in the contents only of the intestine)—become decidedly pathogenic once they have gained access to the general circulation.

DIFFERENTIAL DIAGNOSIS.

The only disease with which it is at all possible that the above described lesions may be confounded is tuberculosis of the intestine, and this mistake is hardly likely to be made by any one who is in the least acquainted with the lesions of the malady last mentioned. However, examination of the mesenteric lymphatic glands will speedily settle any doubt which may exist, for whilst these are invariably involved in intestinal tuberculosis, they are intact in the case of the nodular intestinal disease (asophagostomiasis) provided, of course, that the latter is not complicated by some other disease involving the mesenteric lymph glands.

It may not be out of place to call attention to certain lesions of the mesenteric glands, and sometimes also of the liver, which are not uncommonly met with in cattle at the Cape, namely, those due to invasion by the larval form of the *Linguatula Tienoides* (this larval form being known as the *Linguatula denticulata*).

These "linguatula nodules" vary in size from a pin's head to a pea, or may be even much larger than this, and after a time they assume a greenish or yellowish-grey to a green colour, and are frequently of a caseous, mortar-like, or even calcareous consistency. The colour is somewhat characteristic, but in case of doubt microscopic examination will decide the question; the parasite, or if this has degenerated, then its hooks, will be found in the nodules, whilst of course in the case of tuberculous lesions the specific bacillus can be demonstrated. The writer has found the "pentastome lesions" of the mesenteric glands co-existent in some cases with the parasitic nodular disease of the intestines in cattle at the Cape—a combination of lesions which

might deceive the layman, and especially so if only a casual or hasty examination had been made.

PREVENTIVE MEASURES, ETC.

With regard to prevention and treatment of the nodular disease of the intestine one has but few remarks to offer. It is obvious that whilst the larvae remain encysted in the wall of the intestine—that is in the nodules—drugs administered to the host by the mouth will hardly be likely to come in contact with or to have much effect on them.

In the case of valuable animals, one can treat the symptoms of diarrhoea and irritation of the intestine as they arise by the administration of astringents and demulcents—chalk, catechu, and opium in gruel, for example. Raw eggs may be added to this mixture with benefit.

The administration of medicinal agents, such as arsenic, tartrate of antimony, or thymol, will probably rid the host of some of the round worms free in its intestinal contents. Afterwards tonics, such as iron salts (sulphate), and a liberal allowance of rock or common salt, are indicated.

With regard to prevention, naturally, if one is aware that animals become infected at a certain pasture or with one particular water supply, one should remove them, if possible, from such source of infection.

The intestinal contents of slaughtered cattle in which lesions of the nodular disease are present in the intestinal walls should be disposed of in such manner (burning, burying, etc.) that they do not contaminate fresh pasture, since such material is liable to contain adult and fertilised female worms, as well as the ova of these.

There is no reason against the use of the meat of such carcasses for food purposes, provided that it is not emaciated, and that it is otherwise free from evidence of disease.—*Agricultural Journal of South Africa*.

BOVINE TUBERCULOSIS—ITS INTER-COMMUNICABILITY AND DANGER TO MAN.

A. M. TROTTER, M.R.C.V.S., Glasgow.

Presented at the meeting of the Scottish Metropolitan Veterinary Medical Society on February 10th.

The discovery of the bacillus tuberculosis by Koch announced in 1882, opened up new avenues for investigation. At that time Koch claimed that "Bovine tuberculosis is identical with human tuberculosis, and is thus a disease transmissible from animals to human beings." Cultures of the bacillus isolated from human and bovine sources inoculated into test animals produced a disease similar in every respect. Maffucci, a few years later, directed attention to differences between the bacilli of mammalian and avian tuberculosis, and for a time these were believed to be two distinct diseases. Kruse and Pansini, working independently, placed on record the isolation of tubercle bacilli from man and cattle which they regarded as belonging to the avian type. Trudeau, in a paper contributed to the New York Pathological Society, referred to differences in the growth of tubercle bacilli isolated from two different sources. The first grew upon glycerine agar in the form of dry scales, and abundantly on potato. The second, upon glycerine agar, had the consistency of thick cream and failed to grow on potato. Crookshank, in 1891, published the results of a comparative study of the bacilli isolated from men and cows, the horse, pig, cat, guinea-fowl, pheasant, and ostrich. He concluded that "morphological differences are found under different circumstances, and within limits the morphology of the tubercle bacillus varies

with its environment." In 1896 Theobald Smith directed attention to certain differences in morphology, biology, and pathogenesis he had found to exist between tubercle bacilli obtained from a tubercular bull and from a bear which had died of the disease. The bear had been, at one time, a household pet, and it is conjectured it had contracted the disease from its master. The bacilli isolated from this animal was therefore presumed to be of human origin. Two years later the same observer published the results of further investigations and pointed out that the tubercle bacilli isolated from bovines differed from those present in the sputum of human consumptives in that the former were shorter, straighter, more irregular in outline, grew less vigorously upon artificial media, were not so influenced by certain modifications of the culture medium, possessed a tendency to remain short, even when grown on media through several generations, and were more virulent; whilst the latter grew profusely and quickly, and when cultivated became long and slender if they were not so at the commencement.

Vagedes, Dinwiddie, and Frothingham, also published papers on this subject, but it was not until Koch's famous pronouncement in 1901, that the matter aroused universal interest, and investigations were at once undertaken by Government Commissions and by noted scientists all over the world. Koch, in his address to the members of the British Congress on Tuberculosis, stated, "I feel justified in maintaining that human tuberculosis differs from bovine, and cannot be transmitted to cattle. I should estimate the extent of infection by the milk and flesh of tubercular cattle, and the butter made of their milk, as hardly greater than that of hereditary transmission, and I therefore do not deem it advisable to take any measures against it."

These statements were based on the results of a series of experiments which he, in collaboration with Schulz had carried out on nineteen young cattle with material obtained from humans; six had been fed with tubercular sputum almost daily for seven or eight months; four had been caused to repeatedly inhale a large number of tubercle bacilli which had been mixed in water and dispersed through the air in the form of a spray; in the others pure cultures of the bacilli or sputum had been injected under the skin, or into the peritoneal cavity, or into the jugular vein. None of the cattle experimented upon had shown any symptoms of disease and when slaughtered from six to eight months later small suppurative foci only had been found at the place of injection and in which a few tubercle bacilli had been discovered on microscopic examination. Again, six young pigs had been fed daily for three months with the tubercular sputum of human consumptives. Three and a half months later these animals had been slaughtered and on autopsy "no trace of tuberculosis was found, except here and there little nodules in the lymphatic glands of the neck, and in one case a few grey nodules in the lung." Koch, therefore, considered that he was justified in maintaining that human tuberculosis differs from bovine, and that the disease of the former could not be transmitted to the latter. These experiments did not supply an answer to the more important question of whether man is susceptible to bovine tuberculosis. It was, of course impossible to solve the problem by having recourse to the experimental inoculation of man with tubercular material obtained from bovines. Unfortunately, however, there was ample opportunity of determining the transmissibility of bovine tuberculosis to man through the ingestion of milk and its products containing tubercle bacilli. Koch approached this part of the enquiry on the assumption that a case of tuberculosis caused by alimenta can only be assumed with certainty when the intestines suffer first, i.e. when a so called primary tuberculosis of the intestines is found. Taking this as his criterion he instanced that he had only seen

primary tuberculosis of the intestines twice; the records of the Charité Hospital, Berlin, showed only ten cases in five years: Baginsky, at the Emperor and Empress Frederick's Hospital for Children, made post-mortem examinations on 933 children affected with tuberculosis, but never found tuberculosis of the intestines without simultaneous disease of the lungs and bronchial glands, and Biedert only sixteen cases among 3104 post-mortem examinations of tubercular children. He was by no means certain that even those few cases were due to infection by bovine tuberculosis. He concluded, therefore, that the danger to man by the milk and flesh of tubercular cattle, and the butter made from their milk was infinitesimal, and he did not deem it advisable to advocate the enforcement of preventive measures against bovine tuberculosis so far as mankind was concerned.

Two days later M Fadyean (Sir John) delivered a paper on tubercle bacilli in cow's milk as a possible source of tubercular disease in man, in which he submitted Koch's statements to destructive criticism and controverted many of his assertions, and in concluding a masterly oration advocated that we ought not to concede to the milkmen the right to sell us tubercle bacilli, even if we were assured that like Dr. Koch's experimental pigs we had nothing to fear beyond the development of "little nodules here and there in the lymphatic glands of our necks," and "a few grey tubercles in our lungs."

The contention of M Fadyean that human and bovine tuberculosis is inter communicable was supported by Nocard, Bang, Sims Woodhead, Ravenal, Crookshank, and others.

Crookshank contended that Koch had drawn wrong conclusions from his experiments, and that whilst the tubercle bacilli present in the tissues of man and of animals had undergone modifications in the body of their respective hosts, they were in reality derived from a common ancestor. In support of his contention he quoted two experiments which he had carried out some years previously. In one he had injected human sputum rich in tubercle bacilli into the abdominal cavity of a healthy calf. An autopsy on the calf forty-two days later revealed a tubercular deposit at the seat of inoculation with innumerable secondary lesions on the peritoneum and in the internal organs. In the other he had injected tubercle bacilli intravenously into a calf, with a negative result.

The opinion of Koch, however could not be ignored, and the Government of that day deemed it expedient to appoint a Commission to enquire and report with respect to tuberculosis:—

(1) Whether the disease in animals and man is one and the same;

(2) whether animals and man can be reciprocally infected with it;

(3) under what conditions, if at all, the transmission of the disease from animals to man takes place, and what are the circumstances favourable or unfavourable to such transmission.

The Commissioners caused exhaustive enquiries to be made, and their conclusions are published in reports issued in 1904, 1907, 1909, and 1911.

In the first report they showed that the bacilli found in the lesions of certain cases of human tuberculosis produced in cattle a disease indistinguishable from bovine tuberculosis.

In the second they dealt with bovine and human tuberculosis and embodied the results obtained in the investigation of the characters of the bacillus of bovine tuberculosis.

The third dealt with certain conditions of the tuberculous cow which rendered her milk infective.

Their final report dealt with the whole of their enquiry into the tuberculosis of man, of the ox, pig, horse, and some other mammals and birds.

By adopting certain methods of investigation they

were able to compare the characters of the bacilli isolated from tuberculous lesions in different species of animals. They were thus able to distinguish three types of tubercle bacilli—avian, bovine, and human.

The leading characters of these are stated to be as follows:—

Avian. The avian tubercle bacillus forms a slimy, whitish growth, which is easily emulsified, thus contrasting with the growth of bovine and human tubercle bacilli. It grows especially well on glycerinated media.

Fowls are very susceptible to the action of the avian tubercle bacillus by intravenous, subcutaneous, and intramuscular inoculation, and by feeding. On the other hand the rabbit and mouse are the only two mammals in which the avian tubercle bacillus causes progressive tuberculosis. In the former animal moderately large doses of the avian bacillus, though fatal, are less virulent than the bovine, but more virulent than the human tubercle bacillus. This bacillus never causes progressive tuberculosis in the calf, pig, monkey, guinea-pig, horse, cat, or rat, but it sometimes multiplies in the body and becomes disseminated in the tissues, and may kill it a large dose is given intravenously.

Bovine. The bacillus which was found in natural cases of tuberculosis in cattle is that classified by the Commission as the bovine type. It is regarded as the standard for comparison with the bacilli found in the tuberculosis of other animals. This organism grows slowly on serum, and at the end of the second or third weeks shows on the surface of the media a greyish uniform growth, not wrinkled and not pigmented. It is much more virulent than the *Typus humanus*. Its virulence, as evinced by the severity of the invasion produced when inoculated into calves or rabbits, and its mode of growth in artificial cultivation, permits of its being differentiated from the human variety. The effect produced in calves and rabbits was striking and definite. The injection of bovine tubercle bacilli into these animals caused an acute generalised tuberculosis which rapidly terminated in death. For instance, the duration of the life of rabbits subcutaneously inoculated with bovine tubercle bacilli was from 28 to 65 days, whilst with human tubercle bacilli the animals survived or were killed in 94 to 725 days.

Human. The bacilli isolated from the majority of cases of human tuberculosis were found to have definite characters which distinguish them from those present in bovines.* These were therefore termed human tubercle bacilli. They grow more rapidly on serum and the growth tends to become wrinkled on glycerinated media, and becomes pigmented to a greater or less extent in all media. Their virulence is, as a rule, not so marked as those of the bovine type when subjected to inoculation tests under the same condition. In the case of the chimpanzee and the monkey, however, the effect is the same—an acute generalised tuberculosis.

A very considerable number of the cases of human tuberculosis, especially in young persons, revealed the presence of bacilli possessing all the characters of the bovine type, whilst the virulence of others was ascertained to be somewhere midway between the human and bovine types. Experiments were undertaken to determine if the latter were transitory forms between these two types, but it was demonstrated by plate cultivation and by the repeated re-inoculation of test animals that these were merely mixed infections. It is common knowledge that certain pathogenic organisms growing in living tissue or on artificial media are influenced by their environment, and after a longer or shorter time their characters and properties are changed. They may either gain or lose in virulence. The human and bovine tubercle bacilli, however, are very stable, and

their virulence has been found to be little impaired after prolonged sub-cultivation. There can therefore be no doubt that the tubercle bacilli found in man possessing the character of the *Typus Bovinus* are of bovine origin.

Of the 108 cases of human tuberculosis—other than lupus—investigated by the Commission, 84 yielded human tubercle bacilli only, 19 yielded bovine tubercle bacilli only, and 5 both bovine and human tubercle bacilli. By far the greater number of cases in which the bovine tubercle bacilli were present were in individuals affected with primary abdominal tuberculosis. Of the 29 cases of primary abdominal tuberculosis investigated, 14 yielded bovine tubercle bacilli, 13 human tubercle bacilli, and 2 a mixture of human and bovine tubercle bacilli. The ages of the patients in which the bovine tubercle bacilli were present were as follows:—ten were aged from 1 to 3 years, three from 4 to 5 years, and one 8 years. It will be noticed that the age period during which the greater number occurred in which the bovine tubercle bacilli were the exciting cause, synchronises with the period when milk forms the bulk of the diet.

It has been known for many years that milk drawn from a cow affected with tuberculosis of the udder contains a large number of virulent tubercle bacilli. The researches of the Commission and others show that it is possible for tubercle bacilli to be excreted in the milk without the udder itself being affected. Milk contaminated with tubercle bacilli is—if used for food—an undoubted menace to the health of the consumer.

In their second Report the Commissioners summarise the result of their enquiries as follows:—

"There can be no doubt but that, in a certain number of cases, the tuberculosis occurring in the human subject especially in children, is the direct result of the introduction into the human body of the bacillus of bovine tuberculosis; and there also can be no doubt that in the majority, at least, of these cases the bacillus is introduced through cows' milk. Cows' milk containing bovine tubercle bacilli is clearly a cause of tuberculosis, and of fatal tuberculosis, in man."

Their subsequent reports have tended to strengthen this conviction, and to-day the doubt raised by Koch as to the communicability of bovine tuberculosis to man has been completely dispelled. It cannot be too strongly emphasised that bovine tuberculosis is a disease communicable from animal to man and from animal to animal. This fact is of peculiar interest to veterinarians, for the duty will devolve on us of eradicating the disease among animals. The fight will be a stern one. It is impossible for economic reasons to accomplish the eradication of bovine tuberculosis by the application of tuberculin and the indiscriminate slaughter of all reacting animals. The process must of necessity be a gradual one. Our knowledge of the disease is such as to permit of energetic action along right lines. Is it not surprising that no action has been taken to eliminate all dangerously infected animals from our herds? The Board of Agriculture has taken no steps to control the disease among animals, nor have the Local Government Boards for England and Scotland done anything to protect mankind from the undoubted danger arising from the use as food of milk and its products infected with bovine tubercle bacilli. It is true that the Local Government Boards of England and Scotland amended the Dairies, Cowsheds, and Milkshops Order in 1899 providing *inter alia* that article 15 of the 1885 Order be altered so that the expressions therein which refer to diseases should include, in the case of a cow, such disease of the udder as shall be certified by a veterinary surgeon to be tubercular.

In the 1885 Order as so amended local authorities are only empowered to order* that the milk of such diseased cow:—

* In one instance the avian bacillus was found in a nodule in a mesenteric gland of a calf.

* As regards England the Order of 1885 as amended, is made applicable only to paragraphs (a) and (b).

- (a) shall not be mixed with other milk ;
- (b) shall not be sold or used for human food ; and
- (c) shall not be sold or used for food for swine, or other animals, unless and until it has been boiled.

It is left to the discretion of local authorities to put these Orders into operation, but allowing for the sake of argument that every local authority faithfully executed them to the full, even then one is forced to the conclusion that they are utterly inadequate to safeguard the public health. The apathy of the Government and the Government Departments to this matter is deplorable. It is even excusable under the circumstances to state that this failure on the part of the authorities to enforce efficient supervision of our milk supply amounts to criminal negligence, because four years have elapsed since the Commission reported that "Cows' milk containing bovine tubercle bacilli is clearly a cause of tuberculosis and of fatal tuberculosis in man. I believe that the majority of local authorities in Scotland have appointed veterinary surgeons under the Milkshops Order and under the Public Health (Scotland) Act, 1897. That is very satisfactory, but please do not probe too deeply into the matter. For instance, some local authorities give the veterinary surgeon a retaining fee of a few pounds, and in addition allow a fee for every animal they are called upon to inspect. It is a pity to rend the veil but duty demands it. Their appointment is a sinecure - they receive the retainer but nothing more, because they are never called upon to examine. No doubt the veterinary surgeons themselves are largely to blame for this discreditable condition of affairs. They ought to take every opportunity of emphasising the importance of the work, and to lay claim to their undoubted birthright of being recognised as the fit and proper persons to safeguard the health of man from animal diseases.

Mr. Watt, the indefatigable member for the College Division of Glasgow, elicited from the President of the Local Government Board for Scotland that the number of cows examined by Veterinary Surgeons, under Article 3 of the amended Order of 1899, in each of the years from 1900 to 1905 inclusive, and the number certified under said Article to be affected with tuberculosis of the udder, were as follows :-

Year.	Examined.	Affected.	Per Cent.
1900	20,076	54	268
1901	22,604	46	203
1902	26,382	40	151
1903	29,870	40	134
1904	29,305	37	126
1905	38,309	43	112

This table is of interest in that it shows a diminishing percentage of animals affected with tuberculosis of the udder. The percentage in 1900 was 268, but during the succeeding years it gradually diminished until, in 1905, it reached its lowest level, namely, 112 per cent. This appears satisfactory, in view of the inadequate powers possessed, and, if the statistics be accurate, shows what could be done to safeguard the public health by an examination of all milch cows by thoroughly qualified veterinary surgeons.

A comparison of the number of cows in Scotland with the number of cows examined under this Order shows that, whilst a few authorities are doing their utmost to prevent the sale of milk drawn from animals affected with tuberculosis of the udder, there are a great many other authorities who are doing absolutely nothing -- not even exercising the inadequate powers they possess, as will be seen from the subjoined figures :-

Year	Total Cows.	Examined.	Not examined.
1900	434,264	20,076	414,188
1901	433,981	22,604	411,377
1902	438,890	26,382	412,508
1903	437,418	29,870	407,548
1904	439,358	29,305	410,053
1905	437,138	38,309	398,829

Presuming that the proportion of affected cows among those not examined is in the same ratio as among those examined in 1900, when inspection commenced, then it follows that there were in

1900.	1901.	1902.	1903.	1904.	1905.
1,110	1,102	1,105	1,092	1,098	1,068

cows, which, though affected with tuberculosis of the udder, escaped detection owing to not having been examined by a veterinary surgeon, and were consequently permitted to yield milk for human consumption, to disseminate broadcast disease and death, and to bring grief and mourning into many a home.

The reply of the Secretary for Scotland to a further question by Mr. Watt was characteristic of the apathy of the Local Government Board, on whom, as the central authority, devolves the duty of controlling and directing the energy of the local authorities. Asked as to the manner in which the cows so certified were disposed of, the reply was, "I have no information as to how the cows certified were disposed of."

It must certainly be admitted that Local Authorities under the powers contained in the amended Order of 1899, are merely empowered to prevent the milk of a cow suffering from such disease from being sold or used for the food of man, or, unless boiled, for the food of swine and other animals. They have no power to slaughter the affected animal. This is a grave defect, and one patent to the merest tyro. A cow affected with tuberculosis of the udder is obviously an animal which is not -- and, indeed, can never be -- in fit condition to yield milk for human food, but, unfortunately, it may continue to do so for a considerable time.

The mere issue of a verbal or written instruction for the destruction of the milk of a cow so affected does not necessarily mean its faithful fulfilment by the dairyman. There is only one way to accomplish that end, and that is by the slaughter of the animal. There is no hardship in this. Such an animal is of no value for milking purposes, and the sooner it is destroyed the better for all concerned. Some farmers, when they become aware that a cow in their possession is affected with tuberculosis of the udder, cause the animal to be immediately slaughtered, but there are others who are willing to resort to any subterfuge to defeat the object of the Order. The owner frequently attempts to fatten such an animal, but this course is open to many serious objections, one being that the milk of this animal, teeming, it may be, with the organisms of tuberculosis need not be destroyed, but may be mixed with that of the herd and sold for human food. Again, a dairyman may and he is at liberty to do so -- dispose of the animal for a milk producer to his neighbour. The seller is under no compulsion to say in what manner he has disposed of the animal, and the buyer is not compelled to notify the authorities that he is in possession of a cow affected with a disease of the udder. Thus all the efforts of the authorities have been unavailing, and all that they have accomplished, if even that, is that one supply has been purified and, in the purification process, another contaminated.

It is therefore evident that the Dairies, Cowsheds, and Milkshops Order, as amended in 1899, does not afford that protection to human health and life that was anticipated, and we are therefore not surprised to find that, in 1903, certain milk clauses were included in the Burgh Police (Scotland) Act of that year. This Act, which, as its title denotes, applies only to burghs, with the exception of Edinburgh, Glasgow, Greenock, Dundee, and Aberdeen, provides that, "if the medical officer of health of the burgh has reason to believe that milk from any dairy, situate outside the burgh, from which milk is being sold, or suffered to be sold, or used within the burgh, is likely to cause tuberculosis to persons residing within the burgh," then he is to communicate with the local authority of the district in which such

dairy is situate, and it is for the officials of the latter district to take action. It is obvious that, before the burgh medical officer of health can do so, he must be convinced that the milk in question is likely to cause tuberculosis to consumers in his district, and this can only be determined in either of the following ways:— In the first place, he must obtain clinical evidence in the consumers of their having contracted tuberculosis through the use of milk contaminated with tubercle bacilli; but this, in the majority of cases, is impossible, owing to the length of time which ensues between consumption of the milk and manifestation of the signs of the disease, as also to the difficulty of eliminating all other sources of infection. What a travesty and burlesque of efficient administration, that we are empowered to take action against this national scourge only after it has been allowed irretrievably to fasten its fangs upon its helpless victims! In the second place, recourse may be had to animal inoculation, that is, taking samples of market milk and injecting small quantities into animals, such as guinea-pigs, but by this method a delay of several weeks must elapse before the result of the examination can be ascertained, and during all this time the milk is continuing to be sold, and it may be disseminating the seeds of disease and claiming numberless victims before the supply can be stopped.

The previous Royal Commission was compelled to direct attention to the continued prevalence of "tabes mesenterica" among the younger members of the community, regarding which they stated, as will be found on page 3, par. 2, that "the rate of mortality from tabes mesenterica—which more than any other represents tuberculosis in infancy—has signally failed to undergo any noteworthy diminution during the very period of sanitary progress which has been associated with such substantial diminution of death from tubercular affections at all ages in England and Wales, and (it must also be remembered) that this result has coincided in point of time with a large increase in the consumption of milk."

Confirmation of this result is also found in the late Sir Richard Thorne Thorne's "The Administrative Control of Tuberculosis," in the following striking excerpt from page 29, par 3:—

"... if we limit ourselves to the first year of life when milk is most largely used as a food... we find that the reduction in the rate of death from the various forms of tuberculosis—which reduction has been going on at 'all ages' for about half a century—not only disappears, but is actually transformed into a large increase, reaching no less than 27·7%. This in itself is grave enough, but its significance is still further emphasised when we remember what are the circumstances under which this increase in the rate of death from tabes mesenterica has gone on synchronously with a decrease in that from other forms of tuberculosis."

The "milk" clauses of the Burgh Police Act are also defective in that they do not compel the dairyman to notify *all* cases of udder disease, do not insist upon the examination of all the cows being carried out by veterinary surgeons, and do not empower the local authority to slaughter useless animals. They deal exclusively with tuberculosis of the udder, but do not refer to other forms of tubercular disease, and many other diseases, which may equally render milk dangerous and unfit for human food. They appear, indeed, to be modelled on the lines of Section 60 of the Public Health (Scotland) Act, 1897.

This section was framed to cope with milk-borne outbreaks of infectious disease, but tuberculosis is not comparable with such infectious diseases as scarlet fever, diphtheria, or typhoid, in which the incubation period is short and the disease soon manifests itself, whereas in tuberculosis there may be no evident signs of the disease for a long time.

It therefore follows that the procedure which is found adequate to cope with outbreaks of infectious disease proves utterly ineffective when adopted in the vain attempt to prevent the ravages of such an insidious disease as tuberculosis.

The question naturally arises:—"To what extent is man affected with bovine tuberculosis?" It is not one easy to answer. The statistics compiled by the Registrar General regarding tabes mesenterica cannot be regarded as reliable. These have been largely tabulated from death certificates granted by medical men on opinions formulated after clinical examination alone. Medical men admit that it is impossible to recognise during life many cases of abdominal tuberculosis. We are, therefore, forced to turn to other sources for the desired information.

Northmann, of the Clinic for Children in Düsseldorf, and six other investigators, employing tuberculin, found 53 to 94% of the children under 14 years of age to be affected with tuberculosis.

Comby has published reports showing that the post-mortem examination of children in the Paris hospitals revealed 38·5% to be tubercular.

Müller, in Munich, found 43% affected out of 500 post-mortem examinations.

Hamburger and Sluka discovered 41% affected in 401 autopsies on children under 15 years.

Investigations by Shennan, Still, Carr, and Guthrie, to determine the frequency of tuberculosis originating from the alimentary tract show that 28·1, 29·1, 16·7, and 24·6% respectively were affected.

It would be entirely misleading, however, to attribute all cases of tuberculosis in children to bovine origin.

Theobald Smith estimates that from 25 to 50% of the cases of human tuberculosis starting in the cervical and mesenteric glands are bovine in origin.

For the sake of argument let us assume that 50% of all children are affected in some degree with tuberculosis. Twenty-five per cent. of these are infected through the alimentary canal, and of those thus affected 25% are infected from bovine sources. In other words 31 out of every 1,000 children are infected with tuberculosis from bovine sources. No doubt these figures are alarming, but when we consider that of 8,050 samples of market milk examined during the years 1896 to 1911 by Delépine no less than 703 or 8·73% were infected with tubercle bacilli, one is forced to the conclusion that the number of children affected from bovine sources is no greater than one would expect.

The duty which must necessarily devolve on the veterinary profession cannot, however, be limited to the protection of man against the use as food of meat and milk affected with disease. A vigorous warfare must be waged against the transmission of the disease from animal to animal. This entails the slaughter of every animal affected with open tuberculosis, and in many cases improved housing accommodation. I will give but one instance to show the importance of preventive measures.

The Commissioners examined material obtained from 59 pigs. The results obtained are as follows:

Degree of tuberculosis in the pig	Bovine Virus	Human Virus	Avian Virus	Mixed Virus and bovine	avian TL.
Local	18	3	5	—	26
General	32	—	—	1	33
	50	3	5	1	59

The cases of infection by the bovine tubercle bacillus were by far the most numerous—50 cases out of 59.

The number of pigs in Scotland in June, 1909, is given in the Board of Agriculture returns as 129,819, and during that year 5·1% of the pigs slaughtered in the Glasgow abattoirs were found affected with tuberculosis. As pigs are consigned from all parts of Scotland to the

Glasgow market this percentage may be taken as applicable for the whole country. A simple calculation shows that there were 6620 tubercular pigs, and of these 5610 were infected with bovine tubercle bacilli.

The Commission on Tuberculosis which reported in 1898 recommended that "in view of the greater tendency to generalisation of tuberculosis in the pig, we consider that the presence of tubercular deposit in any degree should involve seizure of the whole carcase and of the organs."

If this recommendation, which has received the imprimatur of the Local Government Boards for England and Scotland, be taken as the standard for the adjudication of the carcasses of those pigs infected with bovine tubercle bacilli, it follows that all ought to be seized and destroyed as unfit for human food. Now, assume that each carcase is of the average value of £3 it follows that the pecuniary loss to the pig industry in Scotland would be £16,830—surely a sufficient incentive for the enforcement of stringent preventive measures, apart altogether from the greater necessity of protecting human life against such a fell disease.

What steps ought to be taken to safeguard the public health against this undoubted danger? The existing legislation lays the onus of carrying the present powers into effect on the different local authorities. It is deplorable that the authorities have been remiss in this all-important duty. In 1906, of 107 landward and 250 burghal local authorities in Scotland, only 82 landward and 139 burghal local authorities had exercised their powers contained in the Dairies, Cowsheds, and Milkshops Order and had framed regulations:—

- (a) For the inspection of cattle in dairies,
- (b) For prescribing and regulating the lighting, ventilation, cleansing, drainage, and water supply of dairies and cowsheds in the occupation of persons following the trade of cowkeepers and dairymen.
- (c) For securing the cleanliness of milk stores, milk shops, and milk vessels used for containing milk for sale by such persons.
- (d) For prescribing precautions to be taken by purveyors of milk and persons selling milk by retail against infection or contamination.

The mere issue of regulations does not mean their efficient enforcement. I know of dairy premises in rural districts which are only visited at long intervals. I impute no blame to the officials, because, owing to their multifarious duties, it is impossible to overtake the work in the manner commensurate with its importance. Another factor which must always be borne in mind is that the majority of the members constituting county councils are directly or indirectly interested in agriculture. It is therefore advisable under certain circumstances for the official to temper his zeal with discretion.

The result is that chaos reigns supreme.

In my opinion the importance of a pure, wholesome milk supply is much too great to continue to perpetuate the unsatisfactory present régime. A pure, wholesome milk supply is of national importance, and therefore a national service ought to promote and maintain its purity. It is a question bristling with difficulties. A solution satisfactory to producer, vender, and consumer will only be possible after the whole "pros and cons" have been carefully and dispassionately considered. The report of the Royal Commission on Tuberculosis shows that man incurs grave danger in contracting the disease through the consumption of milk and its products infected with virulent tubercle bacilli. This is but one impurity rendering milk and its products dangerous and injurious to the health of man. I would suggest that in order to determine the best means of promoting and maintaining a pure milk supply, the Government, through the Secretary for Scotland, be asked to appoint a Commission composed of agriculturists, representatives of local authorities, town and county clerks, medical

and veterinary officers, and sanitary inspectors, to consider the whole question, and draft a Bill which would have for its object the protection of the public health and the eradication of all animal diseases communicable to man through the milk supply.

IODINE AS THE SOLE DRESSING FOR OPERATION WOUNDS.

Address by REGINALD ALCOCK, M.B., F.R.C.S. (EDIN.), at a meeting of the Staffordshire Branch of the B.M.A.

Medical opinion concerning the utility of iodine as an agent in the production of asepsis has oscillated between contemptuous neglect and unqualified praise. At the present time its virtues are recognised on every hand, and its exceptional usefulness as a skin sterilisant needs no further emphasis, but reliance on its extended efficacy as the sole dressing to be applied to the operation wound from the date of the operation to the discharge of the case, is, I venture to think, a new departure.

This paper is based on the successful results of 31 cases treated by such a method, which, shorn of details, may be summed up as the treatment of the operation area by tincture of iodine, applied at intervals for the first few days, the incision being left exposed to the air, and only covered by the patient's night clothes.

My acquaintance with the use of iodine as the sole dressing for operation wounds dates back to 30 years ago, when I first remember seeing the practice of my father, who, besides being a hospital surgeon, was also public vaccinator, and it is vividly impressed on my mind that when the children came to have their arms inspected on the week following the vaccination, each arm which showed any sign of redness was painted over with a strong solution of iodine, and simply allowed to dry. This was invariably successful in preventing any spread of the cellulitis.

The first time I noticed iodine being used for the preparation and preservation of catgut was in America in 1907, whilst I saw it used for the sterilisation of the skin of the abdomen in the gynaecological clinic in Vienna in 1908, and this method I adopted on my return.

Last year, immediately after my visit to the annual meeting of the British Medical Association in Birmingham to hear the discussion on the technique of wound treatment, it occurred to me, Why use dressings except iodine to operation wounds, and what is their use? and the more I thought of it the less reason I could see for them in suitable cases, and I at once proceeded to put the idea into practice.

Looking through the literature relating to the sterilisation of the skin, I have been struck with the fact that special stress is laid upon the difficulty experienced in rendering the deeper layers of the skin sterile, and especially with the fact that any moisture of the skin means the detection of bacteria, where previously they were absent, if attempts had previously been made to discover them on a dry skin.

Although this stress is laid upon the action of moisture in macerating the epidermis and letting free the various micro-organisms, in no case does one find any special attention paid to the hair follicles, sweat and sebaceous glands, as possibly being the most important home of these microbes. Norman Walker, in his book on dermatology, says:

"While the sebaceous gland opens with a distinct mouth, either on the surface or into a hair follicle, the sweat duct terminates in the germinal layer. From this point a channel may be traced between the cells of the epidermis, where the sweat communicates freely with the interepithelial lymph, and the duct appears in the well-known corkscrew form in the horny layer."

These so-called sweat or coil glands, according to Unna, are not only concerned with the excretion of a watery fluid, but also in the lumina is a considerable amount of fat; and the fact that the palm of the hand, where, if anywhere, perfect lubrication of the skin is required, contains no other glands but the coil glands is a strong piece of clinical evidence bearing on the character of their excretion.

That these sweat glands play an important part in giving a resting place for these microbes probably explains the difficulty experienced in sterilising the hands, as the palm of the hand contains no other glands except these sweat glands winding intricately through the epidermis.

What Mr. Leedham-Green tells us about the position of the microbes on the skin is also of interest. He says that we may expect to find them wherever fine molecular dirt can penetrate, but not deeper than that, and that we meet them not only on the surface of the cuticle, but between the cells of the superficial layers of the epidermis, and in the entrance of the sweat glands, sebaceous ducts, and hair follicles.

In the North Staffordshire Infirmary we have two preparations of iodine in use—the one for ligatures consists of 1 part of *B.P.* tincture with 15 parts of 60 per cent. alcohol, and the other for application to the skin and wounds consists of 2 per cent. of iodine with 90 per cent. industrial methylated spirit.

This industrial methylated spirit has been used for some little time, and has proved perfectly satisfactory, and from a hospital economical point of view it is of great advantage, as it costs only 2s. a gallon as compared with the 26s. a gallon paid for rectified spirit. It contains only 5 per cent. of impurities in the form of wood-naphtha, as compared with the 10 to 15 per cent. of impurities in ordinary methylated spirit. It also has the great advantage that it does not cause any smarting of the eyes or other unpleasant effects.

The effects of the application of iodine to the skin is, first of all, destruction of the microbes of the surface, and, for a very short distance, by its penetrative powers, of those embedded in the very superficial layers of the skin. Probably as equally important an effect is the locking-up of the micro-organisms in the sweat glands by its hardening action on the skin and the simultaneous contraction of the mouths of the glands.

Haegler noted that the microbes do not penetrate deeply anywhere, either between the cells, or in the sweat or sebaceous glands, but I would suggest (and it is on this suggestion that I base my treatment) that their penetration is deeper in the sweat glands than in the layers of the skin.

Mr. J. M. Graham has shown that iodine penetrates more deeply into the pores of the skin when there has been no preliminary washings, and the freer the skin is from moisture and grease, the more efficient is the action of the iodine.

Objection to the use of iodine has been made on the ground that it causes eczema in children and old people, but the usual experience is that it only causes this phenomenon when the iodine dressing has been covered with gauze or wool, and not when left exposed to the atmosphere, unless it is applied very frequently.

Asepticity of the skin is probably impossible of attainment, but it is quite possible to inhibit the growth of bacteria until the wound itself has become sufficiently resistant.

Our aim in the treatment of a wound is to let it be hermetically sealed against the entrance of outside organisms by its own dried secreted serum, and then to render this sterile to growth of the bacteria, if they should escape from the infected sweat glands.

There is a great probability that tincture of iodine owes a great part of its therapeutic action to the hyperæ-

mia it induces—like the Bier treatment—causing a phagocytosis or intracellular destruction of micro-organisms in the neighbourhood of the wound, as seen in cellulitis, erysipelas, etc., and also on account of the increased flow of blood to the part, causing a more rapid union of the cut edges.

In emergency cases there is no preliminary washing, which would not only macerate the epidermis, but also open the pores of the skin; therefore the area is only dry-shaved, rubbed over with ether, and iodine painted on, which serves to kill the bacteria on the surface and lock up the rest.

The following precautions are considered essential for success: Perfect asepsis is to be observed during the operation. All bleeding points are to be stopped, and the wound rendered quite dry. All abdominal and deep wounds are to be sewn up in layers; peritoneum, muscle fibres, sheaths, and skin to be united separately to give the necessary support. Care is to be especially taken in skin apposition.

No wet swabs are to be used, in order that the skin may be kept dry, and only that blood is to be cleared away which adheres either to a plain dry swab or is removed by the iodine-containing swab when applying it to the stitched-up wound.

Iodine is to be applied immediately after operation, and again three hours afterwards, to render sterile any serum of blood which may possibly have oozed out. The wound is again painted over daily for the next three days only, except in cases involving wounds about the perineum, as the sweat glands in this region are so numerous; in addition, the wound is painted over with iodine every time after urine has been passed.

The method is, of course, only applicable to those cases in which the wound can be completely closed up, and can in no case be used where a drain of any kind is necessary. In all operations where support is afterwards necessary, it cannot be used, as in amputations, excisions, etc.

All the cases treated by this method have given excellent results, not even a stitch abscess having been observed.

I feel that this is a somewhat revolutionary practice in the treatment of wounds, after being used to the elaborate mass of sterilised gauze, wool, and Gamgee tissue which one has been in the habit of applying, and amongst my immediate friends the method was at first received very sceptically, dire consequences being prophesied. I am pleased to say that it is now being adopted by some of my colleagues with the same encouraging results.—*B.M.J.*

A Danger from Iodine.

Propping acknowledges the sterilising properties of tincture of iodine, but utters a word of warning in the *Zentralblatt, für Chirurgie* about its use in abdominal surgery, basing his statements on the results of his own clinical experience, in cases of appendicitis. Animal experimentation has shown the facility with which the tissues take up iodine. Twenty minims of tincture of iodine in physiological salt solution injected into the peritoneal cavity of a dog are sufficient to produce fibrinous adhesions between all the organs. He states, therefore, that tincture of iodine is dangerous for the peritoneum and for the intestines. If this drug be used to disinfect the abdominal skin, sterile dressings should always be interposed between the skin and the bowel drawn out from the wound and wrapped in a sufficient thickness of dressings which have been wrung out in a warm solution of sodium chloride.

Donations to R.C.V.S.

The Secretary of the Royal College of Veterinary Surgeons begs to acknowledge the receipt of the following donations to the College funds, from

Mr. J. Clarkson, Garforth, nr. Leeds £1 1 0
Amount previously acknowledged 5 5 0

Grant to Dick Veterinary College.

At a special meeting of Midlothian County Council, held in Edinburgh, a deputation from the Board of the Royal (Dick) Veterinary College attended for the purpose of soliciting financial aid towards the completion of the new College buildings. The Board are still almost £5,000 short of the necessary amount in order to secure the £8,000 conditionally promised by Mr. A. Inglis MacCallum, a member of the Board, as well as a further sum of £5,000 from the Education Department.

Mr. MacCallum said that two chairs in the College were now endowed—namely Pathology and Bacteriology, and Physiology, and the relations of the College with the University of Edinburgh had been drawn closer by the appointment of their teacher of anatomy as a University lecturer on comparative anatomy. Moreover, their students were now eligible to present themselves for the University degrees of Bachelor and Doctor of Science in Veterinary Science. The relationship of veterinary science to public health was of the closest nature, as was abundantly shown by the final report of the Tuberculosis Commission. It was desired to so equip the College that its functions might be adequately and satisfactorily performed.

Mr. Martin, in thanking the Council for receiving the deputation, appealed on behalf of the farmers of the neighbourhood, as well as the College, for a liberal donation.

Dr. Bradley said what they wanted to-day was to pro-

duce a body of men with a sound practical training—trained in the sense that they had done things themselves. Lecture rooms nowadays had to take a second place to laboratories and clinical wards, and they wanted a greater and wider accommodation and equipment for actual practical teaching.

It was agreed that a grant be given.

Mr. James Cormack, Colinton, proposed that the sum be £600, to be spread over three years—£200 per year.

Mr. A. T. S. Scott, Crosswoodhill, moved that they give a donation of £300.

Ten voted to give £600 spread over three years, and nine to give a sum of £300 down, the former being accordingly carried.—N. B. A.

REVIEW.

SHEEP AND GOATS.—By G. MAYALL, M.R.C.V.S. With 35 plates and 18 figures in the text. Pp. x + 126. Price 3 6 net. Baillière, Tindall and Cox, 8 Henrietta Street, Covent Garden, London, W.C.

This small volume is intended as a companion to the two similar ones, dealing respectively with cows and pigs, which the same author has produced recently. Those who have read either of the first two will have a good idea of the size, scope, and method of treatment of the present third publication.

The two animals it concerns are dealt with in separate sections, overlapping being avoided, in the second section referring to the goat, by frequent references back to advice given upon the sheep in the first section. With regard to both animals alike, the work may be very briefly summarised. It is a succinct and elementary guide to the breeds, breeding, rearing, feeding, and general management in health and disease, of sheep and goats, written throughout with extreme simplicity, and especially adapted to the needs of the small holder or

cottage farmer. From this it follows that the book contains nothing that will enlighten either the veterinarian or the really skilled agriculturist; it is intended for a different class of readers, to whom it will be very useful. Many men already do a little amateur stock keeping as an adjunct to their incomes, and many more might do so with profit. This series of popular handbooks will tend both to increase the practice and to improve the methods of its performance.

W. R. C.

About Degrees and Diplomas.

The Medical Council is charged with the duty of supervising the separate examining corporations, and of insisting upon such a standard of stringency as may be deemed necessary. The duty thus imposed by the State is really a tacit recognition of the principle of one uniform portal to the medical profession, though, with the usual British love of half-measures, it is not pushed to its logical conclusion—State examinations for all medical students of the United Kingdom. The number of bodies which are competent to grant a registrable qualification is fairly large; and it is in respect of their various distinguishing titles that the public very naturally gets so often confused.

Many schemes have been propounded at different times by would-be reformers of the present makeshift system, but none has been within measurable distance of adoption. One reason for this is doubtless that examinations and the titular distinctions which depend on them are of less importance in the eyes of the general public than tact, clinical acumen, and experience. A man may have passed with the highest possible distinction those examinations which are the best esteemed by the laity (and professional colleagues); but if he be a mere bookworm or have a tactless manner, he will take second place to a man less capable of outwitting an examiner but more conversant with human nature and everyday problems of disease. Examinations, in fact, are no test at all of common-sense, without which no doctor is worth his salt.

At the same time, degrees and diplomas are very far from negligible. They are of the most vital importance whenever there is any public post or office to be filled by competition. Here they have very often an altogether fictitious and exaggerated value, because they are in many cases the only criterion which a non-medical selection committee possesses of discriminating between one candidate and another. Let no student, therefore, imagine that one qualification will be as good to him as another; for he never knows when he may have to submit those he possesses to the scrutiny of men who have no means of assessing those real signs of efficiency which could be taken into account by his professional brethren.

Further, there are certain examinations which are earmarked, as it were, for special purposes; and as such have a special value. The best example is the Diploma in Public Health (D.P.H.), which is now indispensable for anyone who aspires to whole-time employment in the organised sanitary service of the community. Yet the D.P.H. is not of itself a registrable qualification.

There are signs which indicate the future possible extension of the system initiated in connection with public health. At the University of Oxford a Diploma in Ophthalmology (D.O.) was instituted a year or two ago; so, too, in tropical medicine special tests of attainment have been created by several of the educational authorities; and the D.T.M. is tacitly recognised by the Colonial Office.—*The Hospital*.

Personal.

SWANSTON.—On the 30th January, at Lucknow, the wife of Capt. Nelson Swanston, A.V.C., of a daughter.

Mr. JAMES HOPE PRIMMER, M.R.C.V.S., who had established what is regarded as a lucrative practice in Dunfermline has received an important appointment under the New Zealand Government. A son of the Rev. Jacob Primmer, the well known and aggressive ecclesiastic, Mr. Primmer inherits the hard-working qualities of his father, and during his short professional career in the west of Fife has made many warm friendships among the farming classes and the general community. At present he is in Germany, where he is further equipping himself for his new duties.—*N. B. A.*

HANKS.—Victoria Sophia Clementina, the beloved wife of Frederick William Hanks, of "Eskdale," Wantage, who passed away Feb. 3rd, aged 57 years.

CORRESPONDENCE.

POLYMYOSITIS METASTATICA.

Sir,

In *The Veterinary Record* for February 3rd I was interested to read an extract from the *Berliner Tier. Woch.* on the above disease.

About twelve months ago I was shown an old English sheep dog which exhibited precisely similar symptoms, viz., partial paralysis and localised myositis; moreover the paralysis was most marked shortly after copulation. I suggested that the prostate glands be removed, and a course of nerve tonics be given, but within a few days the owner left the district, and the case was lost sight of.

I should think that this disease is not so rare in the lower animals as is generally supposed, and if our professional brethren who are largely engaged in canine practice would record the most notable of their countless valuable observations, this disease would take its place in our manuals on surgery as a definite condition.

L. L. STEELE.

Beckermest, Cumberland.

CRUELTY PROSECUTION IN GLASGOW.

Sir,

I am not surprised that the two Glasgow veterinary surgeons whom I named in my letter to you a fortnight ago (and whose names you omitted to publish) have made no attempt at replying. I hardly expected that they would enter into a controversy with me. And yet, why shouldn't they? Perhaps they don't read *The Veterinary Record*—but that is unthinkable: everybody reads *The Record*. Is their silence the result of regardful contemplation of their own dignity? Yes, I think it must be their dignity; or can it possibly be that they are afraid? Surely not that! They would have every advantage in a discussion. They are two against one ("two minds with but a single thought"—if you had read their certificates, Mr. Editor, you would appreciate the aptness of the quotation). They are men of honours and experience: I am guilty of the crime of being young. Why should they hesitate to give their views for my criticism? Under the covering wing of the R.S.P.C.A. they found it an easy matter to annihilate me in the J.P. Court, when I had practically no opportunity of replying. Dignity is a poor excuse for shirking a discussion, and I am driven to conclude that they entertain serious doubts of their ability to emerge successfully from an encounter with me now that they are removed outwith the pale of that "Divinity that doth hedge" the R.S.P.C.A.

Perhaps you will consider, sir, that this is a petty quarrel, but my view of the matter (and I hold to it strongly) is that my work in this case was condemned as a result of grossly mistaken diagnosis on the part of the two veterinary surgeons for the prosecution. I think I am entitled to have a kick like the others.—Yours faithfully,

DONALD CAMPBELL.

THERMOFUGE

Is a compound of aluminium silicate, glycerin, boric acid, menthol, thymol, oil of eucalyptus, and ammonium iodide, forming a convenient and efficient antiphlogistic application superior to poultices, fomentations, etc.

THERMOFUGE

Does not require the repeated changes which poultices necessitate and, unlike them, it does not afford a medium for the growth of disease germs.

THERMOFUGE

Reduces swelling and capillary congestion, allays pain, soreness and throbbing, and has an alterative effect upon inflamed glands. It softens indurated tissues, reduces tense tumefactions, and restores tone to strained tendons.

THERMOFUGE

Is a thick paste which is spread over the affected area (or applied on linen) and covered with oiled silk retained in position by a bandage.

Supplied in Tins of $\frac{1}{4}$, $\frac{1}{2}$, 1, 5 and 10 pounds.

PRACTICES FOR DISPOSAL

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains: reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

EAST COAST. Agricultural practice returning £600 per ann. Good house containing 2 recept. 4 bedrooms, bath, kitchens, etc. Stabling for 4 horses, coach-house, kennels, etc. Price required for house and practice £1300, of which £400 can remain on mortgage, or vendor would sell practice for £500 and would let house on lease at £45 per annum.

SOUTHERN COUNTY. Easily worked practice returning £850 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

HOME COUNTY. Practice returning £350 to £400 per ann. In present hands nearly 20 years. Small house with $\frac{1}{2}$ acre garden and good stabling. Rent £35. Premium £200.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended

Professional Advertisements.

These will be received up to Thursday morning.
Five lines or under 2/6 (exclusive of heading): for two insertions 4/-; for three 5/-; after three 1/- each.
Each line above five—first insertion 6d; after first 3d.
Average—seven words in a line.

These Advertisements will not be inserted unless prepaid, and if replies are to be received at this office an extra sixpence must be included.

University of London

"BROWN" ANIMAL SANATORY INSTITUTION,
149 Wandsworth Road, S.W.

THE Committee of this Institution invite applications for the post of Veterinary Assistant at a salary of £150 per annum together with furnished rooms in the Institution, attendance, coals and gas. The appointment will be for one year in the first instance.

Information as to the duties of the veterinary assistant may be had on application to the Acting Secretary of the Brown Institution, University of London, South Kensington, S.W., to whom applications for the appointment should be addressed.

The latest date on which applications for the post can be received is February 29th, 1912.

Midland Counties V.M.A.

THE Annual Meeting will be held at The Grand Hotel Birmingham, on Friday, February 23rd, at Two p.m. The President, H. L. Pemberton, Esq. in the chair. Agenda. Routine business: Election of Officers. Dr. O. Charnock Bradley, M.D., B.Sc., M.R.C.V.S. Principal of the Royal (Dick) Veterinary College, Edinburgh, will read a paper on "Hereditry." Dinner at 5 o'clock.

H. J. DAWES, Hon. Sec.

As Manager or Assistant

QUALIFIED man desires post as assistant or branch manager in good mixed or town practice. Castrate standing. Good references. Address, 2302 V.R., 20 Fulham Road, London, S.W.

For Sale

GENUINE Country Practice in Dairy and Agricultural district, excellent stables and house, rent, £24. Returns, £150. Price to immediate purchaser, £20. Address, 5302 V.R. 20 Fulham Rd., London, S.W.

For Sale through Ill-Health.

COUNTRY Practice. Beautiful part. Favourite county. Hunting, shooting, golf, fishing, polo close. Garden, greenhouse, large orchards, paddock, etc. Returns last eight years £390—£420. Price £250 for quick sale. Address, 8302 V.R., 20 Fulham Road, S.W.

As Manager or Assistant

QUALIFIED veterinary surgeon, married, requires situation as manager or assistant in good town or country practice, good all-round operator. Steady and obliging. Disengaged 2nd week in March, excellent testimonials. Address, 3302 V.R., 20 Fulham Rd., S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,

73 Victoria Mansions,
South Lambeth Road, S.W.

T. FENN-ADDISON, M.R.C.V.S.,

LOCUM TENENS, (or Assistant)
Horton Road, Gloucester

Moderate terms. Excellent references from well-known practitioners.

HUGH R. SINGLETON, M.R.C.V.S.

LOCUM TENENS.

44, St. Michael's Road.

Bedford.

Assistant Wanted

QUALIFIED or unqualified for a country practice. State age, experience, and salary required to live out, with references. Address, 6302 V.R., 20 Fulham Road, London, S.W.

As Assistant

RECENTLY qualified M.R.C.V.S. seeks situation as Assistant. Experience in country and town practice. References. 1302 V.R., 20 Fulham Road, S.W.

As Assistant

UNQUALIFIED, requires post. Many years experience town and country. Good references as to capabilities and character as locum and assistant. Address, 4302 V.R., 20 Fulham Road, S.W.

To Veterinary Surgeons

UNQUALIFIED man wishes situation as assistant, or locum, town or country. Age 29, unmarried, steady and sober, life experience. Excellent references. Address, 7302 V.R., 20 Fulham Road, London, S.W.

Partner Wanted.

WANTED a practical qualified partner in an old established horse and dog practice on the South Coast. Easy terms might be arranged. Address 9302 V.R. 20 Fulham Road, S.W.

Wanted

QUALIFIED assistant of experience, capable of taking charge. Must be well up in country practice and able to castrate. Must be of business habits. Salary to commence £150, live out. Sign bond, permanency to good man: references required. Address, 3021 V.R. 20 Fulham Road, London, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

For Immediate Disposal

GENUINE established mixed practice, hunting and agricultural district. Excellent house and stabling. Vendor having accepted a colliery appointment he would be prepared to sell at a reasonable price. Full particulars furnished to *bona fide* applicants. Address, W. H. Blackburn, M.R.C.V.S., Barnard Castle.

Assistant Unqualified

SON of V.S., aged 26, requires assistantship in a busy mixed country or town practice. Good at parturition and general practice. Previous situation 18 months. Permanency if possible, terms moderate. Good dispenser and book-keeper; ride, drive, and cycle, and not afraid of work. Excellent references. Address, 1029 V.R., 20 Fulham Road, London, S.W.

Wanted

POSITION with veterinary surgeon by man of superior ability, good worker, etc. References. Address, 2022 V.R., 20 Fulham Road, London, S.W.

Assistant Wanted

QUALIFIED, for a Northern town practice: Sign usual bond, must be sober, reliable, and not afraid of work. State if married or single, age, and salary required. Address, 2024 V.R., 20 Fulham Road, S.W.

As Assistant

MR.C.V.S. requires berth in busy canine practice. Good references: steady: moderate salary in return for good experience. Address, 6202 V.R. 20 Fulham Road, London, S.W.

Pupil Wanted

VACANCY occurs in extensive mixed practice for gentlemanly youth as pupil, or would take C or D student for three or four months. Address, 9202 V.R. 20 Fulham Road, London, S.W.

Assistant Wanted

FOR town practice, state age, references, and salary required. Address, 1021 V.R. 20 Fulham Road, London, S.W.

As Assistant or Locum

VETERINARY surgeon desires post in genuine country practice. Thoroughly experienced and reliable, not afraid of any work, 34, good horseman. Permanency; interview if possible: excellent references. Address, 1401 V.R., 20 Fulham Road, London, S.W.

For Disposal

MIXED town and country practice with C.C. appointment in rapidly growing town in North Ireland, doing about £360. Introduction and every assistance given; nearest opposition 10 miles. Price, £150. Address, 4015 V.R., 20 Fulham Rd., London, S.W.

To Veterinary Surgeons

ADVERTISER, age 21, would be pleased to hear from V.S., who would take him to see practice, would do horse, etc., board in return. No previous practical experience, but very anxious. Pecuniary position will not allow premium. Address, D. H. Ransom, 27 Market Place, New Malden, Surrey.

Assistant Wanted

MR.C.V.S. practical and steady, for mixed practice: permanency for good man. Sign bond. Reply stating age, height, terms required living in or out, with references. Address, 5202 V.R., 20 Fulham Rd., S.W.

For Immediate Disposal

GENUINE old established town and country practice in Yorkshire, increasing yearly. Suitable house at low rent, stable and kennels attached. Returns for the last 4 years over £300 per annum. Good introduction given. Address, 2023 V.R., 20 Fulham Road, S.W.

Partner Wanted

Wanted a thoroughly reliable, practical, qualified (married man preferred) as partner in an extensive country practice. Full particulars in strict confidence. Only bona fide applicants with capital at command will be entertained. Address, 4201 V.R., 20 Fulham Road, London, S.W.

To Vendors.

WANTED Veterinary Practices and Partnerships. Surgeons wishing to sell the whole or a share of their practices are invited to communicate with Messrs. Peacock & Hadley, Veterinary Transfer Agents, 19, Craven Street, Strand, W.C., who will be pleased to introduce likely purchasers. No charge whatever made unless a sale be effected.

As Locum

EXPERIENCED M.R.C.V.S., will act as locum, town or country practice. Free end of March! Address, J. B. Taylor, M.R.C.V.S., Shawlands House, by Larkhall, Lanarkshire.

FOALING SEASON. Agents required in unrepresented districts for the Imperial Accident Insurance Co., Ltd. Est. 1878. Horses Insured against Death from Accident or Disease, Mares for Foaling and Loss of Foals; Farmers' Liability for Accidents to Labourers, Servants, and Workmen's Compensation. Claims paid £500,000. Address Agency Manager, 17 Pall Mall East, London, S.W.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

No. 1232.

FEBRUARY 17, 1912.

VOL. XXIV.

THE LATE LORD LISTER.

Probably every veterinary or medical weekly journal published to-day throughout the world is paying its tribute of homage to the great healer we have just lost. Our own is a short one, for two reasons. So much has been written during the last few days upon Lister's life-work, and much of it has been written so well, that it is difficult to add to what has already been said. And certainly, to those able to comprehend the magnitude of Lister's achievements, it seems impossible for any pen to do justice to the man and his work.

The story of the rise and progress of Listerian surgery has passed from scientific history into common knowledge. The man in the street knows how Lister sought for many years to combat the ghastly hospital mortality of his youth, how he perceived the bearing of Pasteur's work upon the problem, and how, the principle once grasped, he worked out his methods through all necessary modifications of detail to the triumphant conclusion. That he owed something to the French *savant* in no way detracts from the merit of his own work, but rather increases it. Few of the expert operating surgeons of those days had either the breadth of view to appreciate the possibilities arising from Pasteur's discoveries, or the practical chemical and microscopical knowledge necessary for their application to surgery. Fewer still, perhaps, possessed the steadfast purpose which enabled Lister to follow an untrodden road for years in the face of doubt and opposition. The fact is that Pasteur's early work on micro-organisms opened up a host of such untrodden roads, some of which Pasteur himself could never hope to follow. One was surgery, which Lister, by his temperament and early scientific studies, no less than by his professional opportunities and experience, was peculiarly fitted to take up. He did so, and lived to be recognised as the world's pioneer.

It has often been truly said that the benefits Lister conferred upon the world are incalculable. But we may and that they did not stop short at surgery. Apart from the many serious operations which have become trivial, and the many operations which have only become possible at all, under Listerian methods, it must be remembered that those methods have penetrated into medicine and sanitary science. Modern prophylaxis owes almost as much to Lister's work as does surgery.

No one can guess the number of lives saved, or the amount of suffering averted, by the work of this one man. But we all know that the recent descriptions of him as the greatest medical benefactor the human race has ever possessed are no more than the truth.

Remembering the stupendous benefits he gave to the world, it is good to think that everything personally known of the man himself was much more than favourable. The world has owed much, directly and indirectly, to men whose motives and characters were largely ignoble. Science has owed much to men whose lives held little of the altruistic ideal. Lister was not of these. It was typical of his character that his sole motive in taking up his epoch-making work was the desire to lessen the death and suffering in the hospitals of those days, the constant sight of which would have hardened a man of coarser fibre. It was characteristic of him, also, that in his later years he seemed to think the success of the work itself to be his best reward.

We ought long ago to have enrolled Lister as an Honorary Associate of the R.C.V.S. We never did; but the Council, meeting a few years ago upon his birthday, sent their congratulations. A cordial reply was received, and is preserved in the College archives. In it the veteran acknowledged having received great assistance in his work from veterinary surgeons; but veterinary surgeons, all the world over, will reverence his memory as that of one of their greatest teachers.

THE DIAGNOSIS AND TREATMENT OF PLEURISY.

Marchal and Séjournant, in the course of an outbreak of equine pleuro-pneumonia, had the opportunity of testing certain diagnostic and therapeutic measures which are already customary in human medicine. They now record (*Bulletin de la Soc. Cent. de Méd. Vét., Recueil*) their results.

The authors tested the "signe du sou" or "Zeichen des Geldstücks" (= sign of the coin) diagnostic method of Prof. Pitres. This is carried out as follows. An assistant lays a ten-centime piece upon the thorax between two ribs, and strikes it with the edge of another ten-centime piece, while the veterinarian or medical man auscultates the thorax at a place opposite to that percussed. So long as the percussion goes on at a healthy region, the ear receives the sound in an accentuated form, in consequence of the resonance of the thorax. On a hepatized area, on the other hand, the resonance is dulled, as if the sound penetrated through a layer of plaster. When the percussion is carried out upon an exudate, however slight this may be, the sound is delayed, is clearer, and has a metallic ring, like that produced by striking a half-empty cask. This is explained by the fact that the conduction of sound through fluids, while it certainly takes place more slowly than that through gases,

does so more completely than the latter. The alteration of the sound is especially marked in the region lying closely over the level of the exudate.

Therapeutically, the authors have made very successful use of a method hitherto little practised in veterinary medicine. They advise thoracentesis as early as possible and the withdrawal of only a small quantity of the pleuritic exudate. The fluid withdrawn from the thorax is immediately injected subcutaneously. The authors find that small doses of the fluid are more active than large ones, and they have been accustomed to inject from 25 to 50 grammes (= approx 5-6ths. to 10-6ths. oz.)

This treatment causes a speedy reduction of the fever and a rapid resorption by the induction of a crisis of urination. Along with it, the authors endeavour to assist the organism in its reaction by generally stimulating, heart-strengthening and diuretic, but not irritating means. They have employed caffeine and camphor in large doses, injected intra-muscularly.

During the outbreak in question eighteen horses were affected with pleuro-pneumonia. Only the first one died; and this was *before* the application of the method of treatment described above.—(*Berliner Tier. Woch.*)

[This "sign of the coin" diagnostic method should be compared with the tracheal percussion of Smith and Schindelka.—*Transl.*]

HÆMORRHAGE INTO A GUTTURAL POUCH WITH MORTAL SEQUEL.

Wester records (*Tydschr. v. Veeartsenijkunde*) the case of a racehorse which, while at exercise, fell against an obstacle. He contracted a small wound on the inside of the right eye and showed slight nasal hæmorrhage. Six weeks later, he appeared absolutely normal. However, at the end of that time, a violent nasal hæmorrhage appeared; and, fifteen days later, this was repeated with the same intensity, especially upon the left side.

The animal was then brought to the Utrecht Veterinary School. His temperature was found to be normal; but the pulse was 72 to the minute, and was intermittent. It remained intermittent after light trotting exercise; but the number of pulsations then rose from 72 to 100 per minute. The appetite was normal, but the respirations counted 44 to the minute. The author believed the case to be one of cardiac hypertrophy, induced by overtraining.

At the end of six days, all the symptoms had improved so much that the horse showed little that was abnormal.

Eight o'clock on the night of the sixth day, however, the animal became nervous; the pulse rose to 96 per minute, and was irregular; the respirations were 40 per minute; while the temperature remained normal. Two hours later, a violent hæmorrhage set in from the mouth.

The next day, Wester found considerable engorgement of the throat and head. Marked dysphagia was present, and also dyspnea. The temperature was now 103.1 F., and the pulse 60 per minute. Tracheotomy was performed immediately,

and a large quantity of water was seen to flow from the tracheotomy tube. This had been drunk by the horse, and had passed into the larynx without its passage provoking any reaction.

Next day, the engorgement of the throat and the general temperature had diminished, but the dysphagia remained unabated. The treatment applied was the subcutaneous administration of stimulants, and rectal feeding with milk. At the end of five days, the horse succeeded in swallowing a few oats, but a little water still continued to flow away from the tracheotomy tube when he drank. The heart's action had now become calmer and stronger.

The improvement only lasted for two days, at the end of which time the dyspnea again became intense. Manual exploration of the pharyngeal and laryngeal regions revealed nothing abnormal. The animal lost flesh progressively, and finally died from "pneumonia caused by foreign bodies."

Post-mortem, a diffuse inflammation of the larynx was found; but the pharynx was normal. The left guttural pouch, which was considerably dilated, contained a large blood clot. In the region of the superior angle of the pouch, the author clearly perceived a ruptured artery obliterated by a small clot of recent formation. It is probable that the hæmorrhage into the guttural pouch had been the starting point of all the morbid symptoms. The dyspneic troubles probably, should be attributed to a paralysis of the pharynx; and it may be presumed that the insensibility of the larynx betrayed a similar condition of the laryngeal nerves.—(*Annales de Méd. Vét.*)

FOOT-AND-MOUTH DISEASE IN HORSES.

It is known that horses possess a certain amount of receptivity to foot-and-mouth disease, although the cases of its transmission to them are very rare. Recently De Jong has observed an instance of such transmission to them, which he now records (*Tydschr. v. Veeartsenijkunde*). On the 15th of July last, three foals which had been weaned a few days before were placed in a field occupied by cattle affected with foot-and-mouth disease. Five days later, the foals showed the first symptoms of the disease, viz., difficult prehension of food, and salivation. The author, however, did not observe the special sound which affected cattle produce when chewing. The buccal mucous membrane showed aphthæ—some intact and others burst—at different points.

On the 30th of July, one of the foals still shewed salivation, and traces of vesicles were still clearly apparent upon the tongue and in other portions of the mucous membrane. Lesions upon other parts of the body, notably upon the feet, did not exist.

This case proves that it is quite wrong, in dealing with epizootics of foot-and-mouth disease, to confine the preventive regulations to ruminants and pigs.—(*Annales de Méd. Vét.*) W. R. C.

BLEEDING IN HÆMOGLOBINURIA.

Wysmann is convinced that that bleeding is one of the best methods of treating hæmo-globinuria, because the alterations it produces in the larger

yessels are quickly transferred to the circulation in the peripheral vessels.

In acute cases one always notices the marked alteration in the pulse and the rapid painful breathing, which conditions are at once relieved by bleeding, and this relief is not merely mechanical, but a quantity of toxic products are removed.

Bleeding also induces activity in the secretion of urine and favours the indirect elimination of waste products much more rapidly than can be done by drugs, this has been physiologically demonstrated by Von Hoesslin. It is also probable in haemoglobinuria that bleeding has a direct stimulating action on the haematopoietic organs, the medulla of the bones and spleen.

Of 43 of Wismann's cases, 37 occurred during spring and 6 in summer, so he concludes that although cold may be a predisposing it is not an essential factor.

Four to eight litres of blood were taken from the jugular. In 10 cases the horses were off their legs, 7 of these died. Of 33 bled before they went down only one died.—(Schweiz. Arch.)

GRANULAR VAGINITIS.

Nopisch recommends surgical treatment for granular vaginitis. Scraping the roots of the growth and washing with sublimate 1:2000, he gets cures within three or four days. (Berliner Tier. Woch.)

E. E. P.

AS TO THE NATURE OF THE PARASITES OF LEPROSY AND TUBERCULOSIS. By ALEXANDER G. R. FOULERTON, F.R.C.S., Lecturer on Bacteriology and on Public Health to the Middlesex Hospital Medical School.

In a recent communication Dr. Bayon, criticising an opinion expressed by Beauchamp Williams to the effect that "leprosy may be caused by, perhaps, several varieties of a highly pleomorphic streptothrix," remarks that "to suit Williams' view it"—that is to say, the parasite of leprosy—"would have to be an actinomyces also." As a matter of fact the generic terms, *Streptothrix* and *Actinomyces*, and *Cospora* and *Nocardia* also, are synonymous. The first of them is used by British pathologists generally, German pathologists appear to prefer usually the second, and the other two are in common use by French pathologists. A fifth generic synonym, *Cladothrix*, has fortunately fallen out of use. Consequently, the terms *Streptothrix* and *Actinomyces* are applicable equally as the generic designation of the parasite of leprosy. For there cannot be any reasonable doubt but that the parasites which Hansen identified in the tissues of lepers and described as *Bacillus leprae*, which Deycke was apparently the first to demonstrate in culture from leprosy lesions, which Rost first succeeded in growing freely on artificial media, which Williams subsequently studied in full detail, and which have been isolated during the last year or two by a considerable number of bacteriologists, all belong to one and the same species (*Streptothrix leprae*) of "ray fungus" or streptothrix.

I have seen only stained cover-glass preparations of the acid-fast, and morphologically typical, streptothrix which Deycke obtained from cases of leprosy. But by the courtesy of Beauchamp Williams I have had opportunities of examining three strains of the organism which he has isolated from cases of leprosy occurring in

Persia and India, and two strains of an identical organism which had been isolated by Rost.

It is certain that these latter parasites belong to a single species which, under certain conditions of culture on artificial media, presents a number of acid-fast rod forms which are identical with the acid-fast forms recognisable in leprosy granulomata. And it is evident, I think, that this parasite is that which Deycke described under the name of *Streptothrix leproides*. Deycke, however, appears to have hesitated at first to accept as the essential parasite of leprosy a micro-organism which, being a streptothrix, did not conform in growth on artificial media with the then accepted morphology of Hansen's *Bacillus leprae*. Kedrowsky also recognised streptothrix forms in cultures of an organism which he isolated from a case of leprosy.

A review of modern literature concerning the parasite of leprosy shows that confusion as to the proper place in botanical classification of the specific infecting organism has been caused partly by the multiplicity of nomenclature already referred to, and partly by failure to connect the varying morphological phases of streptothrix generally at different stages of their life-cycle. This matter was dealt with fully in the Milroy Lectures for 1910, and need not be referred to again, except very briefly.

The type-form of the genus *Streptothrix* is represented by the tangled masses of branching mycelium found in pus when suppuration has occurred in cases of streptothrixosis. Similar tufts of branching mycelium, the branching being lateral and not dichotomous, can be demonstrated nearly always in young cultures of streptothrix in broth. The typically mycelial stage in the growth of the parasite is succeeded successively by stages of "segmentation" and "fragmentation." Rod-shaped, bacilli-like segments become differentiated along the length of the mycelial threads. Degeneration of intervening segments of the mycelium occurs with, or very soon after, the segmentation—so that, when fragmentation follows, the original tuft of branching mycelium is replaced by a confused aggregation of bacillary forms, some of which are long and thread-like, whilst others may appear as short bacillary or spirillar forms. The occurrence meanwhile of "chain sporulation" complicates the morphological picture. In cultures on artificial media aerial hyphae grow out from the surface of the mycelium, and present single chains of spores. When fragmentation occurs the aerial hyphae become separated off from the mycelium, and then present exactly the appearance of streptococci. Later these chains break up, and the spores appear as isolated spherical bodies, or in pairs. It is probable also that endogenous spore formation occurs along the length of some of the isolated rod segments.

In an old culture of the streptothrix, therefore, one finds the following elements: Longer or shorter bacillary forms, some of which may have a spiral or wavy appearance, some of which may resemble diphtheroid bacilli, and some of which may have the stump of a lateral branch still attached; short chains of spores, which resemble exactly streptococci; and paired or isolated spores. All these elements stain deeply by Gram's method; and, except when traces of branching remain—and segments showing this may be very few and far between—the surviving elements of the original mass of mycelium are indistinguishable morphologically, according to their nature, from bacilli and cocci. Under varying accidental circumstances incidental to the examination of cultures on artificial media, the spherical spores of the streptothrix may appear in stained specimens, as though they might be streptococci, diplococci, isolated cocci, or irregularly grouped staphylococci. If a species happens to be one of the acid-fast streptothrix, a correct morphological interpretation of specimens stained by the Ziehl-Neelsen method is obscured in another way

by the fact that in many cases some only of the persistent rod-shaped or bacillary segments have acid-fast properties. Also, with most acid-fast streptotrichæ, as with Koch's parasite of tuberculosis, acquisition of acid-fast properties is a matter of age. Some species which have this property develop it early and show it in nearly all of the rod segments, whilst in other species acid-fast properties are acquired only after some weeks of growth on artificial media, and then the special property is manifest only in a small minority of the segments. And so it will be found that in specimens from old cultures of a typical acid-fast streptothrix—such as *St. Nocardii*, *St. eppingeri*, or *St. lepræ*—which have been stained by the Ziehl-Neelsen method, not only have "bacillary" and "coccal" forms to be considered, but the bacillary forms are, apart from casual morphological variation, of two kinds—those which are acid-fast and those which are not so.

Something may be added generally as to the function of the spores and persistent rod form which in old cultures succeed the original branching mycelium of the streptothrix. With most of the numerous species which have now been examined in my laboratories, there is no possible doubt as to what happens when the organism is growing under conditions of culture on artificial media. Both the spores and the persistent rod forms of an old culture are capable, on transference to a new soil, of reproducing the branching mycelium which represents the type form of the genus. Under no circumstances of artificial culture has it appeared that rod segments are produced directly from pre-existing rod segments, and without the intervention of a mycelial stage. Equally, the spherical spores invariably sprout out into a new mycelial mass—a process which can be easily watched if an old culture of a quickly-growing species is kept for twenty-four hours in a drop of nutrient broth on a warm stage under the microscope. Also I have found clear microscopical evidence that the rod segments of a pathogenic streptothrix may develop into a new mass of branching mycelium under the conditions of parasitic life in an animal host. In some of the more slowly-growing species the intervention of the typical mycelial stage before the development of new persistent rod forms may be difficult to demonstrate when an old culture is transplanted in a fresh medium, and especially when the culture medium used is a solid one. But this difficulty arises from the fact that, growth being very slow on artificial media, segmentation and fragmentation of the mycelial threads follow so closely on increasing growth that it is almost impossible in some species to trace continuously the true morphology of the organism.

It is certain that the typical streptotrichæ present two distinct persistent and reproductive forms—spherical spores produced under conditions of artificial culture in special spore-bearing hyphæ, and rod segments. Either of these produces a new mycelium when transplanted in a fresh artificial culture medium; and the rod segments, as well as the spherical spores, are capable of producing similar mycelium in the tissues of an animal host. Further, whilst we have no evidence at present that the persistent rod forms are capable of directly reproducing themselves, as such, in growth on artificial media, there is a possibility that this direct reproduction may occur under strictly parasitic conditions. This possibility is suggested by what is known of the biology of *Sporothrix schenckii*, belonging to a closely allied but somewhat higher genus of mould fungi.

SPOROTHRIX.

Some ten years ago I pointed out that *Sporothrix* presented two different reproductive forms which may be termed provisionally, and for purposes of distinction, endogenous "spores" and exogenous "spore bodies." The type form of *Sporothrix* when growing on artificial

media is represented by a tangled mass of branching mycelium which resembles generally that of *Streptothrix*, but which is definitely septate, and of coarser character than the other. As the culture of *Sporothrix* grows older provision for reproduction is made in two ways. Spherical "spores" appear along the length of, and within, the comparatively coarse mycelial thread; and ovoid, yeast-like "spore bodies" bud out from the sides of the primary mycelial threads and from the extremity of secondary lateral branches. In course of time the mycelium degenerates and, as such, disappears; the only remnant of it is amorphous, Gram-staining *débris*. The persistent recognisable morphological elements in oldish cultures are the spherical "spores" and the yeast-like "spore bodies." If some of an old culture of *Sporothrix* is transferred to nutrient broth and afterwards watched on a warm stage under the microscope, it will be seen that each of the two morphologically different persistent elements gives rise to a new mycelium which sprouts out from either form, exactly as the nearly similar mycelium of a streptothrix sprouts out from either the spherical spore or the rod segment.

But whilst I have not hitherto been able to find any evidence as to the direct multiplication of the persistent rod forms of *Streptotrichæ* in growth on artificial media, it is otherwise with the persistent forms of *Sporothrix*. In old cultures of *Sporothrix schenckii* in a nutrient broth medium there are appearances which suggest direct multiplication of the persistent yeast-like bodies. One finds in such a culture large yeast bodies, like to those which in younger cultures are seen sprouting out from the mycelium, in immediate contact with three, four, or more smaller yeast forms. Also, under the conditions of parasitic life, a direct multiplication of the yeast-like bodies, as suggested by Hektoen, appears to be indisputable. If a mouse be inoculated subcutaneously with either a young mycelial culture or with an older culture which contains only spherical and yeast forms, a slowly-extending infective infiltration of the subcutaneous tissue follows. On examination after death it is found that the area of infected granulomatous tissue is thickly crowded with Gram-staining yeast forms; but no trace of mycelium can be found. The appearances are, in short, those of a yeast infection, except that the parasites are present in much larger numbers than one finds usually in an experimental yeast infection. On transplanting these yeast forms of *Sporothrix* from the animal tissues in an artificial medium, a growth of the typical mycelial form occurs at once, with subsequent development of the persistent forms. It should be added that my own experiments were carried out with a culture of *Sporothrix schenckii* with which Hektoen had very kindly supplied me. And a statement made in the paper referred to, that "mycelium apparently does not occur under parasitic conditions," applies only to experimental infection of the mouse with the particular species. Pinoy, on the other hand, has described recently natural cases of infection of man by *Sporothrix beurmannii*, in which, whilst yeast forms predominated in the tissues, mycelial forms were found in and around the capillaries of the parts infected.

BACILLARY FORMS.

In view, however, of the evidence as to the reproduction of the persistent yeast forms of *Sporothrix* by direct multiplication, the possibility of a similar reproduction in parasitic life of the persistent rod segments or "bacillary" forms, of the streptotrichæ has to be considered seriously. And the comparison is the more interesting when we remember that just as reliance on the morphology on one particular phase of development of the parasites of leprosy and tuberculosis as it occurs more conspicuously in the tissues has, unchecked by

cultural investigation, been responsible for the inclusion of these diseases amongst the bacillary infections, so a similarly misplaced reliance on the morphological significance of a phase of the life-cycle of the parasite as it occurs in the tissues has caused error in the diagnosis of cases of sporotrichosis. It is obvious from published records that in the past certain cases of infective granulomata occurring in man, which were attributed to "yeast" or "protozoal" infection, were actually cases of sporotrichosis. The persistent yeast forms of *Sporothrix* in the tissues were mistaken for yeasts, or coccidia, as the case happened. It was not until Schenck succeeded in obtaining the parasite in culture, and until Hektoen added to our knowledge of it, that a correct determination of the nature of sporotrichosis was possible. Similarly Calvin, Frothingham, and Paige have quite recently proved, by the isolation of *Sporothrix schenckii* from the infected tissues, the true nature of epizootic lymphangitis of horses, a disease which had been regarded at one time as a protozoal infection, at another time as a yeast infection.

The rod segments of streptotrichiae generally representing persistent forms which are capable of reproducing the mycelial form of the parasite, and possibly also capable of direct multiplication as rod forms, the particular significance of the specially staining rod segments of the acid-fast species has to be considered next. The acid-fast properties are associated with the presence in the organism of special fatty bodies (neutral fats, fatty acids, and lipoids) whose biochemical relations have been studied especially by Much and his pupils. Much has shown that the fatty bodies are specific generally for the acid-fast group of organisms, and are capable of producing specific antibodies in the serum of infected animals. Thus the nastin obtained from the parasite of leprosy is capable of causing a powerful reaction when injected into patients with either leprosy or tuberculosis; and the similar nastin obtained from the parasite of tuberculosis will cause a reaction with patients having either infection. Much and Kossli have shown by a series of complement-fixation tests that other, and non-pathogenic, acid-fast organisms—a "smegma" bacillus and the "blind worm" bacillus—are capable of reacting as antigens with the serums of tuberculous patients. Wills has shown, by an extended series of complement-fixation experiments, that the serums of leprosy and tuberculous patients, and of lower animals which have been immunised artificially against the respective parasites, contain antibodies which are specific for either organism, and also for the two non-pathogenic species, with differences which are merely quantitative. An excellent summary of the work done in the direction indicated by Much and those associated with him is given in Will's paper, and affords strong additional evidence as to the close relationship between the parasites of leprosy and tuberculosis and certain other reputed bacilli of the acid-fast kind, whose relationship with the streptotrichiae has been suspected for many years.

But whilst the requirements of acid-fast properties is associated with the presence of certain specific fatty bodies which are apparently common to all the acid-fast group, it must be remembered that the possession of these properties is, in a sense, an accidental characteristic, and one which certainly depends to some extent on external circumstances. Experience with organisms such as *St. novacardi*, *St. eppingeri*, *St. caprae* and *St. leprae*, shows that the acquirement of acid-fast properties during growth on artificial media is a matter of much uncertainty. Sometimes a culture will show acid-fast segments within a week, or less, of the commencement of growth; in other cultures none will be found for three or four weeks. The general rule is that the older a particular culture is the more conspicuous are the acid-fast forms.

In the case of *St. leprae* it would appear that the conditions of parasitic life specially favour the acquirement of acid-fast properties; under saprophytic conditions of growth the rod segments tend to remain non-acid-fast. With Koch's parasite of tuberculosis acid-fast properties are acquired quickly during saprophytic growth; it is only in very young cultures that the non-acid-fast forms described by Klein and others can be demonstrated.

What evidence is available on the point suggests that the acid-fast forms of *Streptothrix* may represent not only persistent but also specially resistant elements. The spherical spores of the streptotrichiae are generally distinctly less resistant against injurious physical and chemical influences than are the spores of fission fungi; and it may be that a second resistant element—the acid-fast rod form—has come into existence. Thus Marino found that the acid-fast forms of the parasite of tuberculosis preserved their vitality for a considerable time in the intestinal canal of the leech, resisting the action of the digestive juices for as long as fifteen months. At the end of that time there was marked attenuation of virulence; but still inoculation of the parasites into the guinea-pig was followed in some cases by a very slow infection which resulted in death. There is also evidence of a probably similar kind with regard to the parasite of leprosy. It has been suggested that growth of this organism on artificial media is favoured in symbiosis with intestinal amoebae, and Beauchamp Williams has recorded his own experiments bearing on this question. With certain strains of his streptothrix the acid-fast forms appeared to die out in the course of successive subcultures. Then subcultures which appeared to consist of non-acid-fast diphtheroid rod segments were mixed with amoebae. At the end of forty-eight hours the amoebae were found to be full of acid-fast rod segments. But an explanation other than that which supposes favourable symbiotic influences may be suggested. There is evidence that bacteria form a part of the natural food of the intestinal amoebae, and of *Amoeba dysenteriae* in particular. And under the circumstances it would seem most likely that the amoebae digest and assimilate the non-acid-fast segments of the streptothrix, and that in the struggle for prolonged existence other, more resistant, acid-fast forms survive, as Marino's experiments have shown to be the case with the acid-fast form of the parasite of tuberculosis which is resistant against the digestive ferments of the leech.—*Brit. Med. Journ.*

PROTECTION OF ANIMALS ACT, 1911.

[1 & 2 GEO. 5. CH. 27].

CHAPTER 27.

An Act to consolidate, amend, and extend certain enactments relating to Animals and to Knackers; and to make further provision with respect thereto.

[18th August, 1911].

BE it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

1.—(1) If any person—

- (a) shall cruelly beat, kick, ill-treat, over-ride, over-drive, over-load, torture, infuriate, or terrify any animal, or shall cause or procure, or, being the owner, permit any animal to be so used, or shall, by wantonly or unreasonably doing or omitting to do any act, or causing or procuring the commission or omission of any act cause any unnecessary suffering, or, being the owner

permit any unnecessary suffering to be so caused to any animal : or

- (b) shall convey or carry, or cause or procure, or, being the owner, permit to be conveyed or carried, any animal in such manner or position as to cause that animal any unnecessary suffering ; or
- (c) shall cause, procure, or assist at the fighting or baiting of any animal ; or shall, keep, use, manage, or act or assist in the management of, any premises or place for the purpose, or partly for the purpose, of fighting or baiting any animal, or shall permit any premises or place to be so kept, managed, or used, or shall receive, or cause or procure any person to receive, money for the admission of any person to such premises or place ; or
- (d) shall wilfully, without any reasonable cause or excuse, administer, or cause or procure, or being the owner permit, such administration of, any poisonous or injurious drug or substance to any animal, or shall wilfully, without any reasonable cause or excuse, cause any such substance to be taken by any animal ; or
- (e) shall subject, or cause or procure, or being the owner permit, to be subjected, any animal to any operation which is performed without due care and humanity ; such person shall be guilty of an offence of cruelty within the meaning of this Act, and shall be liable upon summary conviction to a fine not exceeding twenty-five pounds, or alternatively, or in addition thereto, to be imprisoned, with or without hard labour, for any term not exceeding six months.

(2) For the purposes of this section, an owner shall be deemed to have permitted cruelty within the meaning of this Act if he shall have failed to exercise reasonable care and supervision in respect of the protection of the animal therefrom :

Provided that, where an owner is convicted of permitting cruelty within the meaning of this Act by reason only of his having failed to exercise such care and supervision, he shall not be liable to imprisonment without the option of a fine.

(3) Nothing in this section shall render illegal any act lawfully done under the Cruelty to Animals Act, 1876, or shall apply—

- (a) to the commission or omission of any act in the course of the destruction, or the preparation for destruction, of any animal as food for mankind, unless such destruction or such preparation was accompanied by the infliction of unnecessary suffering ; or
- (b) to the coursing or hunting of any captive animal, unless such animal is liberated in an injured, mutilated, or exhausted condition ; but a captive animal shall not, for the purposes of this section, be deemed to be coursed or hunted before it is liberated for the purpose of being coursed or hunted, or after it has been re-captured, or if it is under control.

2. Where the owner of an animal is convicted of an offence of cruelty within the meaning of this Act, it shall be lawful for the court, if the court is satisfied that it would be cruel to keep the animal alive, to direct that the animal be destroyed, and to assign the animal to any suitable person for that purpose ; and the person to whom such animal is so assigned shall, as soon as possible, destroy such animal, or cause or procure such animal to be destroyed, in his presence without unnecessary suffering. Any reasonable expenses incurred in destroying the animal may be ordered by the court to be paid by the owner, and thereupon shall be recoverable summarily as a civil debt :

Provided that, unless the owner assent, no order shall be made under this section except upon the evidence of a duly registered veterinary surgeon.

3. If the owner of any animal shall be guilty of cruelty within the meaning of this Act to the animal,

the court, upon his conviction thereof, may, if they think fit, in addition to any other punishment, deprive such person of the ownership of the animal, and may make such order as to the disposal of the animal as they think fit under the circumstances :

Provided that no order shall be made under this section, unless it is shown by evidence as to a previous conviction, or as to the character of the owner, or otherwise, that the animal, if left with the owner, is likely to be exposed to further cruelty.

4. If any person shall, by cruelty within the meaning of this Act to any animal, do or cause to be done, any damage or injury to the animal or any person or property, he shall upon conviction for the cruelty under this Act, be liable upon the application of the person aggrieved to be ordered to pay as compensation to the person who shall sustain damage or injury as aforesaid, such sum not exceeding ten pounds, as the court before whom he is convicted may consider reasonable :

Provided that this section shall not—

- (a) prevent the taking of any other legal proceedings in respect of any such damage or injury, so that a person be not twice proceeded against in respect of the same claim ; nor
- (b) affect the liability of any person to be proceeded against and punished under this Act for an offence of cruelty within the meaning of the Act.

5.—(1) Every person who shall carry on, or assist in carrying on, the trade or business of a knacker shall observe and conform to the regulations set out in the First Schedule to this Act, and, if any person, carrying on or assisting in the carrying on of the said trade or business, contravenes or fails to comply with, or causes or procures or permits any contravention or non-compliance with, any such regulation, he shall be liable upon summary conviction to a fine not exceeding ten pounds.

(2) Any constable shall have a right to enter any knacker's yard at any hour by day, or at any hour when business is or apparently is in progress or is usually carried on therein, for the purpose of examining whether there is or has been any contravention of or non-compliance with the provisions of this Act, and, if any person refuses to permit any constable to enter any premises which he is entitled to enter under this section, or obstructs or impedes him in the execution of his duty under this section, he shall, upon summary conviction, be liable to a fine not exceeding five pounds.

(3) For the purposes of section one, which relates to offences of cruelty, of this Act, a knacker shall be deemed to be the owner of any animal delivered to him.

(4) For the purposes of this Act, an animal shall be deemed to have been delivered to a knacker if it has been delivered either to the knacker himself, or to any person on his behalf, or at the knacker's yard.

6.—(1) It shall not be lawful for any person who shall be licensed to slaughter horses, during the time while such licence shall be in force, to carry on the trade or business of a dealer in horses.

(2) If any person shall act in contravention of this section, he shall be liable upon summary conviction to a fine not exceeding ten pounds.

7.—(1) Any person who impounds or confines, or causes to be impounded or confined, any animal in any pound shall, while the animal is so impounded or confined, supply it with a sufficient quantity of wholesome and suitable food and water, and, if he fails to do so, he shall be liable upon summary conviction to a fine not exceeding five pounds.

(2) If any animal is impounded or confined in any pound and is without sufficient suitable food or water for six successive hours, or longer, any person may

enter the pound for the purpose of supplying the animal therewith.

(3) The reasonable cost of the food and water supplied to any animal impounded or confined in any pound shall be recoverable summarily from the owner of the animal as a civil debt.

8.—If any person—

- (a) shall sell, or offer or expose for sale, or give away, or cause or procure any person to sell or offer or expose for sale or give away, or knowingly be a party to the sale or offering or exposing for sale or giving away of any grain or seed which has been rendered poisonous except for *bona fide* use in agriculture; or
- (b) shall knowingly put or place, or cause or procure any person to put or place, or knowingly be a party to the putting or placing, in or upon any land or building any poison, or any fluid or edible matter (not being sown seed or grain) which has been rendered poisonous,

such person shall, upon summary conviction, be liable to a fine not exceeding ten pounds:

Provided that, in any proceedings under paragraph (b) of this section, it shall be a defence that the poison was placed by the accused for the purpose of destroying rats, mice, or other small vermin, and that he took all reasonable precautions to prevent access thereto of dogs, cats, fowls, or other domestic animals.

9.—If any person shall use, or cause or procure, or being the owner permit, to be used, any dog for the purpose of drawing or helping to draw any cart, carriage, truck, or barrow, on any public highway, he shall be liable upon summary conviction in respect of the first offence to a fine not exceeding two pounds, and in respect of the second or any subsequent offence to a fine not exceeding five pounds.

10.—Any person who sets, or causes or procures to be set, any spring trap for the purpose of catching any hare or rabbit, or which is so placed as to be likely to catch any hare or rabbit, shall inspect, or cause some competent person to inspect, the trap at reasonable intervals of time and at least once every day between sunrise and sunset, and, if any person shall fail to comply with the provisions of this section, he shall be liable, upon summary conviction, to a fine not exceeding five pounds.

11.—(1) If a police constable finds any animal so diseased or so severely injured or in such a physical condition that, in his opinion, having regard to the means available for removing the animal, there is no possibility of removing it without cruelty, he shall, if the owner is absent or refuses to consent to the destruction of the animal, at once summon a duly registered veterinary surgeon, if any such veterinary surgeon resides within a reasonable distance, and, if it appears by the certificate of such veterinary surgeon that the animal is mortally injured, or so severely injured, or so diseased, or in such physical condition, that it is cruel to keep it alive, it shall be lawful for the police constable, without the consent of the owner, to slaughter the animal, or cause or procure it to be slaughtered, with such instruments or appliances, and with such precautions, and in such manner, as to inflict as little suffering as practicable, and, if the slaughter takes place on any public highway, to remove the carcase or cause or procure it to be removed therefrom.

(2) If any veterinary surgeon summoned under this section certifies that the injured animal can without cruelty be removed, it shall be the duty of the person in charge of the animal to cause it forthwith to be removed with as little suffering as possible, and, if that person fail so to do, the police constable may, without the consent of that person, cause the animal forthwith to be so removed.

(3) Any expense which may be reasonably incurred

by any constable in carrying out the provisions of this section (including the expenses of any veterinary surgeon summoned by the constable, and whether the animal is slaughtered under this section or not) may be recovered from the owner summarily as a civil debt, and, subject thereto, any such expense shall be defrayed out of the fund from which the expenses of the police are payable in the area in which the animal is found.

(4) For the purposes of this section, the expression "animal" means any horse, mule, ass, bull, sheep, goat, or pig.

12. (1) A police constable may apprehend without warrant any person who he has reason to believe is guilty of an offence under this Act which is punishable by imprisonment without the option of a fine, whether upon his own view thereof or upon the complaint and information of any other person who shall declare his name and place of abode to such constable.

(2) Where a person having charge of a vehicle or animal is apprehended by a police constable for an offence under this Act, it shall be lawful for that or any other constable to take charge of such vehicle or animal, and to deposit the same in some place of safe custody until the termination of the proceedings or until the court shall direct such vehicle or animal to be delivered to the person charged or the owner, and the reasonable costs of such detention, including the reasonable costs of veterinary treatment where such treatment is required, shall, in the event of a conviction in respect of the said animal, be recoverable from the owner summarily as a civil debt, or, where the owner himself is convicted, shall be part of the costs of the case.

13. (1) Where proceedings are instituted under this Act against the driver or conductor of any vehicle, it shall be lawful for the court to issue a summons directed to the employer of the driver or conductor, as the case may be, requiring him, if it is in his power so to do, to produce the driver or conductor at the hearing of the case.

(2) Where proceedings are instituted under this Act, it shall be lawful for the court to issue a summons directed to the owner of the animal requiring him to produce either at, or at any time before, the hearing of the case, as may be stated in the summons, the animal for the inspection of the court, if such production is possible without cruelty.

(3) Where a summons is issued under either of the foregoing subsections of this section, and the owner or employer, as the case may be, fails to comply therewith without satisfactory excuse, he shall be liable upon summary conviction to a fine not exceeding five pounds for the first occasion, and not exceeding ten pounds for the second or any subsequent occasion, on which he so fails, and may be required to pay the costs of any adjournment rendered necessary by his failure.

14. (1) An appeal shall lie from any conviction or order (other than an order for the destruction of an animal) by a court of summary jurisdiction under this Act to quarter sessions.

(2) Where there is an appeal by the owner of an animal from any conviction or order by a court of summary jurisdiction under this Act, the court may direct that the recognisance required to be entered into under subsection (3) of section thirty-one, which relates to procedure on appeal to general or quarter sessions, of the Summary Jurisdiction Act, 1879, shall include an undertaking not to sell or part with the animal until the appeal is determined or abandoned, and to produce it on the hearing of the appeal if such production is possible without cruelty.

15.—In this Act, except the context otherwise requires, or it is otherwise expressly provided—

- (a) the expression "animal" means any domestic or captive animal ;
- (b) the expression "domestic animal" means any horse, ass, mule, bull, sheep, pig, goat, dog, cat, or fowl, or any other animal of whatsoever kind or species, and whether a quadruped or not which is tame or which has been or is being sufficiently tamed to serve some purpose for the use of man ;
- (c) the expression "captive animal" means any animal (not being a domestic animal) of whatsoever kind or species, and whether a quadruped or not, including any bird, fish, or reptile, which is in captivity, or confinement, or which is maimed, pinioned, or subjected to any appliance or contrivance for the purpose of hindering or preventing its escape from captivity or confinement ;
- (d) the expression "horse" includes any mare, gelding, pony, foal, colt, filly, or stallion ; and the expression "bull" includes any cow, bullock, heifer, calf, steer, or ox, and the expression "sheep" includes any lamb, ewe, or ram ; and the expression "pig" includes any boar, hog, or sow ; and the expression "goat" includes a kid ; and the expression "dog" includes any bitch, sapling, or puppy ; and the expression "cat" includes a kitten ; and the expression "fowl" includes any cock, hen, chicken, capon, turkey, goose, gander, duck, drake, guinea-fowl, peacock, peahen, swan, or pigeon ;
- (e) The expression "knacker" means a person whose trade or business it is to kill any cattle not killed for the purpose of the flesh being used as butcher's meat, and the expression "knacker's yard" means any building or place used for the purpose, or partly for the purpose, of such trade or business, and the expression "cattle" includes any horse, ass, mule, bull, sheep, goat, or pig ;
- (f) The expression "pound," used in relation to the impounding or confining of animals, includes any receptacle of a like nature.

16. This Act shall not apply to Scotland.

17. This Act in its application to Ireland shall be subject to the following modifications, namely :—

- (1) (a) Section twenty-three of the Summary Jurisdiction (Ireland) Act, 1851 (which gives a right to appeal) shall apply as respects any conviction or order under this Act (other than an order for the destruction of an animal), notwithstanding that the fine imposed does not exceed twenty shillings or that the term of imprisonment imposed does not exceed one month ;
- (b) A reference to section twenty-four of the Petty Session (Ireland) Act, 1851, shall be substituted for the reference to sub-section (3) of section thirty-one of the Summary Jurisdiction Act, 1879.
- (2) Nothing in Section eight of this Act shall prevent owners or occupiers of land in Ireland from laying or causing to be laid any poison or poisonous matter as therein described, after a notice has been posted in a conspicuous place, and notice in writing has been given to the nearest constabulary station.

18. Except so far as applying to Scotland, the enactments mentioned in the Second Schedule to this Act are repealed to the extent mentioned in the third column of that schedule.

19. (1) This Act shall come into operation on the first day of January nineteen hundred and twelve.

(2) This Act shall not apply where proceedings have been instituted before the commencement of this Act.

(3) This Act may be cited as the Protection of Animals Act, 1911.

SCHEDULES.—FIRST SCHEDULE.

1. The name of the knacker, together with the word "knacker," shall be painted or affixed in a conspicuous manner over the door or gate of the knacker's yard.
2. The hair shall be cut from the neck of any horse, ass, or mule directly the animal has been delivered to the knacker.
3. All animals shall be slaughtered, with as little suffering as possible, within two days from the time they have been delivered to the knacker. Any animal which is in pain shall be so slaughtered without delay.
4. All animals shall be properly fed and watered after they have been delivered to the knacker.
5. No animal shall be used or employed for any work after it has been delivered to the knacker.
6. The knacker shall enter in a book kept for the purpose such a full and correct description of the colour, marks, and gender of every animal delivered to him as may clearly distinguish and identify the same, and the name and address of the owner thereof, and the book shall be produced by him before any justice of the peace upon the requirement of such justice, and the knacker shall allow such book to be inspected and extracts to be made therefrom at all reasonable times by any police constable or by any other person authorised by a justice of the peace.
7. No person who is under the age of sixteen years shall be admitted to, or permitted to remain in, the knacker's yard during the process of slaughtering or of cutting up the carcase of any animal.
8. No animal shall be killed in the sight of any other animal awaiting slaughter.
9. The knacker shall not sell or part with alive, or cause or procure or permit any person to sell or part with alive, any animal which has been delivered to him.

SECOND SCHEDULE.—ENACTMENTS REPEALED.

- 26 Geo. 3. c. 71. The Knacker's Act, 1786.
Extent of repeal : Section four.
- 7 & 8 Vict. c. 87. The Knacker's Act, 1844.
Section three.
- 12, 13 Vict. c. 92. The Cruelty to Animals Act, 1849.
The whole Act, so far as not already repealed.
- 17, 18 Vict. c. 60. The Cruelty to Animals Act, 1854.
The whole Act.

The Doomed Horse Cab.

The picturesque Berlin cabman, with his white enamel hat, his out-of-date vehicle, his aged horse, his exorbitant charges, and his ungrateful manners, is to disappear. The Chief of Police rules that the obsolete conveyances can no longer be allowed in the thoroughfares of the city after April 1st next. Compensation (£30) is to be paid to each of the sixty licensed drivers who are affected, and application for permission to drive motor vehicles is to be favourably considered provided they are able to qualify.—*Evening News*.

COLLOIDAL SOLUTIONS AND ARTIFICIAL ENZYMES.

Among the many departments of scientific work in which the researches of recent years have led to notable progress, two which are of considerable interest and importance are the study of colloidal solutions and that of enzymes and enzyme action. These branches of investigation are not altogether independent of each other, and in particular they converge on questions of the chemistry of physiological processes. In this field it is claimed by some that the results already arrived at are of great importance to practical medicine, and it will not be out of place here to give a brief summary of this part of the subject.

The systematic study of colloids was first undertaken by Thomas Graham, and various papers on the subject were published by him in the years 1861 to 1864. In investigating the properties of substances in solution, Graham found that the bodies studied could be arranged in two classes, to which he gave the names *crystalloids* and *colloids*. The most characteristic and constant difference between them was that the former can diffuse, when in solution, through a membrane of parchment or similar material, while the latter cannot. The terms are still retained with the same general meaning as that given by Graham; but instead of considering crystalloids and colloids as different classes of bodies, investigation has shown that it is more correct to speak of the crystalloidal and colloidal states of matter, since a large and increasing number of substances have been obtained in both kinds of solution. Graham used the term *sol* to denote a colloidal solution, and this term is now in

general use in this sense, such solutions being called *hydrosols* when water is the medium, *alcosols* when the solvent is alcohol, and, generally, *organosols* when the solvent is an organic liquid. The coagulated form of a colloidal substance is called a *gel*, and a gel formed from a hydrosol and retaining water is a *hydrogel*. A sol may be converted into a gel in a variety of ways, two of the most usual being the addition of an electrolyte and the application of heat; in some cases a reversal of the conditions restores the sol form of the colloid, but in other cases the gel cannot be redissolved by any such means. In accordance with their behaviour in this respect, colloids may be classified into reversible and irreversible, and the distinction is of some practical importance.

Some of the most interesting of the sols which have been studied in recent years have been those of the metals: gold, platinum, silver, mercury, and many other metals have been obtained in the form of hydrosols, while others, such as the alkali metals, have been obtained as sols in certain organic solvents. An impure sol of silver was prepared as long ago as 1839 by Wohler, although its real nature was not understood by him; the method used in preparing it—heating silver citrate in a stream of hydrogen—gives substantially the same product as the “colloidal silver,” or “collargol,” which has found its way into medicine in recent years. Another metal which has found some therapeutic application in the form of a sol is mercury, and colloidal calomel is also employed. A more familiar example, now much less used than formerly, is the so-called “dialysed iron” (liquor ferri dialysatus), which consists of a hydrosol of ferric hydroxide. The addition to this of a very small quantity of sodium sulphate, or of some other salt hav-

ing no *chemical* action upon it, causes "gelatinization" of the liquor, or, in other words, converts the sol to a gel; and the other sols just alluded to show a similar behaviour on the addition of a trace of an electrolyte. On the other hand, many of the common colloids only show reversible changes; a fairly strong solution of gelatin, for example, sets to a "solid" or a gel on cooling, but resumes the sol form on again raising the temperature; a large excess of salt will throw out the gelatin, but on washing away the salt it can be redissolved. An important fact is that in some cases if the sol of an irreversible colloid is mixed with the sol of a reversible one the mixture is reversible.

Colloids differ from crystalloids, not only in being non-diffusible, but also in the fact that they have no osmotic pressure, or almost none; hence the boiling and freezing points of the solvent are not altered by the colloid as they would be by the presence of a dissolved crystalloid. It is not possible at present to make positive assertions as to the actual condition in which a substance exists when in colloid solution, but a good deal of knowledge with regard to the matter has been gained in recent years by the use of the ultramicroscope in the form given to it by Siedentopf and Zsigmondy. A pencil of convergent rays of light is passed into the solution under investigation, and the path of the beam is examined, against a black background, with a strong microscope. In the case of a perfectly homogeneous liquid nothing is seen; the light passes without diffraction or reflection, and none of it, therefore, is diverted into the microscope. But if the liquid contains solid particles in suspension (which may be far too small to be detected by ordinary microscopical examination in a bright field), some of the rays will be scattered by reflection at the surfaces of the particles; if they are sufficiently numerous and of sufficient size, the amount of light so scattered may be sufficient to be perceived by the unaided eye, and the path of the rays will then appear luminous; on examining it with the microscope the luminosity may be seen to be not continuous, but to proceed from numerous small particles, which reflect portions of the beam.

A good analogy is furnished by the familiar fact that if a pencil of rays of sunlight passes through a hole in a shutter into a darkened room in which the air is perfectly still and pure, the rays are invisible from a point at the side of their path, and are only perceived by the image formed on the opposite wall; but if the air has been recently disturbed the particles of dust floating in it scatter so much of the light that its path appears luminous from a little distance, while closer inspection shows the particles of dust as brilliantly illuminated objects, although they become invisible if light is freely admitted into the room.

If ordinary distilled water, even after filtration, is examined with the ultramicroscope, it is seen to contain numerous suspended particles, and it is only after standing undisturbed for weeks, in order that they may subside, that it is obtained tolerably free from them. If a colloid solution is examined with the ultramicroscope it usually shows numerous particles of varying sizes in active movement; in some solutions, however, only a general luminosity has been observed, discrete particles not being distinguishable. When particles are suspended in a liquid of greater or less density than themselves, motion is always observed, and has received the name Brownian movement. The movements to be observed in a colloidal solution with the ultramicroscope, however, have not the characters of the usual Brownian motion. Zsigmondy thus describes his first examination of a metallic hydrosol, in which he expected to see the ordinary Brownian movement of particles:—

"How entirely erroneous was this idea! The small gold particles no longer float, they move, and that with astonishing rapidity. A swarm of dancing gnats in a sunbeam will give one an idea of the motion of the gold particles in the hydrosol of gold. . . . This motion gives an indication of the continuous mixing up of the fluid, and it lasts hours, weeks, months, and, if the fluid is stable, even years. . . . The smallest particles which can be seen in the hydrosol of gold show a combined motion, consisting of a motion of translation by which the particle moves from 100 to 1000 times its own diameter in one-sixth to one-eighth of a second, and a motion of oscillation of a considerably shorter period, and on this account the possibility of the presence of a motion of oscillation of a higher frequency and smaller amplitude could not be determined, but is probable."

It is possible to arrive at approximate measurement of the particles thus rendered visible: in colloidal solutions their diameter is from 20μ down to about 1μ (1μ =one millionth of 1 mm.). They thus approach in smallness the limits which have been assigned from other considerations for the diameter of molecules. The motions which the ultramicroscope reveals are always going on, and were found to be undiminished after keeping for months. A statement of Graham's that "the colloidal is, in fact, a dynamical state of matter, the crystalloidal being the static condition; the colloid possesses *Energia*" is thus shown to be well founded.

Sols of metals may be prepared in several ways, one of the simplest being that introduced by Professor Bredig, of Heidelberg, in 1898, in which a current of electricity is passed between poles of the metal whose sol is required, below the surface of pure water. Some disruption of the metal of the cathode occurs, and the particles which fly off from it assume the colloidal state, the liquid becoming coloured after a short time and then consisting of a hydrosol of the metal. Sols of gold, silver, and platinum, containing about 0.004 or 0.005 per cent. of the metal, were so prepared, and the method has been modified and extended to other cases by Svedberg since 1905. The metallic sols so obtained are extremely sensitive to traces of electrolytes and to the influence of heat, the change to gels being irreversible. They possess some remarkable properties, before discussing which it will be necessary to refer to enzyme action.

The natural enzymes form a large group of bodies occurring in animal and vegetable organisms, characterised by having the power of inducing chemical changes in other bodies without themselves becoming changed; in other words, they are catalytic agents.

Various hypotheses have been put forward to account for catalytic action, but no one of them has been proved to be true to the exclusion of the others, and there is good reason to believe that the mode of action is different in different cases. One of the proposed explanations is that the catalyst acts by means of molecular vibrations; the molecules of the substance acted on are supposed to be already in a state of vibration, which becomes increased by sympathetic vibrations in the catalyst to such an extent that the vibrations pass the point of equilibrium, and the substance accordingly undergoes decomposition. According to another view, the substance acted on first forms a compound with the catalyst; then this compound breaks down more completely than merely into its two components, fresh products being formed, and the catalyst set free in its former condition. A third hypothesis is that the acceleration of a reaction caused by a catalyst is due to the altered solubility of the substance acted on, and to its having a different reaction velocity when dissolved in the medium *plus* the catalyst. Whatever the explanation of catalytic action may be, a remarkable fact about the organic catalysts known as enzymes is that the range

of their activity is extremely limited, so that a given enzyme which can cause the decomposition of some one substance is often quite powerless to effect the similar decomposition of some nearly allied substance; in other words, their action is specific in a high degree. For example, cane sugar is hydrolysed into glucose and fructose by the catalytic action of the enzyme invertase, which is unable to exercise a similar action on maltose (an isomer of cane sugar); for the corresponding hydrolysis of this the presence of another enzyme, maltase, is required. A few of the known enzymes can resolve a number of different bodies; thus emulsin induces the decomposition of any of the glucosides amygdalin, arbutin, helicin, salicin, phloridzin, daphnin, and others; but, as a rule, one enzyme can cause decomposition of one particular body and of no others, even stereo-isomerism being in many cases a sufficient difference, so that one of a pair of stereo-isomers is acted on by a given enzyme, while the other is not. Thus, whatever may be the mechanism of enzyme action, there must be some very close relation analogous to that between key and lock, between an enzyme and some grouping or structural arrangement in the molecule attacked.

Enzymes play an enormous part in the chemistry of the physiological processes of both plants and animals. That this is the case with the digestive processes has long been known, but further research has extended the observation to most of the chemical actions of living cells. This has necessarily meant a very large increase in the number of individual enzymes known; but it is probable that no enzyme has as yet been prepared in a state of purity, the fact that they are all colloids making purification extremely difficult, while it also makes the establishment of definite criteria of purity a much less easy matter than it is in the case of crystalloids. The fact that the natural enzymes are all colloidal substances leads naturally to the inquiry whether any other colloids, not produced by living matter as enzymes are, possess catalytic powers similar to those of the latter; and it is found that the simplest of all known colloids, the hydrosols of certain metals, possess in a high degree some properties resembling those of enzymes; and some enthusiastic workers on this subject have applied to them the names of "metallic ferments" or "artificial enzymes."

Although an enzyme has usually some specific and characteristic power of acting as a catalyst towards some one substance, many are capable of acting as catalysts towards certain other bodies also, the changes which result not being specific but being induced by many enzymes indifferently. The most general of such catalytic actions is that which causes hydrogen peroxide to break up into water and oxygen: the many enzymes capable of doing this are called peroxidases. This property is shared by the hydrosols of gold, silver, and other metals; but since the decomposition of hydrogen peroxide may also be induced by finely-divided metals in the solid state, such as platinum black, it must not be too hastily regarded as evidence of an enzyme-like nature in the sols. Another group of natural enzymes, called oxidases, are able to cause oxidation by means of the oxygen of the air, and some colloid mineral substances have been found to exhibit a similar action. Neilson has shown that colloidal platinum and platinum black are able to cause hydrolysis of starch and decomposition and resynthesis of fats. But no case appears to have been recorded in which an "artificial enzyme" has shown a specific power of catalytically inducing decomposition of only one substance, or even a small group; on the contrary, their catalytic power is always far more general than that of natural enzymes.

A striking similarity between enzymes and some inorganic colloids is seen in their sensitiveness to the inhibitive action of minute traces of certain substances;

the proportion of catalyst to substance acted on, and of the inhibiting substance (which has been called a paralyser) to the catalyst, are very small—for example, a solution containing 0.00001 gram of colloidal platinum per c.c.m. acting upon a solution of hydrogen peroxide containing 0.06 gram per c.c.m., converted more than half of it into water and oxygen in forty minutes; the addition of 0.000000014 gram of hydrogen cyanide per c.c.m. reduced the rate of change by one-half.

This resembles the effect which has been found to be produced upon living organisms by minute traces of certain metals in distilled water, traces far too minute for detection by any chemical analysis. Thus, mere immersion of a strip of clean copper in a vessel of distilled water containing a number of tadpoles, which would otherwise live in it for several weeks, is sufficient to kill them in a few hours. At the last *soirée* of the Royal Society (June 14th, 1911) Mr. Henry Crookes exhibited a number of cultures of *B. phosphorescens*, and photographs of cultures of *B. coli communis* and *B. prodigiosus*, showing the germicidal effect of certain metals. Nutrient fish-agar was poured into Petri dishes, each containing a small square of metal, and when the agar had set the surface was inoculated with the bacilli; after twenty-four hours they were found to have grown freely except in a zone round the metal. It is interesting to note, however, the differences between different metals in this germicidal effect. Gold, platinum, and a few others had no such action; copper, bismuth, zinc, etc., had a slight germicidal action; and silver and mercury were among those showing strong germicidal action.

Professor Albert Robin, of Paris, in a treatise entitled *Les ferments métalliques et leur emploi en thérapeutique*, has described the results obtained in a number of therapeutic trials of metallic hydrosols, prepared according to the method of Bredig described above. He refers to the theory that the catalytic powers of enzymes are not due directly to their constitution, but to their molecules being in a state of vibration and capable of communicating such vibration to other substances, and so to cause them to undergo chemical change; he expresses his own view that metallic sols, which he calls metallic ferments, act by virtue of the intense vibratory movement of their extremely minute particles. According to his experience the properties of the sols appear to be identical, whatever the metal dissolved; this is slightly qualified by the statement that he thought he had obtained more regular therapeutic results with palladium than with platinum and gold, but he found that the solutions of the two latter which he was using at the time underwent alterations more rapidly than the solution of palladium, and he ascribes the superiority of the latter solution to this fact. In regard to germicidal action, the experiments by Charrin, Monnier-Vinnard, and others which are quoted were all made with colloidal solution of silver, and showed a very high germicidal effect on pneumococcus, staphylococcus, and several other organisms; it would have been interesting to know how far similar properties were shown by gold and platinum, in view of Dr. Robin's statement that they did not appear to differ therapeutically, and the great differences in the germicidal actions of the metals themselves as shown by Mr. Crookes's experiments. In his therapeutic tests Dr. Robin employed hydrosols of silver, gold, platinum, palladium, and an organosol containing manganese combined with albumen and alkali. The hydrosols were prepared by Bredig's method; as already noted, they are immediately converted into gels by the addition of an electrolyte or by heat, and consequently they cannot be employed in isotonic solution, nor can they be sterilised by boiling; the author states, however, that these hydrosols should alone be used, and not those preparations in which the addition of a reversible colloid has produced a more stable mixture. His words on this

point are emphatic: "It is necessary to call the particular attention of practitioners to the fact that it is impossible to use in practice with advantage metallic solutions said to be stabilised by an organic colloid, sterilised by heat, and containing sodium chloride or other salts designed to render them isotonic. There are, in fact, a number of commercial preparations thus produced the use of which can only lead to failure or to incomplete results by which therapeutic agents of the highest value are discredited." He also insists that Bredig's silver hydrosol is quite a different thing from collargol, and gives a list of reactions in which they behave quite differently; it is interesting to note, however, that Zsigmondy examined Carey Lea's colloidal silver with the ultramicroscope in comparison with Bredig's, and found that at suitable dilutions, the number, size, and motions of the particles were much alike in both.

An account of the results recorded by Dr. Robin would be beyond the scope of the present general summary; it will suffice to say that he described in some detail the use of these colloids in various diseases, including pneumonia, acute rheumatism with complications, meningitis, typhoid fever, scarlatina diphtheria, and puerperal septicaemia, in which the results appear to have been very favourable, and Bright's disease, secondary syphilis, pulmonary tuberculosis, and cancer, in which no benefit was obtained.—*Brit. Med. Journ.*

THE CANADIAN REPORT, 1910-11.

The Report of the Veterinary Director-General and Live Stock Commissioner to the Department of Agriculture, Canada, for the year ending March 31, 1911, is a volume containing 388 pages of closely written literary matter, exclusive of the index and some appended maps and figures; and the whole is of exceptional interest.

The first 94 pages are taken up by the main report of the then Veterinary Director-General and Live Stock Commissioner, Dr. J. G. Rutherford, C.M.G. This surveys the whole of the year's work in connection with both the health of animals and the live stock industry. Not a little of it is statistical; and the whole, while deeply interesting, covers far too great a variety of subjects to be even summarised adequately here. Leaving almost the whole of it, therefore—from the suggestive opening remarks upon the decrease in Canadian exports of live stock and meat onwards—we merely note, at the absolute conclusion, that the comparatively recent amalgamation of two Governmental branches seems to be working well.

Dr. Rutherford's concluding sentences are:—"The wisdom of the arrangement by which in 1906 the activities of the Health of Animals and Live Stock Branches were combined under one head becomes yearly more apparent. These branches which formerly crossed and overlapped each other to a regrettable degree, now work harmoniously together, and by this co-operation achieve infinitely better results, while at the same time effecting a very appreciable saving in salaries and other expenses." Certainly there seems very much to be said in favour of working the two branches in combination in all countries.

The lengthy remainder of the volume is taken up by a number of appendices. Amongst them are reports of different officials concerning their special provinces, Acts of Parliament and quarantine regulations (the question of quarantine, as might be expected in a country like Canada, looms large throughout the report), the records of performances of pure-bred dairy cattle, and—last but not least—a number of scientific reports of the work done in special laboratories or in the investigation of certain diseases. Perhaps the most interesting of the

latter is the account given by Dr. S. Hadwen, v.s., First Assistant Pathologist, of his researches upon the peculiar disease known as "redwater" in the cattle of British Columbia. This is not a hæmoglobinuria, but a hæmaturia or hæmorrhagic cystitis. Its exact mortality is somewhat doubtful, but is certainly high; and its causation is quite obscure at present. Formerly it was regarded as contagious: but Dr. Hadwen's observations tend to negative this view, and to cast suspicion upon dietetic and climatic influences. The main symptoms are hæmaturia, emaciation, occasionally icterus, and often, in the later stages, dropsy. The post-mortem lesions are insignificant, and are confined to the bladder and liver, with only occasional changes in the kidneys. Treatment, so far, has not been very satisfactory: but calcium lactate seems to give the best results.

Equine Swamp fever, which is attracting increased attention in North America and Canada, also formed the subjects of special reports by various officers; while, of course, statistics of all important diseases are included in the volume. Speaking generally the progress made with all these has been exceedingly good, and perhaps especially so with regard to anthrax, black quarter, and sheep scab. Rabies, which was re-introduced from the State of New York in 1907, and since assumed a serious aspect in Canada, has now been brought under control.

The last appendix (Appendix xxiii), with five additional sub-appendices arising from it, is a reprint of the first report of the International Commission on the Control of Bovine Tuberculosis and those of its committees. In 1909, the American Veterinary Medical Association appointed this Commission, the members of which (at first twelve in number, but afterwards rising to fourteen) were representative of both Canada and various of the United States, to "study the methods of the Control of Bovine Tuberculosis" and report thereon to the Association. A word of explanation of how this has been done is here necessary. No experiments have been performed, and no expert evidence has been taken. To quote from the report—"The members fully understand that the purpose which their appointment was intended to serve was less the acquisition of new knowledge regarding bovine tuberculosis than the careful study of the knowledge already available, and of the thoughts and opinions of those most entitled to speak with authority on the subject. The conclusions reached in this report are, therefore, simply the outcome of an earnest and thoughtful consideration of the various modern aspects and phases of the problem, with the object of crystallising public opinion and so clearing the way for legislative action." The Commission, therefore, is a deliberative rather than an investigatory body; and as its *personnel* included many men—such as Rutherford, the late Leonard Pearson, Torrance, and others—having very special knowledge of the subject, the result of its labours could hardly have failed to be valuable. The report deals with every aspect of the subject on broad lines, and therefore consists partly of an explanatory summary of the existing knowledge of tuberculosis and its eradication, and partly recommendations based upon that knowledge.

The summary, naturally, contains nothing that is not familiar to every veterinarian; the suggestions for action may be briefly described as consisting, in the main, in the slaughter of clinically affected animals and the building up of new tubercle free herds on lines similar to those of Bang. Along with these measures, general advice regarding prophylaxis is given; and the subject throughout is dealt with very broadly, it being admitted that different local conditions may necessitate some modifications in the details of the operations. While recognising the necessity for compulsory legislation upon the disease, the Commission lay great stress upon the need for popular education regarding the subject

as an indispensable adjunct. Certainly the report itself, which is written throughout with admirable simplicity and clearness, may be expected to exercise a very potent educative influence indeed.

Taking this large volume as a whole, we have only one regret upon laying it down. And that is, that the work of which it treats is now going on without the aid of Dr. Rutherford, who has done so much for the agriculture and veterinary science of Canada in the past.

Potassium Permanganate in Fistulæ.

There is little doubt that oxidation and allied conditions often act upon aerobic as well as upon anaerobic bacterial lesions, and the fact that many a chronic case of empyema is hastened in its healing by oxygen put into the wound by means of a sterilised glass cannula attached to an oxygen cylinder is familiar enough. There are certain other conditions in which the application of oxygen is less easy, and the use of certain oxidising agents may be resorted to. The effectiveness of potassium permanganate crystals inserted into a snake-bite immediately after its occurrence is known to many people who have lived in the Tropics: Dr. Scobie advocates its use in a somewhat similar way for the cure of tuberculous fistulæ.

Amongst other cases he had a male patient, twenty-eight years of age, who suffered from tuberculosis of the left lung and from two tuberculous areas in the region of the anus. These were situated to the left of the anal aperture, each being half-an-inch in length and apparently healed, but examination in a good light showed that they were still discharging a little pus: to the right of the anus there was a bluish unhealthy-looking swelling about the size of a bantam's egg, the residue of an ischio-rectal abscess which had been incised but which had filled up again. When opened it discharged a tablespoonful of thick pus. Careful probing of all three lesions did not reveal anything in connection with the bowel. The patient was in a very emaciated condition, and would allow of no further operative treatment. Crystals of potassium permanganate were introduced into the healthier of the two fistulæ after it had been carefully washed out. The patient experienced a sharp pain lasting about a minute, but there was no other discomfort; the treatment was continued for three weeks, the crystals being allowed to dissolve slowly in the feeble discharge. The result was a perfect healing of the fistula. Dr. Scobie, thus encouraged, packed the other in the same way twice a week, and in two months' time it also healed up finally. The ischio-rectal abscess was now washed out with hot, freshly made permanganate solution, the interior being thereafter filled with crystals of permanganate of potash. The cavity being larger than the others had been, the patient experienced more pain, and this lasted about an hour after the crystals were inserted but the effect on the discharge was considerable and marked. The general health of the patient continued good, and the cavity steadily shrunk up until presently there was no pus visible except at intervals of a week or ten days, and in due course the wound healed as the others had done.

Potassium Permanganate in Treatment of Cholera.

Mr. H. D. Pant, L.M.S., Lucknow, says that he called attention to the use of potassium permanganate, which he has employed for seventeen years, in a discussion which followed the reading of a paper on the treatment of Asiatic cholera by Major Leonard Rogers, at the Bombay Medical Congress in 1909. He adds the following quotation from the transactions on the Congress:—"Hypodermic injections of camphor, rectal injection of

saline solution, and teaspoonful doses every quarter or half an hour of a solution of permanganate of potash, gr. $\frac{1}{2}$ to oz., are my sheet anchors during collapse. What effect the permanganate has, and how I came to adopt it, I am unable to explain. Suffice it to say that the use of this drug has satisfied me and my patients by giving force to the wavering and flickering pulse."

R.S.P.C.A. Prosecutions at Reigate—Dismissed.

Harry Fright, of St. John's Road, Redhill, horse-keeper, was summoned for cruelty to a horse by causing it to be worked in an unfit state at Redhill on the 15th January.—Mr. G. L. Patten, solicitor, defended, and pleaded not guilty.

Inspector Tetley said on the 15th January he was in the Brighton Road and he saw a horse attached to a four-wheeled van. The horse was very lame on the off fore limb, and was in pain. The same day he saw the defendant, who said the horse had gone rather bad while they had had it. Witness referred to a previous occasion when he sent the horse home, and the defendant said he thought the shoe was then pinching it. Witness saw the horse on two later occasions, and it was still lame.

Richard A. Thrall, M.R.C.V.S., said on the 17th January he examined the animal, and found it very lame on the off fore limb, and it was totally incapable of doing any kind of work.

For the defence, James Washer, the driver of the horse in question, said on the first occasion when the horse was stopped Inspector Tetley told him that he thought it was all right for light work walking. The horse had always been walked since. On the 15th January the horse was only going a bit stiff.

Defendant, on oath, said there was no heat in the leg, and the animal did not flinch when he touched the tendons. He thought probably the shoe was a bit tight. When he saw the horse on the 15th he could find no lameness.

Charles A. Squair, M.R.C.V.S., said he saw the horse on the 19th January. It was in very good condition and he noticed it went rather stiff on the off fore limb—an altered gait, which would look like lameness to an ordinary individual, but there was no pain whatever. It was mechanical lameness. There was no cruelty in working the horse.

Herbert Sargent, the employer of the defendant, said the horse had the sprain when he bought it about nine months ago.

Alfred Glover, M.R.C.V.S., said on 22nd January he saw the horse, and he agreed with the evidence of Mr. Squair.

The Chairman said the Bench had decided to dismiss the case. The Society's costs were remitted.

Defendant was then summoned for a similar offence alleged to be committed on the 16th January.—Mr. G. L. Patten, solicitor, defended, and pleaded not guilty.

Inspector Tetley said a bay gelding which he examined was uneasy. There was a sore about the size of a shilling, and the action of the collar on it must have caused it pain. When he saw the defendant he said he saw the defendant he said he was sorry it was rubbed like it was, and if he had noticed it he would not have sent the horse out. It was caused by a too large collar rubbing on it and he had treated it by putting ointment on it.

P.C. Mann also gave evidence, and said one had difficulty in seeing the sore, as the horse was restless.

Richard A. Thrall, M.R.C.V.S., said on the 17 January the swelling on the withers was larger than a chicken's egg. He did not look at the sore. The enlargement was denuded of hair.

Inspector Tetley said the sore adjoined the swelling. For the defence, Joseph Collins, the driver of the horse, said that the sore was no bigger than a threepenny bit. The swelling was not there when he went out, and when he came back it was present; it was more prominent.

Defendant, on oath, said the collar, when it was put on the horse, did not touch the "place."

Charles A. Squair, M.R.C.V.S., said he examined the horse on the 22nd January, and it had a prominent wither. He came across a wound less than the size of a pea—a mere speck. A considerable quantity of hair was rubbed off the wither, and it was his opinion there was no swelling. With his experience he thought it was the most trivial case that had ever been brought before the Bench.

Alfred Glover, M.R.C.V.S., corroborated.

The Chairman said the Bench had decided to dismiss the case against the defendant. The costs would be remitted to the Society.

A summons against Joseph Collins, of Earlswood Road, Earlswood, for working the horse, was withdrawn.

Mr. C. Stephenson's Gift to Armstrong College.

A meeting of the Council of Armstrong College was held at Durham on Monday afternoon, February 12th, Sir Hugh Bell presiding.

Dr. Hadow, the Principal, announced that he had received from Mr. Clement Stephenson, veterinary inspector for Northumberland, an offer to give £5,000 for the proposed buildings for a new agricultural department at the College to undertake advisory work among farmers in the North of England. The scheme has been planned at the invitation of the Board of Agriculture under the scheme proposed by the Development Commissioners.

The Council accepted Mr. Stephenson's offer with cordial thanks. It is hoped that the new buildings will house the present agricultural department of the College, the head of which is Professor D. A. Gilchrist. The site has not yet been definitely fixed, but it will probably be within the College grounds.—*The Times*.

Use of Armorial Bearings—L.C.C. v. Kirk.

At the Bow Street Police Court, on Friday, 9th inst., Mr. Curtis Bennett was called upon to deal with a case, remitted from the High Court, against Mr. William Kirk, a veterinary surgeon, for using armorial bearings without a licence.

The armorial bearings consisted of the arms of the Royal College of Veterinary Surgeons which Mr. Kirk, in common with many other members of the College, had had printed on his business notepaper. As reported in *The Times* of June 10, the summons was dismissed by the magistrate, but on appeal by the London County Council, it was decided that there ought to have been a conviction, and the case was sent back for the magistrate to fix the penalty.

Mr. Philip Conway, who defended, reminded the magistrate that Mr. Kirk used the arms in consequence of permission which the Inland Revenue Authorities gave to the members some 20 years ago.

A penalty of 3s. and 2s. costs was imposed.

Arthur Chapman, a Waltham Abbey magistrate, was fined £1 4s. 6d., including costs, by the Bench, of which he is a member, for failing to notify the police of a case of parasitic mange on his premises, the Abbey Farm, Waltham Abbey. Colonel E. W. Postans, of The Grange, Sewardstone, Essex, was similarly fined for a like offence.

Donations to R.C.V.S.

The Secretary of the Royal College of Veterinary Surgeons begs to acknowledge the receipt of the following donation to the College funds from:

Mr. H. G. Bowes, Leeds	£1	1	0
Amount previously acknowledged	6	6	0
	£7	7	0

Personal.

FAITHFULL-DAVIS.—On the 9th inst., at 9 Queen Street, Hadleigh, Suffolk, to Mr. and Mrs. T. Faithfull-Davis, a son.

Mr. WALTER JAMES BEART, M.R.C.V.S., aged 74 years, of King's Lynn, Norfolk, veterinary surgeon to the late King Edward VII. from 1863–1910, left estate of the gross value of £15,184 12s., of which the net personally has been sworn at £13,331 12s. 11d.

ACCIDENT.

On Tuesday evening last Mr. E. H. Leach, of Newmarket, had attended the meeting at Norwich of the Eastern Counties' Veterinary Medical Society, of which he was elected President, and about seven o'clock was just entering Wymondham on his journey home. When nearing the bend in the road at the entrance to the town, the chauffeur, in coming round the corner, mistook the turn, and the car ran on to the path on the off side. Finding he was running into the hedge, the driver turned, and in getting off the path collided with a telegraph pole with considerable violence. Mr. Leach, who was inside the car, a Daimler landaulette, was thrown forward, his head going through the front window of the car. As it was evident that his injuries were severe, Mr. Barnard, who was on the road close by, sent into the town for a doctor, who considered it advisable to remove Mr. Leach home with all speed. Mr. Goffin, of the King's Head, accordingly motored the injured man to Newmarket in company with Dr. Maurice Hughes. Mr. Leach's car was considerably damaged, the front wheel being stripped, and the axle spring smashed.—*Eastern Daily Press*.

Indian Silahdar Cavalry.

Few of the British public, and it might be added few even of the officers of the Army outside India, know anything of the organisation of that fine body of fighting men who form that portion of the native army of India which enjoys the somewhat puzzling title of Silahdar cavalry. Of the thirty-eight regiments of Indian cavalry only three are "regular" regiments, the remaining thirty-five being Silahdar or irregular cavalry. It may be explained that the term Silahdar means in Persian an armed man, and is the name given to the Khudaspas, the horsemen who owned their own horses and weapons, and were the mounted soldiers of feudalism, the Indian Silahdar cavalry preserving in itself the last relic of feudal organisation. It will easily, therefore, be understood that the Indian cavalry soldier very naturally occupies a position of honour and social distinction, not only because of his services under the British Raj, but because he comes from the backbone of the Indian peoples, the landowner and farmer class, the sons of the soil.

The irregular cavalry is of peculiar importance in India. It is the favourite arm of the native, and attaches

him to our service by the strong ties of interest and affection, and it prevents him being engaged against us. He comes of the warrior class, one entitled to bear arms, a yeoman—that is, one who possesses property of sufficient value to enable him to ride to battle on his own horse, with his own equipment, transport and arms. In practice, however, the Silahdar no longer brings his own weapons and mounts, because it is necessary for the Service to have the most modern weapons and the best horses, but he brings the cash equivalent of a horse and baggage pony, which amount is duly paid into the funds of the regiment. This is known as *asami*, and represents the value of the property the trooper is bound to maintain in order to be an efficient soldier. He is then allotted a horse and half a share in a baggage pony or mule, and is debited with the value of the saddlery, uniform, and necessary kit, which he is usually glad to take over from the man to whose vacancy on the latter becoming non-effective he succeeds. The share in the economy and organization of the regiment which he thus acquires the trooper will have to maintain by monthly deductions from his pay and horse allowance, the subscriptions serving as a guarantee against the death of the horse and of deficiencies in, and the inevitable deterioration of, kit. All that Government does for him is to supply bandolier, rifle, ammunition, and the cost of the food of the horse and the half share of a transport animal. The heavy business of maintaining, equipping, and mounting regiments or four squadrons of 625 sabres or lances, as the case may be, devolves upon the man and upon his British and native officers. The cost of the renewal of the horse, baggage, pony, uniform, etc., is met by the man's subscriptions, which not only suffice for the purpose, but leave a surplus which forms the insurance effected by the regiment against the depreciation of its live and dead stock, and by which means some regiments amass considerable funds. When a man goes to pension or in any other way becomes non-effective he receives from the incoming recruit the value of his paid-up share in the regiment which he as a recruit purchased on the commencement of his service and now sells, with his kit and accoutrements, to his successor.

I have had the advantage of reading the opinions on this subject of Col. Norman, of the 22nd Cavalry (Frontier Force), and of Capt. Wallis, of the 20th Deccan Horse, both of whom endorse the high opinion which is so generally held of the traditions, the proud achievements, and the merits generally of the Silahdar cavalry, and of their feudal devotion to their officers. There is something financially very sound in an organisation such as this. In comparison with its cost to the Government, the Silahdar cavalry is probably the most efficient arm in the world. It certainly compares more than favourably with the three Indian regular cavalry regiments, the entire cost of which is borne by the Government. A Silahdar regiment costs annually 422,521 rupees, or some 23,300 rupees less than a regular regiment; and it has the further advantage of possessing twenty-three men, 109 horses, and 320 transport mules more than the non-Silahdar. A Silahdar regiment is self-supporting, maintaining its remounts, stabling barracks, troop servants such as grooms, washermen, cooks, tailors, saddlers, and a great part part of its conservancy and sanitation.

The system is, of course, not free from defects, such as the want of uniformity in equipment, the doubt of its ability to maintain the supply of horses in time of war, and the difficulty which many regiments experience in making both ends meet; but generally speaking, self-contained, self-supporting, loyal, and efficient, as they undoubtedly are, the Indian Silahdar cavalry regiments are fit and prepared to go anywhere and do anything. —*The Field*.

ARMY VETERINARY SERVICE.

Extract from *London Gazette*.

WAR OFFICE, WHITEHALL, Feb. 9.

TERRITORIAL FORCE. ARMY VETERINARY CORPS.

Lieut. H. Edie resigns his commission. Dated Feb. 10.

Feb. 13.

REGULAR FORCES. ARMY VETERINARY CORPS.

The following Lieuts. to be Capts. :—

H. A. Stewart, G. B. C. Rees-Mogg, H. C. Stewart, T. Lishman, R. Tindle, S. Black. Dated Feb. 13.

At an examination held at Aldershot on January 31, and following days, the undermentioned candidates were successful and have been recommended for Commissions as Lieutenants on probation :

G. V. Golding, H. E. Lewis, D'Arcy S. Beck, H. Stephenson, T. L. Shea.

The following transfers have taken place : Capt. L. M. Verney, from Bulford to Newcastle-on-Tyne. Capt. T. E. Burrage from Bulford to Woolwich for duty with No. 2 Remount Depot.

ARMY VETERINARY SERVICE.

ENTRANCE EXAMINATION : JANUARY, 1912.

VETERINARY MEDICINE.

Time allowed, Two Hours.

Maximum marks, 1,000 (250 each question).

Discuss the bacteriology of strangles, and give the general line of treatment you would adopt in an outbreak of this disease.

What are the different methods employed in the preventive inoculation for rinderpest in cattle?

Define piropilosis, and state where the causal agent is found, and how the disease is conveyed from one animal to another.

What are the generally recognised causes of purpura haemorrhagica?—and outline the symptoms and treatment.

VETERINARY SURGERY.

Time allowed, Two Hours. Maximum marks, 1,000.

Discuss the causes, symptoms and differential diagnosis of navicular disease.

What are the causes, symptoms, and treatment of traumatic arthritis in horses? Name the joints most frequently involved.

Describe fully, either of the following operations :—

(a) Median neurectomy. (b) Tracheotomy.

Discuss paralysis of the facial nerve in horses, and arrange under the following headings the principal causes and symptoms :—(a) When the paralysis is confined to one side. (b) When double-sided.

VETERINARY HYGIENE.

Time allowed, Two Hours. Maximum marks, 1,000.

What are the principles of disinfection? Describe the routine of disinfection and general prophylaxis you would adopt in a stable occupied by eight (8) horses, from which a case of sarcoptic mange has been diagnosed.

Enumerate the most common vegetable parasites affecting fodder or grain in the United Kingdom, and the general effect of these organisms on the food itself.

What are the common faults experienced in the preparation of horses feet for shoeing?

Discuss generally the following principles in the dietetics of horses:—(a) Watering prior to feeding. (b) Feeding in small quantities and often. (c) The abstention from hard or fast work following a full feed.

OBITUARY.

WILLIAM MOLE, M.R.C.V.S., 443 Bathurst St., Toronto, Canada. Graduated, Lond: July, 1876.

Death occurred in hospital on August 6, 1911. A correspondent adds:

"A few hours before he was taken to the hospital he was sure he had rabies, having been bitten about two months before. His own doctor was on his holidays, but the doctor engaged said he had one symptom of rabies. When he was in the hospital two hours, three doctors thought he had rabies, but not one had seen a case. I may say about thirty cases in Toronto and surroundings have been treated for rabies. By his death the public have been roused: and he was so widely known the public would believe his statement."

The following is from a Toronto paper:

"One of the best known veterinary experts in Ontario was removed by death in the person of Dr. William Mole, 443 Bathurst Street. He was taken to the General Hospital on Friday, suffering from severe nervous breakdown, due to overwork and died on Sunday morning."

Dr. Mole, who was 60 years of age, came to Canada to better his health in 1890, and, after two years in Hamilton, became a resident of Toronto. He was foremost in founding the Toronto Veterinary Medical Association and was identified with the Canadian Institute. He wrote extensively for numerous publications on veterinary matters. He was a Conservative, though not active in politics, a Mason, and member of St. Stephen's Anglican Church.

Dr. Mole is survived by a widow, three sons, and three daughters. The sons are William, Hugh, and Lewis, of Toronto, and the daughters, Elsie, of Calgary, and Dorothy and Nellie at home."

W. OVERED, Aylsham, Norfolk, died on Feb. 11th, at Wortwell, Norfolk. Aged 83 years.

The Late Mr. T. W. Butler.

Mr. Thomas William Butler, of Hampton, near Evesham, for many years was one of the best known veterinary surgeons in the district. He had been in failing health for the past three or four months, and for the last month had been more or less seriously ill. He attended Evesham stock sale as usual on the Monday, but had to be taken home in a conveyance, and he rapidly became worse, and passed away at 9.45 p.m. on Saturday. He was 71 years of age two or three weeks ago.

Mr. Butler was the son of a Yorkshire farmer, who somehow or other got into touch with a nobleman of Saxony, who owned large estates near Dresden. Mr. Butler's father was a very successful stock breeder, and the nobleman in question induced him to go out to Saxony to superintend his estates. Mr. T. W. Butler, who at this time was a lad, accompanied his father, who had him educated at a large college in Dresden, where there were something like sixty masters, and where the discipline and methods were very rigid. Mr. Butler always spoke strongly in favour of the system of education under which he pursued his studies, and compared it with the system of the English colleges very much to the disadvantage of the latter. Mr. Butler was in fact a highly educated man. He could speak German and French, was a good Latin, Greek, and Hebrew scholar,

and had a fair knowledge of several other languages. His scientific attainments were considerable, and he was a very clever musician, performing on the piano and violin. When he had finished his college course he entered the Army for his term of service, and it is understood that he saw active service (though upon the point we have been unable to get authentic information) in the Austro-Prussian war.

Shortly after this he fought a duel. He was dancing at a military ball with the sister of one of the officers, when someone in the company began to make disparaging remarks on the fact that he was an Englishman. Mr. Butler promptly slapped the man in the face. There could be only one termination to such an episode. Seconds quickly settled all the necessary details, and it was a case of pistols for two and coffee for one. Mr. Butler killed his opponent on the spot, with a bullet straight through the heart. He himself was wounded, but he was hurried across the frontier and got home to England without mishap. He then qualified at London as a veterinary surgeon, and commenced practice at Bengeworth, shortly before the Franco-Prussian war broke out. During the war he was commissioned by Prussian officers to buy remounts; he purchased a very large number of horses in this district, and sent them across to his father, who was still on the estate near Dresden, and who sometimes had as many as a couple of thousand remounts at a time. For some years past he has acted as local inspector for the County Council under the Diseases of Animals Acts, and was to be seen on duty at Evesham Market every fortnight. Years ago—from 1876 to 1879 he was a member of the Evesham Town Council. He was the first district councillor for Hampton, holding office from December, 1894, till April, 1898, when he was defeated on the vaccination question by the late Mr. S. Summers. He was also one of the original members of the Hampton Parish Council.

In 1888 he bought the Hampton Manor Estate from Mr. J. G. Ledsam and went to live at the Manor House, where he has resided ever since. With the Manor went the manorial rights, so Mr. Butler was lord of the manor of Hampton. He was twice married: by his first wife (a Miss Sprague, of Evesham) he had a family of three sons and four daughters. His second wife died about 1898.

CORRESPONDENCE.

USE OF THE COLLEGE ARMS.

Sir,

After reading a report of the above in *The Veterinary Record*, I must confess that I am disappointed not only with the verdict but perhaps more so with the case.

In the first place I don't think it will affect a very large number of the members of the veterinary profession who use "the arms of the Royal College" the whole of it and nothing else but it, and further are not ashamed of putting around it "Member of the Royal College of Veterinary Surgeons."

The Lord Chief Justice said, "But look at that notepaper and assume I received it. He has not put M.R.C.V.S. upon it. What is there to tell a man that is not his own crest."

Again His Lordship asks, "What there was to show, looking at the notepaper, that the gentleman was a member of the College."

A third time he says, "But here this gentleman has put within his own name a crest, and nothing in the world to show it is not his own crest, and nothing to show it is the crest of the Royal College."

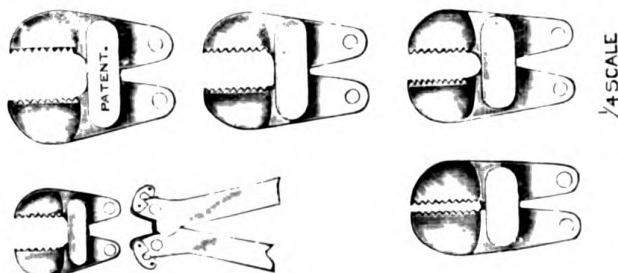

In my humble opinion this all points to the fact that if we do use the Arms of the Royal College we must have something plainly printed on to show that we are members of that College, and that it is our College crest, and we shall be all right.—Yours faithfully,

W. J.

THE Annual College Dinner will be held in the Royal British Hotel, on Wednesday, February 28th, at 7 p.m. It is hoped all old students will endeavour to attend. Tickets, may be had on application to the President of the S.R.C.

Wanted

RECENTLY qualified man as assistant. Must have a good knowledge of dog practice and be a fair horseman. Live out. Reply, stating salary required, to 1402 V.R., 20 Fulham Rd., London, S.W.

As Assistant

CLASS D student, farmer's son, up in July, desires position as assistant in country practice, from March 16th to May 1st. Good horseman. Address, G. W. H. Ryl. Vety. Coll., Camden Town, N.W.

Wanted at Once

QUALIFIED assistant for mixed country practice in the Midlands. Apply, stating age, height, weight, and salary to live in. References. Address, 3402 V.R. 20 Fulham Road, London, S.W.

As Assistant

CLASS D student (22) farmer's son, desires position as above from March 16th to May 1st, country practice preferred: ride, drive, cycle. Address, H. S., Royal Vety. Coll., London, N.W.

For Disposal

GENUINE old established country practice, average returns exceed £700. Convenient house with good yard, outbuildings, paddock, garden, and six acres of land at a rental of £53. Thorough introduction and assistance given until established. Premium £500. Address, 4402 V.R., 20 Fulham Road, London, S.W.

Wanted

PRACTICAL man to manage country practice (married), good operator and cyclist. House found. Address, 9402 V.R., 20 Fulham Road, London, S.W.

Assistant Wanted

QUALIFIED assistant for mixed practice, must be practical and steady and well up in castration and parturition. Sign bond. Permanency. Reply, stating age, height, and terms, with references, to 8402 V.R., 20 Fulham Road, London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,

LOCUM:

73 Victoria Mansions,
South Lambeth Road, S.W.

T. FENN-ADDISON, M.R.C.V.S.,

LOCUM TENENS, (or Assistant)

Horton Road, Gloucester

Moderate terms. Excellent references from well-known practitioners.

HUGH R. SINGLETON, M.R.C.V.S.

LOCUM TENENS.

44, St. Michael's Road.
Bedford.

Notice

M.R.C.V.S. would like to communicate with H. Williams, M.R.C.V.S., late of Lancaster. Address, 5402 V.R., 20 Fulham Road, London, S.W.

As Assistant or Improver

FINAL year student wants situation as assistant or improver for the six weeks commencing March 15th. Has seen town and country practice. Address, (E. R.) Royal Vety. Coll., Camden Town, N.W.

Wanted Immediately

QUALIFIED assistant to manage branch practice, (town and country) practical, and abstainer. Sign bond. Reply, stating age, height, and terms required, with references, to 6402 V.R., 20 Fulham Road, S.W.

Assistant

WANTED for a mixed country practice, a steady reliable assistant, must be a good dispenser. Apply, giving fullest particulars as to age, etc., to 7402 V.R., 20 Fulham Road, S.W.

For Sale through Ill-Health.

COUNTRY Practice. Beautiful part. Favourite country. Hunting, shooting, golf, fishing, polo close. Garden, greenhouse, large orchards, paddock, etc. Returns last eight years £390—£420. Price £250 for quick sale. Address, 8302 V.R., 20 Fulham Road, S.W.

As Assistant

RECENTLY qualified M.R.C.V.S. seeks situation as Assistant. Experience in country and town practice. References. 1302 V.R., 20 Fulham Road, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

For Disposal

ESTABLISHED mixed practice in the North of England, will bear strict investigation. Introduction and assistance would be given. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell. Address, "Practice," c/o Willows & Co. 40 Aldersgate Street, London.

To Purchasers

PRACTICES & PARTNERSHIPS for Sale. Messrs. Peacock and Hadley, Veterinary Transfer Agents, 19 Craven Street, Strand, W.C., will be pleased to forward to intending purchasers, who register their requirements, full particulars of anything suitable on their books. No charge to purchasers or for inquiries.

New Parturition Instrument.

ILLUSTRATED description of same in actual use and testimonials sent on application. Removal of limb and dissection made easy. Orders for this season must be sent early. Address, W. J. Fletcher, M.R.C.V.S., Wrexham.

As Manager or Assistant

QUALIFIED veterinary surgeon, married, requires situation as manager or assistant in good town or country practice, good all-round operator. Steady and obliging. Disengaged 2nd week in March, excellent testimonials. Address, 3302 V.R., 20 Fulham Rd., S.W.

As Manager or Assistant

QUALIFIED man desires post as assistant or branch manager in good mixed or town practice. Castrate standing. Good references. Address, 2302 V.R., 20 Fulham Road, London, S.W.

For Sale

GENUINE Country Practice in Dairy and Agricultural district, excellent stables and house, rent, £24. Returns, £150. Price to immediate purchaser, £20. Address, 5302 V.R. 20 Fulham Rd., London, S.W.

Partner Wanted.

WANTED a practical qualified partner in an old established horse and dog practice on the South Coast. Easy terms might be arranged. Address 9302 V.R. 20 Fulham Road, S.W.

Wanted

QUALIFIED assistant of experience, capable of taking charge. Must be well up in country practice and able to castrate. Must be of business habits. Salary to commence £150, live out. Sign bond, permanency to good man: references required. Address, 3021 V.R. 20 Fulham Road, London, S.W.

As Assistant

UNQUALIFIED, requires post. Many years experience town and country. Good references as to capabilities and character as locum and assistant. Address, 4302 V.R., 20 Fulham Road, S.W.

Assistant Unqualified

SON of V.S., aged 26, requires assistantship in a busy mixed country or town practice. Good at parturition and general practice. Previous situation 18 months. Permanency if possible, terms moderate. Good dispenser and book-keeper; ride, drive, and cycle, and not afraid of work. Excellent references. Address, 1029 V.R., 20 Fulham Road, London, S.W.

The Journal of The Board of Agriculture

ISSUED on the 15th of each month. Twelve months 4/-, three months 1/-, or single copies 4d., direct from the Board of Agriculture and Fisheries, 4 Whitehall Place, London, S.W., or through any bookseller.

Wanted

POSITION with veterinary surgeon by man of superior ability, good worker, etc. References. Address, 2022 V.R., 20 Fulham Road, London, S.W.

As Assistant

M.R.C.V.S. requires berth in busy canine practice. Good references: steady: moderate salary in return for good experience. Address, 6202 V.R. 20 Fulham Road, London, S.W.

As Assistant or Locum

VETERINARY surgeon desires post in genuine country practice. Thoroughly experienced and reliable, not afraid of any work, 34, good horseman. Permanency; interview if possible: excellent references. Address, 1401 V.R., 20 Fulham Road, London, S.W.

For Immediate Disposal

GENUINE old established town and country practice in Yorkshire, increasing yearly. Suitable house at low rent, stable and kennels attached. Returns for the last 4 years over £300 per annum. Good introduction given. Address, 2023 V.R., 20 Fulham Road, S.W.

Partner Wanted

Wanted a thoroughly reliable, practical, qualified (married man preferred) as partner in an extensive country practice. Full particulars in strict confidence. Only bona fide applicants with capital at command will be entertained. Address, 4201 V.R., 20 Fulham Road, London, S.W.

As Locum

EXPERIENCED M.R.C.V.S., will act as locum, town or country practice. Free end of March. Address, J. B. Taylor, M.R.C.V.S., Shawlands House, by Larkhall, Lanarkshire.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

THE FARRIERS' JOURNAL.

A Monthly Magazine for Horse Shoers. The only paper devoted to the interest of the Shocing Smith.

Price 2d., by post 2½d.

Published by G. WILD, 62 Mount Street, Ashton-under-Lyne,

Royal Veterinary College, London.

(Founded 1791.)

Principal and Dean : Professor **SIR JOHN M'FADYEAN, M.R.C.V.S., M.B., B.Sc.**

Membership Diploma of the Royal College of Veterinary Surgeons :

Complete Courses of Instruction are conducted in all the Subjects of the Examinations for this Diploma. The facilities, etc., afforded for the Practical Training of Students are unrivalled.

Bachelor of Science Degree, University of London.

The Professors of Chemistry, Biology, Anatomy, Physiology, Hygiene, and Pathology, are Recognised Teachers of the University, and conduct in their respective subjects courses which qualify for the Science Degree (B.Sc.), which may be taken concurrently with the above Diploma.

POST GRADUATE COURSES.

These Courses in Veterinary Pathology and Bacteriology are conducted under the supervision of the Principal and are specially adapted to the requirements of officers of the Army Veterinary Department, Colonial Veterinary Surgeons, Veterinary Inspectors under the Contagious Diseases of Animals Acts, and Candidates for the Fellowship Diploma of the Royal College of Veterinary Surgeons.

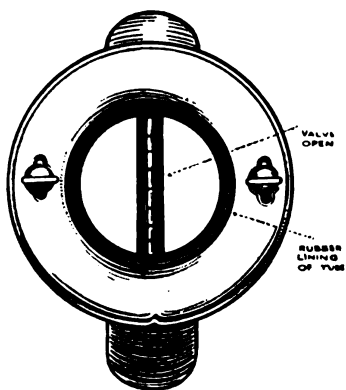

The number of places for these Courses is limited and early application must therefore be made to prevent disappointment. The next Course will begin on Monday, October 7th, and terminate on Friday, November 29th, 1912.

The College Calendar, containing full particulars, will be forwarded on application to

The Secretary,

Royal Veterinary College, Camden Town, N.W.

GIBSON'S PATENT TRACHEOTOMY TUBES

Patent No. 3528/07.

ALSO

Improved Open Tubes for Race Horses

Reduction of 20 per cent. in the price.

Send for particulars and Testimonials to

G. E. GIBSON, Oakham.

The Royal Sanitary Institute

Patron—His Majesty the King.

EXAMINATIONS

FOR

Inspectors of Meat and other Foods.

CENTRES for 1912.

Cardiff	...	March
Hull	...	March
London	...	May
Birmingham	...	July
Leeds	...	October
Liverpool	...	November
London	...	December

The EXAMINATIONS are officially recognised as qualifications for appointments by Government Departments and Municipal Authorities.

COURSES OF LECTURES for Candidates preparing for the Examinations are held by the Institute in London in the Spring and Autumn.

Application Forms and full particulars can be had from the Secretary, 90 Buckingham Palace Road, London, S.W.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1233.

FEBRUARY 24, 1912.

VOL. XXIV.

PROTECTION OF ANIMALS ACT, 1911.

This Act, which we reproduced in full last week, is most important to veterinary surgeons. We should understand its provisions so that we may assist our clients. We should note also that one of its clauses does for us what the original draft of the Veterinary Bill failed to do—makes it penal for ignorant and unskilled persons to operate on animals. In another column will be found a report of the conviction of a man for burning a horse's "lampas." The exact words of the Act are "shall subject any animal to any operation which is performed without due care and humanity." Blistering, firing, and the use of caustics, employed as they often are without care, would come well within the reach of this clause. Docking, also, which now disfigures every Hackney bred animal, should afford much work for policemen and general informers.

The Act is an amending and consolidating act. It repeals in whole or part two Knackers's Acts, two Cruelty to Animals Acts, Poisoned grain and flesh Acts, Drugging of Animals Acts, The Injured Animals Act, and the Wild Animals in Captivity Act. The provisions of all these Acts are re-enacted and made more stringent. The maximum fine is now "not exceeding twenty-five pounds" and the punishment on conviction may be "imprisonment with or without hard labour for any term not exceeding six months."

There are two quite new powers given to magistrates—"power to destroy an animal when the court is satisfied that it would be cruel to keep it alive" and power to deprive an owner on a second conviction of "the ownership of the animal and may make such order as to the disposal of the animal as they may think fit."

Article 7 of the Act says, "Any person who impounds or confines any animal in any pound shall supply it with sufficient and suitable food, and if he fails to do so he shall be liable to a fine not exceeding five pounds." In the country the "pound" is generally open and visible to the passer-by, so that neglect would soon be noticed. In London the pound is replaced by "the greenyard," which is any stable selected by the police. In some cases it is alleged that animals are badly neglected in these places, but there is little chance of redress because even the owner is not permitted to see, let alone attend to his animal when impounded. This Act apparently renders the policeman liable for the feeding of animals in "greenyards."

Article 11, which re-enacts the Injured Animals Act, requires a police constable who finds an animal "so diseased, injured, or in such a physical

condition that in his opinion there is no means of removing it without cruelty" shall call in a veterinary surgeon, upon whose certificate as to its state he shall act. This throws a heavy onus upon veterinary surgeons. It is no easy task, at times, to say whether a horse is fatally injured or diseased, and any "negligence" leading to an erroneous diagnosis might end in a law suit.

Article 14 provides for an appeal from any conviction to quarter sessions.

We find no clause in the Act under which a defendant may claim to be tried by a jury, but in London the stipendiary magistrates at the outset of all cases now inform defendants that they may elect to be tried here or go before a jury.

The Act should be read by all horse-owners and veterinary surgeons. Even owners of tortoises and hedgehogs kept in a garden are interested, as are menagerie owners and managers.

IRREGULAR STRANGLES TREATED WITH STREPTOCOCCUS VACCINE.

By ALEC. KEVAN MURRAY, M.R.C.V.S., Turiff, N.B.

Subject.—A grey, Clydesdale gelding, five years old, belonging to Mr. G. Wright Newton, of Fortrie Farm, Inverkeithney, Banffshire.

On the 6th December, 1911, I was called in to the horse and found him swollen, the submaxillary gland considerably hardened, and temperature 105. Diagnosis: Strangles.

Treatment.—Poultices and fomentations to the gland, fever medicines, and mashes for food, in addition to which the patient was completely isolated.

On December 9th I lanced the abscess, and the horse was apparently getting convalescent.

On the 11th I was again sent for, and on arrival found the parotid right gland, swollen, hard, and very painful, in addition to which the right fore-leg was also swollen and very stiff.

Dec. 15th the parotid swelling had disappeared, but the hind legs were still greatly swollen and painful—the horse refusing food; temperature 106½. Treatment same as before.

Dec. 18th, symptoms much the same, with large swellings on off lumbar region, and there was considerable pain.

Dec. 20th, swellings of legs slightly diminished, but lumbar region on near side also swollen. The horse began to exhibit "colicky" pains, and it was evident that the disease by extension was attacking the mesenteric glands, the mucous and serous membranes, and internal organs, and the danger of

the horse developing peritonitis, etc., was very great. The temperature was 105.

Subsequent treatment.—The disease being of the nature of a contagious eruptive fever, and caused by a streptococcus, I determined to try Streptococcus vaccine, which I had seen recommended by Parke, Davis, and Co., in their "Veterinary Notes." Having procured a tube of ten tablets, each tablet containing 500 million streptococci, I dissolved two tablets in about 5 c.c. of sterile water and injected the solution hypodermically. I was careful not to make the injection, which was subcutaneous, in the immediate area of the infection, but at a reasonable distance away. This was on the 23rd of December, 1911, and on Monday the 25th I revisited the horse and was surprised to see all swellings gone and the horse looking and feeding well; the temperature had fallen to 103, and on the following day to 101½.

On December 29th I received information that the patient's off stifle and near fore-leg were greatly swollen, and the animal was quite off his feed, and the temperature had risen to 104½. I repeated the previous dose and the swellings entirely disappeared by January 6th. The horse quickly recovered, and has since shown no signs of refusing his food, nor has he missed a day's work.

I regard the results in this case as nothing short of marvellous, particularly as all usual treatment failed. It is the only case in which I have used Streptococcus Vaccine, but I certainly think that it should be given a trial in cases of irregular strangles.

IMPERFORATE HYMEN IN CATTLE.

This complaint is not common, and, we are told, is only seen in white and roan heifers; moreover, it is said to be most common in Cumberland. In my limited experience the latter contention is correct, for in twelve cases which have come under my notice only one occurred in another county.

Last week I was interested to hear of a heifer which showed symptoms of imperforate hymen; this animal had been straining for several days, and was evidently suffering considerable pain, which first appeared soon after copulation. On examination per vaginam the hymen could just be reached with the middle finger, so that it could not be broken down by means of the hand. A catheter was next tried, but the hymen proved capable of withstanding considerable pressure, so a trocar was cautiously introduced on the under surface of the finger. After being punctured by the trocar, violent uterine contractions were observed, and about half a gallon of fetid brownish-white discharge was passed. The contractions soon ceased, and after irrigation with a solution of lysol the animal made an uneventful recovery.

Beckermest, Cumberland.

L. L. STEELE.

ABSTRACTS FROM FOREIGN JOURNALS.

ACCIDENTS CAUSED BY INGESTION OF FOREIGN BODIES IN THE PIGEON.

Hebrant and Antoine, discussing this subject, remark that the conditions in birds are somewhat different to those in cattle, where accidents from the ingestion of foreign bodies are also not rare. In birds, the only foreign bodies causing trouble are those having slender points or cutting edges. For the most part, these consist of small nails mingled with the food, which are swallowed accidentally; and this is especially likely to occur during the hurried eating resulting from a group of birds being fed at the same time.

All the foreign bodies swallowed by birds, after remaining some time in the crop, pass into the proventriculus without producing any really serious trouble, and then into the gizzard. Here they are arrested by the grit and gravel which that organ contains; and, if they are without sharp points or cutting edges, they mingle with it to fulfil the same role of grinding the grains of the food. If, however, they possess points or edges capable of piercing the tough layer which lines the cavity of the viscus, they become penetrating bodies, implant themselves in the wall of the circumference of the circular sinus, paralyse the muscle for a certain time, perforate it, and emerge from it surrounded by an inflammatory exudate, which is fibrinous and coagulated, and always very abundant. This mass then occupies a position in the abdominal cavity, where it is often adherent to the intestines.

Usually its presence may be detected by palpation of the abdomen. A rounded body, often irregular in its surface, and slightly elastic, is felt; and this, in the female bird, may easily be confused with the fruit of an intra-abdominal ovulation. This, moreover, is the diagnosis usually reached by the bird's owner; for egg-laying is arrested, and the owner himself can feel the abnormal mass within the abdomen. In the male bird, the diagnosis is more easy. In some cases, the fibrinous mass becomes adherent to one or another subcutaneous point of the abdominal wall.

But this passage of the foreign body through the wall of the gizzard, often not far from the origin of the intestine, is only affected very slowly; and, during the period of its progress, the bird eats little, is often constipated, and becomes very thin. It may even happen that the bird dies in a cachectic condition before the foreign body has entirely traversed the wall of the gizzard.

Various foreign bodies, such as fragments of iron wire may occasion these troubles; but the authors call special attention to one, which they have found the most frequent of all in the pigeon, and which they cannot identify. This is a little steel rod of about a centimetre (= 4-10ths inch) long, square in its section, nearly a millimetre (1-25th inch) in breadth, and terminated at each end by a bifid extremity. Each of these extremities consists, in fact, of two little cutting lamellae, each in continuity with the opposed faces of the rod. These little

lamellae are about two to three millimetres (1-12th to 1-8th inch) long, and are terminated in a point. Their edges, in consequence of the thickness of the lamellae, are cutting.

For some years the authors have found these particular foreign bodies post-mortem in numerous pigeons. They have always been of the same dimensions; but despite all enquiries, the authors remain completely ignorant of their source and usage. They are not nails, and are not found in the trade of nail making. Probably they are the teeth of instruments employed by grain merchants in cleaning grain; and the authors add that pigeon owners feed their birds upon various grains, which are often of foreign origin. The authors are ignorant of the operations which these grains undergo before being placed in the market; and they consider that the origin of these foreign bodies should be sought in this direction.

Finally, the authors deal briefly with treatment. When the foreign body can be diagnosed, surgical operation is always indicated. Its procedure varies in accordance with whether the foreign body has not yet completely emerged from the gizzard, or has done so and, embedded in a mass of fibrin, is floating in the abdomen. In the first case, after extirpation of the fibrinous mass containing the foreign body, the gizzard should be sutured; and the bird should then be kept under observation to see if new fibrinous exudates, formed at the seat of operation, require to be removed. One case of this nature has been successfully operated upon by Jorisson, of Ixelles, the treatment lasting for five weeks.

In the second case, the after results are less serious; for, when the abnormal mass is removed and the abdominal wall sutured, an unfavourable result is not likely. Recently one of the authors has obtained a rapid and excellent result in a case of this nature.—*Annales de Méd. Vét.*

W. R. C.

[The authors give no symptoms likely to be very useful in the diagnosis of these foreign bodies before they have completely emerged from the gizzard.—*Transl.*]

CENTRAL VETERINARY SOCIETY.

An ordinary meeting was held at 10 Red Lion Square, London, on Thursday, February 1st, Mr. R. J. Foreman, President, in the chair. The following Fellows and visitors signed the attendance book:—Messrs. F. W. Willett, Alex. Crabb, D. Stewart, E. Lionel Stroud, P. W. Dayer Smith, Ralph Bennett, B. Gorton, N. Almond, H. D. Jones, Wm. Hunting, Prof. J. Macqueen, J. F. Macdonald, F. G. Samson, G. Gordon, Vet.-Capt. C. H. H. Jolliffe, J. Willett, J. Rowe, Prof. G. H. Wooldridge, A. L. Wilson, R. F. Wall, R. Eaglesham, A. L. Butters, W. R. Davis, J. W. McIntosh, W. L. Harrison, R. Bryden, F. O. Parsons, W. D. Halfhead, A. Rogerson, H. King, W. R. Clarke, and Hugh A. MacCormack, Hon. Sec.

Visitors: Messrs. Geo. Bailey, R. B. Wood, S. L. Slocock, G. W. Bushman, W. F. Wright, S. C. Rowbotham, and Geo. Bates.

On the proposition of Mr. P. W. D. Smith, seconded by Mr. E. Lionel Stroud, the minutes of the previous meeting were taken as read and confirmed.

CORRESPONDENCE.

Letters regretting inability to be present were announced from Messrs. J. C. Coleman, W. S. Mulvey, and S. H. Slocock.

A circular letter was read from Prof. Gofton asking for representatives to be appointed to the National Association of Veterinary Societies. It was agreed that the matter should be on the agenda for the next meeting.

NOMINATIONS.

Messrs. W. E. BLACKWELL, Norfolk House, Towcester and T. W. LLOYD, Arcade Mews, Aldershot, were nominated for Fellowship.

POST-MORTEM SPECIMENS.

Mr. H. D. JONES exhibited a fractured pedal bone. The horse being lame for some time and no satisfactory result accruing from treatment, it was unnerved. It then worked for six months, quite sound. The coronet then began to swell and the hoof to slough, and on post-mortem the pedal bone was found to be fractured, but not completely. There was a small necrosed area in the centre of the articular surface.

Mr. D. STEWART exhibited a navicular bone of a horse which had picked up a nail. The bone was in two halves; the horse was practically sound for two weeks after picking up the nail.

He also exhibited an ordinary case of picked up nail in which the horse was dead lame from start to finish.

Replying to the President, Mr. Stewart said there was no mark at all upon the coronet.

Mr. BENNETT exhibited an unusual case of fracture of the os suffraginis in the near hind of a hunter. The mare jumped short at an easy jump, fell, got up again, took three more jumps, and then went dead lame in galloping across a meadow. He saw her the next day, and found little difficulty in getting crepitation. The bone was in nine pieces.

Prof. WOOLDRIDGE exhibited the liver of a cat, a part of which was herniated through the diaphragm into the mediastinum. The cat was destroyed for pronounced wasting, the causes of which during life he was not able to determine. As the owner told him she was under treatment for tuberculosis, and the cat was coughing somewhat, he thought it was better to have the animal destroyed. On examination, at the domial cavity appeared to be normal at first sight, but on opening into the chest there was what seemed to be a growth as big as a duck's egg into the pericardium. The nature of the growth could not be determined by the naked eye, and sections were cut which proved it to be liver. One portion of the liver was herniated through the diaphragm and a portion was in front of the diaphragm, and half the gall bladder was on one side of the diaphragm and half on the other. It was a question whether it was possible for a portion of the liver to have got into the pericardium, but Mr. Gorton, who made the post-mortem examination, was distinctly of opinion that it was lying in direct contact with the heart, inside the pericardium. He himself thought it was more likely that it was lying in the mediastinum, exterior to the pericardium.

TWO REMARKABLE CASES:

PSEUDO-TETANUS, OR MUSCLE FATIGUE TOXEMIA (?)

Vet.-Capt. C. H. H. JOLLIFFE

Whilst looking through some old papers I recently came across some clinical notes which, though somewhat out-of-date, might perhaps still be of some interest, especially to the more recently qualified members of the profession. I had every intention of publishing them at the time, but pressure of work and unfavourable circumstances for writing prevented my doing so, and led to

to the notes being laid on one side and their existence practically forgotten until now.

On the 13th Sept., 1902, shortly after the termination of the Boer War, the 3rd Hussars, of which I was then in veterinary charge, started from Newcastle, Natal, to march with 200 remounts to Mooi River, a distance, of roughly 140 miles. The remounts were all in very bad working condition, having evidently been fed on soft food and given no exercise for a considerable time, and there were several casualties *en route* from laminitis, exhaustion, etc.

On reaching Mooi River on the 19th Sept., it was reported to me that there were three cases of lockjaw amongst the horses. I was at first inclined to ridicule this report, but on examining the animals I found it to be apparently correct. There were two horses showing most of the usual signs of tetanus, viz., tonic spasm of all the facial muscles, the jaws being closed to within a quarter of an inch, whilst it was perfectly impossible to force them any further apart. There was also firm tetanic contraction of the levators of the upper lip and alæ nasi, the retractor of the lower lip and orbicularis oris being in a like condition, giving a most strange appearance (*risus sardonius*) to the countenance. In one case the membrana nictitans protruded partially over the eye-ball. In both there were clonic spasms of most of the other voluntary muscles of the body; the tails were rigid and twitching; the animals were trembling violently all over, and appeared scarcely able to balance themselves on their limbs. The pupils appeared normal. The temperatures were 102° and 102·6° respectively; respirations in both cases shallow, and about 120 per minute. Pulse small and hard, and about the same in frequency as to respirations. On presenting water to them they made efforts to drink which were entirely unsuccessful. The conjunctivæ were deeply congested.

The third horse showed similar symptoms including trismus, but in addition, he was down, unable to rise, and in a state that could not be described otherwise than that of violent convulsions, and being apparently quite *in extremis*. I had him destroyed at once.

The other two, despite protests from some officers of the regiment, I decided to leave till the morning, but was unable to adopt any treatment (for which, possibly, they were all the better).

The history was the same in all three cases. The horses had started in the morning apparently well, but had been showing signs of considerable fatigue on the two previous marches, and on this day they had only with extreme difficulty been got into camp, their riders being compelled to dismount, off saddle, and drag them along the last few miles. As soon as they had stood still for a short time these remarkable symptoms commenced.

I regarded it as a most extraordinary and unparalleled occurrence that there should suddenly be three cases of tetanus simultaneously occurring at the same moment and all in precisely the same stage of the disease, but it was nothing to my astonishment when on visiting the two survivors the following morning—some ten hours later—I found both patients feeding eagerly and exhibiting every sign of perfect health! They trotted up freely and appeared as bright and cheerful as any horse one could wish to see, all trace of the urgent symptoms shown the previous night having completely vanished.

The horses did no further marching, but were left at Mooi River and remained perfectly well, passing out of my hands some three days later. Moral—never be over-hasty or over-certain in your diagnosis, nor yet place too much reliance on the value of your treatment, which in three cases consisted solely of rest and fresh air, assisted by that propitious and ever-present agency—*Vis medicatrix nature*.

Concerning the possible pathology of these cases, it is evident that they had no connection with true tetanus. The symptoms shown must have been due either to strychnine poisoning or to some other unknown and unrecorded vegetable poison peculiar to Natal, or else, as is more likely, they resulted from long-continued and gradual fatigue in horses in an unfit condition. Their pace never exceeded a trot, and about nine-tenths of the march was done at a walk.

Now in most cases of extreme over-fatigue, the animal is probably travelling at considerable pace, and blood deoxygenation and impending heart failure compel the animal to stop before a state of absolute muscular exhaustion is arrived at. In the horses under discussion the pace was insufficient to produce either "auto-asphyxia" or cardiac syncope, and the voluntary muscles, for which periodical rest and recuperation are necessary, were thus forced to work on until their very last grain of energy was expended.

Physiologists have shown that precisely the same changes take place in muscles during muscular contraction as occur after death (only in a more extensive degree) in *rigor mortis*.

Starling states:—"In *rigor-mortis* chemical changes take place; muscle which was previously alkaline becomes acid, the acidity being due to the formation of an excess of sarcolactic acid. At the same time there is a production of CO₂ and an evolution of heat."

Again, when speaking of muscular contraction, or muscular energy, during life, he states:—"When a muscle contracts there is an increased formation of CO₂ and sarcolactic acid, and an increased consumption of oxygen."

It is thus apparent that if muscular exertion be gradually carried to an excessive or extreme degree, chemical changes will take place in the muscular system which in no way differ from those occurring in the rigid and tetanised condition known as *rigor mortis*. This is further supported by the fact that when animals are hunted and killed after a prolonged pursuit, *rigor mortis* sets in instantaneously, it being well known that foxes and hares killed under these circumstances have been found perfectly stiff and rigid, and capable of being propped up erect on their legs the very instant after death has taken place.

It therefore seems probable that extreme muscular exhaustion or "muscle-fatigue toxæmia," accentuated, no doubt, by unfit condition, is accountable for the curious phenomena observed in these cases, though the remarkable coincidence that these horses should have been attacked in identically the same manner, and on the same day, is quite beyond the bounds of explanation. I have never heard of any cases of this nature having been previously described, which is my excuse for publishing these notes.

DISCUSSION.

The PRESIDENT doubted whether these were cases of muscular fatigue, because in his district he often saw horses that were absolutely worked to a standstill, even to such an extent that they had to be destroyed, but he had never seen a case approaching those described. He should like to know whether the horses had been traveling close together, or in the same troop.

Captain JOLIFFE said the horses were not together, as they belonged to different troops. He enquired from various people whether there was any poison in the country which would produce symptoms of the kind, but nothing was known. He also enquired whether nuxvomica grew anywhere in the neighbourhood, as it looked somewhat like strychnine poisoning, but could obtain no knowledge of the plant growing in South Africa at all.

Mr. J. WILLETT asked whether there had been any other cases at the time in South Africa.

Capt. JOLLIFFE said he had not heard of any, although he enquired.

Mr. ALMOND asked whether a post-mortem had been made on the horse that had been killed, and whether the spasm were intermittent as they usually were in tetanus.

Captain JOLLIFFE said no post-mortem was made, and the spasms were more or less continuous. The only exception to the clonic spasms was in the muscles of the jaws, which had tonic spasms. The jaws were absolutely locked to within a quarter of an inch.

Mr. EAGLESHAM said he had seen in this country in ponies conveyed by rail symptoms similar to those shewn in Captain Jolliffe's three cases. Six Welch ponies that had been bought at a fair in North Wales and conveyed in a cattle truck to a midland county during severe winter weather, when unloaded were all found to be suffering from spasms of the muscles of mastication with chattering of the teeth, the jaws being almost fixed, and could not be forced open. The membrana nictitans was not affected, nor the muscles of the tongue, pharynx or larynx, for they were able to swallow liquids given in drench. Stiffness of the muscles of the neck with protrusion of the nose was noticed, and the muscles of the body were somewhat rigid and drawn, but did not show that hard and tense condition found in tetanus due to the tetanus bacillus. The pulse, temperature and respirations of the animals remained normal, and with treatment and warmth they were all well again the next day. The condition of spasm of the muscles was, he thought, brought about by exposure to cold and want of food, and was not due to the toxic infection of poisons.

MOTION BY MR. J. WILLETT.

"To discuss the unfair treatment meted out to our Profession when giving Expert Evidence in Police Courts."

Mr. President and Gentlemen,—I make no apology for bringing this subject before the meeting, for I am sure you will all agree with me that the treatment meted out to us at the Police Court leaves something to be desired, and also that the strictures passed upon different members of our Profession, by more especially, the Metropolitan Stipendiary Magistrates are becoming more frequent. These reflect on us as a body, and owing to the wide publicity given to them in the Press, act adversely on us in the eyes of the general public, and tend to discount our evidence in future cases. I am therefore hoping that the discussion to-night may be useful, and that at the end, some resolution may be drafted, and forwarded to the other Societies asking for their support in any action we may take to counteract these statements.

I expect you have all read in the proceedings of the last Council Meeting of the R.C.V.S., published in *The Veterinary Record*, that a letter had been received from the London Master Carmen and Contractors Association, complaining of injustice owing to the conflicting evidence of Veterinary Surgeons, it therefore makes it imperative that we should do what we can to avoid such charges in the future.

I do not purpose giving you a long paper, but will content myself with a few points that might be advantageously discussed and no doubt you will be able to add many more.

The treatment of the animal while in the custody of the Police. Should the horse be taken to the "Green Yard" for the night, in the majority of the cases I have seen, it is brought up the following morning to the Court uncleaned, and should it have been very hot or wet the previous day, it gives the animal a miserable and unkempt appearance (no matter how good the condition is) that must prejudice it to a certain extent in the eyes of the magistrate.

The evidence of the Police Constable or R.S.P.C.A. officer is more often than not that which should only be given by a veterinary surgeon; not only that, he enumerates all the defects he finds, or he thinks he finds, on the animal irrespective whether they are causing the alleged cruelty or not, without let or hindrance from the magistrate or his clerk. I maintain that this should not be. It should be quite sufficient for him to mention the particular limb the animal is lame on, or the position of the sores, as the charge may be.

Expert Evidence. This is a matter that directly concerns ourselves, and I wish to be careful to explain that any remarks I make are general, and no personal reflection on any one.

The system of one particular veterinary surgeon being attached to any court, (by being attached, I mean seeing every case charged there) and giving evidence on behalf of the Police, is not a desirable one, for it has a tendency to make him dogmatic in his evidence, and perhaps unconsciously biased. Then the magistrate seeing that particular expert day after day relies on his evidence, often to the detriment of the opposing expert, here, again, I have heard the expert enumerate defects on the animal which are not the subject of the charge, and which the one opposing should not be called upon to answer.

The mode of Examination. I have seen horses examined immediately previous to the expert giving evidence on oath, much more superficially than if the examination had been to diagnose the lameness for a client.

There is a tendency in these cases to fix on the obvious and search no further. For instance, how many horses there are working to-day who have, we will say, both ringbone (or sidebone) and corn on the same limb, yet the corn is not searched for, in fact I have seldom seen the shoe removed at the Police Court, yet in private practice one would seldom or never give an opinion until after the foot had been examined.

Then there is the question of sidebone and ringbone lameness. How often the opinion is given, that the horse must have been lame some considerable time, in other words, implying to the magistrate that there had been cruelty over a more or less lengthened period. This opinion in many cases needs qualification, for we all know how possible it is for a horse with either of these to work for years without going lame, until one day he may step on an uneven stone and go suddenly lame. This evidence when given, may, and often does do an injustice to the owner, by causing an adjournment for either himself or his horsekeeper to be summoned with the driver, and these are the cases that are the hardest for the opposing veterinary surgeon to combat.

Then there is the question of mechanical lameness. We all know that some magistrates will not listen to the defence of mechanical lameness, yet they must know many human beings who are mechanically lame.

The veterinary surgeon for the prosecution, in my opinion, acts in a dual position, one of which is apt to be lost sight of, and that is he acts as veterinary adviser to the magistrate morally, if not legally, more especially those veterinary surgeons who act for the Police in each case at that particular court, for there is no doubt the magistrate relies on his evidence. Under these circumstances he should be careful there should be no exaggeration in his evidence, in fact, I go further, and say that should the officer who has brought the charge exaggerate in his evidence, it is his duty when in the witness box to correct this.

Finally, there is the veterinary surgeon for the defence. How is he treated? Very often not allowed to examine the subject of the charge without the veterinary surgeon for the prosecution is present. In the court he is treated as of no account by the officials, herded with

the people at the back of the court if he is in a district where he is not known, and subjected to many petty annoyances, and when in the witness box his evidence is treated with very little consideration.

A well-known K.C. once said there were three classes of witnesses—liars, liars with an accentuating adjective, and expert witnesses, and it is evident from the observations frequently made by the magistrates he puts us in one of the first of these.

Why are we treated in this manner? There is no doubt there are cases where the evidence given for the defence has not been in accordance with the facts, yet there are so many differences of opinion—and honest differences of opinion as to lameness, both as to duration and degree, that we should not all be condemned as a body because of this.

Other experts in the different professions disagree and are not subjected to the insulting remarks we have to submit to, then why should we submit to them without a protest?

The magistrate has the power to call in a third opinion when two experts disagree, but this power is seldom used in our case, although I venture to say it is the most satisfactory way of dealing with conflicting evidence, and should be made compulsory.

DISCUSSION.

Mr. McINTOSH said the profession was unanimous in its desire to assist any reasonable measures for promoting the comfort and happiness of domestic animals, and he was quite sure no veterinary surgeon would ever think of shielding anyone who, by wilful intent, carelessness, and indifference, subjected animals to cruelty. But his observations and experience in the Courts of London had shown him that the methods adopted by the authorities in initiating prosecutions were absolutely unfair, and a disgrace to British justice. The evidence of police officers and the R.S.P.C.A. officers—and about the latter he had not the same complaint to make—was in the majority of cases so grossly exaggerated, and so inaccurate, that it was almost impossible to recognise the animal when one went to see it, and he was sorry to say there seemed to be no difficulty in getting members of the profession to support evidence of that kind. Most of us had probably noticed the degree of confidence with which these officers gave their evidence; there seemed to be no doubt in their mind as to the existence of lameness and the degree of suffering, they had no difficulty in finding the cause of the lameness, and they are quite certain as to how long it has been in existence. In the case of a sore they are equally confident, and can actually see pus oozing from the surface of a wound which has only been in existence for a few hours. Unfortunately those men had the ear of the Court, while veterinary surgeons called in for the defence were invariably treated as hostile rather than professional witnesses. In addition they are very often kept hours waiting to suit the convenience of the police veterinary surgeon, during which time they are allowed the privilege of a seat amongst the frequenters of police courts, whilst the police veterinary surgeon on arrival is shown into a favoured seat in the well of the Court. We have a right to equal respect and courtesy from the Bench as professional men, and it is our duty to demand it. Nobody can object to a fair representation of facts, and nobody wants to. A fair trial was not obtained at police courts, at any rate as far as horse cases were concerned. Then the conditions in the greenyard left much to be desired. A horse was taken there and allowed to stand all night practically unattended, and no attempt was made to alleviate the suffering—assuming there was any. It was certainly not groomed, and it was a question whether it had anything to eat or drink, and very rarely did it get bedded. Next morning it was brought

to the Court and very often kept standing in the cold for hours, and naturally presented a very miserable appearance, which seemed to be partly the object. That was surely most unfair to the man who was being tried. He mentioned a case in which a man was fined for working a horse in a lame condition. There was a remand in order that the owner might be summoned. The animal was certified as lame, and it was said the lameness had been in existence for several days. The owner was held to have known this, and was therefore convicted. The animal was discovered afterwards to have a fractured navicular bone which had occurred in the course of the journey—an accident over which the owner had no control; and many similar cases could be mentioned. He urged the Society to take steps to see that veterinary surgeons who appeared for the defence in police courts had those rights and privileges to which they were entitled as members of an honourable profession, as it was clearly their duty to afford all reasonable protection to the owners of animals.

The PRESIDENT said he had had three nasty experiences in Police Courts, when he had been spoken to very roughly by magistrates, and was once ordered out of the box. In one Police Court a case came up in which he had performed the French lateral cartilage operation about three months before and had told the owner to have the horse shod at the same forge, where he instructed the man how to put the shoe on. To save a few pence, the owner had the work done by a local man, and a very unsuitable shoe was put on, with the result that the horse went lame immediately after being shod, although he had been going well for about a month. He appeared to give evidence for his client and the magistrate was very nice, and asked him if it was the operation that had been done on a certain stallion a few months before; there was quite a long conversation, and he thought the case was won as the magistrate showed such knowledge of the operation. But to his surprise the magistrate said it was quite evident he (the President) was just practising to gain experience! (As a matter of fact he (the President) had done about twenty cases, and most of them had been successful). Being rather cross he spoke up sharply, and was told to sit down or he would be committed for contempt. The client was fined £5 and costs, and the magistrate remarked that if he had not been misled by his veterinary surgeon he would have sent him to prison! In another case he was ordered out of the box by the magistrate because he alluded to a certain thing as a "Police Court trick." As to the greenyards, he believed it was possible in the majority of cases to send a man to feed and groom the horse; at least that was very rarely objected to in his district.

Mr. McINTOSH said the police would not allow it in the majority of cases.

The PRESIDENT said he told his client to feed and clean the horse night and morning if the case was held over. He could bear out Mr. Willett that ringbones, strained tendons and shot fetlocks were very great favourites with the prosecution as the cause of lameness, though it often turned out to be a suppurating toe or corn that required treatment. As a rule he refused to go into Court, telling the client to plead "Not Guilty" and then withdraw the plea and have the case dealt with at once, and that appeared to him to be about as good advice as could be given in the present day. Magistrates' clerks and many of the magistrates seemed to think, and sometimes say, they know about a case better than any veterinary surgeon, and they will not allow a veterinary surgeon to plead for his client.

Mr. ALMOND asked whether there was any way of convincing the magistrates that they were not expert veterinary surgeons.

The PRESIDENT thought there was not, though he had

tried to do it privately once or twice. When once a layman began to think he knew something about a horse he was as bad as a "doggie" man.

Mr. F. WILLETT thought the discussion was very opportune, as the penalties under the new Act were much more severe. He understood that from the 1st of January the maximum fine was £25 or six months' imprisonment. Only a short time ago a client of his had two pair-horse vans stopped and the horses taken out and sent home. It seemed that one of the drivers had been knocking a horse about and had been summarily discharged that morning, and for spite made a complaint to the police about the firm's horses. In his own district there was a policeman whose speciality was horse cases; and in every case the Bench listened to him; usually it was little use the veterinary surgeon appearing for the defendant. This officer stopped the vans on account of three of the horses. One had a sand crack that had been clamped, and was going sound but a little on her heels. Another had the head of a small pimple rubbed off on the wither, which could be covered by the end of a lead pencil, and the third had a small abrasion on the shoulder the size of a threepenny piece, for which the collar had been well eased. One of the magistrates came down to the greenyard shortly after the horses were stopped and saw them in his presence. When he explained to the magistrate that the mare had been treated and was perfectly fit to work, and that the other two cases were most trivial and should not have been stopped, nothing more was heard about any of them. This was fortunate, as it might have been most serious for the owners had the cases been proceeded with.

Mr. WALL thought that a number of horses stopped for cruelty were not stopped solely through the humanitarian feelings of either the police or the Society's officer. He certainly thought the profession should take some stand for more consideration in the Police Court, if only to prove that veterinary surgeons were dead against cruelty. It was a difficult matter to make a magistrate believe the defendant veterinary surgeon, because certain gentlemen who regularly attended the court had the ear of the Bench. He had tried to think out some suggested remedies. The local authority might appoint a veterinary surgeon to a court to examine all cases, or the veterinary surgeons in the district might be called upon in turn, or, what seemed more practical, all cases which were stopped might be taken to the nearest veterinary surgeon, or if he could not be found, to the next nearest one. The majority of the profession would willingly give gratuitous advice to the officer as to whether it was a case for prosecution or not. He thought if the police and the R.S.P.C.A. were approached with some such suggestions a practical working arrangement might be come to. He endorsed the remarks that had been made with regard to horses taken to greenyards. As a rule the animal was given little to eat and drink, had very little attention paid to him, and was given no treatment whatever for the relief of pain. He had often wondered whether the officer in charge of such a case could not himself be prosecuted for cruelty. He remembered one case in which a horse was stopped and walked nearly two miles to the greenyard which he reached between two and three in the afternoon: he was kept at the greenyard the whole night. On seeing him about five o'clock the same day, he suspected a fractured pastern, and asked if the horse could be put under treatment, but that was not allowed. The animal was then walked between two or three miles, dead lame, to the Police Court, and stood in the Police Court yard from before ten o'clock in the morning until nearly four o'clock in the afternoon without the slightest shelter on a cold, wet day. The driver of the animal was fined for cruelty. He told the magistrate quite clearly what he thought about the matter and very nearly got committed for con-

tempt of court. He proved afterwards that the horse had a fractured pastern. In the case of another horse that was stopped, he told the inspector the horse was in terrible pain and asked to be allowed to take the shoe off, suspecting something in the foot. The request was refused. He asked that a local veterinary surgeon might be called in at his expense, but that was refused. There was much more cruelty inflicted by those who professed to suppress it than by those who were charged with it. At the majority of police courts the yards were uncovered, and horses could be seen day after day standing there shivering with cold, and frequently were taken ill as the result of the exposure. The treatment of the veterinary surgeons at police courts was very off-hand. The veterinary surgeon for the prosecution was listened to and kowtowed to more or less, but the moment the veterinary surgeon for the defence went into the box the magistrate started writing or looking round the court, and in some cases the magistrate had gone so far as not to allow a veterinary surgeon to get into the box at all. It was imperative that the profession should do something to assert its rights, not only for its own sake but for the sake of its clients and for the sake of the animals!

Mr. ALMOND thought the profession was very well convinced of what took place and the discussion should be directed to finding a solution. It seemed to him that many of the cases were very trivial and many of them unwarranted, and the question was whether there was any interest other than a desire for avoiding cruelty in the prosecutions that took place. In the London district he had only been concerned with one case, which he thought was a very good one, but he was opposed by a veterinary surgeon who was a frequenter of the Police Court, who presented the case in an utterly false aspect and controverted everything which was said for the defence. He thought no consideration should be shown to men who disgraced the profession by upholding prosecutions by what was absolutely false evidence. With regard to the attitude of magistrates towards veterinary surgeons it would appear that they took upon themselves to decide questions for which they had no qualification whatever, and there ought to be means for bringing magistrates to their senses.

Mr. W. R. DAVIS mentioned that the Chairman of the Bench in his district told the inspector that his business was not to get convictions but to stop cruelty. It was the intense desire to get a conviction that caused the trouble, and the Society upheld its inspectors in that matter. Police officers, in his experience, were not nearly as bad in exaggerating a case, because as a rule they had not such a frantic desire to get convictions.

He had known of a veterinary surgeon standing in the road watching for lame horses and calling the inspector to stop them. He thought the veterinary profession should reform itself before attempting to reform others. He had seen a man get into the witness box and swear he could feel "eat in the 'ock"! He did not think a magistrate should listen to a police officer who said that with his horny paw he could feel "eat" in a "ock." In his opinion the alleged presence or absence of heat in a part of which so much was made in many of these cases was absolutely useless as evidence—he always told the magistrates that he attached no value whatever to supposed differences of temperature of the parts.

A good many cases were spoilt by the way the evidence was given. Whenever he went into the witness box he never went to the full length of saying that the horse was perfectly sound and all the rest of it. Because one side exaggerated there was no reason that the other side should do so.

Prof. WOOLDRIDGE thought the solution of the difficulty very largely depended upon the profession itself, and it was a difficulty the profession was responsible for. In the first place he thought the whole trouble had

arisen from the fact that often members of the profession on either side exaggerated in the witness box to the very utmost degree. In those instances where the magistrate had exerted his powers and asked a third party to examine, true justice had no doubt been done. It was the duty of the veterinary surgeon to assist his client, but not at the expense of truth. If a veterinary surgeon would go into the box and give his evidence on the case as he found it, without exaggeration and without minimising cruelty, then the treatment of the profession by magistrates would be quite different. A magistrate was a layman who had no expert knowledge on the case, and had to come to a decision on statements of facts submitted to him on oath. He found that skilled persons would give diametrically opposed views, exaggerated to such an extent as to be absolutely beyond reconciliation. If he were in the magistrate's place he should say, "I cannot believe any of you because I do not know which of you is right and which of you is wrong." But such an occurrence did not in any way justify wholesale condemnation of a profession. There are black sheep in every flock, even amongst lawyers. He sympathised very strongly with those who had been in the box and had been met by a magistrate as hostile witnesses before they had had an opportunity of giving their opinion for the defence. He had had the same experience himself. He had gone into the witness box for the defence on some occasions, not to say that the horse was fit for work at that time but in order if possible to show that the horse although lame was not necessarily so bad that it should be destroyed; and before he had been able to give the evidence at all he had been met in a very hostile spirit by the magistrates, but after giving evidence they had generally been much more courteous. If a veterinary surgeon was obviously telling the truth without exaggeration the magistrates were very willing to listen to him.

Prof. MACQUEEN asked how the magistrate was to know that.

Prof. WOOLDRIDGE said he could very often see it in the attitude of the person before him.

The PRESIDENT read a newspaper cutting of a case that had recently been heard before Mr. Plowden.

Mr. W. HUNTING said veterinary evidence was often very controversial in Courts of Law, and there might be men on each side absolutely contradicting each other. Not long ago there was a case in which six men said that a mare had ringbone and another six said she had not. Who was to decide? There were tremendous difficulties in all these questions, difficulties arising sometimes from misuse of words and sometimes misreading of symptoms. For instance, as to misuse of words, what was a ringbone? One man went into court and said the horse had a ringbone and the other said it had not, and all the difference between the two was that there was some bony enlargement on the pastern which the one man wrongly called ringbone, while the other said there was no such thing because there was no articular mischief. They did not explain, and were not asked to explain. If there was a solicitor or counsel in the case the endeavour was to make the man swerve in one direction or the other. One's own counsel enticed one to say more than one wanted to, and the opposing counsel might get one's back up by suggesting something which made one go a little bit further in the other way. It made a lot of difference with some men whether the horse at a Police Court belonged to his client or to another man's client.

It was not only the policeman or the Society's officer who exaggerated but members of the profession—and he included himself amongst them. For years the magistrates of London had had a certain training in the matter of cruelty, having had cases brought before them pretty well every day, and they naturally noticed the exaggeration. It was strange and almost inexplicable

how a magistrate in a criminal case, in which a man might be sent to prison, reversed the ordinary maxims of English law—that until a man was proved guilty he should be assumed to be innocent. With regard to symptoms and the different ways in which they were interpreted, he remembered once at Marlborough Street Mr. Hannay, who was a very good magistrate, saw a horse with a slight abrasion caused by the belly band, and he adjourned the case for the owner to be summoned. The owner asked him (Mr. Hunting) to go with him, and all he could see was a bit of bare skin with some hair half rubbed off. The magistrate looked at it and said he did not think there was much wrong with it and then unfortunately put his finger on the hairless spot, it happened to be a "squealy" mare, and you may imagine the result! He turned round and said, "poor thing, it is still very sensitive," and went into the Court, and without hearing a word from the defence fined the man 40/- and costs.

Then there was flinching. A horse might be found with old scars on his neck or back. Probably he had had a bad time on some occasion or other, and for years afterwards the finger only had to be put on his neck or back for him to flinch and shudder, giving the novice the idea of pain. It might be safely said that in the case of scars there was no pain at all, but simply remembrance by the animal of the time when they were painful. Then there was chronic thickness of joints and swelling of limbs, very few of which he thought caused any pain at all. He was inclined to think a man was perfectly justified in working a horse with chronic grease, because if he left it in the stable it would get worse every day.

In stiff joints the difficulty was to know whether there was any articular mischief going on. There were some clear cases of a stiff knee almost half fixed by fibrous ankylosis. In those cases there were distinctly symptoms of mechanical lameness, and yet Mr. Montagu Williams once told a veterinary surgeon at Wandsworth that he need not come and tell lies, because if the horse was lame he was in pain. It was impossible to argue with a man like that. Mr. Williams must himself have known half-a-dozen of his own friends who had mechanical lameness, and yet he would not apply that knowledge to the horse.

The omniscience of some of the men who gave evidence as to the duration of little ailments was sublime. "How long has that sore been there?" "Months!" "How long has this spavin existed?" "So long." He saw a case not long ago which he thought was very instructive—a horse that suffered from false ringbone and every now and then went lame. He went lame on a certain occasion, and cold water bandages and rest put him sound again, but the first day he went out he fell lame and was stopped, and the veterinary surgeon said he was lame from ringbone, and the ringbone had been there three months.

In the greenyard there was a lot of cruelty permitted, probably in ignorance. In one case a horse was stopped on the Saturday, and he saw it and thought there was something wrong with the foot, and asked to be allowed to have the shoe off, in fact he took a farrier with him, but he was not allowed to do so. He could obtain no order from the Police Station to be allowed to touch the horse. When the case came on on the Monday it had broken out at the coronet, and the horse must have suffered very great pain for thirty-six hours. Mr. De Rutzen heard the case and dismissed it, but he was a magistrate in a dozen; the other eleven would have fined the man, and condoned the cruelty in the greenyard.

There were some cases, he thought, in which a man ought to be ashamed of himself for the evidence he gave. In the case that had been before Mr. Plowden recently he had thought there could be no mistake, but three days ago he was shown a horse which ran out quite

sound, and he was told that evidence had been given the previous day in Court that it was lame.

He suggested the formation of a small Committee of the Society to see if there was a possibility of obtaining any remedy. If he were a horse-owner he should try and get up an Association for the protection of horse owners, because under the new Act prosecutions are a very serious matter. A man with a large stud of horses might be fined, and the second time get a full penalty, and the third time somebody had to go to prison. Three cases in a year in a stud of 500 or 600 horses was not at all unlikely. He thought the Act of Parliament had slipped through without the slightest notice being taken by the public or by horsemen in the Commons.

Mr. UPRON thought the remedy rested with veterinary surgeons themselves. He believed one man would swear black was white against his neighbour, at any rate that was his experience of veterinary surgeons. They either did it for money, self-aggrandisement, or spite. The young men who were now being turned out by the College did not try to help a man who was working in the cause of truth or for the benefit of the community at large; if they could secure a client they would work against any member of the profession. He wished they would remedy that state of things at the College.

Prof. MACQUEEN said if the main idea of the discussion was to show the British public that veterinary surgeons were first of all concerned with the prevention of cruelty, the proper procedure for the Society to enter upon was to approach the police and the Society for the Prevention of Cruelty to Animals. There was no reason why a representation should not be made to the Chief of the Metropolitan Police, Sir Edward Henry, who no doubt would be quite amenable to any useful suggestion as to the management of horses that were kept in greenyards. He was a man quite above the average on the question of cruelty, and if he were shown satisfactorily that horses were exposed to severe hardships when awaiting the trial of a case, no doubt he would give instructions to make some alteration which would be beneficial to both sides. The Society for the Prevention of Cruelty to Animals had a Committee upon which there were two veterinary surgeons, Major-General Smith and Mr. Stewart Stockman. If proper representations were made to that Committee they would probably consider some of the objections that veterinary surgeons had to make against the alleged exaggerated evidence given by the Society's officers.

With regard to the attitude of some of the magistrates, he was afraid that very little could be done. The magistrate in cruelty cases did not assume any different condition of mind from that which he assumed in connection with any other kind of case. The magistrate had to rely entirely on the evidence given for and against the individual in the box. He believed one magistrate had said that he would not believe all the veterinary surgeons of the Royal College if they were brought before him, but that no doubt was said in the heat of the moment. He did not know that veterinary surgeons had statutory employment in Police Courts, but some of them were certainly so frequently there as to lead one to think they were officers of the Court. When they went into the box they were received with great respect, partly due, he believed, to their very excellent knowledge of the art and practice of their profession—and it might be also partly due to an overweening desire to assert the truth on every occasion. Sometimes that truth might be misplaced, but at the same time the magistrate, from long experience of these gentlemen, believed that they were thoroughly reliable. The veterinary surgeon for the defence might be an entire stranger, perhaps not very prepossessing, and often gave his evidence in a jumpy sort of manner which upset the magistrate, and the magistrate accepted the evidence of the known veterinary surgeon, and fined the

defendant. He could only judge from what was brought before him. He thought nothing could be done to improve the magistrates. The profession must improve itself. In this democratic age a man who had to live by his profession could not be too particular as to the evidence he might give on these occasions. He suggested that the Committee Mr. Hunting had proposed should be empowered to make representations first to the Chief of the Metropolitan Police and afterwards to the R.S.P.C.A.

Mr. A. L. WILSON said he had had very little to complain of in the matter of magistrates, having always been met with courtesy. Perhaps that was partly due to the fact that he always took a very moderate view of the cases and never tried to exaggerate his evidence. There had been a good deal to complain of in the conduct of the police. For instance, a carman was locked up in the cell and could not be seen except in the presence of a policeman, and the horse was not allowed to be seen for several hours. The horses in the greenyard were shamefully neglected, and no facilities given to the defence.

Mr. ALMOND proposed that a Committee be formed to deal with the matter.

Mr. WALL seconded the motion, which was carried unanimously. The Committee was nominated as follows: The President, Messrs. J. Willett, McIntosh, Hunting, Profs. Wooldridge and Macqueen, Messrs. H. G. Simpson, D. Stewart, and Capt. Jolliffe.

The PRESIDENT, replying to Prof. Macqueen, said he thought the Committee would do the best they could, and report progress at the next meeting. They would no doubt draft a letter asking for an interview.

Mr. MCINTOSH suggested the Committee might be empowered to go to the Home Secretary if they thought it necessary.

Mr. J. WILLETT agreed. He did not think the Commissioner of Police had anything to do with magistrates. He thought if the Home Secretary suggested that magistrates should always call in a third opinion a better state of things might be brought about. The third man might be paid by the loser of the case.

Mr. HUNTING thought it would be better to have the matter very clearly set down. He understood the Committee was formed to send a letter to the R.S.P.C.A. and to the Chief of Police. Were the Committee empowered to approach the Home Secretary over the head of the Chief of Police. [No!]

The PRESIDENT said if no satisfaction was obtained from the Chief of Police the Committee should go on to the Home Secretary.

Mr. HUNTING said his idea was that the Home Secretary ought to be approached afterwards, and not at the time the Committee was communicating with his second in command.

It was agreed to leave the Committee to discuss the matter and take the best steps possible in the interests of the profession, and report again to the Society.

On the proposition of Mr. Willett, seconded by Mr. McIntosh, a vote of thanks was accorded to those Fellows who had brought forward post-mortem specimens; and on the motion of Mr. Butters, seconded by Mr. MacCormack, a vote of thanks was accorded to Capt. Jolliffe for his paper.

HUGH A. MACCORMACK, Hon. Sec.

Voltaire's famous description of medicine as consisting in the introduction of drugs the properties of which are little known into bodies of which we know still less, is only a paraphrase of Senac's statement made in 1749 that those who are lavish in the administration of remedies know neither the causes they wish to combat nor the weapons they use.

YORKSHIRE VETERINARY MEDICAL SOCIETY.

The annual meeting was held at the Hotel Metropole, on Friday, Jan. 26th, when the following members were present: Mr. A. McCarmick, President, in the chair; and Messrs. A. W. Mason, H. G. Bowes, G. C. Barber, S. Wharam, Leeds; P. Deighton, Selby; M. Robinson, J. A. Hodgman, Barnsley; Robert Cockburn, Eastwood, Notts; H. M. Holland, Keighley; J. McKinna, Huddersfield, F. Halliday, Dewsbury; F. W. Pawlett, York; J. Clarkson, Hon. Sec., and others.

The visitors included Mr. W. Woods, Wigan; Mr. Shipley, Yarmouth; Mr. F. W. Garnett, Windermere.

After the Secretary had read the notice convening the meeting, the minutes of the last meeting were taken as read and duly adopted.

Correspondence. This included a letter received some time ago from the Sanitary Institute. The Secretary pointed out that it had been decided at the last meeting to bring the matter forward again and pass some resolution as to joining the Sanitary Institute. However, on the proposition of Mr. A. W. Mason, seconded by Mr. Deighton, it was resolved not to join the Institute.

A letter from the Association of Veterinary Officers of Health embodying a resolution passed by that body calling upon the Government to take immediate steps to control the disease of tuberculosis in animals.

Mr. MASON asked whether the purpose of sending the letter was to ask for the Society's support: if so, he certainly thought such an action deserved their whole-hearted support. There was only one small point to which he took exception—as to the proposal to give only partial compensation to owners of tuberculous animals and carcasses notified and condemned. It was his opinion that the owners should be compensated in full. Mr. Wharam seconded, and Mr. Clarkson spoke in support.

Mr. SHIPLEY said he was very much interested in the matter. He felt that tuberculosis amongst cattle was a disease which they knew could and should be stamped out. They were also aware of the fact that tuberculosis had existed amongst cattle for generations, and that the agriculturist at the present time was not suffering through his own neglect. If the general public wanted to rid herds from tuberculosis they should help to pay for it, and adequate compensation should be given to the agriculturist in stamping out the disease. It was a wicked thing that a disease like this should be allowed to exist without some serious attempt being made to stamp it out.

The resolution, on being put to the meeting, was carried unanimously.

A letter of resignation from Mr. A. W. N. Pillers, Sheffield, who had removed from Sheffield to Liverpool, and therefore felt that he could not attend the meetings. The Secretary explained that he had immediately replied on behalf of the Association asking Mr. Pillers if he could not possibly see his way to continuing his membership. Mr. Pillers' answer, however, was that he felt such a course quite impossible.

On the proposition of Mr. Mason it was decided to once more ask Mr. Pillers to re-consider his decision, the Secretary characterising him as one of their most brilliant young members.

Mr. R. R. THOMPSON, Halifax, was elected a member of the Society.

ELECTION OF COUNCIL R.C.V.S.

On the question of the election of the Council of the Royal College of Veterinary Surgeons, Mr. Bowes said their Secretary was their candidate for this year and he thought they had an excellent chance of carrying his election.

The SECRETARY pointed out that the reason for introducing the matter into the agenda was with the idea of strengthening the Council's hands in the matter of amalgamation with other societies.

Mr. BOWES thereupon proposed that the Yorkshire Society should amalgamate with the Lancashire, Liverpool, and Eastern Counties Societies, as on previous occasions. Mr. Shipley, as a member of the Eastern Counties Society, said he felt quite certain his Society would only be too glad to adopt Mr. Clarkson as their candidate. They, as a weak Society, were glad to have the support of big Societies like Yorkshire and Lancashire. Personally he should like to see more candidates from such societies. He thought there were too many members of the Council at the present time who represented Schools, whereas they ought to have more men representing the general practitioner. (Hear, hear). As far as the Eastern Counties were concerned they were unable to supply any further candidates, but a wealthy Society like the Yorkshire one should have no difficulty in providing a fresh candidate every year.

Mr. WHARAM suggested amalgamation with the Midland Counties Society also.

The SECRETARY, however, pointed out that when they were approached last year they were not willing to amalgamate.

Mr. WHARAM considered that was no reason why they should not do so this year. In his opinion Mr. Clarkson had a good chance of getting elected, but if they had the help of the Midland Counties also he would have a still better chance, and they should leave no stone unturned. It might be that the Midlands had had no candidate of their own this year.

Mr. GARNETT urged they should endeavour to get the Midland to amalgamate with them. When they did so formerly the candidates were always successful.

After some further discussion, Mr. Bowes said he was willing, with the seconder's permission, to add the "Midland Counties Association" to his proposition if they agreed to amalgamate.

Mr. WHARAM agreed, and the resolution being put to the meeting was carried unanimously.

AFFILIATION WITH N.V.A.

The SECRETARY proposed "That the Society be affiliated to the National Veterinary Association under the amalgamation of Societies scheme."

Mr. BOWES seconded. There was no need, he said, to go into the question again. It had been gone into on numerous occasions and had been so well ventilated it needed no introduction. The resolution was carried.

Following upon this the Secretary explained that they would require to elect representatives to serve on the Council of the National Veterinary Association. He proposed that the choosing of the representatives be left to their own Executive Council. Mr. Bowes seconded, and the motion was carried.

PRESIDENTIAL ADDRESS.

A. McCARMICK, M.R.C.V.S., Leeds.

Gentlemen,—I take the present opportunity of thanking you for your great kindness in electing me as your President for the current year. I consider it the greatest honour you could confer on a colleague, and I only hope I shall give you no cause to regret your choice.

I think our Society ought to be much stronger, both numerically and financially, considering this is the largest and almost the most populous county in England. I scarcely know how we could exist without our Society. We all know the great advantages we have derived from the meetings, and our general conversations afterwards. It makes us all meet as colleagues, and not as opponents, and I am sure if any member requires professional

advice on any case, he will readily meet with some colleague who will do his very utmost to assist him ungrudgingly.

The Election for Council will soon be upon us again. I certainly think it is a retrograde action for Societies to amalgamate for election purposes. I take it, if a man is ambitious, and worthy of attaining the honour, he ought to appeal to the electors individually, requesting their support. Amalgamations (not always honourably adhered to) are really sinking individual merit, and often prevent the most worthy man being victorious.

Although I hold these views, they have not prevented me signing the nomination paper as President of the Society, for our worthy Secretary, Mr. Clarkson, and I hope he will at last reach the Council Chamber, and do some good work there.

Financially, our profession at present is in a very critical condition, and I must say candidly that, although at one time I had a few scruples to the contrary *re* The Veterinary Surgeons' Bill, I think it time that all individual opinions on small matters ought to be sunk, and that we should all try our utmost to get the Bill made law at the very earliest opportunity, as it is now becoming a vital matter; indeed, I think it is our only salvation, for we cannot go on decreasing the invested funds of our College as we are doing at present.

I wonder if the National Veterinary Defence and Mutual Benevolent Society would come to the assistance of our College and give the profession a loan of a substantial sum, to be refunded with interest on the Bill becoming law. The invested funds of that noble Society are, as we know, very handsome, and are annually increasing, would it not show at any rate that we have a practical and worthy defence society—defending the integrity of our profession.

I hope the Board of Agriculture will not entertain the views of the various deputations that have waited upon them on the removal of the embargo on Foreign Cattle, and also on Foreign Hay and Straw, for we well know that contagious diseases are very rampant abroad. It would be most serious to all stock owners; although for a short time it would no doubt decrease the price of food, ultimately would end in disaster.

The Board of Agriculture returns for 1911 show that there was a large reduction in the number of horses bred—4·2 per cent.—largely due to the substitution of motors for horses. The total number of cattle for 1911 was slightly increased (1·1 per cent.) These figures show conclusively that the veterinary surgeon of the future will have to look to the country for the best part of his income.

And we must look forward to the growth of country work, not only under the Board of Agriculture, but also under other public bodies. If the Board of Agriculture appointed more veterinary and fewer lay inspectors they would find it greatly to every one's advantage, more especially the taxpayers.

The time has certainly arrived when some endeavour ought to be made to abolish private slaughter houses and have Public Abattoirs in their stead.

All Dairy Shows ought to be tested with Tuberculin, and the reactors isolated at once. Tuberculosis should be scheduled under the Contagious Diseases (Animals) Act, and by that means, I think, it would gradually become much less common than it is to-day.

The various sera ought to be under State control and obtainable only by the veterinary and medical professions. As we all know, they are frequently mixed, and by being so mixed they are often brought into unnecessary disrepute, and let us hope the Government will bring forward a Bill in Parliament on the lines of the one we thought Mr. John Burns would have been able to carry successfully through ere now.

The Parasitic Mange Order of 1912 will, I consider, be

a great boon to horse owners, and the only means of eradicating a most troublesome disease.

The Coal Mines Bill. I am sure the profession owe a deep debt of gratitude to Mr. H. Peele, Durham, for the action he, in the first place, took regarding the Bill, and also to the Deputation from the R.C.V.S. who waited on the Chief Inspector of Mines at the Home Office. Let us hope that through their efforts duly qualified veterinary surgeons will alone be entrusted with the testing of horses for glanders before their descent into the mines. I think we have had a very narrow escape in losing the most vital part in the Bill, but for a private member's foresight, or from some private information, received by said member out of our own profession. I hope the Council will take this as a lesson, and in the future guard our interests rigidly and well.

It has just been announced that the Ordinance for the Institution of Degrees in Veterinary Science, promoted by the University of Edinburgh, has been passed by the Privy Council and has received His Majesty's sanction. The Ordinance will come into operation at the beginning of the next summer session, and by it the University is empowered to confer the degree of B.Sc. and D.Sc. in Veterinary Science. I am sure we ought to be highly satisfied, and I hope our College and the University will work harmoniously together to the advantage of everyone.

The Kirk appeal case *re* the use of the Coat of Arms on our note paper, has ended against us. Mr. Kirk deserves our thanks for his manly but unsuccessful fight undertaken against great odds; he was very badly supported throughout the profession in fighting for the rights we have had for so many years past.

I would like to say how I deplore the readiness with which some of our profession go into the witness-box and give evidence in cases they know practically little about, calling themselves expert witnesses, and by their evidence doing a great injustice in the eyes of judges, magistrates, and the general public, to our profession. I think such cases ought to be taken in hand by our Council and dealt with rigorously.

Before concluding, I am sure we all feel the great loss our profession has sustained during the past year by the death of Prof. W. O. Williams. There have been very few annual gatherings of the Yorkshire V.M.S. without the presence of a Williams, in fact we have always looked forward to having a few pleasant words with either the late Principal or his son.

Mr. McKinna, at the conclusion of the address, in proposing a vote of thanks to the President, said though there were a good many controversial points in the address their thanks were due for the gentle way in which he had touched upon them. They had experienced a keen pleasure in getting their friend Mr. McCarmick into the chair, but they felt a keener pleasure in the way in which he had conducted the business, and it was now in no formal way they accorded him their hearty thanks for his excellent address.

Mr. Bowes seconded, and said though they had had longer addresses he did not think they had ever listened to an address which gave more food for thought than the short address they had just heard.

Mr. CLARKSON spoke in support, and the resolution was carried with acclamation.

ANNUAL DINNER.

After the loyal toasts of "The King," and "The Queen, Queen Alexandra, the Prince of Wales, and Royal Family" had been duly honoured,

Mr. McKinna proposed "The Imperial Forces." As a man of peace, he said, he could not quite understand how it was he was put down to propose this toast. However he believed the toast was intended to include

the first line of defence—the Navy, which every Britisher was proud of; the Army; and he supposed he should include also the Boy Scouts. (Hear, hear.) He hoped they would never need the services of the Army, but it was good to have it there if needed. He wished he could have said something about the Army Veterinary Department. Col. Raymond, unfortunately, who should have responded to the toast, was unable to be there. However, he thought the veterinary profession compared very favourably with their medical comrades in status and other respects. In the absence of Col. Raymond, he coupled the toast with the name of Major Mason.

Maj. A. W. MASON, in responding, said he wondered why those present should be inflicted annually with his speeches. (Laughter.) He, however, thanked them for the honour they did him in asking him to respond to the toast of "The Imperial forces." He did know something about them he flattered himself. First of all, in regard to the Boy Scouts, he remembered even in his own time they used to wave flags and pretend to be brigands. He supposed the Boy Scout movement embodied something of the same spirit only it was on better lines. They got out into the open country on the pretence of doing something and by their training they qualified to become better citizens. (Hear, hear.) As regards the first line of defence, the Sailor Boys, they knew what the Germans would do if they themselves did not do it. However, they would be one better than them, or rather two better, for they would continue to lay down two vessels to one—and he was sure they had the stamina. No finer fellow existed than Jack Tar. If they got him in the fighting mood he believed he was second to none. The English Army, of course, was very small, and was scattered here, there, and everywhere, but he confidently believed the traditions of the past would be borne out. They would emulate the achievements of those veterans who had gone before, and everyone of them would do or die. The Territorial scheme was probably the next best thing to conscription, but it was his opinion they might all see conscription an accomplished fact in a short space of time, and perhaps the sooner it came the better. The Territorial scheme was the thin end of the wedge. The "Powers that be" were certainly giving them something for their money now, for the Territorial was better equipped, and he was taught something of real soldiering.

Prof. SETON, in proposing "The Veterinary Profession," said he thought those who had drawn up the programme might have selected a more suitable proposer for what he supposed was the toast of the evening, yet in spite of that he had not allowed it to spoil his dinner. (Laughter.) He remembered on a previous occasion when he was enjoying the hospitality of this Society being called upon to make a speech when, judging from the countenances of those around him, he made a serious blunder, though they were gracious enough not to say anything at the time. (Laughter.) He was determined, however, not to allow that to happen this time. Some members of the veterinary profession were bemoaning the fact that the importance of the equine branch was gradually becoming less and less, while other veterinary practitioners in some parts of the country had actually discarded horses and been known to use motor cars in pursuance of their professional duties, and against all preconceived notions they had shocked the feelings of agriculturists and farmers by actually driving into their farmyards in motor cars, instead of in the orthodox fashion with a carriage and pair. (Laughter.) If he was correctly informed he believed they had received university recognition this year for the profession, and in future university veterinary degrees would be obtainable. Though he himself happened to be connected with a university he did not say that it was any great thing to have a uni-

versity degree unless that entailed the best possible training. If it meant that recognition for the veterinary profession was just as important as any other of the learned professions, be it law, medicine, arts or divinity, then he thought it was a step in the right direction so long as it meant the education of the veterinary was as broad and sound as his education had been in the past. He had been very much struck by a remark made by Mr. Runciman the previous day with regard to the foot and mouth disease. Mr. Runciman had stated it was the intention of the Board of Agriculture to conduct investigations and researches into the origin and treatment of this disease, and that these researches should be carried out in consultation with veterinary experts, and the India Office had been approached with the object of obtaining facilities for carrying out the investigations there. (Hear, hear.) Why this course had not been taken a score of years before he could not imagine. The Veterinary Colleges could not be expected to take up research work of that character with the limited means at their disposal. He wished Mr. Runciman had gone further, because they had many other complaints in England which for lack of funds had not been investigated, or in which no practical treatment had been discovered. The worst feature about such diseases was that they were so obscure that people did not attach very much importance to them. Though not perhaps so infectious as foot and mouth disease, still they meant great financial loss to owners of stock. In the Development Fund Commissioners they had a body of men who were expected to administer certain funds for the purpose of research and so on, and he learned that they had obtained the sum of £1,300 for the Royal Veterinary College for investigation in respect of vaccination. He hoped that that would prove a good omen, and that more money would be forthcoming for the investigation of obscure diseases which in the eyes of the profession were worthy of being taken up as objects of research. He might say so far as the county of Yorkshire was concerned the University of Leeds had applied to the Development Fund Commissioners for certain funds to be devoted to the investigation of certain diseases. He hoped they would not think the University of Leeds were taking the place of the veterinary profession in this movement, but that they were really only doing their duty in bringing the matter forward and endeavouring to have researches made into the origin and cure of these obscure diseases, and it was their intention, if their application succeeded, that a qualified veterinary surgeon should be in charge of that investigation. (Hear, hear.) He did not know that their application would be granted, but if the Development Fund Commissioners said it was not a matter for the agricultural colleges, but for the veterinary colleges, then their end would have been attained. He was somewhat afraid, however, that the thing was going to be shelved. Unless the Development Fund Commissioners were approached annually like the importunate widow he felt certain the matter would be shelved for a good many more years. Agriculturists were accused of quackery. Those of them who were family men must confess that they supported quackery to a certain extent, because when their children had been ill they had not always run straight to the medical man. They had exercised their powers of diagnosis: perhaps they had been wrong and given Epsom salts when they should have given something else. He himself must confess to having bought "red drenches" and other things when he ought to have called in a professional man. (Laughter.) Yet though they might form some fairly accurate idea as to what was wrong with a child, there was some amount of risk in it; but what about dumb animals? He thought diagnosis in their case was very much more difficult than in the case of a human being, because that animal could not express itself as even a small child could. There

was not only a legal obligation but a moral obligation upon breeders of stock in relation to the public health, and they depended upon the veterinary profession to enable them to carry their obligations out. Was it right for a man who knew he had a "screw" to send the animal to the market? Was it right that a man who knew he had a reacting animal, apparently in good health, to send it to market knowing that human beings might consume the meat? On whom did that obligation rest? Was it entirely to rest upon the practical man? He did not think so, because the practical man could not tell. Could his veterinary adviser tell? He thought it was very difficult. The moral obligation rested, in his opinion, both with the agriculturist and with his veterinary adviser. As time went on he felt certain that that obligation, taking into account the trend of affairs, would be more and more impressed upon the farmer and his veterinary adviser, and in the near future he hoped the position of the veterinary profession would be much more important than it had been in the past. He thought he had noticed during the last few years a rather disappointed air about the profession, but in his opinion they might look to the future with a far brighter face. (Hear, hear.)

Mr. WHARAM briefly responded. The proposer of the toast had referred to the use of motor cars by the profession, but he (Mr. Wharam) claimed they were right in doing so, as they were a progressive profession, and they had taken to motor cars with a view to increasing their efficiency, and he believed they had done so by that means to a very great degree. He agreed with Prof. Seton in thinking that the outlook of the profession was very bright indeed. The Council were endeavouring to fix the examinations at a very high standard, and their schools were teaching the students in such a manner that they would be capable of following up all lines of research. He believed they had a class of man coming into the profession that was quite equal to investigating many of those diseases which were at present not very well understood. Their profession was eager to pass what was called "The Bill," which would give them an assured income, and which would facilitate the work that the Council had in hand.

Mr. F. W. GARNETT proposed the toast of "The Examiners of the R.C.V.S." He stated that he had witnessed every one of their examinations for many years past, and he could assure them he did not think the Council had ever been served by a better staff of examiners than existed at the present time. He wished to convey his conviction of their integrity not only towards the College but to the students themselves. He had never seen the slightest favouritism or irregularity in the course of the examinations in any shape or form. At the present time the bye-laws in regard to examinations were under discussion by the Council, and though he did not agree with change for change's sake, yet from time to time it was their duty to look round and see if their examinations were right up to date. He had great pleasure in coupling with the toast the name of Mr. Woods, one of the oldest Examiners on the Board in experience and in length of appointment. (Applause.)

Mr. Woods, who, in order to catch his train, had to respond to the toast briefly, adverted to the fact that not only was he the oldest examiner, but he had actually completed his majority upon the Examination Board of the Royal College, having done 21 years service in that capacity, which he believed constituted a record. He had, moreover, taken his duties so seriously that he had never missed a single examination. (Cheers.)

Mr. CLARKSON briefly proposed the toast of "Kindred Societies," to which Mr. Brittlebank (President of the Lancashire V.M.S.) and Professor Share-Jones responded.

Mr. BRITTLEBANK, after thanking them for the hospitality he had enjoyed at their hands, said they in Lancashire were looking forward to an extremely busy year. It was the year of their jubilee as a Society, and during that year they also were to have the honour of a visit from the National Association. He appealed to Yorkshire to help them during the next 12 months, and he hoped he would not look in vain.

Prof. SHARE-JONES said there was a time when the medical profession, which he characterised as the noblest of all professions, simply dealt with one type of animal, namely, man himself, but modern conditions had shown that the study of one type did not produce the best results, which were only to be achieved by the comparative study of all types from the protozoa throughout the whole series up to man himself. He might remind them with pride, and he would like to remind their medical *confrères* too, of the discovery made by a fellow veterinarian of the trypanosome in the horse. Though insignificant at the time, that discovery remained to-day one of the great pillars upon which that magnificent edifice, the science of tropical medicine, had been built. It was for them to push their claim to the front, and to show that they could be of utility to mankind, and that they were prepared and willing to play their part in the onward march to that millenium of health to which they all aspired. (Cheers.)

Mr. BOWES proposed "The City of Leeds," and on behalf of the Society welcomed the presence with them of Alderman J. Clark, Chairman of the Sanitary Committee of the Leeds Corporation. That was the Committee they, as veterinary surgeons, felt most sympathy with as it involved, to some extent, connection with their profession, part of its work dealing with the control of tuberculosis, and therefore they were pleased to have the opportunity of listening to what Alderman Clark might say.

Alderman CLARK, in responding, said he had made it in his way, as Chairman of the Sanitary Committee, to go round with the Veterinary Assistant to the Medical Officer of Health for the city on various visits of inspection to cowsheds and meat markets, etc., and he had come to the conclusion that the veterinary official was a man of the highest ability and integrity; and when he considered that that man had paid a great amount of money for his education and possessed knowledge and skill that no other official in the city had, and moreover that every person, man, woman, and child, was dependent for his health to some extent on that one person, he felt he was not adequately remunerated for his services. (Hear, hear). It had been suggested by some people that the position was a sinecure, but he emphatically protested against such an idea. He did not think it was a matter of politics, but a matter of common sense that the health of the community should be considered, even at some little extra cost. It was for the veterinary profession to educate the people in regard to the dreadful disease of tuberculosis. They would not be thought much about if they did not make themselves felt, and it was of the utmost importance to the health of Leeds that they should do so. (Hear, hear.)

The toast of "The Visitors" was proposed by Mr. Bowman, and responded to by Mr. Shipley, of Yarmouth, and the final toast of the evening, "The President," proposed by Mr. Clarkson, in the absence of Mr. Whitehead, being drunk with musical honours, brought a very enjoyable function to a close.

During the course of the evening an entertaining musical and recitative programme was rendered by Messrs. Harry Blackie (baritone), Harold Brierley (humorist), Frank Holt (oboist), W. H. Tatham (reciter), and F. E. Johnson (pianist).

The New "Cruelty" Act—Shoeing-smith Fined

An important case was heard by the stipendiary magistrate (Mr. Neville) at Brierley Hill, on Thursday, 15th inst., under the Protection of Animals Act, 1911, which came into operation on January 1st last. The proceedings were taken under Section 1, Sub-section (e), which makes it an offence to subject animals to any operation performed without due care and humanity.

William Henry Cheadle, shoeing-smith, Dudley Road, Brierley Hill, was charged under this Act with cruelty to a horse on February 2nd. Inspector Smye represented the Birmingham Society for the Prevention of Cruelty to Animals, and Mr. J. T. Higgs defended.

Henry Robins, 101 Worcester Street, Stourbridge, in the employ of George Henry Meese, Brierley Hill, said on February 2nd he took to Cheadle's shoeing forge a horse to have a shoe tightened, and he also asked defendant to examine the animal's mouth. He told defendant the horse would not eat, as it was suffering from lampas. Witness left the horse, and, upon returning, Cheadle told him he had lanced its mouth. After this the horse ate all right.

Mr. R. Lewis Green, veterinary surgeon, Dudley, said he examined the horse on Feb. 4th, and found an excoriation of the palate from one side to the other, and from the back of the incisor teeth to the second bar, the first bar being removed and a portion of the second. In his opinion these bars had been removed by a hot iron. Lancing with a knife would not have brought about this condition.

By the Stipendiary: The proper way in extreme cases was lancing with a knife. No doubt there had been swelling, but the hot iron had caused more swelling, and removed the whole of the mucous membrane. This burning of the mouth was cruelty.

ling, and removed the whole of the mucous membrane. This burning of the mouth was cruelty.

By Mr. Higgs: He pledged himself the hot iron was used. A knife and the rubbing in of salt could not produce such an effect.

Mr. Abraham Green, veterinary surgeon, Dudley, and Mr. James Blakeway, jun., veterinary surgeon, Stourbridge, gave similar evidence.

P.S. Beddoes and Samuel James Webb, farmer, Amblecote, were also called for the prosecution.

THE DEFENCE.

Defendant gave evidence that he had been in business in Brierley Hill twelve years, and Mr. Chambers, veterinary surgeon, attended there. The horse was taken to him on the 1st inst., and at his request, Robins took it away, in order to bring it next day, when Mr. Chambers would probably be there. On the 2nd Robins took the animal at 7.30 a.m. As Mr. Chambers did not come, witness lanced it himself, and his assistant held the animal's head. Witness produced a pocket-knife, with which he said he lanced the lampas. Afterwards he rubbed it hard with some salt and a drop of Fryer's balsam. He performed the operation because the horse could not eat; it did so afterwards. He had never burnt a horse's mouth in his life.

Frederick Beddard, assistant to defendant, gave corroborative evidence.

Mr. Thomas Chambers, veterinary surgeon, Dudley, said he had a place of business at Cheadle's shoeing forge, and he regarded him as a very good man. Witness saw his horse on February 5th, and, on cursory examination, he came to the conclusion that it had the appearance of being rubbed, or, as his professional

brethren had said, as if it had been burnt or rubbed. He made careful examination of it afterwards, and he was now of opinion, and came to the conclusion, that what he saw could have been produced by what Cheadle said he did. If it had been burnt there would have been more sloughing of the mucous membrane.

Mr. Higgs handed to the stipendiary a letter which he had received from Lord Hatherton, who gave Cheadle a splendid character. It would have been quite possible, he had no doubt, to get an array of veterinary surgeons for the defence if one had expected he would have been met by three, but it had not been customary, so far as he knew, to call three professional gentlemen to support each other in such a case as this.

The Stipendiary said Mr. Chambers had given his evidence fairly, but he appeared to have been doubtful for some time, and then came to the conclusion that the mouth was lanced. Altogether, he (the stipendiary) thought the evidence of the veterinary surgeons for the prosecution was correct—that defendant burnt the mouth. [Defendant: No, sir.] People who were not properly qualified veterinary surgeons had to be very careful when they attempted to do anything in the way of any operations with horses. It must be made generally known in the district that if unqualified people attempted to perform operations on animals, now that this Act was in operation, they subjected themselves to a risk of six months' imprisonment. The costs were heavy, and defendant would be fined 10s. and £3 4s. costs, or one month.—*County Express (Stourbridge)*.

PARLIAMENTARY.

NEW BILLS.

In the House of Commons, on Monday, 19 :

The following Bills were presented and read a first time :—

* * *

Sir F. Low (Norwich, Min.) Bill to amend the Acts relating to the practice of Veterinary Medicine and Sundry.

[The second reading has been put down for May 10].

Wednesday, Feb. 21.

Sir F. BANBURY (City of London, Opp.)—Bill to prohibit experiments upon dogs.

Mr. FIELD (Dublin, St. Patrick's, Nat.)—Bill to provide for the marking of imported meat in Ireland.

Tuesday, Feb. 20.

AGRICULTURAL RESEARCH.

In reply to Mr. C. Bathurst (Wilts., Wilton, Opp.) Mr. RUNCIMAN (Dewsbury) said : A grant of £30,000 per annum will be made from the Development Fund for work at Research institutes in the following subjects, viz., Plant physiology, plant pathology (Mycological side) plant breeding, fruit growing, plant nutrition, and soil problems, animal nutrition, animal breeding, animal pathology, dairy investigation, agricultural zoology, and the economics of agriculture. Negotiations are proceeding as to the places at which the work will be carried on. It is proposed to allocate an additional sum of £5000 for investigations of a special character during the ensuing financial year, and I hope shortly to be in a position to announce the purposes for which this sum will be expended.

Army Horse Shoeing.

Lord Haldane received a deputation at the War Office. He was accompanied by Colonel Seely, M.P., Under Secretary, and Mr. Tennant, M.P., Financial Secretary. The deputation were introduced by Mr. W. Mullin, Vice-President of the Parliamentary Committee of the Trade Union Congress. A resolution asking for the establishment of Government workshops for the making of Army horse shoes was submitted.

Lord HALDANE said in regard to the shoeing of Army horses, if they were always under peace conditions the War Office would undoubtedly like to use hand made horse shoes. Their business, however, was to prepare for war. Among the things that were necessary was a large stock of ready-made horse shoes so as to be able to shoe "cold" in the field. The late Government was driven to go to America for them during the South African war, because America was then the only country where they were turned out in large quantities. He was glad to say that British manufacturers had turned their attention to the making of horse shoes, and the country was now amply provided with factories for their quick production.

Mr. McPhail Appreciated.

At recent meeting of the Hull Council, on the minutes of the Sanitary Committee was a recommendation that the salary of Mr. McPhail, the Foods Inspector, be increased from £400 to £500 by two annual increments of £50. This arose out of the fact that Mr. McPhail was one of the two candidates selected for an appointment in London under the Australian Commonwealth.

An amendment that the recommendation be referred back was discussed. Mr. Pearlman spoke of the high services of Mr. McPhail: it would be an unwise policy to drive such an efficient servant from the city. It was a matter of common knowledge that since Mr. McPhail came to the city the inspection of public food had been far more efficient than it was before. Mr. Booth and Mr. J. W. Gould, on behalf of the butchers, also paid high tributes to the work of Mr. McPhail.

The amendment was lost by a large majority, and the recommendation subsequently approved.—*M. T. J.*

Donations to R.C.V.S.

The Secretary of the Royal College of Veterinary Surgeons begs to acknowledge the receipt of the following donation to the College funds from :

Mr. S. J. Marriott, Northampton	£1	1	0
Amount previously acknowledged	7	7	0
	£8	8	0

Personal.

Many will regret the resignation, owing to ill-health, of Mr. James MacDonald, F.R.S.E., Secretary of the Highland and Agricultural Society of Scotland, from the position which he has held with marked success for nearly twenty years. Born in Banffshire in 1852 he, early in life, chose agricultural journalism as a profession, and in 1874 became agricultural representative in the northern counties of Scotland for *The Scotsman*. Later he removed to Dublin to edit *The Farmer's Gazette*, but in the early 'eighties he recrossed the channel to become editor of *The Live Stock Journal*. Some

time afterwards he again came to Dublin as Agricultural Superintendent of the Royal Dublin Society, and in 1892 became Secretary of the Highland Society, which position he has just resigned. Mr. MacDonald has long been well-known as an agricultural writer. He edited, and in great part re-wrote, the fourth and fifth editions of "Stephens' Book of the Farm," and was author of other agricultural books. His work for the Highland Society was most successful, and his courteous and affable manner and unusual amount of common sense made for him a multitude of friends whose wishes he will carry with him into his years of retirement.

ARMY VETERINARY SERVICE.

Extract from *London Gazette*.

WAR OFFICE, WHITEHALL, Feb. 16.

REGULAR FORCES. ARMY VETERINARY CORPS.

The following Capt. are seconded for employment with the Egyptian Army:—

J. J. B. Tapley. Dated Nov. 9, 1911.

T. A. Nicholas. Dated Jan. 4.

The following to be Lieuts. (on probation):—

G. V. Golding, H. D. Lewis, D.A. S. Beck, H. Stephenson, Cadet T. L. Shea, from the Royal Vet. Coll. of Ireland O.T.C. Dated Feb. 17.

Feb. 20.

Capt. W. M. Miller to be Major. Dated Dec. 7th, 1911

The following officers arrived from India in Transport "Rohilla" on 20th instant, and have been posted to the stations against their names for duty:

Captains G. Conder, J. R. Hodgkins, and R. W. Mellard to Dublin: Capt. J. W. Dale to Shorncliffe: Lieut. A. S. Lawrie to Chatham.

Capt. R. F. St. C. Houston also disembarked from above ship and has been admitted to Netley Hospital.

OBITUARY.

WILLIAM AULTON, M.R.C.V.S., Derby.

Graduated, Lond: April, 1859.

Mr. Aulton died on February 16th at Nottingham Road, Spondon, at the age of 79 years.

THOMAS DART, V.S., Molland, South Molton, N. Devon.

Mr. Dart left the railway station for his home in his cart about 7 p.m. A considerable portion of the road is steep and narrow. About an hour later Allan Dart, his youngest son, was going towards Molland when he ran against a horse standing in the road. Lighting a match he saw an overturned cart and, almost immediately after, his father. He ran for assistance to Ford Farm, about a gun-shot distance down the Hill, and Mr. R. Elworth came to his help. It was at once seen that the unfortunate gentleman was dead.

An inquest was held at Molland, on Monday. The medical evidence given by Dr. Seal, of South Molton, showed that death was due to a broken neck, caused by the overturning of the cart. Deceased was strictly sober when he returned from the station, where several persons had spoken with him, as well as others on his way home. The jury, in returning a verdict of "Accidental death," expressed sympathy with the family.

Mr. Dart was a native of the parish, of a genial and kindly disposition. Except for a period of about ten years, when he went to Buckinghamshire, he has lived all his life in Molland, and has had considerable practice in a dozen or more parishes. He leaves a widow, three sons, and two daughters.

The Late Rev. Dr. Gillespie.

Agricultural interests in Scotland have sustained a severe loss in the death of the Rev. Dr. Gillespie, which took place on Wednesday at the advanced age of seventy-five.

The son of a Dumfriesshire farmer, Dr. Gillespie was educated at the local school and at the Glasgow University, graduating at the latter in 1857. He was licensed in 1861, and four years later was presented to the living of Mouswald, a sparsely populated parish in an agricultural district near Dumfries. That charge he continued to hold up to the last, his ministry thus extending well over forty years. Dr. Gillespie took a great interest in church work, and rose through various positions to the honourable office of Moderator of the General Assembly of the Church of Scotland. But he was best known to the outside world for the great interest he took in agricultural matters. In addition to writing largely on the subject, he was for thirty years a leading director of the Highland and Agricultural Society. In that long time he missed very few meetings of the Board or very few shows of the Society. For many years he was one of the most influential of the directors, and almost nothing was done that he objected to or disapproved of. In addition to that, the reverend doctor was chairman almost from the start of the Glasgow and West of Scotland Agricultural College. He was also chairman of the Joint Board for conferring agricultural and dairy diplomas, and an examiner in agriculture for the B.Sc. degree in Glasgow University, while he was a member of the Departmental Committee which inquired some years ago into the subject of abortion in cattle.—*L.S.J.*

Dr. Gillespie had the reputation of being one of the best raconteurs of his day. Here is one of his stories:

"A Forfarshire minister wished a new horse—which is popularly known as 'a minister's beast'—suitable to overtake the sort of mixed and miscellaneous work which a quadruped with such an ownership is generally expected to perform. Without seeing the rather ludicrous character of it, he put an advertisement in the local paper in these terms—'Wanted a horse, to do all the work of the parish minister. Apply,' &c."

Another story is to this effect:

Scene: Lockerbie Station during sitting of the General Assembly. Young clerics who have been preaching for members of assembly.

English tourist in train: "I say, porter—porter! Who are all these parsons whom I see at the station?"

Porter: "Oh, these young ministers, sir? They are returned empties, sir!"

On one occasion Dr. Gillespie attended a book sale, when "Mrs. Caudle's Curtain Lectures" was put up, and the minister said to the auctioneer: "Take it home, Mr. McLean." The auctioneer shouted in reply: "Na, na, minister, neither you nor me need tae tak' it hame; we can get it at hame wihoout the book!"

Veterinary Societies Addresses.

THE 'RECORD' PRECISION SYRINGE.

The FINALITY of Hypodermic and Serum Syringes.

"The **'Record'** Precision Syringe is a piece of delicate mechanical workmanship well deserving its name. It meets **all requirements as regards aseptic conditions and accuracy and it is always ready for use.**

It consists of **metal and glass** only. The glass barrel is ground inside perfectly true to cylindrical form. The Nickel vacuum piston is "ground in" into the glass barrel by precision machinery so as to fit hermetically, it slides smoothly, yet tightly, **without any lubricant.**

The cover is fixed on the cylinder with a **bayonet-fastening**; for the purpose of **thorough cleaning** it is provided with a segmental incision, by means of which it can be detached from the piston-rod by sliding it off side-ways. When **completely** taken apart the Record Syringe **forms 3 parts only: cover, piston and barrel.**

The **Needles** are provided with the original "Progressive" flat mounts. By this arrangement a good hold is afforded to the operator.

The fixing of the needle itself in the mount, by means of a smooth longitudinal guide arranged above the screw threads prevents the needle from breaking off in the mount.

EVERY SYRINGE IS GRADUATED BOTH IN C.C. AND 'MINIMS.

Price with 2 Steel Needles in Metal Case—20c.c. 21/- 10c.c. 17/6. 5c.c. 15/- 2c.c. 10/- 1c.c. 9/-

QUALIFIED Veterinary Surgeon, married, to manage practice, town and country, practical and abstainer, good operator standing. Free house, taxes paid. One requiring permanency will be treated to succession at his disposal. Address, 3103 V.R., 20 Fulham Road, S.W.

Wanted

FULL Particulars of Practice for Sale in good agricultural and residential district returning up to or over £700 per annum. Advertiser has sufficient capital to purchase outright. Address, 1039 V.R., 20 Fulham Road, S.W.

Assistant Wanted

UNQUALIFIED, used to forge practice, to keep books, assist in dispensing and veterinary work. Permanency and progressive salary to suitable man. State experience, terms, and references, to 1103 V.R. 20 Fulham Road, London, S.W.

Assistant Wanted

THOROUGHLY experienced in town and country practice, must possess good business habits and able to castrate standing. Qualified preferred, sign bond, probable permanency to good man. References, with lowest salary to live out. Address, 2103 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

MR.C.V.S., (1911) desires assistantship, has seen practice in England, Scotland, and Ireland. Address, X197, c/o Eason & Son, Dublin.

Qualified Assistant

WANTED for permanency, married preferred. Wide district but not heavy, practice includes all animals but no castration, parturition cases frequent. Must be sober, and willing to share all work with principal. Address, S. Beeson, Hereford.

As Assistant or Locum

FINAL year student (29) offers services as assistant or locum, well up in town and country practice, castration, parturition, etc. Ride and drive horse or car. Free March 16th to May 1st. S. H. L. Woods, Ryl. Vet. Coll. Camden Town.

As Assistant

CCLASS D student, farmer's son, up in July, desires position as assistant in country practice, from March 16th to May 1st. Good horseman. Address, G. W. H. Ryl. Vety. Coll., Camden Town, N.W.

Wanted at Once

QUALIFIED assistant for mixed country practice in the Midlands. Apply, stating age, height, weight, and salary to live in. References. Address, 3402 V.R. 20 Fulham Road, London, S.W.

As Assistant

CCLASS D student (22) farmer's son, desires position as above from March 16th to May 1st, country practice preferred: ride, drive, cycle. Address, H. S., Royal Vety. Coll., London, N.W.

For Disposal

GENUINE old established country practice, average returns exceed £700. Convenient house with good yard, outbuildings, paddock, garden, and six acres of land at a rental of £53. Thorough introduction and assistance given until established. Premium £500. Address, 4402 V.R., 20 Fulham Road, London, S.W.

Wanted

PRACTICAL man to manage country practice (married), good operator and cyclist. House found. Address, 9402 V.R., 20 Fulham Road, London, S.W.

Assistant Wanted

QUALIFIED assistant for mixed practice, must be practical and steady and well up in castration and parturition. Sign bond. Permanency. Reply, stating age, height, and terms, with references, to 8402 V.R., 20 Fulham Road, London, S.W.

Notice

MR.C.V.S. would like to communicate with H. Williams, M.R.C.V.S., late of Lancaster. Address, 5402 V.R., 20 Fulham Road, London, S.W.

Wanted Immediately

QUALIFIED assistant to manage branch practice, (town and country) practical, and abstainer. Sign bond. Reply, stating age, height, and terms required, with references, to 6402 V.R., 20 Fulham Road, S.W.

Assistant

WANTED for a mixed country practice, a steady reliable assistant, must be a good dispenser. Apply, giving fullest particulars as to age, etc., to 7402 V.R., 20 Fulham Road, S.W.

For Sale through Ill-Health.

COUNTRY Practice. Beautiful part. Favourite county. Hunting, shooting, golf, fishing, polo close. Garden, greenhouse, large orchards, paddock, etc. Returns last eight years £390-£420. Price £250 for quick sale. Address, 8302 V.R., 20 Fulham Road, S.W.

As Assistant

RECENTLY qualified M.R.C.V.S. seeks situation as Assistant. Experience in country and town practice. References. 1302 V.R., 20 Fulham Road, S.W.

To Vendors.

WANTED Veterinary Practices and Partnerships. Surgeons wishing to sell the whole or a share of their practices are invited to communicate with Messrs. Peacock & Hadley, Veterinary Transfer Agents, 19, Craven Street, Strand, W.C., who will be pleased to introduce likely purchasers. No charge whatever made unless a sale be effected.

New Parturition Instrument.

ILLUSTRATED description of same in actual use and testimonials sent on application. Removal of limb and dissection made easy. Orders for this season must be sent early. Address, W. J. Fletcher, M.R.C.V.S., Wrexham.

Non-Poisonous,
Non-Corrosive,
Soluble in Cold Water.

CHINOSOL

Active Antiseptic,
Strong Deodorant,
Powerful Germicide.

Practical experience for years past proves that Chinosol in solution or ointment readily penetrates diseased tissue, thoroughly cleanses and keeps healthy all kinds of wounds, favours granulation and speedy healing, mostly without a scar, and promotes the growth of hair. Chinosol is supplied in

POWDER.

CHINOSOL PURE POWDER for therapeutical preparations used *INTERNALLY*.

CHINOSOL VETERINARY POWDER for lotions, ointments, etc., for *EXTERNAL* use.

CHINOSOL CRUDE GRANULAR FORM } for prompt production of disinfecting fluids for odourless disinfection.
CHINOSOL CRUDE POWDER F }

CHINOSOL SPRINKLING POWDERS for disinfecting and deodorizing stables, sheds, styes, kennels, fowl-houses, etc.

Also *ANTISEPTIC DRESSINGS, OINTMENTS, SOAPS, PESSARIES, CHINOSOL BORACIC DUSTING POWDER, VETERINARY EQUIPMENT*, etc.

Write for full Price List, also for *POCKET CIRCULAR* for *VETERINARY PRACTICE* giving full particulars of treatment of *MILK FEVER, ABORTION, INFECTIOUS VAGINAL CATARRH* in *COWS*, and a great number of approved formulae.

NOTE.—Buyers of our preparations should in their own interest insist in receiving *ORIGINAL PACKAGES* bearing our trade mark with name and address of the Company and full directions inside, they should reject all packages not answering above description *AS NOT GENUINE* and inform us when such are offered.

Sold by Messrs. **Hewlett & Son, Ltd., London;** **Willows, Francis & Co., London;**
Wyleys, Ltd., Coventry. **Woolley & Co. Ltd., Manchester.**

And all *WHOLESALE CHEMISTS* dealing in *VETERINARY MEDICINES*.

TABLETS.

COMPRESSED TABLETS (disc shape) containing *FIVE EIGHT* or *FIFTEEN GRAINS* Pure Chinosol for internal administration in dry form or solution.

VETERINARY TABLETS (square shape) containing 45 grains Veterinary powder for external use only, to promptly prepare lotions, ointments, etc., of given strengths.

SANITARY TABLETS (square shape) containing 45 grains Crude Chinosol for the immediate production of disinfecting fluids of given strengths.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1234.

MARCH 2, 1912

VOL. XXIV.

A PRESIDENTIAL ADDRESS.

The newly-formed Connaught Veterinary Association may certainly be congratulated upon its first meeting and its first President. Mr. Hamilton's presidential address, which we publish to-day, contains much that is directly valuable and something also of indirect suggestiveness. A strong note is struck at the outset in the appreciation of the value of co-ordination—a lesson which our profession, despite its motto, is even yet only beginning to learn. It seems to have been grasped in Connaught, with prospective good results.

That a few isolated practitioners, while retaining membership of larger and less accessible societies, should found a small one of their own, is bound to benefit the profession locally. That the new Society should aim at speedy union with the "National," augurs that its influence will be more than local—that it will become a factor in the advancement of the profession as a whole.

Much more of the address, as is natural to a speaker engaged in preventive work, is occupied by a consideration of public health legislation. This, consisting in the main of views which we all share, but more effectively set forth than we have sometimes heard them, need not detain us. Then, towards the end of the address, we note a rather unnecessary apology for the amount of attention given to cattle, with the just excuse that it points out a field of usefulness. In our view, an increasing attention to bovine diseases is a natural and a commendable sign of the times.

The fact is that cattle practice, though it has always been an important part of the everyday work of some of us, has never received its due meed of careful study and attention. Much of this has been due, as was the long neglect of canine practice, to the greater interest and importance of the horse. But the horse will never again figure so largely in veterinary practice as he once did; "new fields" must be sought, and this one of bovine disease, which lies ready to our hands, is as yet only half worked. As an increasing amount of general professional attention is paid to it, it will, we think, prove a rich field of study, in which a skilled veterinarian will be found quite as useful to the farmer as he ever was to the horseowner. Farmers scarcely realise this, for in many country districts most of the cattle practice is done by empirics. Neither, we may add, do all veterinary surgeons; for there are still some, even in the country, who pay little serious attention to bovine diseases. So long as that can be said, we can hardly claim to be playing our proper part in the community.

GASTROPHILUS EQUI AND "STOMACH STAGGERS"—A SUGGESTION.

Two cases have come under my direct observation recently in which grave suspicion attaches to the "Bot" as the exciting cause of death.

When one meets a single case of unusual nature where the symptoms and post-mortem point to a certain cause as possible exciting agent, it is wise to be cautious in conclusions, and to take into good account the far-reaching possibilities of co-incidence, but when a series of cases occurs in which the symptoms are almost the same, and the post-mortem examinations reveal similar indications, suspicion is apt to become a certainty. Two cases, however, hardly constitute a pathological series in the accepted sense of the term, and my opinion on the following observations is given with diffidence, and with the hope that some other practitioner may be able to bring more evidence on the subject.

Case 1.—A six-year-old R.F. Colonial Remount, admitted to the Veterinary hospital for debility and asthenia. Unusually dull and depressed, and in poor condition. Clinical examination revealed no symptoms of organic disease, so the ordinary course of tonics and careful dieting was prescribed.

No improvement occurred, and after a week or so symptoms of brain trouble were evident. One becomes diagnostically acute in the retrospective light of a post-mortem examination, and I confess with shame that the symptoms were typically those of the text book "Stomach Staggers," yet at the time I considered them due to a new growth in the brain. In the later stages the animal would press forward and bruise his nose and head against the manger and walls of the loose box. There was no delirium or undue excitement.

For ten days the horse showed the same dull, sleepy symptoms, eating occasionally and mechanically, with absolute indifference to the nature of the food. He would, for no apparent reason, leave a carefully prepared mash and eat dirty bedding from the floor. Death took place quietly, apparently from inanition.

So strong was my conviction as to the cause of the disease that the usual procedure of post-mortem examination was departed from, and the brain first exposed. It was normal, save for a watery sodden appearance.

On opening into the abdomen the huge bulk of the stomach immediately arrested attention. It weighed with its contents nearly forty pounds. The contents were solid and almost dry, amongst them could be distinguished portions of food that had been given a fortnight or longer before death.

This recognition was made possible by the fact that every obtainable variety of invalid diet had been tried, and a record kept on the chart. The organ was emptied of its food contents and search made for a possible cause of the arrest of the normal course of ingesta. *The pylorus was thickly studded with Bots.* They extended a little way into the stomach anteriorly, and about six inches into the duodenum posteriorly. Some were free in the pylorus. Throughout the whole of above-mentioned area there was not a portion of the mucous membrane unoccupied by the parasites. The rest of the intestinal canal was absolutely empty save for water and mucus.

Case 2.—A raw polo pony, recently purchased in Natal. History of persistent poor condition in spite of liberal feeding and an easy time for over six weeks. I was called about 6 p.m. one day to see the animal which was reported very ill.

It was in a loose box surrounded by farriers and grooms who were endeavouring to prevent evident attempts at suicide. It was already bleeding from self-inflicted wounds on the head. Temperature was normal, pulse accelerated, pupils dilated, respiration hurried somewhat.

The evident brain symptoms, the history of preceding dullness, and the apparent absence of abdominal pain, made it probable that here was a case similar to that of No. 1. The only essential difference seemed to be that one had the "violent" stage or variety instead of the "sleepy" stage to deal with. Prognosis was not hopeful, but I prescribed to the best of my ability and did everything possible before leaving the animal for the night.

At 6.30 a.m. the following day the pony was "down" and obviously *in extremis*. It died in the afternoon. The post-mortem was almost identical with that of Case 1.

Now here are two cases showing the same symptoms and revealing the same post-mortem appearances, in which the only discoverable common factor is the bot. Had the parasites been in any other situation than thickly grouped around the pylorus one would have ignored them, but their position makes their presence worthy of careful consideration. One knows how sensitive the pylorus is to irritation: how unwillingly it allows to pass ingesta of an acid nature. It is conceivable that the irritation caused by the presence of multitudes of bots would induce an almost persistent contraction of the pylorus, allowing fluids to pass, but effectually barring the path to solids or semi-solids. It should be remarked that bots are not nearly so common a feature of post-mortems in this country as in the British Isles. They are the exception—at any rate at this station. A reflection that impressed me while making the post-mortems on these cases was the ease with which one might be misled by symptoms of reflex origin. Here were two apparently typical cases of brain trouble. No abdominal distension, no history or present symptoms of obvious abdominal pain.

In Case 1 the entire failure of two aloetic balls that were given should have aided diagnosis, but

one remembered that in brain trouble peristalsis was reputed difficult of stimulation.

To sum up, the arguments in support of the contention that the bots in the pylorus were the main factors in the gastric impaction are as follows:

1. Irritation, causing contraction of the pylorus.
2. Reduction in the calibre of the lumen by the bulk of the parasites.
3. Friction. The perfect lubrication of the normal intestinal wall by mucus is doubtless largely instrumental in facilitating the onward passage of ingesta, and where, instead of such a perfect surface, there is presented a rough corrugated mass of bots, it is reasonable to suppose considerable resistance to the flow of chyme.

WAKEFIELD RAINEX, Capt. A.V.C.

Bloemfontein, S.A.

ABSTRACTS FROM FOREIGN JOURNALS.

COMPOUND FRACTURE—OSSEOUS SUTURE.

Demazel and Lapperousaz record (*Journal de Méd. Vét. et de Zootechnie*) the case of a four-year-old Gordon setter affected with a compound fracture, of five days' standing, in the inferior third of the leg. The tibia and fibula were fractured obliquely, and the two ends of the tibia protruded from a wound on the interior aspect of the limb. The wound was irregular, and its edges were jagged; it was about 2 inches long by 1.1-fifth in. wide. The adjoining muscular and cutaneous tissues were blackish, hæmorrhagic, bathed in pus, and very œdematous. Closer examination showed that the ends of the bones were denuded of periosteum, and contained a greyish and purulent marrow.

Treatment was undertaken, despite the unfavourable outlook. The region was shaved, and the wound was enlarged upwards and downwards to facilitate the employment of antiseptics, but reduction of the fracture could not be effected. An ordinary dressing (wadding, pasteboard splints, silicate of potassium bandage) was applied over the whole limb, with the exception of the wound. A large "window" was contrived in the splints at the region of the wound, from which the end of the bone continued to protrude.

At first, peroxide of hydrogen was applied three times daily; the wound being re-covered, after each application, with a dressing moistened with the same agent. The general condition of the animal was bad. The temperature was 104° F., and the pulse 120 per minute. Constipation was obstinate at first, but was followed soon afterwards by hæmorrhagic diarrhoea. Appropriate symptomatic treatment was applied to the fever, the digestive disturbances, and the prostration. On the third day the dog recovered his spirits. The wound was rose-red, and "laudable" pus impregnated the dressing. The septicæmia was checked.

The application of dressings, however, damaged

the paste-board material of the splints, the bandage ceased to be retentive, and it became important to immobilise the ends of bone. About the fifth day osseous suture was attempted.

Without anæsthetising the animal, the ends of the bones were perforated by a fine gimlet. After accurate co-aptation of the ends a brass wire of about a millimetre in diameter was passed through the holes thus made and knotted in the wound. A second brass wire was then applied as a circular ligature around the bones above the preceding one. In order to facilitate the discharge of pus and the application of antiseptics, a counter opening was then made upon the external aspect of the limb; and this afterwards proved very useful. The paste-board splints were replaced by thin slips of wood, with "windows" in connection with the wound and the counter-opening. The antiseptics used were now changed several times in the week.

Twenty days after the osseous suture it was found that the two ends of bone were united by a rose-red medullary callus, which joined them firmly in a good position. The primary wound was almost closed, but an oily, yellowish pus flowed from it, and this was found to be due to particles of necrosed bone and periosteum acting as sequestræ. These were removed, and with them the two brass wires, which became mobile at the same time. The limb was consolidated. A fresh dressing, without splints, was then applied; and the supuration ceased at the end of two days.

Nearly three months after his entry into the College infirmary the dog was discharged cured. One of the authors saw him later, and found that the limb had recovered its normal volume, showed no deformation, and was quite supple.—*Annales de Méd. Vet.*)

W. R. C.

ROYAL COUNTIES VETERINARY MEDICAL ASSOCIATION.

The annual meeting took place at the Great Western Hotel, Reading, on Friday, Feb. 9th, and the gathering proved a very successful one. The President, Mr. Stewart Stockman, London, occupied the chair at the meeting, which was also attended by Messrs. Wm. Hunting, Hon. Associate; A. L. Butters, Hon. Auditor, London; G. E. King, Abingdon; J. H. Parker, Faringdon; Thos. W. Lepper, Aylesbury; R. Page Bull, v.p., Deddington; R. C. Tennant, Windsor; J. C. Coleman, Swindon; W. T. D. Broad, Marlborough; J. R. Baxter, Lechlade; J. Willett, London; S. H. Slocock, Hounslow; Percy J. Simpson, Maidenhead; W. Shipley, Great Yarmouth; W. A. Hancock, Uxbridge; H. C. Jagger, Bicester; H. S. A. Dunn, Reading; and G. P. Male, Reading, Hon. Sec. and Treas. Visitor—Mr. Reginald James, Swindon.

Letters and telegrams of apology were received from Prof. McCall, and Messrs. T. B. Goodall, E. J. Mellett, R. J. Verney, S. Villar, F. Bazley, W. Pauer, J. H. Wilson, John Varney, F. H. W. Cundell, J. Hatch, Jas. East, Wm. Wilson, L. Barnard, R. Roberts, and F. W. Hanks (with whom the meeting expressed sympathy on the cause of his absence, which was Mrs. Hanks' rather sudden death).

NATIONAL ASSOCIATION COUNCIL.

Mr. MALE submitted a letter from Prof. A. Gofton, Hon. Secretary of the Committee, asking this Association to appoint representatives on the Council of the National Association, in addition to the Hon. Secretary, who is a member *ex-officio*, under Rule 36 of the National Association. Messrs. Slocock, Butters, and P. J. Simpson were appointed.

FINANCE.

Mr. A. L. BUTTERS, the Hon. Auditor, presented the statement of accounts. He drew attention to the fact that the balance sheet did not show all the liabilities of the Association. Their Hon. Sec. had not put in his expenses, so that the balance sheet would next year have to show his expenses for two years instead of one.

Two members in arrear having been dealt with, the report was approved.

NEW MEMBERS.

Mr. J. R. BAXTER, M.R.C.V.S., of Downington House, Lechlade, and Mr. F. H. W. CUNDELL, M.R.C.V.S., of Swindon, were unanimously elected members of the Association, on the motion of Mr. Parker, seconded by Mr. Male.

Mr. NORMAN GILFORD, M.R.C.V.S., of Newbury, was nominated for election at the next meeting by Mr. Male.

FUTURE MEETINGS.

At the invitation of Mr. Stockman, it was arranged, on the motion of Mr. Willett, seconded by Mr. Slocock, that the next meeting of the Association be held at Alperton Lodge on the 16th April, Mr. Stockman very kindly saying that he would give a demonstration, or arrange for some one to do so, or read a paper.

Mr. G. E. KING suggested that the summer meeting might be held at Abingdon, a trip on the Thames to form one of the features of the gathering; and the idea met with general approval.

VICTORIA BENEVOLENT FUND.

The PRESIDENT said that the subject was one which commended itself without words. Everybody knew the object of the Fund, but he doubted if they all knew how much distress there really was in connection with the profession. It was true that they were a small profession in numbers, and so they had a comparatively small number of cases; but in relation to the membership the proportion was high. If they could read some of the pathetic letters of thanks that come from recipients of help from the Society he was quite sure that they would be moved to empty their pockets. He asked Mr. Shipley, as one who was well up in the matter, to give them particulars of a matter which he commended to the notice of all.

Mr. SHIPLEY said that most of those present knew he was very interested in that Fund. As their President had told them, there was a terrible amount of distress amongst the widows of veterinary surgeons, and also amongst old practitioners. What he wanted to obtain, if he possibly could do so, was more individual support—rather than collective—for the Fund. Whilst they appreciated very much donations from the Associations, they would very much prefer to have individual members of the Fund. A subscription from a Society did not go very far to help a poor woman with five or six children. Some of the cases were simply deplorable. One of them was the widow of a young veterinary surgeon who died in South Africa, leaving her with seven children, and absolutely nothing to live upon except what she could collect at a lodge in Ireland: and the most the fund could give her was 10/- a week. He wanted individual support also, from another point of view. He knew as a matter of fact that there were

widows of veterinary surgeons, and some old practitioners also, who were too proud to appeal to them, and he hoped all would help in looking up and reporting such cases. It seemed ridiculous to him that with the number of active veterinary surgeons in the country they had had only 105 subscribers until recently. They were now spending about £180 a year, and only the day before there came another appeal from a widow in Ireland. He wanted every man who felt himself able to do so to give an annual subscription and also to take an interest in the work of the Fund. Mr. Shipley further pointed out that the executive of the Fund were over-spending their income; and added that half-a-guinea a year constituted membership.

Mr. MALE reminded those present that the matter was brought up at the last meeting of the Association, and postponed until they knew how their funds stood. Their balance was now fairly satisfactory, and he thought they were in a position to make an annual subscription towards the fund. Hitherto their donations of £10 10s. had been very irregular.

Mr. SHIPLEY, replying to the President, said the desire was to have an annual income that could be depended on, so that the Council could feel that the grants they made could be continued unless circumstances altered.

It was then agreed, on the motion of Mr. MALE, seconded by Mr. KING, that the Association give an annual subscription of £5 5s. to the Victoria Benevolent Fund.

POST MORTEM SPECIMENS.

Mr. COLEMAN showed a specimen of pseudo-conception, which accompanied a fully-grown calf at birth.

A calculus taken from a horse which during the last two years of its life had shown "colic" pains about every fortnight. The calculus was found in the large colon, and when he split it open he found a small piece of horse-nail in the centre; the calculus weighed 10 lbs. 9 ozs.

Another specimen was, he thought, rather unique. It occurred in a four-year-old heifer with her second calf, and he at first thought it was a case of intussusception. The heifer's temperature and pulse were all right, and it showed no pain; but it had no appetite, and passed no fæces, in spite of enemas. Twice a day she would pass about a quart of serum, more or less blood-stained. When he examined this microscopically he found crystals very much like uric acid crystals. It was, evidently, not a case of intussusception; and he did not know what it was.

Mr. MALE exhibited the skull of a horse, with a very small spicule of bone, and explained that the animal from which it was taken had a sinus up the side of the ear, which had apparently been there about twelve months. There was no history of injury. Ordinary surgical treatment having failed to effect a cure, the owner was prepared for serious operation. It was expected to find a supernumerary molar at the base of the ear. The horse met with an accident and was destroyed. No sign of a tooth was found, but simply a small spicule of bone.

The PRESIDENT thanked Messrs. Coleman and Male for bringing forward such interesting specimens for examination by the members of the Association.

VETERINARY EVIDENCE IN POLICE COURT CASES.

Mr. COLEMAN brought forward the question of evidence given by veterinary surgeons in police courts. He began by saying that he believed the object of the veterinary societies throughout the kingdom was to advance and raise the status of the profession generally; and it was much to be regretted that "blacklegs"—or renegades—existed in the profession who could be bought to give evidence. He learned that the Central Association had formed a Committee; and he thought that an old-

established and honourable society like the Royal Counties' Association ought to take some action to support the Central Association, or the Council R.C.V.S., or both, in the matter, in taking such action as would make examples of persons who, by giving false evidence, lower the reputation of the profession.

The PRESIDENT said that, although at present he did not move in the circles of practice in the way that most members of the profession did, he read the Veterinary Journals, and he felt that the question raised by Mr. Coleman was a subject not only of interest but of great importance.

Mr. COLEMAN commented on the evidence given by some of the Inspectors employed by the Royal Society for the Prevention of Cruelty to Animals, and by some police constables, and of the habit in some police courts of magistrates accepting such evidence in preference to that tendered by veterinary surgeons who were called for the defence.

Mr. WILLETT, who had brought the matter before the Central Association, supported Mr. Coleman; and said that in some Courts a practitioner who gave evidence for the defence appeared to be immediately regarded as a hostile witness. A very serious matter in London was the treatment of horses (in the morning) in the green-yard, the appearance of which, they not having been treated, created prejudice against the defendant.

Mr. SHIPLEY spoke very strongly as to the action of the R.S.P.C.A. in certain cases.

Mr. SLOCOCK endorsed Mr. Shipley's remarks. The Royal Society no doubt did a lot of good work, although he thought they were usurping the duties of the police and also of private individuals, the latter, as he showed, having a perfect right to lay an information in any case of cruelty they witnessed, and to have the case properly heard before magistrates. He had taken the latter course himself. There were, and must be, honest differences of opinion amongst veterinarians as to such questions as the causes of lameness in a horse; and professional men could not be expected to confer before they gave their evidence one against the other; but they could sometimes draw closer together if they, as honest practitioners, had a preliminary word together, without stretching their consciences. In the majority of cases, however, he thought that was absolutely impossible.

He thought the members of the profession greatly "gave themselves away" by supplying a Society's inspector with a written report on a case, which those men sent up to the Society, and some of them afterwards embodied in their evidence in the box, putting their own construction on the certificate. What was wanted was, as he had several times said, a Society for the Protection of Horse-Owners, which should have its branches throughout the kingdom. (Hear, hear.)

Mr. BUTTERS said that his experiences in the matter had been some of them pleasant and others very much in the nature of surprises when he had given evidence. He wished to emphasise what he might call the atrocities of the green-yard, from which animals were often brought to Court in a disgraceful condition, having been deprived of the comforts they would get in their own stables. (Hear, hear.) It was cruel that horses suffering from, say, having picked up a nail, or from a festering corn, having come into the hands of the police, should not have immediate attention. A great many cases were not legally defended on account of the poverty of the horse's owner; and in others many horse-owners had come to the conclusion that it was cheaper to plead guilty rather than to fight the case.

Mr. HUNTING said it was a grievance that so many veterinary surgeons called for the defence seemed to be treated immediately by magistrates as "hostile" witnesses. Under the new Act, the penalty for cruelty was much more serious. If anything was to be done it ought to be done now. He thought that when the

green-yard part of the system was made known to the Commissioner of Police he would put a stop to it. (Hear, hear.) As to two veterinary surgeons giving opposing evidence, he would point out that they might fairly differ as to the amount of pain an animal suffered. It was probably a question of cost, and of time, which actuated a magistrate in not calling in a third opinion when there was conflicting professional testimony. He related some amusing cases of differences of opinion in giving evidence, which had led him to the conclusion that in half of them such differences were reconcilable. Cases of flagrant bad evidence by a practitioner should be reported to the Royal College, that the offender might be dealt with.

Mr. TENNANT agreed that where two veterinarians differ on a case the only practical way is to call in a third opinion. He felt that, whenever possible, there should be a veterinary surgeon on the Bench when such cases were heard. (Hear, hear.)

Mr. SIMPSON felt that it was the individual Inspector, and not the R.S.P.C.A. who employed him, who was to blame in certain cases. He agreed with Mr. Slocock that after the Inspector had taken out of their lips what they had to say the veterinary surgeon could only follow on and say that he agreed with the Inspector.

The PRESIDENT said that, as Mr. Shipley had mentioned, he was on the Council of the Royal Society for the Prevention of Cruelty to Animals. About a year ago there was an attempt, as they knew, to eject him, but, being rather obstinate, he would not go. (Laughter, and hear.) They must not, however, think that the Council of the Royal Society was composed entirely of people who held exaggerated opinions. They had to act very much on the reports they had received from their inspectors, whom they were naturally inclined to support, having no means of analysing a case on the spot. The society, who had an income of about £60,000 a year, was able to employ expert counsel in their cases, and the magistrate had to decide upon what he was told. The method was un-British. (Hear, hear.) They did not find it only in police courts but in actions about unsoundness of horses men of well-known authority and honesty would give differing opinions. Lately, in the examination of stallions for soundness, under the Board's scheme—and he had a great deal of experience on that matter—if a horse worth, say, £300 or £500 was condemned by a veterinary surgeon, and so could not get a certificate, its value went down enormously, and the owner naturally said he could not agree to the Board's certificate, but must have an appeal. As a matter of justice all would agree that he should have an appeal; but the appeal was on the lines that men of well-known reputation were employed by the Board. If the owner appealed against a certificate of unsoundness he must with his appeal present a certificate from a qualified veterinary surgeon saying that the defect mentioned did not exist. When there was that difference of opinion the Board sent a third and independent man, and they had to agree with the majority. There must be some working arrangement of that kind; and he (the President) fancied that a magistrate often found himself in such a position. If they could set up an appeal body, established by a central institution, or by the profession, it would be very helpful, but he did not think that was at present practicable.

There were different types of inspectors, as there were of constables, and some of the former doubtless had the "Bobby" mind. Again, a professional man often had a certain amount of a "philosophic doubt," and gave a qualified opinion after hearing the inspector; so that, all round, he did not think the question was one at which the profession should go "bald-headed." They should have a good scheme to present before going to the Home Office or to the higher police officials. (Hear, hear.)

Mr. COLEMAN proposed "That the Royal Counties Veterinary Medical Association most cordially support the Central Veterinary Society in the steps they suggest taking with the object of obtaining more justice in cruelty prosecutions, especially in so far as it affects the professional evidence for the defence. They also heartily approve the suggestion of a deputation waiting upon the Home Secretary and the Commissioner of the Police in the matter."

This was seconded by Mr. WILLETT, and carried.

THE INTERNATIONAL VETERINARY CONGRESS,

The PRESIDENT said that during the last two or three weeks he had been so hardly hit, not only in professional business, but also in connection with various committees, that he had been obliged to tell Mr. Male that while he was awfully pleased to act as president for the year, his time was not always his own. He had been unable to prepare the usual Presidential address for that meeting. He would like to thank them exceedingly for the honour they had done him in making him their president, even with those drawbacks; and he would certainly do his best to carry out their wishes and to carry on the business of the Association to the best advantage as long as he occupied the chair. (Applause).

There was one matter that he wished to speak about at that meeting, and it was important—he referred to the International Veterinary Congress which would be held in London in 1914.

The idea of holding International Veterinary Congresses was first started by a very great British veterinarian, Mr. Gamgee; and he (the speaker) believed that his idea was to hold the first of such congresses in London. Unfortunately, the money could not be found, and so the congresses had been held abroad ever since.

The year 1913 was the 50th anniversary of the movement, and the 10th Congress, because they were only held once in five years. At the Buda-Pesth meeting in 1905 a great wish was expressed, out of a feeling of honour for the originator of those congresses that the 1913 Congress should be held in London. That was brought forward at The Hague, and, practically, they had to accept it, for it would have been a very difficult thing to say "No." He thought that really it would be the general wish of the profession that they should have the Congress in England. It was put off to 1914, because the International Medical Congress was to be held in London in 1913. The Government had promised their patronage, and were going to issue the invitations and to give them certain entertainment, but they could not give them the funds. Many of the veterinary societies were giving annual donations; and it was suggested that individuals should do the same. He wanted to impress upon the Royal Counties Association that they should think about subscribing to the funds, and that every member should do his best to prevail upon every person interested to put his hand in his pocket as deeply as he could afford to do. He wanted everyone to understand that it was not just a question of a guinea, or two guineas, which men had generally subscribed in the past to public schemes of the profession. They would want more than that from those who could afford it, and he hoped that from now forward promises would come in from members. He (Mr. Stockman) was the honorary secretary, and naturally had to do a great deal of the work of the organising, and, equally naturally, he was not going to run the thing into bankruptcy. There would be no excessive expenditure, but if they were going to have those distinguished foreign veterinarians in England they ought to show them what the British veterinary surgeon could do. (Hear, hear.) The subjects to be discussed were of interest to every branch of the profession, and he hoped

that the members of the Royal Counties' Society would move in the matter. (Applause).

Mr. PERCY J. SIMPSON moved, and Mr. KING seconded, a hearty vote of thanks to the President for his conduct in the chair, and for his address; and the same was carried by acclamation.

THE DINNER.

The Annual dinner of the Association immediately followed the meeting at the same hotel. The PRESIDENT occupied the chair, and was supported by the Mayor of Reading (Ald. J. W. Martin), Councillors W. M. Colebrook (late Mayor), and W. J. D. Venner (Chairman of the Cattle Markets Committee), Mr. Dodd (Corporation Meat Inspector), and others. A well-served repast was placed on the tables.

The PRESIDENT, in submitting the loyal toast, said that they had recently welcomed back their Majesties the King and Queen after a great undertaking in their visit to India, and the toast of their Majesties' health would appear the more to the loyalty of members of the profession. (Applause).

The toast was loyally honoured.

Mr. WILLETT next proposed "The Imperial" Forces. He said he yielded to no one in his admiration of the Territorial Forces, but still he held that the Navy was the bulwark of the nation. (Hear, hear.) With regard to the Territorial forces, with which they were more immediately concerned as a profession, they were not behind the veterinarians of any foreign army in the way in which they treated their patients. He believed that, unfortunately, there was a dearth of horses in the Army; and veterinarians looked upon that as a great danger, knowing, as a profession, the importance of having Army horses should occasion arise in the immediate future. He coupled with the toast the names of Capt. Tennant and Major Coleman. (Applause).

Capt. TENNANT, who first returned thanks, referred to the shortness of horses as a very serious question. At the present moment the Army had only sufficient horses to mount 80 per cent. of present regulars, and none whatever for the irregulars. From his own point of view, motor cars and bicycles would be much more serviceable, as cavalry in this country could only be used for scouting purposes, and a bicycle would be better for that. (Hear, hear.) Personally, he thought that for cavalry manoeuvres in this country horses were not wanted; but when it came to a foreign war he did not know what would have to be done. Nobody in England bred cavalry horses, but in Ireland they made it pay. (Hear, hear).

The MAYOR OF READING submitted "Success to the Veterinary Profession." No doubt, he said, they killed a great many more than they cured, which was common also to the medical profession—(laughter, and hear)—but they had much arduous work, and they did it well. His Worship referred to the late Mr. W. G. Flanagan—at one time proprietor of that hotel—as one of the best men he ever knew, and also a veterinarian of the very highest class. When he (Ald. Martin) as a youth had the good fortune of living in North London for two years, he used to pass the Royal Veterinary College in Camden Town almost every day; and he remembered thinking "what clever men there must be inside." (Laughter.) He had no doubt that the "going about" from town to town of the veterinarians was profitable and pleasurable, as it certainly was in the case of the Law Society, to which he (the Mayor) belonged. He regretted the absence of Mr. Councillor John Eigheten that evening. (Hear, hear.) In Reading they took the advice as a corporation of that eminent veterinary surgeon, Mr. Male, in professional matters. (Applause).

Mr. SHIPLEY responded, beginning by thanking the Mayor of the town for the kind things he had said about the profession. While Home Rule, National Insurance and other troubles were worrying the country, the veter-

inary profession were troubled that they could not get their own little Bill through Parliament. As a matter of fact, they were drifting into bankruptcy; and they must do their best to impress upon their local Members of Parliament the importance of the passage of the measure when it came before the House of Commons. (Hear, hear.) While the general use of motor cars and of bicycles was reducing the incomes of veterinary surgeons, he thought on the other hand that the municipal authorities would see the importance of employing members of the profession to give advice on the health of animals and the question of whether meat was fit, or not fit, for food. (Hear, hear.)

Councillor COLEBROOKE said that when he was twice Mayor he received invitations to attend those dinners, and he had very pleasant memories of those happy occasions. That evening his good friend, Mr. Male, had asked him to propose the toast—The Royal Counties' Association—which required no introduction to that company. He himself had had the pleasure of paying many veterinary bills in connection with horses and other animals—alive and dead (laughter), and he must say that owners and slaughterers were immensely indebted to the veterinary profession, not only for their care and attention, but also for their moderate charges. There was no profession in the country to whom those in his business owed so great a debt. He wondered why the members of the veterinary profession did not combine, as the members of the medical profession were doing, to assert their importance. Even in his (Mr. Colebrook's) trade they were so organised that they could face Parliament and everybody who tried to disturb their business. He congratulated the Association on having as its President so distinguished a gentleman as Mr. Stockman, the head of the Veterinary Department of the Board of Agriculture. (Applause). No department got more "blackguarding," and yet he said with confidence that to no Government department was the country more indebted than to the Veterinary Department of the Board, whose infinite pains and research were invaluable to the agricultural industry. (Hear, hear). They warmly welcomed not only Mr. Stockman, but also Mr. Male. (Applause).

The PRESIDENT, who was heartily applauded on rising to respond to the toast, thanked Mr. Colebrook for the kind and very frank way in which he had proposed the toast of the Association. No doubt members of the profession killed many animals in trying to cure them—(laughter)—but they also killed them for the benefit of the community. (Hear, hear). He had lately given evidence before a Commission, which he thought would be endorsed by the majority of his colleagues in the profession, that if they were going to deal with a disease like foot and mouth disease, to prevent its spread they must not only kill the affected animals and those immediately associated with them, but also those within a reasonable distance where the disease was likely to spread. That was a serious thing. None of them liked slaughtering right and left; but if they thought what was likely to happen if the disease spread all over the country there was no argument, as a business proposition, against the slaughter of, say, 300 animals to prevent its spread, seeing that every affected animal lost from £2 10s. to £3 per head. Some stock-owners black-guarded the Board of Agriculture, and the Veterinary Department of the Board in particular, but he was glad to say that when they were in distress one of the first departments they ran to was the Board of Agriculture, and the Board gave them the best advice they could for their benefit. (Hear, hear). In conclusion, the President repeated his remarks at the business meeting in reference to the forthcoming International Congress of Veterinary Surgeons.

Mr. COLEMAN, in felicitous terms, submitted the toast of "The Mayor and Corporation of Reading," and

touched on the recent expansion of the boundaries of the capital town of the Royal County. He suggested that Veterinary Reports should always be read by the veterinary surgeon and not by the Medical Officer of Health.

The MAYOR suitably responded; and said the Corporation always acted on the advice, in veterinary matters, of their friend, Mr. Male.

Mr. HUNTING gave the health of "The Visitors," and Mr. VENNOR replied, expressing regret at the absence of Dr. Stewart Abram (Chairman of the Reading Sanitary Committee), who had hoped to be present that evening.

During the after-dinner speeches, Mr. Leonard T. Moon, a well-known humorist, gave an entertaining selection.

EASTERN COUNTIES VETERINARY MEDICAL ASSOCIATION.

A meeting was held on Tuesday, Feb. 13. at the Royal Hotel, Norwich. The retiring President, Mr. T. G. Heatley, Woodbridge, was in the chair, and there were also present: Messrs. Wm. Hunting, London; T. E. Auger, Wymondham; H. Buckingham, R. B. Palmer, A. H. Santy, H. P. Standley, Norwich; A. Holl, New Buckenham; W. L. Little, Wm. Shipley, Great Yarmouth; E. H. Leach, Newmarket; A. McTurk, Swaffham; J. Robertson, Stalham; Philip Turner, Ixworth; F. B. O. Taylor, Weston Longville; Wilfrid Waters, Blofield; and Sidney Smith, jun., Hon. Sec.

Apologies for absence were announced from Sir John M'Fadyean, Messrs. N. Almond, W. Burt, Wm. Bower, J. Clarkson, F. T. G. Hobday, F. L. Gooch, J. K. Gooch, J. Barr, M. Bray, W. J. Browninz, J. Cleveland, John Hammond, sen., J. E. Kitchen, E. Margaron, F. Morton Wallis, W. M. Reeman, C. C. Nesling, Sidney Smith, senr., J. F. Thurston, E. W. Wright, and H. E. Wilkinson.

Messrs. A. F. CASTLE, Gt. Yarmouth, and GORDON MACINTYRE, Beccles, were nominated for membership on proposition of Mr. Shipley, seconded by the Secretary.

CORRESPONDENCE.

The SECRETARY said he had received a letter of resignation from Mr. Hewer, formerly of Wymondham, who had gone to Swindon. The resignation was accepted with regret.

A letter was read from the Royal Sanitary Institute with reference to the Congress to be held at York from July 29th to Aug. 3rd, inviting the Society to send a delegate. The Secretary said they had not sent a delegate for the last few years.

Mr. W. HUNTING thought it would be a pity to miss the conference.

Mr. SHIPLEY moved that a delegate be sent.

Mr. T. E. AUGER seconded, and it was carried.

It was agreed that the Secretary should attend the Congress as delegate for the Society.

The circular letter from the Association of Veterinary Officers of Health was read.

SECRETARY'S REPORT.

Mr. S. SMITH: I thought that possibly a short review of the past year's work of the Society might be of interest to the members.

The annual meeting at Norwich was fairly well attended, about twenty being present. A paper was read by Mr. William Shipley on "The recent Orders of the Board of Agriculture."

The summer meeting at Bury St. Edmunds was very poorly attended, but those who were present contrived to make the meeting a most interesting one. Several

post-mortem specimens were exhibited, and most of the members present contributed clinical reports.

It would seem that the summer meeting, which is almost invariably badly attended, might with advantage be devoted to the discussion of clinical experiences; it is certainly most unfair to ask anyone to read a paper to an audience of ten.

The attendance at the autumn meeting at Yarmouth consisted of twenty-nine members and three visitors. A most interesting paper was read by Mr. Leslie Sheather on "Vaccine and Serum Therapy as applied in Veterinary Practice." The President generously entertained the members and their ladies at lunch, previous to the meeting.

During the past year we have lost a member, Mr. J. R. Hewer (who has left the district), and gained one, Mr. A. McTurk, of Swaffham.

In presenting the balance sheet, I am glad to be able to show an increased balance in hand despite the fact that two years' election expenses are included. For those who may wonder what the item of incidental expenses is composed of, I have prepared a statement. I am pleased to be able to state that all arrears have been paid, and as a matter of fact all the 1911 subscriptions have been paid. I have to thank Members for their ready response to my applications. I am afraid I have been somewhat importunate, but I think you will agree that the end has justified the means.

The only real cause I have for a grumble is that several members on the occasion of every meeting omit to send a reply. I quite appreciate the difficulty of being able to forecast whether one will be able to get away, but at any rate it would be possible to fill up the postcard the day before the meeting.

CASH ACCOUNT, 1911.

Receipts.

Balance at Bank, January 1st	£20 17 8
Subscriptions, 47 members at 10 6	24 13 6

SIDNEY SMITH, jr., Hon. Sec. & Treas.

Examined and found correct,

WM. SHIPLEY, Jan. 2, 1912

W. M. REEMAN, Jan. 25, 1912 } Auditors.

COMMITTEE'S REPORT *re* INSTRUMENTS.

1. Tooth forceps: both pairs have sprung handles, and should be sent away to have this corrected. Mouth Gag: rubber worn, needs replacing.
2. Two new Tourniquets are required.
3. The Neurectomy instruments require a pair of scissors to complete the set.
4. The Thermo-Cautery is useless, and as it ap-

parently has never been asked for, there is no need to replace it.

5. A case should be obtained locally for the new tooth shears, so that they can be sent with safety by rail.

It was agreed that the recommendations of the Committee should be carried out, and that the instruments should be in charge of the Secretary.

Mr. SHIPLEY said the tooth shears were in constant request and were the most sensible purchase they had ever made.

The report and balance sheet were adopted on the motion of the President, seconded by Mr. Turner.

ELECTION OF OFFICERS.

President.—Mr. LEACH, of Newmarket, was unanimously elected.

Vice-Presidents.—Messrs. T. G. HEATLEY, F. B. O. TAYLOR, and P. TURNER were elected on the motion of Mr. W. L. Little, seconded by Mr. A. H. Holl.

Committee.—Messrs. Sidney Smith, senr., T. E. Auger, J. K. Gooch, J. Barr, H. P. Standley, W. L. Little, and H. Low were re-elected upon the motion of Mr. Shipley, seconded by the Secretary.

Auditors.—Messrs. W. SHIPLEY and W. M. REEMAN were re-elected, on the motion of the Chairman, seconded by Mr. Turner.

Hon. Sec. & Treas.—Mr. SIDNEY SMITH, junr., was re-elected, on the motion of the Chairman, seconded by Mr. Little.

THE NATIONAL VETERINARY ASSOCIATION.

The SECRETARY said they were entitled to send the Secretary and two other representatives to the Council of the National Veterinary Association, and he moved that Mr. Leach (President), Mr. Heatley (retiring President), be elected.

Mr. SHIPLEY seconded, and expressed surprise that there should be only 47 members of that Society which covered Norfolk, Suffolk, Essex, and part of Cambridgeshire. Some special effort ought to be made to induce every veterinary surgeon in these counties to join them. Now that the Society had become affiliated with the National Veterinary Association they ought to become a strong force in the profession to air their grievances and to help them in any struggles they might have to enter upon in the future. One never knew whether some scheme for helping small holders might not be brought forward, under which veterinary surgeons would have to look after stock at very low fees. Combination was now-a-days a very important factor in labour and professional circles, and they should endeavour to make their Association as strong as possible. Perhaps as an inducement to men to join the Society they might drop the entrance fee for a year and issue a special circular to all non-members residing in the district.

The SECRETARY said that at the beginning of his career as secretary he sent notices to nearly all the veterinary surgeons in the district who were not members, and he did not receive a reply from anyone of them. The only way to get new members was to use personal influence.

The CHAIRMAN did not think they ought to drop the entrance fee. If a man wanted to join a half-guinea entrance fee would not stand in his way. He thought with the Secretary that personal influence would do more than circulars.

THE INTERNATIONAL CONGRESS.

The SECRETARY said that last year they gave a donation of two guineas to the Victoria Benevolent Fund. This year he thought they ought to seriously consider the claims of the International Veterinary Congress. Having read a printed letter on the subject, the Secretary circulated a blank list and invited subscriptions to

the funds of the Congress, which, he said, might be paid in three annual instalments.

Mr. SHIPLEY said for many years the Society had subscribed to the Victoria Benevolent Fund. During the last 12 months he had taken over the secretaryship of that fund, and he wished to say how much he appreciated the kind response to his appeal to them to become members. When he took up the work he knew there was a great deal to be done for the relief of necessitous widows of veterinary surgeons. He was proud to say there were more members of the fund in Norfolk than in any other county. Now that so many of the veterinary surgeons in Norfolk were members of the fund he hardly thought it necessary for the Society to subscribe. He wanted them to subscribe individually. The International Congress to which reference has been made was originated fifty years ago, and the next one was to be held in England. When the Congress was held on the Continent the different Governments had been in a position to make grants towards the costs, but this could not be done in England; hence the need for raising a fund. It would be a very important Congress, and veterinary surgeons from all parts of the world would attend it. The result of the Congress would be to improve and elevate the position of the profession in England, and he hoped it would be made worthy of the veterinary surgeons of England. (Hear, hear.) He proposed that ten guineas be annually set aside for three years for the funds of the Congress.

The SECRETARY said about £4,000 was wanted for the Congress.

Mr. TURNER seconded the motion, and it was carried.

COUNCIL ELECTION R.C.V.S.

On the motion of Mr. Shipley, seconded by Mr. J. Robertson, it was agreed to join with the Lancashire and Yorkshire Veterinary Medical Associations as previously. Mr. Shipley appealed for support for Mr. Clarkson, who is a candidate for election.

THE NEXT MEETING.

On the motion of Mr. Shipley, seconded by the Chairman, it was agreed to hold the next meeting at Newmarket or King's Lynn, according to the wishes of the President.

SOME JOINT DISEASES OF THE HORSE.

By WILLIAM HUNTING, F.R.C.V.S.

The joints I wish to refer to are the moveable ones, made up of two or more bones joined together by ligaments and supplied with cartilages and synovial membranes. I shall limit my remarks to joints of the limbs.

The pathological conditions involved are those of inflammation in its various stages, with complications due to micro-organisms. The inflammatory process in joints causes very diverse clinical conditions, as it affects one or more of the structures of the joint. Ligaments when torn require a long time for repair. Synovial membranes are very sensitive to inflammation. Bone when inflamed is apparently less able to withstand destructive change than softer tissues. Cartilage seems to have little resisting power against inflammation, and even less energy for repair. When all the joint-tissues are affected we have a case which is indeed grave. When only ligaments and synovial membranes are affected we expect complete recovery, but when bone and cartilage have suffered from inflammation there is little hope of permanent resolution in a joint.

The simplest form of joint disease in the limbs of horses is that resulting from injury—bruise or sprain. Of bruised joints probably the knee is the one most frequently injured, whilst sprain is most common in the fetlock. What is called "sprung-hock," a condition in which the whole joint is enlarged, hot and painful, is,

I believe, the result of sprain. The coronary and pedal joints are said to suffer from sprain, and the damage to the ligaments is looked upon as the direct exciting cause of ringbone. This explanation I do not accept. If I have ever seen a case of sprained ligaments of the coronary or pedal joints I confess I did not diagnose it. In indubitable cases of sprain of hock, knee, or fetlock, although much effusion takes place with more or less permanent thickening, even to the extent of fibrous ankylosis, I have never discovered on post-mortem examination any destructive inflammatory change in the joint, and have been surprised to find the cartilages clean and unaltered in colour. Very different is the appearance of a joint in which inflammation has attacked the bone or cartilage: then we find degenerative changes which are the cause of permanent lameness.

Concerning sprains of the ligaments of joints or inflammation resulting from bruises, there is only one point I intend to refer to—treatment. In both these injuries we have tearing or stretching of ligaments with synovitis. Effusion takes place into the joint and surrounding tissues. Our object in treatment is to check, if possible, the effusion, and then to allay pain and promote absorption. Repair takes place when the inflammatory process subsides, and the less the effusion among the tissues the more thorough is the repair.

In the very earliest stage of a sprain, cold, in the form of continuous irrigation may check the effusion, but this stage is seldom or never seen by us; it cannot remain many hours.

When inflammation has reached the stage at which the blood in the vessels is almost stationary and effusion is plentiful, then I think cold is likely to do more harm than good. This stage of the case requires warm fomentation, to allay pain and to establish an active circulation in the surrounding blood vessels of the damaged part. For a day or two this may be continued, and then resort should be had to dry, even pressure, with gentle massage. Pressure is applied by means of a linen bandage with a good thick layer of cotton wool between it and the joint. The bandage should be removed at least every twelve hours, and left off an hour or two. The massage should be done with the hands—a gentle firm pressure in one direction—with the hair. As soon as the horse can stand fairly on the lame leg walking exercise should be commenced, with a duration say of ten minutes at first, and gradual extension every day unless pain is increased. The horse should, of course, be in a loose box, not tied up.

In chronic cases where some enlargement remains and where the motion of the joint is limited, the worst thing to do is to limit active motion by not exercising the horse, and the next worse treatment is to blister. To blister the swelling caused by a bruise or a sprain is almost certain to render it permanent. In addition to massage, a joint that is limited in its motion by effusion or by fibrous thickening should be forcibly flexed and extended for some minutes every day. I say forcibly, but I do not mean violently.

Fracture into a joint is a serious injury, but not always incurable. I used to think that fracture of the acetabulum must necessarily cause permanent lameness, but there is a specimen of united fracture in the Dick College museum taken from a horse that did eight years work after the injury was inflicted. Then there are the more common cases of split-pastern that make good recoveries and resume work. But recoveries are not the rule. In all the recovered cases I have seen post-mortem the union by bone did not extend into the joint, there was no reproduction of cartilage over the fissure, but there was a layer of fibrous tissue. When lameness still existed and the fracture was united by bone there was polishing of the surface.

The diagnosis of some fractures into joints is impossible without the assistance of X-rays. In some

there is sufficient deformity, or there may be crepitus to help us.

Provided that a fracture into a joint heals without much displacement, and that fibrous union takes the place of the cartilage separated by the fracture, soundness may return. But there is always a probability of destructive changes taking place in the articular cartilage, and of ossific invasion of the ligaments ending in complete or partial ankylosis of the joint.

How far pathological destruction of cartilage may take place and be followed by resolution I am not certain. Changes take place in this order—swelling, opaqueness, fibrillation, thinness, grooving, discolouration, necrosis. I have not been able to get sufficient post-mortem examinations of joints, with a full history of the cases, so as to compare the lesions with the clinical symptoms. From what I have seen I believe that when fibrillation and grooving have taken place there is no return to soundness, but a constant advance to greater destruction. The only clinical sign of destructive inflammation of a joint is the quantity and quality of the pain exhibited. Of course pain is acute in all recent injuries, but after a few weeks it subsides. When, however, an injured joint remains acutely painful and the primary inflammation has had time to abate, we may infer that chronic arthritis is established and will continue.

These cases of joint-disease, due to direct injury, are more simple and more easily understood than a group I shall next consider. These may be classified as "Arthritis following Ostitis." The best example of these is what, in London, is called "Cab-horse disease." A fully developed case presents lameness and a well-marked enlargement on the inner head of the suffraginis, *i.e.*, on the inner and lower part of the fetlock joint. The enlargement does not occur as the earlier sign. There is always lameness before any bony swelling appears, and lameness may be the only symptom for weeks. It is often intermittent, and sometimes very acute. Post-mortem examination shows, in every case in which the bony enlargement is found, some articular change not only in the articular cartilage but in the head of the bone. Even in cases where no bony enlargement exists you will find these articular changes in the cartilage and in the bone. I think, then, we may conclude that the first cause of lameness is due to ostitis—inflammation in the bone, and that it is the progress of the ostitis which causes the articular lesions and the periostitis.

My own experience of these cases is that no treatment is of much avail. They do not yield to blistering or firing, so we have only neurectomy as a means of removing the lameness. An ordinary plantar neurectomy is useless, as the fetlock region is not rendered insensitised by this operation. A median neurectomy is effective, and we may hope for some months work without lameness. After a median neurectomy it is not uncommon during the first few days of resumption of work to have a fractured pastern—a thorough comminuted fracture. This sequel, I take it, is a further proof of the disease being an ostitis, because there is only one explanation of the fracture, *viz.*, that the bone is softened by inflammation and yields to the forcible concussion which results from the horse putting his foot down as though the limb were healthy, instead of merely insensitive in its weakest part.

Ringbone is another condition which should be classed as a joint disease, although the most prominent symptom is a bony enlargement. There are two views as to its origin; one that it commences in sprain of the ligaments, and that then bony invasion of those structures occurs, and finally involves all the ligaments of the joint. Another theory is that we have an ostitis commencing in the bone which progresses until it involves the joint and its surrounding ligaments—an analogous course to that followed in Cab-horse disease.

Those who hold that the disease originates in the ligaments say very little about the arthritic lesions. Those who accept the ostitis as the primary mischief point to the presence of marked lesions in the joint affecting the cartilages and the head of the bone. It is unusual to have chronic articular disease as a sequel of sprained or injured ligaments. It is quite usual to have articular lesions as the result of a spreading ostitis.

There is a very common condition known as false-ringbone in which very large masses of bone are formed on the pastern and coronary bones. It is rather remarkable that they never cause articular disease, as seen in the true-ringbone. They are distinct and different pathological conditions, and should not be called by the same name. In both there are bony enlargements, but in one there is articular disease, and this lesion is the essentially important one as applied to the soundness of the horse. The bony lesion may cause no pain—the articular is always a cause of pain—it is incurable. Lameness from ringbone is not merely mechanical, even when complete bony ankylosis of the joint has taken place. There is within the ring of bone a destructive arthritis.

Another joint disease which I consider is primarily an ostitis is spavin. Here we have an inflammation commencing in the bones of the hock and extending until it implicates the articular surfaces and the periosteum. It is rather remarkable that this inflammatory process should seldom be destructive. Given that work is stopped when lameness appears, the majority of spavined hocks become sound—at any rate lameness ceases, and the small bones become fused together.

Sometimes articular inflammation of the hock does not cause periostitis with the resulting visible spavin. It causes destruction of the joint cartilages and extensive necrosis of bone. Ordinary spavin tends to a constructive process—a consolidation of the bones accompanying the removal of cartilage. Occult spavin shows little consolidation but extensive and continuous destruction of cartilage, and necrosis of bone. I confess I do not understand why we should have this difference in the lesions of ordinary spavin and of so-called occult spavin. Are they distinct diseases due to different causes, or only to difference in the direction or intensity of the inflammatory process?

As to the causes of these ostites, it is certain that in ringbone and in spavin heredity plays a large part. It is equally certain that work is a cause. Work produces fatigue, and is accompanied by concussion of the joints and bones of the limbs. Just how concussion should cause ostitis I do not know, but I think there is no doubt that it does so. Below the hock and knee the position of the bones and joints seems to be most favourable for injury by concussion. When we go higher up the leg we should be inclined to think that the angles of the bones would be unfavourable to jars and uneven or excessive pressure on joints or bones. It is borne out by experience that in the joints and bones above the hocks and knees we find much less disease that can be credited to concussion than in those below. But we do find some.

The stifle joint suffers from chronic arthritis, and the lesions are nearly always of the same kind—denudation of cartilage and polishing of articular surfaces of the bones. Sometimes the lesions are found between the patella and the femur, sometimes between the femur and the tibia. In most cases there is an excessive amount of synovia in the joint, but it collects slowly—not as in sprain, rapidly and suddenly.

The cause of these stifle-joint lesions I do not understand. I have not been able to trace any direct injury, such as bruise or sprain. As a rule they commence without any visible change in the joint, and gradually get worse. So far as I know they are always incurable.

Whether they commence in the bone or in the cartilage is not apparent. On post-mortem examination both structures are affected, and not much change is visible in the other parts of the joint. Everything considered, I incline to think that the primary lesion is in the bones.

Perhaps I may mention here a remarkable difference in the lameness produced by stifle lesions when they are found between the tibia and femur, and when between the patella and femur. In the latter case the leg at rest is held with the foot on the ground, and all the joints seem extended, whilst the muscles in front of the femur are contracted to an extent giving them a rigid appearance.

When the lesion is between tibia and femur the most striking symptom is the foot being raised from the ground and held forward. This condition has been described under the title Gonitis.

There is another class of joint disease to which I may briefly refer—that due to invasion of micro-organisms.

An open joint is at all times dangerous, but chiefly from the fact that it may admit pus-producing organisms. Once admitted, the destruction of the joint is rapid, and changes in the cartilage take place in a few days as severe as those resulting from inflammation that has existed for weeks or months in a closed joint. An open joint should be treated with the utmost care immediately on its discovery—we may prevent it becoming septic, but once septic arthritis has been set up the case is almost, if not quite, beyond successful treatment. My experience of septic open joints includes stifle, elbow, hock, knee, fetlock, and pedal joints, and I don't remember one that did any good. I regret to say that I have not tried washing the joint out with antiseptics, a course that seems to offer useful possibilities.

The extreme danger of septic arthritis should make us doubly careful about all wounds in the neighbourhood of a joint, especially those near the elbow and stifle. Purulent wounds near these large joints, although at first having no opening into them, have a tendency to invade the articulation. Probably any joint may become infected through proximity to a suppurating wound. The pedal and coronary joints frequently suffer by spread of infection from a suppurating wound of the coronet, and this may occur with no direct continuation of the wound into the joint. Mr. Willis has described two or three cases in which the upper articular surface of the os coronæ has been the seat of destructive septic invasion as the result of a suppurating wound on the coronet, and yet no sign of disease was found in the tissues intervening between the wound and the bone. I presume the infection in such cases is carried by lymphatics.

Infection of joints through the circulation is not common in horses. The septic arthritis of foals and calves is an illustration, but, as a town practitioner, I can claim no experience of these cases.

Other specific diseases sometimes cause joint infection. Tuberculosis has frequently been seen as an infection of the cervical vertebræ, but I am unaware of any other joint in horses having been found tuberculous.

Glanders seldom attacks the joints. In only one case do I remember this disease causing joint trouble, and then it gave rise only to synovitis and some distension of the hocks and fetlocks. These symptoms gradually disappeared, work was resumed, and death occurred about 12 months later from glanderous pleurisy. This case was one of farcy, and previous to the Order of 1907.

Rheumatism may have been the cause of joint disease in the horse, but I have never diagnosed such a case. I think I have seen rheumatism of muscles, and I feel sure I have of tendons and their sheaths. There are no

objective symptoms to assist recognition, and I rely entirely upon the shifting about of the trouble, with failure to detect any other cause.

DISCUSSION.

Mr. LEACH produced the bones of a young horse, which was killed at the age of one year and five months after it had been lame seven months. The horse had never been shod and had never worked. This was a case of arthritis caused by rheumatism. He expressed the opinion that many ringbones were not hereditary, but were due to various causes.

Mr. SHIPLEY said he was especially interested in the joint disease which was commonly called cab-horse disease, and he was a little surprised that Mr. Hunting should say that neurectomy was of no avail. He did not agree. He knew it was of avail. Mr. Shipley described cases in which he had unnerved the animal with success. Ulceration of bones in the hock without any considerable signs of spavin often occurred. He had found tubercular lesions in the joints of cattle. He was glad Mr. Hunting did not touch upon the subject of heredity. Now the question of Mendelism had cropped up they would be in a difficult position to know what heredity was. It seemed to him impossible nowadays to suggest that disease was hereditary. He supposed they would have to wait for the investigations of scientific men to prove that some of the suggestions as to the hereditary nature of spavin or ringbone were quite mistaken, and that there must be some other cause. He had two or three very troublesome cases of suffraginitis and coronitis. In one case a colt, or a two-year-old filly, was very lame. Nothing could be found in the foot, and eventually a small place broke out on the coronet, and in a few days the mare was in a state of excruciating pain, and was slaughtered. He split open the joint and found a portion of os corona, cartilage and bone, sloughed out as big as a shilling. Undoubtedly the original lameness occurred in the joint itself. Mr. Hunting had introduced a subject worthy of considerable thought, and one that might open their eyes very much as to some of the difficult cases of lameness with which they had to deal.

The CHAIRMAN said they did not see much of cab-horse disease in the country, but the nearest approach they got to it was a lameness when they could see nothing to account for it, as in disease of the pyramidal process. Mr. Hunting's remarks about ringbone were interesting. Apparently all true ringbone must be ostitis. In cart horses they got what was called false ringbone. This was apparently periostitis. It was very difficult when one was examining a horse to say whether the enlargement was really ringbone or not. His experience was that they often got this enlargement round the pastern bone without lameness. It was the exception to find lameness. It would be well if it were distinctly settled what should be termed ringbone. Another joint lameness found in yearlings was stifle lameness. He would be interested to know what the origin of that was, because nearly all presented the same symptoms. They got a swelling of the joint and a lot of effusion into the joint, and a peculiar straight condition of the hock. He had treated these cases with an injection of Lugol's solution of iodine, and in some cases there had been considerable improvements.

Mr. LITTLE said something had been said about the nomenclature of diseases. It struck him it would be better if they could abandon the practice of giving nicknames to diseases. Spavin, ringbone, splints were all nicknames, and it would be far better to call them ostitis or periostitis of a certain joint. It would lead to less confusion, because now different men called the same disease by different names. Mr. Hunting had mentioned unnerving horses for fetlock disease; would

he tell them how high up the leg the disease had to be for unnerving to be satisfactory, and whether it was necessary to take every nerve out.

Mr. HUNTING, in responding to the discussion, said he was very pleased to see the specimens brought forward by Mr. Leach, because they would remove some of his scepticism about rheumatism and joint disease. Mr. Leach was quite sure there was no blood poisoning in this case, and yet he had distinct arthritis, and so he (Mr. Hunting) yielded that point, and confessed to having learned something that day. As to the nomenclature of these diseases, he quite agreed that something ought to be done, because the names were not only at times accidentally misused, but sometimes wilfully. Take the nomenclature of such a thing as cab horse disease. It was too awful. He did not see why they could not call that suffraginitis, really a nice word, and it would express what was meant. In law cases this mixed nomenclature had a bad effect. A man went into the witness-box on one side and said, "This horse suffers from ringbone," and that evidence he gave honestly, believing he was fairly describing a bit of periostitis on the Another man who pinned himself to ringbone always being a disease implicating a joint, positively denied the existence of any ringbone in the case, and for fear he should give away his own side would not even acknowledge a bit of periostitis. Thus the two were made to appear absolutely opposed to each other, whereas in truth it was only a fooling with words. Mr. Shipley had stated that plantar neurectomy would have a good effect sometimes on fetlock trouble, and that was no doubt the result of his experience, but he (Mr. Hunting) was sure when Mr. Shipley had done a few more he would be much disappointed. There were only about three troubles in the fetlock, and he had done neurectomy and got both nerves, and yet the horse was as lame after he had been done as he was before. Median neurectomy was something to be applied to all troubles, including the fetlock and above it, and also to that extremely valuable class of lameness—you did not know where it was. You might catch it, but even the best anatomists did not know all about the distribution of the nerves. There were cases in which median neurectomy was performed, and the horse went well for a time, and then bad again. Where was that horse lame? He did not know. There were very curious distributions of nerves which puzzled the very elect.

It would be extremely useful, not merely from a physiological point of view, but from a jurisprudence point of view, if they could know exactly what changes took place in a joint, and how it was that some cases never got better and always got worse. Even in a tremendously distended joint they would find no change in the cartilage at all, and yet experts would tell them that the mere fact of a joint being full of fluid would make it soak into the cartilage and soften it. It would if it were a bit of dead leather, but there was no soaking in the living tissues so long as they were healthy. Twice in his life he had found what he thought was a grand bone specimen. He remembered a hock that was absolutely unmoveable. It was not a diffuse swelling, but was defined. He secured that and gave the man an extreme tip to boil it in a net and let him have the bones. The result was all fibrous ankylosis. There were huge masses of fibrous material, but no trace of any injury to the cartilage. There was fibrous ankylosis and no damage to cartilage. If they got ostitis it hardly ever escaped damage to the cartilage.

A hearty vote of thanks was accorded to Mr. Hunting, on the motion of the Chairman, seconded by Mr. Leach, and this concluded the proceedings.

VETERINARY MEDICAL ASSOCIATION OF IRELAND.

A general meeting was held at the Dolphin Hotel on Wednesday evening, January 31st, 1912. Principal A. E. Mettam occupied the chair, and there were also present: Messrs. J. McKenny, B. P. J. Mahony, Col. J. Moore, M. Hedley, W. Chambers, F. A. Heney, Jas. Doyle, W. H. Wilkinson, A. J. Moffett, P. D. Ready, J. F. Craig, A. Watson, C. M. Griffin, P. J. Howard, L. M. Magee, J. Holland, and G. W. Tyson.

The minutes of the last meeting were adopted, on the motion of Mr. Chambers, seconded by Prof. Craig.

Letters of apology were received from the following members for inability to be present: Messrs. Vahey, Dobbins, Johnston, Elkins, Norris, R. H. Lambert, Hamilton, and P. J. Howard.

The PRESIDENT said he regretted that a member, Mr. Norris, had met with an accident, but they all hoped he would soon be out and about again. (Hear, hear).

REPORT OF COUNCIL.

A meeting of the Council was held on January 16th, Mr. W. Chambers presided, and there were also present: Messrs. Jas. McKenny, Prof. Craig, P. J. Howard, W. Cargill Patrick, W. H. Wilkinson, F. A. Heney, Prof. O'Connor, M. Hedley, and A. Watson.

Letters of apology for non-attendance were read from Messrs. J. H. Norris, J. B. Dunlop, J. Holland, P. D. Reavy, Lieut.-Col. Steel, and the President.

A letter was read from Mr. Faithfull Davies intimating that a Congress, under the auspices of the Société de Pathologie Comparée would be held in Paris in October, 1912.

The Annual Meeting and Dinner were arranged to be held at the Dolphin Hotel, Dublin, on January 31st. Arrangements were made for the annual election of Officers and Council. In addition to those eligible for re-election without nomination the Council made the following nominations: President, Mr. P. J. Howard; vice-president, J. B. Dunlop; secretary, Prof. O'Connor; Council, L. M. Magee, M. Barlow.

It was proposed by Mr. Hedley, and seconded by Mr. McKenny, that the sum of £2 be allocated from the funds of the Association for expenses in connection with the Annual Dinner.

The following accounts were ordered to be paid: Messrs. H. and W. Brown, £2 5s.; Messrs. Brindley, 16s. 6d.; Hon. Secs. expenses, postage, etc., £3 19s. 9d.; Clerical Assistant, £5.

The Sub-committee appointed to consider the Rules of the National Veterinary Association met on January 16th. There were present Messrs. James McKenny, Prof. Craig, P. J. Howard, W. C. Patrick, and A. Watson. Professor Craig was moved to the chair.

The following resolution was proposed by Mr. Watson, and seconded by Mr. Patrick:—

"We, the Sub-committee appointed by the last general meeting, do recommend the Veterinary Medical Association of Ireland to accept the proposed Rules, and further, we recommend the Association to affiliate with the National Veterinary Association." There voted for the resolution: Messrs. Watson, Patrick, and Prof. Craig, 3; against, Messrs. McKenny and Howard.

Mr. MOFFETT proposed that the report of the Council be adopted. Mr. MAHONY seconded.

Mr. JAS. MCKENNY said that the report of the committee was very brief. That was good, but he might as well tell them that the discussion at the meeting convened for its consideration was nearly as brief. The great point raised for it, and the only point he knew which was feasible, and which they could rely upon was that it should only be as an experiment. Were they to throw away their money on a mere experiment which

had been well considered by the Association previously? And not one single thing that he knew of had been put forward to the advantage of this Association, only three of the Sub-committee voted for the resolution and two against it, therefore he strongly opposed the adoption of the report. If there was anything else that had occurred at the meeting which they had not already heard he would wish the members of the Committee present to speak.

Mr. HEDLEY: To what money does he refer?

Mr. MCKENNY: To the subscription to the National Association.

Mr. WATSON (Hon. Sec.): He is referring to the Sub-committee which met to consider the amalgamation.

Mr. HEDLEY: And they recommend that the amalgamation should proceed, so far as they are concerned?

Mr. MCKENNY: Yes.

Mr. HEDLEY: That is all right.

The CHAIRMAN said that the Sub-committee's report was included in the report of the Council. They should have been separate.

Mr. HEDLEY: The best thing is to consider the report of the Council first.

The CHAIRMAN then put the adoption of the Council's report to the meeting, and it was passed.

The report of the meeting of the Sub-committee was again read by the Chairman.

The CHAIRMAN said that Mr. McKenny objected to the adoption of the report because the matter was not thoroughly and completely discussed, and he did not see why the resolution should be adopted, because it was practically an experiment. He did not believe in spending money on an experiment—he thought that epitomised what Mr. McKenny had said.

Mr. MCKENNY: It was not at all fully discussed. It was almost as brief as the report, and the only thing put forward was to approve of it as an experiment. This Association had already considered it at a large meeting, and they would not adopt it, and we would stultify ourselves by now adopting the resolution unless we have some more feasible reason for so doing than an experiment.

Mr. HENRY: Was a caucus meeting held?

Mr. MCKENNY: No.

Mr. WATSON: Is the report accurate?

Mr. MCKENNY: Yes.

Mr. MOFFETT: Is it a question of discussing it to-night?

The CHAIRMAN: No.

Mr. MOFFETT: I move that the report of the Sub-committee as read be adopted. Mr. Williams seconded.

Prof. CRAIG said he would like to suggest that before they adopted the resolution of the Sub-committee it would be as well to have the opinion of the various members of the Association. That could be obtained through the circular calling the next meeting. All that was required to be done was to put down in the circular "Are you in favour of amalgamation?" If they had a majority in favour of amalgamation, they should then amalgamate.

Mr. REAVY asked what was the result of the meeting held in the veterinary college with reference to this.

The CHAIRMAN said the resolution was that the meeting resolved to wait to see what was the suggestion made at the Carnarvon meeting.

Mr. WATSON was of opinion that they had gone too far to absolutely go back as suggested by Prof. Craig. This subject had been discussed for practically the last two years [A Member: Nearly three], and it had gone before several sub-committees, and if they adopted the suggestion of Prof. Craig they would be going over the same ground again. He held that it was not practical.

Mr. MCKENNY said if Prof. Craig would put his suggestion as an amendment he would second it.

Prof. CRAIG declined to do so.

Mr. McKENNY: It is a scandalous shame. This Association has gone to expense and much trouble to forward a magnificent scheme of amalgamation and it has been taken out of our hands, and if it is not carried out will throw back all the Associations for many years. The original scheme—"amalgamation of the Associations"—if carried out would so unite them, in all important matters of interest to the profession, that we no doubt would have derived much benefit therefrom, but by the scheme under consideration only one Association will reap any benefit from it. I hope these remarks will be taken down and printed for circulation, as I feel sure time will reveal the accuracy of my prediction.

Mr. REAVY: Could Prof. Craig propose an amendment as being a member of the Sub-committee?

The CHAIRMAN: Yes; it would not debar him. I think the best thing would be to either adopt the report or refer it back.

Prof. CRAIG said he would not propose what he said as an amendment, but only as an addition to the report—nothing more, because he was entirely in favour personally of trying it as an experiment—as Mr. McKenny had spoken of it. But although that was his opinion, he was not going to say it was the opinion of all the members of the Association, and that was the only reason for his suggestion.

Mr. DOYLE said that at the meeting there were three in favour and two against it, and he thought it would be well to take a vote of all the members of the Association.

Mr. WATSON said that the question had been circulated amongst the members for the last three years, Meetings had been summoned, and it had been put on the agenda for discussion, and if the members thought so little about the question they would not turn up at the meetings, they should not go any further. It was high time they settled it.

Mr. DOYLE: We should then want another Sub-committee.

Mr. HEDLEY: We should want sub-committees to consider the rules, to elect some one to take the matter in hand, another to put it in form for the members to understand, and subsequently a meeting for something else. It is only playing at time-wasting.

Mr. HENEY: What is the feeling of the Northern and Central Societies with regard to this? Had they passed any resolution?

Mr. McKENNY said he could not see how Mr. Hedley's remarks applied. It appeared that some people wanted to rush into this thing now. A very magnificent suggestion came from Prof. Craig—an honest and straightforward suggestion to ask every member to vote. That was a straightforward thing, and it would be definite and there would be no more meetings or discussions required or anything else. Whatever way the voting went would be final. It was ridiculous to rush into this thing now.

Mr. DOYLE proposed the following amendment:—"That the report be sent back to Sub-committee and that a referendum be taken of the members of the Veterinary Medical Association."

Mr. McKENNY seconded.

On the amendment being put, only the proposer and seconder voted for it.

The report of the Sub-committee was then put and carried, the report being adopted.

(Signed) JOSEPH H. WOODWORTH, F.C.A.

25th January, 1912.

Prof. CRAIG, Honorary Treasurer said he was sorry that he was unable to have the accounts audited in time to have copies circulated to the members before the meeting. The following, however, was the state of affairs. The balance from 1910, was £15 15 11. The balance for this year was £27 15 10, so that they had been able to pay their way this year and have a little to the good at the end. In referring to the subscriptions, he had to note that for the current year only about 65 members paid current subscriptions out of a membership of something like 130. As treasurer he would like every member to pay his subscription at the beginning of the year, so as to have no further trouble with it. He thought all the expenses were inserted in the balance sheet. They had invested a certain amount of money, amounting to about £145. That amount indicated, he believed, the sum that was paid for the Consols, India 3½ per cents., but he did not think the same sum could be obtained for them to-day. The annual interest from that sum amounted to £4 4s. 4d.

Mr. REAVY proposed the adoption of the Treasurer's report. Mr. CHAMBERS seconded.

Mr. HEDLEY said the books of the Association showed a membership of 130 or 135, but I am afraid this is not the actual state of affairs. The point we want to ascertain is what is the membership of good sound subscription payers, or is the list filled with laggards who for a length of time have not paid their honourable dues. How many should have their names deleted from the list? If the Association had only 60 out of 90 paying members, it would be in a better position than it appears to be at present. The next point of interest is that the Treasurer told them they had to their account the sum

of about £140. He would remind the Treasurer that the amount mentioned was of long standing, and nothing had been added to the account for two years past. Notwithstanding such fact there was only £27 shown in the balance sheet. That was not as good as they would like to see it. He did not remember any time when the Association was so badly off. It had generally been able to invest at least £20. At any rate it should be practicable to do more than live on the income.

The CHAIRMAN: On the year's working we are £10 to the better, less one penny.

Mr. HEDLEY: What was the year before?

The CHAIRMAN: £15 15s. 11d.

Mr. HEDLEY said that they did not gain by keeping their money in current account. Such is like tying their talent up in a napkin; the money should be put to interest. What had they on the last account for interest?

Prof. CRAIG: £4 4s. 4d.

Mr. HEDLEY said that was not for leaving the money in the bank, but produced by investment. He suggested that the accounts should be received.

Mr. MAHONY seconded this, and remarked that the members who had not paid their subscriptions for two years should be struck off. Those members gained some advantage from the Association, and paid nothing.

The PRESIDENT suggested that the meeting receive and adopt the Treasurer's report, and refer to the Council the question of investing further monies and also the matter of the subscriptions in arrear.—Agreed.

MR. EMERY'S RESIGNATION.

The following letter was received from Mr. F. W. Emery.

My dear Mr. Watson—Your favour of the 5th ult. came to hand at a time when I was unable to give it proper attention, I trust you will excuse my delay in replying.

I regret the circumstances which have been the cause of my tendering my resignation, but I am unable to alter my decision.

Thanking you for your very courteous letter.

Yours faithfully, F. W. EMERY.

Belfast, 27th January, 1912.

INSTITUTE OF PUBLIC HEALTH. REPORT OF DELEGATE.

Mr. HENRY apologised for not at the last meeting handing in his report with reference to the meeting of the Royal Institute of Public Health, but it was owing to circumstances arising over which he had not control. He then read his report.

Mr. President and Gentlemen—In accordance with the wish expressed by your Council, I had the pleasure of attending as your delegate the Congress of the Royal Institute of Public Health held in the University of Dublin, by kind permission of the Senate, from 15th to 21st August, 1911, and I beg to submit this my Report.

The Congress opened at noon on Tuesday, the 15th, when a very large number of delegates and others interested met to hear the Presidential Address delivered by Her Excellency the Countess of Aberdeen, who needs no words of mine to commend her to you as an ardent supporter of every movement calculated to be of use in the amelioration of those conditions in life which the aims of the Congress seek to remedy. Her Excellency, in a very able address, sought with cogent arguments to impress upon her audience the vital necessity of enlisting the assistance of the female sex in the indoctrination of household sciences, as also that of public health.

Subsequently, a large number of those present submitted themselves to be photographed in the College Quadrangle. Her Excellency, accompanied by the Lord Lieutenant and the Right Honourable the Lord Mayor who attended in state, accompanied by many Civic dignitaries, being in the centre of the group.

Immediately afterwards the members broke up to their respective sections, and as the section in which we as veterinarians are primarily interested, I will proceed to refer to the Presidential address which was given by Principal Mettam, B.Sc., M.R.C.V.S. As we can easily expect, it was an interesting and able one, dealing with the relationship of infection between man and the lower animal creation. The President opened with a short yet cogent address welcoming the delegates and visitors to the Section, in the course of which he briefly enumerated the various papers to be submitted for their delectation. A vote of thanks was duly carried amidst applause.

On Wednesday, Professor McWeeney, who needs no words of mine to introduce him—being such a well-known and able scientist—delivered his lecture entitled "The relation of Bacilli of the Typho-coli group to Meat Poisoning and Para-typhoid." He referred to poisonous elements present in food that was not apparently objectionable, and instanced the very lamentable outbreaks of poisoning which took place in Limerick a short time back, due to the Bacillus of Gaertner, and proved his point by experiments which he made on some fresh beef. The lecturer strongly advocated the slaughter of animals for human food in public abattoirs where efficient inspection can be carried out, and where a practical laboratory for the examination of the meat could have place. The lecturer referred to the ease with which this might be secured, and in passing paid a tribute of high praise to the standard of knowledge exhibited by the students of Pathology and Bacteriology in the Royal Veterinary College of Ireland. He strongly advised that in any laboratory, besides apparatus, various sera should be stocked, especially that of paratyphoid and Gaertner bacillus.

One point which the lecturer referred to deserves a special note—that the typho-coli group is only found in wasted beasts, sold for a small price, therefore no compensation should be allowed. He further instanced where in the Limerick case some of the diseased meat had been supplied by a contractor at 5d. per lb.

This lecture attracted considerable interest, and many speakers expressed their appreciation of the practical nature of the paper. Amongst those who added remarks to an interesting discussion were Sir C. Nixon, Profs. Craig and O'Connor, Mr. Begg from Scotland, Mr. C. Coony, President of the Victuallers' Association, and Mr. Joseph Hatch, President of the Cowkeepers' Association. Both these latter gentlemen showing a deep interest in the section, both by regular attendance and taking a practical interest in the discussion of the various papers, and who with Mr. F. Mason strongly advocated compensation to owners of animals found tubercular on slaughter, as they advocated that even with the best judgment, cattle might prove to be less valuable after post-mortem lesions had been revealed.

In this connection I may note that a resolution proposed by Mr. Coony, seconded by Mr. Mason was duly passed *nem. con.*

"That the Government be called upon to pay from the Imperial Exchequer compensation for all animals purchased in open market and presenting a healthy appearance, which on inspection after slaughter were found to be tuberculous."

This resolution is very good in its way, but unless some strong agitation is made in its favour I am fearful of profitable results.

Later in the day Mr. Brennan Devine, F.R.C.V.S., of Birmingham, read a paper entitled "Contamination of Milk occurring between the Cow and the Consumer." The paper elicited a good discussion, and amongst others who spoke, Mr. Joseph Hatch strongly referred to the great expense to which owners of cows were forced by having the tuberculin test applied, and that the public did not fully appreciate it, nor did medical men in authority enforce a recognition of the attempts being

made by up-to-date milk purveyors to secure a healthy milk supply.

Professor Sir Chas. Cameron added to the papers by reading one on "Suggested Amendments in the Laws and Regulations dealing with Milk"—in which he advocated compensation to owners of cows slaughtered in the public interest.

On Thursday, Professor Craig, Royal Veterinary College of Ireland, delivered an excellent paper on "Diseases communicable from Animals to Man." He particularly dealt with the transmissibility of tuberculosis through the medium of pigeons. He also dealt with the disease in dogs and cats due to human infection.

In connection with this paper the section was favoured by a very rousing speech from the Rt. Hon. W. Russell, M.P., Vice-President Board of Agriculture, in which he very strongly referred to the great necessity of stimulating research work.

On Friday we had two practical veterinarians in Mr. Cargill Patrick and Mr. P. J. Howard giving us papers on "Keeping of Animals and their relation to Public Health"—and the latter "Meat Inspection in rural Ireland—what it is and what it ought to be." Mr. Howard was very strong in showing that meat inspection in rural Ireland was certainly what it ought not to be, and detailed many glaring fractures of the sanitary laws, to say nothing of meat sold as sound from carcasses that were largely diseased.

The social side of the Congress was most agreeable, and comprised visits to various places of interest in and around the metropolis, a pleasure indeed I was informed that was not fully availed of; but the garden parties given by Their Excellencies at the Vice-Regal Lodge, as also that of Mr. Stanley Cochrane were largely attended and freely enjoyed by a large gathering, and by none more than by the members of this section. I desire very briefly to add that my opinion of the Congress, and particularly of our veterinary section, is that it proved a distinct success. The proceedings were very freely reported in the local press, and I am certain that the entire Congress will be noted one of the most successful that has ever been held.

I would, however, be entirely lacking in the discharge of my duty to this Association did I not draw its attention to the grave want of interest displayed by its members in the Congress.

Several Dublin veterinarians and a few from the country were there, but there was a very evident paucity of attendance. This is greatly to be deplored, for unless we as a body show ourselves interested in our own section it is small blame to others outside our profession if they consider us unworthy of any honour to be derived from such Congresses.

FRED. A. HENEY.

The CHAIRMAN, on behalf of the Association, tendered to Mr. Heney his thanks for the report that he had put in, and for the trouble that he had been put to. They were very grateful for all that he had told them. (Hear, hear).

ELECTION OF OFFICERS.

The CHAIRMAN then announced the result of the ballot for the officers, and the following were declared elected:—

President.—Mr. P. J. Howard.

Vice-presidents.—Mr. W. Chambers and Mr. J. B. Dunlop.

Hon. Treasurer.—Prof. Craig.

Hon. Secretary.—Prof. O'Connor.

Council.—Messrs. J. A. Thompson, J. F. Healy, Prof. O'Connor, B. P. J. Mahony, F. A. Heney, P. D. Reavy, and L. M. Magee.

THE R.C.V.S. VISIT.

The CHAIRMAN said that the Royal College of Veterinary Surgeons had decided to hold the annual meeting

of the profession in Dublin this ensuing year. The annual meeting was to be held, according to the by-laws, on the first Wednesday in June, and he had asked that the meeting should be held in Dublin. This had been complied with, and he took it as a compliment to the profession in Ireland that the meeting should be held in Dublin, and he would like them to rally round the Royal College of Veterinary Surgeons, and its present President, to make the meeting in Dublin a success. He had approached the Royal Dublin Society, who had kindly granted the use of the theatre for the annual meeting. In the evening he would like to hold a dinner. For a few years past—up to a few years ago—it was customary in London to hold a dinner which was recognised as being the professional dinner, and a re-union. As the annual meeting was to be held in Dublin for the first time in the existence of the college, they should have a dinner worthy of the college and the profession, and he intended to circularise the members in Ireland to ask them to come to it. They ought to do their level best to make the dinner a success. (Hear, hear).

VOTE OF THANKS.

Mr. McKENNY proposed a vote of thanks to the retiring President, and said they had to thank him for the able and kind manner in which he had treated them all.

Mr. J. HOLLAND seconded, and the motion was passed.

Prof. METTAM briefly acknowledged the compliment.

Mr. HEDLEY proposed a vote of thanks to the various officers connected with the Association, for the manner in which they had done their duty during the past year. Any criticisms put forward had been in good spirit, and had been received as such. There had been a general willingness to do everything for the good of the Association, and the profession generally in Ireland and the United Kingdom.

Mr. McKENNY seconded, and said that the Secretary (Mr. Watson) who had been in office for the last two years, had worked hard, and deserved their sincere thanks.

The motion was carried with applause.

Mr. WATSON, in replying, said that he was glad to know that if he had pleased no one else, he had pleased Mr. McKenny, and having pleased him, it proved that he had pleased everyone else. (Laughter.) It was all very well in proposing votes of thanks to office bearers for the duties they performed, but there was a great deal due to the officers, and the members did not give the assistance and co-operation to the officers they deserved, and on behalf of the new Secretary he asked the gentlemen present to assist him in his important duties. For instance, there was the point of sending out the various remarks for editing, and it was of the greatest importance that they should be returned quickly. During his term of office he had complaints to make against leading members of the Association for delays in sending back their remarks, and the report was delayed in publication. The members should assist the Secretary in every possible way. He had a lot to do, and these delays upset him tremendously.

The annual dinner was subsequently held at the Dolphin Hotel.

CONNAUGHT VETERINARY ASSOCIATION.

A general meeting was held on Feb. 1st at Claremorris; the following members were present: Messrs. D. Hamilton, Ballina (Pres.), T. J. Flynn, Ballyhaunis; J. J. O'Brien, Belmullet; P. McDonnell, Westport; James Dodd, Swinford; J. C. Doran, Castlereagh; P. F. MacCormack, Castlebar; A. F. O'Dea, Tuam; and A. J. Moffett (Hon. Sec.), Galway.

Letters and telegrams regretting inability to attend were received from Messrs. J. J. Vahey, E. A. Ryan, J. J. McCormack, P. D. English, and Cantrell Tracy.

The minutes of the last meeting were read by the Secretary, passed, and signed by the President.

PRESIDENTIAL ADDRESS.

DAVID HAMILTON, M.R.C.V.S., Ballina.

Gentlemen,—I congratulate you upon the successful start that has been made by this Connaught Veterinary Association, and I thank you for the honour you have conferred upon me in electing me President for its first year, but I honestly wish that the mantle had fallen upon abler shoulders. I shall, however, do my best to further the interests of our profession, having special regard to those identified with this remote part of the kingdom. I presume that you expect me to comply with the time-honoured custom of giving an address, and I intend to comply, in so far as a few remarks relative to our position is concerned.

It may be well to refer to the circumstances that induced us to form this Society. We are quite aware that unity is strength, and we have no idea of setting up an opposition Society, on the contrary, some of us are members of at least two of the three sister societies existing in Ireland at present, and I hope we may continue to remain as such for some time at least. It has been found impossible for us to attend these meetings, the distance, loss of time, and expense almost—might I say altogether—prohibit us. Situated as we are on the extreme west of the country, some of us reside 200 miles from the city of Dublin; thus our position on the map alone requires consideration, and at least in the case of our habitual absence could not receive that attention it deserves at our metropolitan meetings.

Now instead of weakening the existing societies, we hope to strengthen them, and by united action to bring matters of public importance before the notice of the public, and of public boards, in such a way that grievances may be removed, administration of orders perfected, and conditions improved for the good of the public, and I hope, with advantage to ourselves. Perhaps these reasons may be sufficient explanation for the need of this Society, and in due time I expect we will become affiliated to the National Veterinary Association, and I trust that instead of being looked upon as opponents we will be found ready helpmates in furthering the interests of the profession to which we have the honour to belong.

As you are aware, the veterinary profession, qualified by scientific proficiency, is now called upon to take a wide grasp of questions affecting public health. As the public health of man cannot be dissociated from the public health of animals, it is obvious that we are called upon to play an important part in the welfare and health of both, as well as in the wealth of the nation. It is admitted on all sides that there are diseases of animals communicable to man, and it is hard to conceive how this important matter has been, and is being, neglected. Politicians seem to ignore the fact that wealth without health is more of a curse than a blessing; they flutter the tinsel, the public are allured by the dreams of avarice, and the reality is neglected. It is, however, beginning to dawn upon the public that there is danger to be apprehended in relation to animals and animal foods. Rabies was a palpable danger, it was acute and fatal; they realised the danger, and I believe were thankful when it was eradicated, but they are slow to get up in arms against other diseases which, in many instances, are insidious but none the less fatal, and until they are awakened to a sense of their danger, and demand protection, I am afraid the same unpractical methods of dealing with such diseases will continue.

The Royal Commission on Tuberculosis settled the

question of the transmissibility of the Bovine bacillus to man from the ingestion of tuberculous infective material, and there are other bacilli besides that of Tubercle injurious to man; some give rise to toxins, and are accountable for many cases of serious illness. Now when this is known one would expect such steps to be taken as would protect the consumer. We are told that this has been done! A Dairies and Cowsheds Order has been issued aiming at the supply of pure, clean, wholesome milk. This order, like most others, is administered by the Local Authorities, and some of them have actually refused to put it into operation. Some have appointed a relieving officer or unskilled laymen to carry out the provisions of this order, and they have been sanctioned by the Local Government Board. Such administration is an impudent fraud imposed upon a confiding public, who are made believe that they are being protected in their milk supply.

It is common knowledge that nothing is more liable than milk to take up infection, both within the animal body and outside of it, and being the product of the cow, to be wholesome, must be the secretion of a healthy animal; and for the animal to maintain health, she must be properly fed and housed; and for the milk to leave the cow-house clean and pure the house must be clean, the cow must be clean, the attendants clean, and the surroundings clean and free from contaminating materials.

All of those are important, but who is likely to know whether the cow is healthy or unhealthy? The relieving officer, the local butcher, or the veterinary surgeon? Who but an expert could possibly diagnose conditions which produce toxins in the animal body that are conveyed to the milk? This employing of unskilled labour is an insult to the intelligence of the public, and a gross insult to our profession. Why name us in the order if anyone can perform the duties? Has Parliament granted us a charter to enable us to compete with the relieving officer or the local handyman?

This is a point that should be settled at once and for all. Either make it imperative that a veterinary surgeon should be appointed in every case, or erase us from the Order altogether; then if we wished we could compete with the relieving officer, if not on merit, on whatever local influence we may possess. Our position with the public would be clear, we could not be responsible where we had no responsibility, and they would more readily see that the health of the nation was of so little importance that it was not worth protecting. That the curing of disease in man is held to be more important than its prevention.

The ingestion of infected meat cannot be over-estimated, and the first step to be taken is to have public abattoirs; so long as animals are slaughtered for human consumption in any hole or corner, so long will unwholesome food escape the vigilance of inspection. It is simply scandalous the way meat is treated in many so-called private slaughterhouses; neither the houses nor the persons engaged in the work are clean, and there does not appear to be any control. Some diseased, and much unwholesome food is undoubtedly consumed. Considerable attention is now being paid to the meat supply of cities and large towns, and are not the smaller towns and places equally important? The individual is part of the community, the wealth of the nation is the labour of its population, and the labour is dependent upon the health of the people.

The eradication of contagious diseases of animals, the protection of their health, and the improvement of the breeds are matters which might very well concern us, closely associated as we are with an agricultural community. Enormous sums of money have been lost in the past by the ravages of contagious diseases, and too much attention cannot be paid to their prevention, control and eradication. Perhaps some might be added to the list of

diseases already scheduled, such as Tuberculosis, Swine erysipelas, and Blackleg. At present the contagious diseases are worked by the local authorities under the control of the D.A.T.I., but I think it would be far better if they were under the direct control of the veterinary branch of the department, having one central and governing body would insure a more uniform service and action. Except for the levying of taxes, I see no purpose in having local authorities concerned in matters of which they are indifferent and quite ignorant. Optional discretion should not be given to local authorities to use their will or judgment in applying orders for the control of those diseases; a uniform system is essential to insure benefit, and most certainly none but qualified inspectors should be entrusted with this important work.

The agriculturists in this country have reason to be thankful that Rinderpest, Pleuro-pneumonia, Rabies, and Glanders and Farcy have been eradicated from our island, and Foot-and-mouth disease prevented from entering its shores during the past 30 years. This is a very good record, and there is no reason why more might not be done. I do not want it to go abroad that our country is teeming with tuberculosis, I do not believe that it is, but I know that the disease exists, and we all know that it will not die out of itself, but that it will tend to spread and increase where animals are allowed to mix freely, the diseased with the healthy. This being an undoubted fact, the sooner its control and eradication is tackled the better. The danger of contact will apply especially to our part of the country as the agricultural population increases, and the herding and housing of animals consequently become more confined.

I am not an advocate for general slaughter, but I think clinically affected animals should be slaughtered and some compensation given. Milch cows affected should be indelibly branded if they are not slaughtered; all animals in an affected herd should be tested, and reactors separated and put under suitable hygienic conditions. The State would ultimately benefit from a healthy animal kingdom. In the meantime, apart from the losses which occur from death, the producer and the consumer must both be paying for the butchers' insurance against loss from condemned carcasses. I may state here my opinion that the State should prepare and supply tuberculin or authorise the Royal Veterinary College to do so, it would be a guarantee to the V.S., to the owner, and to the buyer of tested animals.

Having glanced at our relationship with public bodies in connection with some of the diseases of public interest, I may mention a subject which affects the farmer more than ourselves. It would be well if the Department which is trying to improve the condition of the farmer would pay more attention to the breeding and rearing of stock, and instruct their lecturers to treat of the animal in health rather than in disease. No one wants disease or illness, but there appears to be a greater desire amongst our farmers for a cure than for a preventative, and their desires are often gratified. If the lecturers confined themselves to the feeding and rearing of young stock they could do useful work, and by teaching the breeding of animals they would confer immense benefit. Our cattle have deteriorated, they are being crossed and re-crossed indiscriminately; it is becoming more difficult every day to get a good milch cow. Many of our cows do not yield 300 gallons of milk per annum, and a cow is considered unprofitable that does not yield 600 gallons with, say, $3\frac{1}{2}\%$ of butter fats. The difference calculated at 6d. per gallon would often pay the rent of the little farm. Here is a source of wealth being lost to the country for the want of attention and education.

I have not said a word about horses, and I must apologise for having said so much about cattle, but my apology is that it points out a field of usefulness, and

with an increased value in our animals will come an increased demand for our services. I hope that the universal breaking up of grazing lands will not tell against the production of that national asset—the Irish Hunter. I fear he cannot be so good if reared on small patches as when roaming over large tracts, and I, for one, hope that the powers that be may see their way to leave suitable ranges in every district for this purpose.

I could have wished to deal in my address with the Veterinary Dispensary Scheme, but I fear that this is a subject that could profitably occupy a special day for itself, and I hope we may be able to arrange for having this important matter discussed on an early date. There are many conditions in the scheme that require adjusting, and we will require to assert our views in a definite manner.

I trust that this brief address may be accepted as an outline or idea of our line of action as regards our relation with public bodies. We believe that we are the only body qualified to deal with the diseases of animals, and we should never rest until duties pertaining to them are vested in members of our profession, or, where it may seem impracticable to have a qualified inspector to do all the duty, a V.S. should have supervision.

I fully expect that you will bring forward subjects of clinical importance at our meetings, and I humbly suggest that notes on cases, and the exhibition of specimens are often more acceptable and profitable than many of the so-called scientific papers we see published from time to time.

I thank you again for the honour you have done me, and I earnestly ask your co-operation in discharging the duties of office, and hope that our labours may bring credit and profit to ourselves, and honour to our profession.

Mr. P. F. MACCORMACK wished to heartily thank the President for his address. He thought the members' ideas had been voiced on the subjects contained in the address. The President had taken a great interest in the Association, and as one who was well known and esteemed in the Province of Connaught, and indeed all over Ireland, they should feel very grateful for that interest. He considered they could not have a better man to lead the Association in its first year of being.

Mr. A. F. O'DEA also thanked the President for his address, and thought it would be a good thing if it were published in the local papers—it would show the general public the veterinary surgeons' view of their relationship to the public and their interest in the public health. He had listened with great pleasure to the address.

Mr. J. C. DORAN, in thanking the President for his able address, supported Mr. O'Dea's suggestion—that it should be sent to the local papers for insertion; it would show the public the interest veterinary surgeons were taking in public health matters, and that they were thoroughly capable of dealing with such questions.

Mr. MOFFETT thanked the President for his sterling address. The President in the beginning of his address had deprecated his ability to guide the affairs of the Association for the coming year, but he considered that before the end of the address he had well proved his ability to undertake the responsibilities. It was a strong address, and showed that the President was determined to do his best for the Association by showing the public the proper relationship of the veterinary surgeon in public health matters. It would show the general public also that they had the interest of the public at heart. He thought they could have no better man at the head of the Association.

Mr. FLYNN: We are all tired now of praising the President.

The PRESIDENT: There seems to be a danger of this meeting becoming a mutual admiration society. (Laughter).

Mr. FLYNN: But still he thanked the President for his able address. The President had been, as long as he knew him, as a father to him, and he knew no one who would take a keener interest in the Association. He also thought the Secretary should be thanked for the trouble he had taken, and was very sorry Mr. Vahey was not here to accord. Indeed, all the younger members of the Association should be thankful to the President, Vice-president (Mr. Vahey), the Secretary, for the trouble they had taken in forming the Association.

The PRESIDENT briefly thanked them all for their kind reception of his address, and said he would do all in his power to make the Association a success.

The SECRETARY also thanked them for their kind remarks, and said the best thanks they could give him would be to come to their meetings and make the Association a success. He, personally, did not grudge any trouble in forwarding the interests of the Association.

DAIRIES AND COWSHEDS ORDER.

Mr. MacCormack and Mr. Flynn brought up the question of the Local Government Board directing the Claremorris District Council to appoint three laymen to the position of inspector, and that there was no question of the appointing of a veterinary surgeon to supervise them.

Mr. MACCORMACK said he spoke to members of the District Council, who said they would be grumbled at by the public for not appointing lowest tender, and that the L.G.B. sanctions the appointment, and does not insist on qualified men being appointed.

The PRESIDENT thought they should put their views before the Milk Supply Committee when it sat in their districts.

LECTURES TO AGRICULTURAL CLASSES ON VETERINARY HYGIENE.

Mr. DORAN said he was appointed by the County

Council at thirty shillings per lecture, and had to go ten miles of a drive. He refused to act at less than two guineas per lecture, and the Secretary of the Agricultural Committee told him that a Department official told him that he could get no veterinary surgeon to take up the lectures except one from the South of Ireland, who would get three guineas per lecture and expenses.

Mr. MACCORMACK said it was a question of principle.

Mr. MOFFETT said he thought no honourable veterinary surgeon from the South of Ireland would come to lecture in face of the resolution passed at last meeting stating they would not take less than two guineas per lecture.

Mr. DODD said it was optional for the County Agricultural Committee to appoint lecturers at all. At first he had refused to take less than two guineas per lecture, but later took thirty shillings rather than let some other lecturer in.

The PRESIDENT: In order not to interfere with the studies of the agricultural students, he thought it would be better to allow members to accept the terms offered for this year.—This was agreed to by all the members present.

AFFILIATION WITH NATIONAL VETERINARY ASSOCIATION.

It was decided that a copy of the rules be sent to each member before the next meeting, when the matter could be discussed.

Rules. The SECRETARY said the Council had gone through them and it was decided to have them printed and circulated among the members.

After a vote of thanks was passed to the President the meeting adjourned.

A. J. MOFFETT, Hon. Sec.

Football—Dublin v. London.

The annual Inter-college Match was played in Dublin on Saturday, Feb. 10, the London team left Euston on Friday, accompanied by Professor Wooldridge, and Messrs. Smith, O'Kell, Bailey and Woods, a special saloon being provided. Bridge helped to pass away the time spent on a comfortable train journey, but the sea passage was not so pleasant. A high wind, rough sea and blinding rain made the three-hour passage seem an eternity. The team suffered—the casualties being numerous, and a night's rest in Dublin failed to fill the aching void. There is no doubt that these circumstances interfered with the otherwise promising chances of victory held by the visitors, who have been undefeated during the past two seasons. On Saturday morning a visit was made to the fine college premises, and many acquaintanceships were renewed. After the match the visitors were entertained at the Gresham Hotel. The speeches were enthusiastically received, and toasts were drunk to musical honours. Mr. Dunlop figured amongst the guests of the evening. Professor Mettam occupied the chair. After dinner the company adjourned to the Royal Theatre, where seats had been reserved; an excellent entertainment in the form of a pantomime, bringing to a close an evening acting as a splendid antidote to the experiences of the previous day. On Sunday afternoon the party partook of tea at Bray, followed by a smoking concert, to the programme of which members of both colleges contributed. Amongst the many excellent turns Mr. Clunes' dramatic number, "Kissing Cup's Race"; Mr. O'Neill's (M.R.C.V.S.), "Wreck of the Desperate Cuss"; Mr. O'Leary's "Elephants to ride on," and the songs rendered by Messrs. Clancey, Porter, Hickie, and Preston, were truly representative of the Irish College talent. For the visitors, Messrs. Davies, Gilbert, Smith, Fieldhouse, Herratt, Sheffield and Woods acquitted themselves with distinction. Mr. T. J. Herratt undertook the arduous duties of accompanist, and his fine playing was greatly appreciated. The London team returned on Monday, after a most enjoyable week end. The thanks of both parties are cordially offered to the energetic secretary, Mr. J. J. Mills, in whose capable hands the entertainment arrangements were placed.

Royal Vet. College, Dublin: P. Huston; J. A. Brew, T. V. O'Connor, C. P. Fisher, H. A. Connolly; S. O'Donel, J. Guerin, J. R. Ellison, J. Clune, T. O'Leary, C. Stewart, J. J. Mills, M. H. Reid (Capt), T. Finch, and J. J. Pomeroy.

Royal Vet. College, London: Williams; Huston, Soutar, Leach, Going; DeKoch, Fieldhouse, Sheffield, Lawrence, Viljoen, Melch, Gilbert, Stewart, Daly, and W. Williams.

Referee: Mr. Louis Magee.

London started, and following the usual exchanges play settled at the home 25. The visiting backs tried passing, but they were hustled by the Dublin forwards, who, led by Clune, rushed down to the visitors' line. A free let London back to the centre, where hard forward work was the order for some time. A good run by Huston gave the homesters a footing in their opponents' ground, but the London forwards, led by Gilbert and Stewart, worked back. London continued to have much the better of the exchanges, and a try seemed likely when the ball was sent dead. From the drop out London returned to the pressure, and following some exciting work in the home ground De Koch obtained possession and dropped a smart goal.

Some good work by the home pack gave Dublin a footing in their opponents' territory after this. The defence

prevailed until near the interval, when a loose rush, in which Clune and Reid were prominent, resulted in a try being scored. Guerin converted, and at half-time Dublin led by a point. DUBLIN—1 goal (5 points); LONDON—1 dropped goal (4 points).

On resuming London pressed, but faulty passing by their three-quarters lost ground, and following a good forward rush by Dublin, Clune forced his way over for a try under the bar, Huston adding the points. The exchanges continued to favour Dublin, and the visitors had to touch down. An improvement in the visitors' position was brought about by their forwards, who reached the home 25. Here Souter got the ball, and running through the home backs scored a clever try which was not converted. Some clever kicking by Williams prevented Dublin from increasing their lead a minute later, and De Koch getting in a fine kick, eased the pressure. However, Dublin returned, and a sharp attack ended in Brew scoring an unconverted try. Once more Dublin attacked, and the London full back was repeatedly called upon to save, which he did in good style. O'Connor made great efforts to score for the visitors, but the home defence prevailed. Result: Dublin 2 goals, 1 try (13 pts.); London, 1 dropped goal, 1 try (7 pts.)

THE PROTECTION OF ANIMALS ACT—A QUERY.

Sir,

In your current editorial remarks upon that clause of the new Act which renders it highly penal to "subject any animal to any operation which is performed without due care and humanity," I see no reference to two points which have occurred to me. The first concerns the word "care." Would not a *veterinary surgeon* who was, or was thought to be, liable to an action for negligence in the performance of an operation, be also exposed to a prosecution under this section of the Act? I think he would be, but I will not dwell upon this first and minor point. The second is much more important. Would not the words "due humanity" be held to include the use of anaesthetics for all severe and painful operations? In other words, is not a veterinary surgeon performing such operations without anaesthesia now liable to prosecution?

Personally, I think that most magistrates would hold the word "humanity" to include anaesthesia. I know what I should hold, if I were a magistrate and it were proved to me that a veterinary surgeon had performed, say plantar neurectomy on both fore limbs of a horse, without anaesthesia. The same might be said more or less forcibly of many other operations, such as those for quittor and poll-eil, firing, etc. But the most serious application of the clause appears to be castration and spaying.

My interpretation of the Act would really illegalise the "standing operation." That might not be a bad thing, though I know that some qualified men say they prefer it to all other methods. But what is to be said of the bearing of the clause upon the castration of calves, lambs, and pigs, and the spaying of sows? These small animals could not be chloroformed under the fees generally paid for their castration. But does not the Act enjoin that they shall be?

Of course, a great deal depends upon this question—how far do those chiefly responsible for initiating prosecutions under the Act intend to enforce its provisions? I do not suppose that the police will propose to enforce universal chloroforming for castration; but what about the R.S.P.C.A.? I think I am right in saying that, many years ago, the R.S.P.C.A. attempted to stop sow-spaying altogether, and failed. What use are they likely to make of these new powers?

I believe that anglers are now holding meetings and consulting lawyers to ascertain the bearing of this new Act upon their sport. Should not veterinary surgeons do the same in a matter affecting the everyday work of a good many of them? And should they not also communicate with agricultural bodies?—for, if the operator is liable under the Act, so is the owner who merely "permits" the operation. If the clause really means what I think it does, we ought to lose no time in finding out whether it is intended to enforce it to the full.—Yours faithfully,

"GARDEN PRACTITIONER."

Several communications are unavoidably held over.

PRACTICES FOR DISPOSAL

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains: reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises. Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

EAST COAST. Agricultural practice returning £600 per ann. Good house containing 2 recept. 4 bedrooms, bath, kitchens, etc. Stabling for 4 horses, coach-house, kennels, etc. Price required for house and practice £1300, of which £400 can remain on mortgage, or vendor would sell practice for £500 and would let house on lease at £45 per annum.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

HOME COUNTY. Practice returning £350 to £400 per ann. In present hands nearly 20 years. Small house with 1 acre garden and good stabling. Rent £35. Premium £200.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended.

New Parturition Instrument.

ILLUSTRATED description of same in actual use and testimonials sent on application. Removal of limb and dissection made easy. Orders for this season must be sent early. Address, W. J. Fletcher, M.R.C.V.S., Wrexham.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

"MAGNUM" PESSARIES.

(HEWLETT'S)

"Magnum" Pessaries are prepared with a medicated non-oily base which is both effective as a Uterine Antiseptic and of special benefit in Parturition both in Cows and Mares.

A "Magnum" Pessary should be inserted directly after parturition in order to maintain the Uterus in a healthy state. It can be inserted with the greatest ease and will keep the parts in a thoroughly antiseptic condition for a lengthy period.

Alkaline "Magnum" Pessaries have recently been recommended to neutralise excessive acidity of Vaginal secretion.

"Magnum" Pessaries are supplied according to various formulæ as below, and Veterinary Surgeons' own formulæ can be made up as required.

		Doz.	12 doz. @	Doz.

VOL. XXIV.

DIAGNOSTIC METHODS.

Veterinary Surgeons collectively have shown no great readiness to adopt many physical and chemical aids to diagnosis which are in common use among medical men. Ophthalmoscopy, which many of our members have never once practised, might be cited as an instance. A better one, because much wider and more general in its application, is auscultation and percussion. Many veterinary surgeons auscultate with the unaided ear; and few use instruments for percussion—though in the latter connection it must fairly be said that some of those who have specially studied the subject deliberately prefer digital to instrumental percussion. But, speaking generally, it must be admitted that, except with regard to auscultation of the heart, our members do not pay sufficient attention to auscultation and percussion. Anatomical factors will always limit their value to some extent in veterinary practice; but nevertheless we have not yet fully proved their utility.

Urine testing, again, which is a routine procedure amongst medical men, is practically unheard of in everyday veterinary work. The obvious excuse for this—the difficulty in collecting urine—is by no means an invariably sufficient one. There are many cases in practice in which urine testing is not feasible; but it might be resorted to much more often than it is. In veterinary infirmaries especially there are not a few opportunities; and it may be added that infirmary patients are now chiefly canine, and it is in the case of old dogs that urine testing, if generally adopted, would probably be of most value. Urinology never has received the attention it deserves from veterinary surgeons. A few men in the schools have worked upon it; but it has been practically ignored by the great majority of clinicians. Yet it is one of the subjects which an ordinary clinician might very often work upon with good results.

Considering how speedily we recognised the value of such revolutions in diagnosis as mallein and tuberculin, it seems strange that we should be inclined to disregard these other methods which have long been everyday ones amongst medical men. Should we not do well to consider the adaptability of such procedures to our work. Many of them would require some modification;

most would prove of more value than we now suppose. Even cystoscopy, a novel and difficult diagnostic procedure, has been successfully practised upon some animals. Yet there are not a few veterinary surgeons who never use either stethoscope or ophthalmoscope, and never dream of testing the urine.

EQUINE HAY FEVER.

Last summer I attended several horses which appeared to be suffering from a rather uncommon outbreak, although in previous dry seasons I have occasionally treated a few odd cases of a somewhat similar nature.

They did not suffer quite so acutely as those described a few weeks ago in *The Record* by Walther, of Leipzig, but otherwise they were in much the same state. The deep red and swollen condition of the conjunctivae, the slimy and watery discharge from the eyes and thin mucus from the nostrils were all present, as also the general dullness. The cough was not extremely violent in my patients, but I never saw any of them at work or undergoing any exertion, otherwise it might have proved more distressing. The temperature was never more than 103, generally under, and the appetite and circulatory system were only slightly impaired.

They had all been turned out night and day in the neighbourhood of hay and clover fields, and when stabled made a rapid recovery, as a rule in less than a week. A few of them had been turned directly on a portion of the mowing grass, on account of the bareness of the pastures.

Many of the said cases had a great resemblance to Pink-eye—one reason why they received extra observation, especially some which had been standing in a day or two and had consequently filled in the legs, but I had plenty of proof that there was nothing whatever infectious in connection with the lesions.

Dust from motor-cars, smells from sewage and other nuisances were blamed by owners for the mischief, and where nothing of the sort was accessible the changes of temperature—very hot days and cold nights, were thought to have had a good deal of influence, but I strongly believed, and am now more convinced since reading the interesting translation referred to, that the irritation from pollen was the principal cause of the trouble.

ABSTRACTS FROM FOREIGN JOURNALS.

THE TRANSMISSION OF HUMAN TUBERCULOSIS TO CATTLE.

Since the year 1903, Prof. Eber, of the Veterinary Institute of Leipzig, has carried out several series of experiments bearing upon the question of the unity of species of the tubercle bacillus. The results of the first three series, which were published from 1905 to 1908, showed that the ox may be infected by human tuberculous products derived even from adults, and that this may happen, not only after an intermediate passage through the guinea-pig, but even by the direct inoculation of pure cultures.

Eber has recently published the results of the fourth series of experiments. The infective material which was utilised came from fifteen cases of human tuberculosis, of which eight were cases of surgical tuberculosis, and seven of pulmonary tuberculosis.

The inoculations were carried out upon 54 calves of from three to four months old (not reacting to the tuberculin test), 236 rabbits, and 360 guinea-pigs.

Eber succeeded in transforming bacilli of the human type into those of the bovine type; but he found that the transformation takes place gradually, and is only complete after repeated passages through the ox.

He also found that passage through the guinea-pig facilitates the adaptation of the human bacilli to the organism of the ox. These results distinctly support the view of the unity of species of human and bovine tubercle bacilli, and confirm the findings of the French School (Chauveau, Nocard, Arloing, Cadiot, Gilbert, Rayer, etc.—(*La Semaine Vétérinaire*).

THE PASSAGE OF TUBERCLE BACILLI THROUGH THE INTACT SKIN.

Konigsfeld (*Zentralbl. f. Bakteriologie*), discusses this question. Animal experiments have shown that tubercle bacilli are able to traverse the uninjured skin. They penetrate by way of the hair follicles and lymphatic clefts, and $7\frac{1}{2}$ hours later they are in the subcutaneous cellular tissue, where they are to be found even 24 hours after the inoculation. After the expiration of (at the longest) four days, they can be demonstrated in the regional lymphatic glands. From these they pass to the internal organs by the lymph or blood stream.

The cutaneous affection fails in the case of bacilli of low virulence, or when only a few bacilli are concerned. No distinction seems to exist between the infection with human tubercle bacilli, and that with perlsucht bacilli. The skin itself seems to possess a great resistance against tuberculous infection.—(*Berliner Tier. Woch.*)

[All this suggests that internal tuberculosis may

be due to cutaneous infection, if not often, at least less rarely than we have supposed.—*Transl.*]

AN INFECTIOUS DISEASE OF CANARIES CAUSED BY BACTERIA OF THE PARA-TYPHUS GROUP.

Willy Pfeiler reports that, some years ago, he observed a disease in a stock of very well-bred canaries, the cause of which was ascertained to be a bacterium of the para-typhus group.

The disease was extremely infectious, and considerably over a hundred birds succumbed to it. During life, the affected birds showed the depression customarily seen in sick canaries; but the most prominent symptom of illness was a profuse diarrhoea.

Post-mortem, all the birds showed a catarrhal or hæmorrhagic inflammation of the intestinal mucous membrane. Most of them showed, in addition, a fibrinous or sero-fibrinous pleurisy and peritonitis, and hæmorrhages under the epicardium and endocardium. Most birds also showed a striking hyperplasia of the spleen.

Bacteria were found in the blood of the heart and in the organs, and these, when stained by the aniline dyes, presented an extraordinary resemblance to the bacteria of fowl cholera. The organisms grew easily and luxuriantly on the ordinary culture media. Smears from pure cultures showed ovoid bacteria and with them some of somewhat longer appearance, which also had an inclination to bipolar staining. The bacteria were Gram-negative; and, when examined in hanging drop preparations, were actively motile.

Pfeiler undertook a series of biological experiments, of which he gives details and tables, with this bacterium; and proved it to be related to the para-typhus group. He remarks that, as canaries are the housemates of mankind, and often, among canary breeders, hundreds of them live together in one room with human beings, it is possible that such proximity may be dangerous to human health. On that account, he considers his observation of epidemiological interest.—(*Berliner Tier. Woch.*)

W. R. C.

CEREBRAL HÆMORRHAGE IN A DOG.

A two months old pointer puppy was brought to me in a fit. The breathing was irregular, after a few hurried expirations, a halt followed: the heart's action was similar, now rapid, now slow, pulse imperceptible. The left hind leg alternately with the fore was quickly convulsed. At times there was a convulsive opening of the mouth, champing of the jaw and bending of the head backward, or of the back. There was loss of consciousness, the eyes were open, the pupils did not react to light. The feet were cold. Thinking there was cerebral hæmorrhage I tried treatment, but death occurred in 20 minutes. Before death the symptoms decreased in frequency and severity. P.M. I found two or three drops of blood in the right ventricle of the brain. Afterwards the owner succeeded in learning that the maid servant, whom the puppy worried in play

had thrown it against the wall when it immediately lost consciousness.

ENCERBA SANGELFLUO CE HUNDO.

Oni alportis al mi 2monatan hundidon-pojuteron, al kiu ĵus okazis la nerva paroksizmo pro nekonata kaŭzo, daŭranta same antaŭ mi. La spirado-interrompa; post kelkaj oftaj eksopiroj sekvis halto; ankaŭ la koro, ĝijen ofte batis, jen malrapidis, la pulso estis nesentebla. La malantaŭa maldekstra piedo, alterne kun la antaŭa, rapide ektremadis. Kelkfojojn okazis jen konvulsia malfermo de la buse, jen la ofta salivmacado kaj fleksigo de la kapo malantaŭen aŭ fleksigo de la dorso. Konscio mankis, la okuloj-malfermitaj, la pupilo ne reagis kontraŭ lumo, la piedoj-malvarmaj. Konsiderinte, ke okazis encerba sangelfluo, mi faris iajn penojn por savi, sed la morto sekvis post 20 minut. Antaŭ la morto la nomitaj simptomoj estis ciam pli kaj pli maloftaj kaj malakraj. Post la sekcio mi trovis 2-3 gutojn de sango en la dekstroa ventrikulo de la cerbo.

Jam poste la poscedanto sukcesis ekscil, ke servistino, kiun tiu hundido tedis per sia ludo, repusis ĝin kaj ĝi alfrapiginte al muro tuj perdis konscion.

NORTH OF SCOTLAND VETERINARY MEDICAL SOCIETY.

The half-yearly meeting was held in the Agricultural Department, Marischal College, on Saturday, Jan. 27th. The following members were present: Messrs. Anderson, Keith; Brown, Banchory; Hepburn, Aberdeen; Howie, Alford; Kerr, Ellon; Murray, Cullen; Morrison, New Deer; Marshall, Aberdeen; McPherson, Huntly (President); McGregor, Old Deer; Sievwright, Tarland; Laing, Turiff.

Apologies for absence were sent by Messrs. Gunn, Peddie, Watson, Bell, and Baxter.

The minutes of last meeting were read and approved.

CORRESPONDENCE.

A letter from Mr. Stockman, Board of Agriculture regretting his inability to accept an invitation to come north to deliver an address on Anthrax before the Society.

A letter from Mr. Gofton asking the Society to appoint representatives to act on the Council of the reconstructed National Society.

On the motion of Mr. Morrison, seconded by Mr. Anderson, and unanimously carried, Mr. McPherson, Huntly, President, and Mr. Howie, Alford, Hon. Sec., were appointed.

A letter from the Royal Sanitary Institute inviting delegates to the forthcoming Congress at York was allowed to lie on the table.

The PRESIDENT said that the annual event called the President's inaugural address might, in his opinion, be very well dispensed with, for the reason that it was very difficult for presidents to find anything fresh in the way of veterinary politics to speak about; so much of

the same kind being repeated again and again at meetings of the various Societies and published in the veterinary papers.

He would just like to say a word or two about anthrax. He regretted extremely that Mr. Stockman had not been able to accept the Society's invitation to come North to address the members on this subject. He felt quite certain that such a visit to the most anthrax-infested district of Great Britain would have been productive of nothing but good, and would have tended to remove many misunderstandings at present in existence regarding the diagnosis of anthrax.

He stated that he was one of those who recognised that there was a decided difficulty in diagnosing anthrax. He had last summer had several of his diagnoses upset by the Board of Agriculture, and feeling somewhat aggrieved thereat sent duplicate slides to a friend on whose bacteriological knowledge he could depend. In every case the diagnosis of the Board of Agriculture was upheld by his friend. He stated that in his experience cases occurring in summer were more difficult to diagnose than those we get in winter. The heat probably promoting the growth of bacilli, such as those of malignant oedema, and thus confusing the issue.

He counselled the members to have very great patience with the officers of the Board, because they had a very difficult task to perform, though he would admit that it was perhaps a little galling to have one's opinion upset. He thought that we should all do our best to support and assist the Board. For veterinary surgeons were likely to have a lot more to do with the Board of Agriculture in the near future than at present, as there was every likelihood of both tuberculosis and contagious abortion becoming scheduled diseases.

STERILITY.

By Mr. WM. BROWN, M.B.C.V.S., Banchory.

I have chosen this subject for discussion, as it is one which falls in with my special liking. It has received very inadequate attention from both medical men and veterinary surgeons, and the condition is so common amongst animals of the more approved breeds that it causes much loss to those engaged in the breeding industry.

I propose to confine my remarks, more especially to the female, as sterility is perhaps more often found in the female than in the male, and more may be done for the condition in the former than in the latter.

We may define "Sterility" as the incapacity on the part of an animal to reproduce its species. It may be absolute or relative. Absolute when the animal fails to conceive; relative where conception occurs only very occasionally, and where the animal breaks service habitually, or aborts.

Before considering the ætiology of the condition, we might first inquire into the cause of normal heat or œstrum and the conditions which accompany it, in order that we may more clearly follow them pathologically. The physiology of œstrum has only recently been elucidated. We owe our knowledge of it to the excellent work of Mr. Walter Heape and Dr. Francis Marshall, of Cambridge, which was communicated to the Royal Society in 1900-1903.

In 1865 Pflüger advanced the hypothesis that œstrum was due to a nervous reflex, caused by the pressure of the ripe Graafian follicles on the nerve endings in the ovaries. Goltz, however, in 1874 disproved this by transecting the spinal cord in the lumbar region, and finding that normal œstrum occurred nevertheless. This distinctly proved that œstrum was not nervous in origin.

Brown-Sequard (1889) was the first to show that the ovary, like the testicle, produced an internal secretion into the blood which has an important bearing on meta-

bolism. This secretion, which Starling has named a hormone, is formed continuously, but at certain regular periods is produced more abundantly, and has been proved by Heape and Marshall to be the cause of œstrum. Various extracts from the ovary during an œstrus period have been made and used in human medicine for certain ovarian disorders. These, such as "ovarine" "oophorine" and "ovigenine" when injected in sufficient doses will produce a condition to all appearance like ordinary œstrum, but, to my knowledge, they have not been used on veterinary patients. It has further been shown by Marshall that if the ovaries be entirely removed from the female, œstrum will not occur, but if they be transplanted into any part of the body, even subcutaneously, the condition will reappear. Where only parts of ovaries are transplanted œstrum will follow to a lesser degree.

It is interesting to note here with respect to the male, and especially in the case of cryptorchids, that Shattuck and Seligmann (1904) have shown in several experiments that if a testis be broken up and fragments remain in normal position or even become attached to viscera, the animal will retain a certain amount of his male characters. They say "one must regard the external character of maleness as a quantity which varies proportionately with the amount of gland tissue present."

Concomitant, and practically synchronous with œstrum is the process of ovulation, a process by which the ovum (one or more) becomes mature, and is then extruded from the ovary ready for fertilization by the spermatozoa. The cavity from which the ovum escaped is filled up by a tissue known as the corpus luteum—a tissue which, if conception occurs, persists during the greater part of the period of gestation, and has a very important bearing on the fixation of the fertilized ovum to the uterus. At the same time as these phenomena are going on a complicated process of preparation is proceeding in the uterine wall. There is a congestion, and an increase of capillaries in the submucous coat. The walls of the vessels give way and blood is extravasated into the submucosa. The uterine mucous membrane then ruptures here and there, and blood in some animals, in others blood mixed largely with mucus finds its way into the uterine cavity, then to the vagina, and thence outside. This is followed by a process of recuperation—a repair of the uterine wall—leaving it fresh for the fixation of the fertilized ovum. Geddes and Thompson, in their evolution of sex, say the process is viewed as a kind of surgical freshening of the uterus for the reception of the ovum, whereby the latter during the healing process can be attached safely to the uterine wall.

With these preliminary remarks on the phenomena of œstrum we will now turn to the ætiology of sterility. Eugen Bass, *Journal of Comparative Pathology and Therapeutics*, 1894, has divided this under three heads:

Inability to Form Ova.

The power to produce ova presupposes a healthy ovary. If these are absent—which is very rare—or if they be markedly pathological, ova will not be produced. Absence or deformity of the ovaries is mostly seen in a heifer which has been twin with a bull—a "Free marten," an animal often masculine in appearance. I have, however, seen a heifer which was twin with a bull breed.

Under this heading we also class all inflammatory conditions of the ovaries and their results, such as atrophy, or septic or purulent formation, which latter may be secondary to similar conditions previously present in the uterus. The ova and ovarian tissue may thereby be destroyed. Tuberculosis of the ovaries in cows is not uncommon, and to this may be added cysts, fibromata, carcinomata, melanomata, and sarcomata.

The diagnosis of these conditions is by no means easy. We may have absence of œstrum, or exaggerated œstrum

or nymphomania. Tuberculosis of the ovaries, in the early stages at any rate, is a frequent cause of nymphomania. The cow becomes what we call a "buller," she loses her shape, becomes masculine in appearance, often loses condition, and often is nearly constantly in œstrum.

Pathological conditions of the ovaries, however, are not always the cause of nymphomania. Certain cases are undoubtedly due to nervous irritation, especially in mares, and this leads to a degeneration and atrophy of the ovaries as a result. Its cause is difficult to determine—it may be one of the disharmonies which Metchnikoff, in his "Nature of Man," has pointed out to be so common in the generative systems of animals.

Climatic conditions, heat and cold, a dry, warm season, influence reproduction to a great extent, and thus may be looked on as acting through the nervous system.

Food plays a very important part in reproduction. Animals which are underfed or overfed often do not breed. Good feeding, however, is necessary, and is well demonstrated by the practice of "flushing" sheep, where they are put on to better rations a month before the "tupping" season. This has been distinctly proved by Marshall to produce a greater percentage of lambs. The quality of food also is important; many mares will not "settle" until put to grass for some time. Animals in poor condition should be put on better rations and tonics. Animals over-fat must be reduced by bleeding, physic, change of food and change of work. Obesity is, however, often a sign of pathological conditions of the ovaries, as absence of ovarian secretion leads to a deposition of adipose tissue, such as is seen after ovariectomy. Animals systematically prevented from breeding have been shown by Heape to become ultimately sterile. Animals mated at too early an age sometimes become sterile in after life.

Treatment.—In cases where there are pathological conditions of the ovaries treatment is of little avail. It has been recommended to crush cysts through the walls of the rectum, or withdraw their contents with a trocar, but such would give little result. On the other hand, sterility through bad feeding and keeping can usually be remedied. In this connection I am of the belief that there are many cases in which inability to produce ova, and often, too, absence of œstrum, is due to inertia of the ovaries through no pathological condition. In such cases the treatment depends on the use of certain aphrodisiacs, and upon these I should like to say a few words. These include Strychnine, Phosphorus, Arsenic, Damiana, and Chloride of Aphrodine. Cantharides has often been used, but its action is almost entirely as an irritant to mucous membranes, especially that of the uterus; whereas what is required is to increase ovarian secretion.

Aphrodine, according to Finlay Dun, stimulates the central nervous system, and causes marked congestion of the genital organs. It has the disadvantage of being costly, but I have used it with good results. I gave a heifer one grain per day hypodermically. She had never previously been seen "in season," but she took the bull after the 8th injection. She did not settle, however, and twice after came in season at regular intervals and settled the third time. Other cases in which I employed this drug were somewhat similar.

Damiana is also a valuable agent in absence of œstrum. Its effect is somewhat like aphrodine. A very useful combination is: Extracts of Damiana and Nucis vomica with Phosphate of zinc. Another is Phosphorus, Aloes, Iron and strychnine. Another prescription I have found useful is:

R	Ext. Coca	grs. xxx.
	Cinchona Sulph.	ʒi.
	Phosphorous	gr. ʒ.
	Ext. Nucis Vom.	grs. x.
	Ferri Brom.	grs. xl.

In these cases ovarian extracts would, I believe, be of very great value.

Inability to perform Coitus.—This may be due to abnormalities or adhesions of the vulva or vagina, to excessive development of the clitoris or hymen. I have known of one case of excessive development of the hymen which prevented coitus in a mare. After it was severed the mare began to breed. Imperforate hymen is common in cattle. In old, lean cows we sometimes see the vagina in almost a vertical position, preventing contact with the bull. Tumours within the vagina are not uncommon. The treatment in this condition depends upon the cause, adhesions may be cut or broken down, and tumours removed.

Inability to Conceive.—Before conception can take place the spermatozoa must meet the ovum in the fallopian tube, and perhaps sometimes in the ovary. Any condition therefore which prevents the ascent of the living spermatozoa will prevent conception.

Mechanical Obstacles.—The first of these is occlusion of the os. It is a very common cause of sterility in the lower animals. It may be a congenital condition or it may be acquired, due to injury from a previous parturition. It is not uncommonly the seat of malignant growths or ulceration. Strictures, displacements and tumours of the fallopian tubes, and displacement of the uterus enter into the category.

Treatment of stricture of the os. Dewar maintains that if a quill can pass through the lumen of the cervix it is sufficient to allow of the passage of the semen. As a rule, we find on examination after coitus in the mare that the lumen will admit of the passage of one or two fingers. If the whole hand can almost or wholly pass the condition is often one of nymphomania. If not, the animal is nervous and relaxation of the os is present, the semen is often expelled in the same way as in spasm of the vagina (vaginismus). In complete closure of the os dilatation may be accomplished by the fore finger, and afterwards may be dilated to the extent of admitting all the fingers of one hand. When, however, passage of the finger is impossible a blunt smooth sound or bougie of small diameter should be pushed through the cervix. If the closure be due to adhesions it may be necessary first to use a bistoury. When one has succeeded in passing a small bougie a larger and larger may be passed until the os is well dilated. If the occlusion is due to muscular contraction the os may again contract as soon as the sound is removed, or if due to adhesions these may again unite; it is well, therefore, that a tent be introduced into the orifice for a few days. If this is done the dilated os will remain in this position for a time, and ruptured adhesions will have healed up. Craig describes a tent made by soaking a sponge, to which a short string is tied, in a solution of Gum Arabic; it is then closely wound round with a thread, so as to form an elongated pointed mass four to five inches long; when dry the thread is removed, and the sponge smeared with glycerine is inserted into the os. Here it softens and expands, and in so doing widens the canal. Tents made of dried seaweed are also on the market, and answer very well.

It must not be forgotten that in conditions of complete closure of the os, a certain amount of fluid may be retained within the uterus, due to the secretions from the uterus during the periods of œstrum having accumulated. These secretions may decompose and become septic or purulent, but the most common condition perhaps is acidity. Acidity may be tested with litmus paper, and if present it will at once destroy spermatozoa. In such cases the uterus should first be rinsed with a weak solution of Iodine, followed by repeated flushings with a 2% to 5% solution of bicarbonate of soda. I have often noticed that an animal would not conceive until the second or third period of heat after the os has

been dilated. I take it that only after that time the secretions and mucous membranes of the uterus have taken on a healthy condition.

In cases where the cervix uteri is contracted, long, narrow, or small, and where the vagina is small or ruptured, artificial insemination has been practised with fairly good results. I believe it was first used in bitches by Spallanzani in 1784, and later by Rossi, but it seems to have fallen into disuse in this country until 1897 when it was carried out in bitches and mares by Walter Heape. It is also practised in America and India. The operation consists of introducing semen through the os uteri by means of a syringe. After coitus the semen will be found in the lowest part of the vagina, it is drawn into the syringe, which should be sterile and at blood heat, the nozzle is then passed through the os and the semen discharged into the uterus. From my own experience I have had a certain amount of success with this method, but I much prefer to dilate the os and follow with a uterine tent, as by this method the uterus can be more easily flushed out, and I consider this a very important point if success is to result.

Pathological conditions of the uterine mucous membrane. There are many conditions of the uterine mucosa which cause sterility. Catarrh of the mucous membrane, metritis, acute and chronic, hydro or pyometra destroy the semen when it enters the uterus. Inflammatory conditions of the membranes also prevent fixation of the ovum after it may have been fertilized. Tuberculosis of the uterus has a similar effect. Manual examination of the genital tract, the presence of mucopurulent or evil-smelling discharge will help one to arrive at a diagnosis. As treatment, washing out of the uterus with antiseptics and astringents is indicated. For acidity of the uterine discharges Boillard recommends injection of a little warm water into the vagina before copulation, while others recommend the injection of a warm soap solution.

Retention of the foetal membranes after parturition or abortion and consequent endometritis is a fruitful cause of sterility. These I consider should be removed after 24 hours, and the uterus thoroughly irrigated with disinfectant and astringent solutions.

Nervous obstacles. Lastly we may mention nervous obstacles to conception. Colin has pointed out that the semen is often passed out as a result of severe straining after copulation. This is often seen in young animals in good condition. It may depend on a neurosis: it is sometimes known as vaginismus. In order to prevent this, Colin recommends that the animal be exercised briskly after coitus, and that cold water should be poured over the hind quarters.

DISCUSSION.

The PRESIDENT congratulated Mr. Brown on the excellence of his paper on such an interesting and important subject to all country practitioners.

Mr. CUMMING thanked the essayist for his excellent paper, and said that he had not made a hobby of the subject, though he had practised artificial insemination with varied results, and dilatation of the os with partial success.

Mr. MARSHALL thought that the greatest difficulty was in diagnosing the exact cause of sterility in view of adopting any particular line of treatment. He believed that high feeding for show purposes was a great cause of sterility. In mares his experience had been that hard workers conceived best. In artificial insemination of cows he had often experienced a great difficulty in getting the nozzle of the syringe into the os, owing to the spiral form which that organ often assumes. In some cases indeed he had completely failed.

Mr. ANDERSON had experience of contagious vaginitis,

and asked Mr. Brown if he thought that disease would act as a cause of sterility.

Mr. HEPBURN said that in his experience occlusion of the os and endometritis were the chief causes of sterility. He quite agreed with Mr. Marshall about the great difficulty in dilating the os in cows. He had had a special instrument made and yet had little success. He was of opinion that chronic endometritis often followed contagious abortion, and acted as one of the causes of sterility. Regarding the injections of Iodine, he would like to ask Mr. Brown the strength of the solution and his reason for using it. He believed that feeding had a great deal to do with sterility. He had used the artificial inseminator with a fair amount of success in mares, but in cows with none at all.

Mr. SIEVWRIGHT thanked Mr. Brown for his excellent paper, and said he had had various successes with both dilatation of os and the inseminator.

Mr. MCPHERSON (President) said he could add very little to the discussion which had not been already said. Finding out the exact cause was the great difficulty, as on a correct diagnosis depended the particular line of treatment to be adopted in any particular case. In cases of a discharge from uterus he had good results after injecting twice daily a solution of Condyl's fluid.

Mr. BROWN thanked the members for the favourable reception given to his first paper. Regarding the difficulty in dilating the os in the cow, he called to mind two cases, in one of which the os was entirely obliterated, while in the other a false membrane was growing across it. In one case he used a special lancet with which he made an incision, he then introduced a bougie until he could dilate it $\frac{1}{2}$ -inch. He then pushed a long sound right through, after which he put in a tent. Three days later the cow died from septic peritonitis from rupture of one of the horns of the uterus. This cow had tubercle of the ovaries. Regarding the spiral form of the os in the cow, one had to exercise great patience and work away until an entrance could be effected. He mentioned a new instrument for this purpose which was made of wood in the form of a corkscrew, but as yet he had no experience of it. In reply to Mr. Hepburn, the Iodine solution he used was 1% Lugol's solution which he used quite a fortnight before copulation as a disinfectant; if used more recently than that it would most certainly kill the spermatozoa. He always followed it up with a solution of Bicarbonate of soda. He concluded by saying that his belief was that in healthy animals the principal causes of sterility were occlusion of the os, inertia of the uterus, and diseases of the uterine mucous membrane.

The PRESIDENT then called for a hearty vote of thanks to Mr. Brown which was cordially responded to.

It was resolved that the business for next meeting would consist of a general discussion on interesting and out of the usual cases to be introduced by the members.

Place of Meeting. Mr. Cumming moved, and Mr. Hepburn seconded, that the place of meeting should be removed to some room in, say, a hotel or restaurant where the members could sit round a table and discuss the business of the Society in a freer and more friendly way than from the benches of a class room.

Mr. ANDERSON moved the amendment that we remain in the present place. This was seconded by Mr. Morrison.

On being put to the vote the motion was carried by a majority.

A vote of thanks to the President brought the meeting to a close.

GEORGE HOWIE, Hon. Sec.

NORTH OF IRELAND VETERINARY MEDICAL ASSOCIATION.

The annual general meeting was held in Deveney Chambers, North Street, Belfast, on Thursday, 18th January. The President (Mr. F. W. Emery, F.R.C.V.S.), occupied the chair. The following members were present: Messrs. Howard McConnell, J. Ewing Johnston, W. C. M. Smith, F. R. McRoberts, John McLean, J. McAleer, Henry Gibson, J. A. Thompson, and J. A. Jordan. Apologies were received from Messrs. J. J. Ross, Matt Hedley, Wm. Dawson, A. Snodgrass, and Capt. Nicholas.

The minutes of the last meeting were read, and on the motion of Mr. Howard McConnell, seconded by Mr. J. A. Thompson, passed and signed.

INTERNATIONAL VETERINARY CONGRESS.

The PRESIDENT pointed out that as the expenses of this Congress would entirely devolve on the members of the profession, we should consider what we as an Association were going to do. He would suggest that an amount be decided upon to-night, and that it be spread over three years. Individual members, he said, could forward subscriptions to the Treasurer if they wished. The name of anyone subscribing £10 would appear on the Committee.

After discussion it was proposed by Mr. J. Ewing Johnston, seconded by Mr. W. C. M. Smith, and passed unanimously, that £5 5s. be ear-marked annually for three years and forwarded to the Treasurer of the Congress.

CORRESPONDENCE.

Mr. JORDAN read communications he had received. From Mr. J. B. Dunlop, Dublin, in which the writer expressed a desire to read a paper entitled "Is Tuberculosis Hereditary," before this Association at an early date. It was unanimously decided to inform Mr. Dunlop that this Association welcome the opportunity of hearing him on such an interesting subject, also that the Secretary be requested to convene a special meeting for that purpose to be held on Friday, 16th February.

A letter from Mr. Faithfull-Davies in which he mentioned that a Congress would be held next October in Paris in connection with the Société de Pathologie Comparée, and asking that it might be brought under the notice of this Association. The letter was marked Read.

Letters resigning membership from Messrs. Snodgrass and Crighton. The Secretary was requested to write Mr. Snodgrass asking him to favourably reconsider his decision, and Mr. J. A. Thompson arranged to personally interview Mr. Crighton with a similar object.

The TREASURER submitted his annual balance sheet, which showed that the funds in hand were in excess of the amount of last year. He expressed regret at having to report so many outstanding subscriptions.

Mr. MCCONNELL, in moving a hearty vote of thanks to the Treasurer, said that he was glad to hear that the Association was in such a satisfactory financial position, and he was sure they all felt safe so long as Mr. Thompson had control of the Association's funds. Mr. Gibson seconded, it was passed by acclamation.

ELECTION OF OFFICERS.

Mr. JORDAN said he desired to propose as President a gentleman who had taken a great interest in all the affairs of the Association since its inception, and had been a regular attendant at all its meetings. He believed Mr. Howard McConnell would make a worthy successor to the excellent President who is vacating the chair (Mr. Emery), and he was confident that the Association would continue to prosper under his guidance.

Mr. GIBSON seconded, and it was passed by acclamation.

Mr. EMERY, on vacating the chair, thanked the officers and members for the loyal support they had given him during his two years of office; he sincerely hoped that the same support would be extended to his successor, Mr. McConnell.

Mr. McCONNELL, on taking the chair, thanked the members for placing him in such an honoured position. He hoped, with the assistance of the members, to make the present year a record one; to try and influence all the members of the profession in the North to join this Association, thereby cement the Veterinary profession in the North of Ireland into one body with one object, namely, to elevate the social standing of our profession generally, and to establish, promote, and maintain a good and friendly understanding amongst the members. He trusted the members would attend the meetings of the Association, and take an interest in all the questions that came up for discussion from time to time.

Vice-President. Messrs. W. C. M. SMITH, Newry, and JOHN KERNOHAN, Ballymena, were unanimously elected.

Treasurer. Mr. J. A. THOMPSON, J.P., Lurgan, was unanimously re-elected. In thanking the members for their continued confidence in him as their treasurer, he trusted that the Association would continue to prosper in the future as it had undoubtedly done in the past.

Secretary. Mr. J. A. JORDON was unanimously re-elected. He also thanked the members for their continued confidence and said he would very much have preferred that some of the other members had been selected. He had now held the office for four years, and he could assure them that he would have been only too glad to hand over the seals of office. However, he had decided to accede to their request and continue to discharge the duties to the best of his ability for one more year.

Council. The following members were unanimously appointed: Messrs. J. J. Ross, F. W. Emery, J. E. Johnston, John McLean, F. R. McRoberts, W. Dawson, and Joseph McAleer.

THE RELATION OF VETERINARY SCIENCE TO PUBLIC HEALTH, by F. W. EMERY, F.R.C.V.S.—DISCUSSION.

Mr. THOMPSON, in congratulating Mr. Emery on his excellent paper, admitted he had not read it as carefully as he should have. With regard to the question as to the right of one authority sending their officials into the district of another authority to inspect the dairies, he was quite in agreement with Mr. Emery. He understood the Belfast Corporation sought this privilege, and he considered that if such were granted it would lead to a great deal of confusion, and the results would be deplorable. In his district a great improvement had been made in the sanitary condition of the byres, and greater attention was paid to the condition of the cows. The farmers, realizing the advantage of keeping their byres and cows in a clean and healthy condition, were anxious and willing to carry out any suggestions he made to them. A great number had made improvements in the floors of their byres by putting down concrete. No doubt there were still a number of very bad cases where the milking utensils were not properly cleansed, the cows not groomed, and where the personal cleanliness of the milkers was not as he would wish them.

Referring to Veterinary Lecturers, he said that if they would confine themselves to instructing the farmers in veterinary hygiene instead of describing symptoms and treatment of diseases they would be an advantage not alone to the farmers but to the veterinary profession, instead of being, in his opinion, a curse to both. At present many quacks were practising throughout the country, castrating and operating for hernia. He knew

himself of a young farmer who, after attending one of these lectures, attempted to treat a neighbour's horse for hernia, with the result that the neighbour lost his horse. Some time ago he brought this matter of Veterinary Lectures before the Veterinary Medical Association of Ireland, when it was decided to bring the matter under the notice of the Department of Agriculture. The Department replied that it was not their intention to interfere in any way with veterinary practitioners or do them harm, and that the matter would have their attention. Still the same thing goes on.

Mr. GIBSON congratulated Mr. Emery on his paper. He stated that he had attended a few of these lectures while stationed in County Wexford. He heard the lecturer describe how difficult parturition cases should be carried out, he also heard him describe in detail the Caesarean operation.

Mr. JOHNSTON suggested that a resolution should be framed with reference to these veterinary lecturers, and copies forwarded to the Royal College, to the Department of Agriculture and Technical Instruction for Ireland, and to the different County Councils.

Mr. EMERY considered Mr. Johnston's suggestion should be acted upon, and it was decided to leave the matter in the hands of the Council.

The PRESIDENT thanked Mr. Emery for his most interesting and comprehensive paper. He was glad that mention had been made of the manner in which the transit of pork was carried out in Ireland, especially in the North. No thought was evidently given to sanitation, carcasses were thrown into railway waggons along with other merchandise, and cartloads of dead pigs were conveyed from place to place without any covering whatever. This, to his mind, was most undesirable. He was of the opinion that if the Belfast Corporation Inspectors were granted the power to enter and inspect dairies in country districts the results would be deplorable. If the Belfast authorities had reasons for being suspicious of the milk supplied from any particular district they should communicate with the local veterinary inspector of that district, and ascertain some facts from him before taking any action. In his district he had most trouble with the small dairymen, the more extensive ones took an interest in their places, and endeavoured to bring them up to the required standard. With regard to veterinary lectures he might say that he had them in some part of his district every day. In his opinion they were of no assistance to the farmers. If they were conducted on proper lines and confined to veterinary hygiene and the care of cows—instead of describing symptoms and treatment of diseases, practical demonstrations as to how to examine for side bones, and instructions how to conduct the tuberculin test, he had no doubt that they would be of considerable service to the intelligent farmer. He said that if the Royal College wished to secure the assistance of the veterinary profession in Ireland they should at least try and do something to put a stop to the manner in which these lectures were conducted, and exercise some control over the members of the profession who acted as lecturers. With regard to the question of meat inspection, he had little to say further than he was sorry no such thing took place in his district.

Mr. EMERY in thanking those who had taken part in the discussion, said he very much appreciated the kind things they had all said with reference to his paper.

Mr. JORDAN said that before the business of the meeting concluded he would like to perform a very pleasing duty, namely, to move a most sincere and hearty vote of thanks to the immediate Past-President (Mr. Emery) for the way in which he had conducted the business of this Association during his two years of office. He had maintained the dignity of the chair and the prestige of the Association.

Mr. THOMPSON said it afforded him great pleasure

to second the motion, and he agreed with every word Mr. Jordan had said. [Passed by acclamation].

Vote of thanks having been passed to the President the meeting terminated.

A special meeting was held on Friday evening, 16th February, in the Association's Rooms, 7 North Street, Belfast. The chair was occupied by the President, Mr. Howard McConnell. The following members were present:—Messrs. Robt. Kernohan, J.P., J. A. Thompson, J.P., Frank R. McRoberts, Jno. McLean, James Gregg, James Devlin, Henry Gibson, W. C. M. Smith, J. J. Ross, J. Ewing Johnston, and J. A. Jordan, Hon. Sec.

Apologies for non-attendance were received from Messrs. F. W. Emery, and T. D. Taylor.

The SECRETARY having read the circular convening the meeting, the President in a few well chosen words extended a hearty welcome to Mr. J. B. Dunlop, M.R.C.V.S., Dublin.

IS TUBERCULOSIS HEREDITARY.

By J. B. DUNLOP, M.R.C.V.S.

Mr. DUNLOP, who was received with applause, said that it afforded him a great amount of pleasure indeed to be up amongst his professional brethren in the North once more, and to see so many familiar faces. He thanked the President and members for their courtesy in arranging the present meeting, especially seeing that their annual general meeting had been held so recently. He said the paper which he was about to read contained theories which might be considered by some as not altogether orthodox, however, they were the results of a great many years close observation, and he was going to put them forward in order that they might be discussed.

There is no subject engaging the attention of the profession so much as the eradication of bovine tuberculosis. It is impossible to eradicate the disease in man, even under the most favourable conditions, while he continues to drink unsterilised milk from infected animals. According to the report of the Royal Commission, the milk of cows affected with tuberculosis, even when no tubercular lesion of the udder is apparent, often contains the specific bacillus. Pure milk free from disease is an important part of the food of man and is a necessary food for the infant. Boiling the milk for a few minutes has the effect of destroying any bacilli that it may contain, but this is seldom done, and when done it has the effect of destroying the enzymes which are a necessary aid to digestion in the infant. It is said that milk can be sterilised by means of pasteurisation without destroying the enzymes, but many believe that the bacilli cannot be destroyed in any way without destroying or impairing the enzymes or rendering the milk undrinkable. It is said that twenty-five per cent. of the cases of tuberculosis occurring in the human family are caused by the bovine bacilli, and that the victims are mainly children. Bovine bacilli are much more virulent than the human variety. Twenty-five to thirty per cent. of dairy cows are believed to be affected with tuberculosis, and it has been stated that the eradication of tuberculosis would diminish the annual death rate of British cattle by 20 to 30 per cent.

Before proceeding to indicate the lines on which we, as a profession, must proceed in order to rid our country of tuberculosis, we have to consider whether the disease is hereditary or not. No one can deny that the disease is contagious, and I need not tell you gentlemen that it is also highly infectious. The simplest method of procedure would be the wholesale slaughter of the affected animals, but I need not say that would be too costly.

The object of this paper is to show how tuberculosis in cattle can be eradicated at small cost to the State,

with immediate profit to the farmer, dealer, breeder, and dairyman, and without inconvenience to the community. In order to stamp out the disease with certainty and a minimum cost to the country it must, in my opinion, be dealt with as one which is hereditary as well as highly infectious.

Authorities are unanimous in saying that tuberculosis in man and animals is infectious, but they are divided as to whether the disease is hereditary or not. Looking at the subject from the breeder's point of view, the disease in cattle is, I think, hereditary, inasmuch as the disease runs in families. It is well known that some breeds of cattle are more predisposed to the disease than others, and there is abundant evidence to shew that the degree of susceptibility to the disease varies in different individuals, the only difference being in the chemico-physiological inborn condition of the several individuals, age and other conditions being similar. It is well known that the Ayrshire, the Shorthorn, and the Jersey breeds of cattle are more liable to contract tuberculosis than the Hereford, the Galloway or the West Highland breeds. At one time, when the breeds were more distinct the Alderney was more susceptible than the Jersey.

Tuberculosis, like any other infectious disease, is caused by the entrance into the body of the specific microbe known as the tubercle bacillus. Tubercle bacilli do not multiply naturally outside the body, therefore no person however delicate or susceptible to the disease can contract tuberculosis unless he or she receives the microbe directly or indirectly from some other affected person or animal. Tubercle bacilli have been compared to seed. Some seed falls on hard and stony ground and will not grow, some falls among thorns and is choked. Probably with the great majority of mankind the bacilli are taken into the body but they are unable to penetrate the mucous membrane, which is the first line of defence—the ground is too hard for the seed to take root. Every person receives the specific microbe into his or her body at one time or another, but all do not contract tuberculosis. Happily we are not all good culture ground. Susceptibility is inherited, not the seed. The soil may be greatly modified by environment.

Bacteriologists tell us that the tubercle bacillus is never present in the body of a child at birth, and veterinary bacteriologists tell us that a small percentage of calves are born with the bacilli in their bodies, but the number of such calves is insignificant and they need not be taken into consideration, therefore tuberculosis in animals as well as in man may be taken as not being congenital.

Some veterinary bacteriologists contend that tuberculosis in man is not hereditary or that it does not run in families, and they naturally infer that the disease in cattle also is not hereditary. Being opposed to these views it will be necessary to prove that the disease in man as well as in animals is hereditary.

It is an acknowledged fact that all living things are determined by heredity and environment, therefore there can only be these two factors in the causation of any disease or any form of life. Predisposition to tuberculosis may be part inherited and part acquired by environment.

A large proportion of the human family possess, or rather inherit, the power to resist tuberculosis in a very high degree. Many of these people live for years in the slums in poverty, dirt, and misery, in badly ventilated dwellings, inhaling and ingesting large quantities of the infective material, and die eventually of any disease except tuberculosis. On the other hand some people are extremely susceptible to the disease even under fairly favourable health conditions; between these extremes are to be found in different individuals all degrees of susceptibility or insusceptibility to tuberculosis. With many individuals natural insusceptibility is not well

marked—with them it is only a potentiality. In such cases the environment is a powerful factor tending to develop or to suppress the inherited power to resist the disease. Unhealthy surroundings are predisposing causes because they increase the inborn predisposition to the disease or they decrease the inherited powers to resist the disease. The wise physician advises those under his charge to take special care to avoid and guard against the affection.

To prove that tuberculosis is not hereditary, cases have been cited in which a healthy "disease-resisting" child has been born of a diseased parent, but such cases prove nothing; some diseases pass over one generation. According to Galton's law of ancestral inheritance the two parents contribute one half, the four grand parents one quarter, the eight great grand parents one-eighth (each great grand parent one sixty-fourth) of the total heritage of the average offspring. The offspring are rarely intermediate between the two parents. The offspring may resemble one of the parents. Some of the offspring may resemble one of the parents and some the other. Some of the offspring may inherit some of the peculiarities of one or both parents unimpaired or even enhanced. When both parents possess a certain character or peculiarity we can be almost certain that it will be transmitted. Some individuals possess a high degree of potency to transmit to their progeny their characters, and this is more marked when the other parent is weak in this respect. The inborn disposition to contract diseases, infectious and non-infectious, appears to follow Galton's law of ancestral inheritance.

It is well known that tuberculosis often runs in families, but some people say that the exceptional frequency of the disease among children of affected parents is solely due to the fact that such children, living as they do in close association with their parents, are exceptionally exposed to the risks of infection.

That the exceptional frequency of tuberculosis in the children of affected persons is, in a large measure, due to exceptional susceptibility, has been proved over and over again. The fact is quite apparent where some members of a family contract the disease and other members escape, all having been reared and living under the same roof.

A connection of mine, a healthy man, having a healthy family history, married into a consumptive family. Half the children died of tuberculosis. The eldest daughter nursed the sick members of the family and lived to a good old age. All were born and reared in the same house. The father married again into a healthy family. The second family, a son and daughter, are alive and strong, and they, too, were reared in the same house. Such cases are not uncommon. I have known of instances where two sisters slept together and one died of consumption, and the other lived to a good age and remained healthy. Many of us must have known or heard of cases where one of a married couple died of consumption. In the majority of these cases the survivor never exhibited any symptoms of tuberculosis; in a minority of cases the survivor contracted the same disease. Obviously the difference in the results depended on the difference in the degree of susceptibility of the individuals. In all such cases the survivors must have been exposed to large quantities of the infection.

Long before Koch discovered the tubercle bacillus, nay, long before the germ theory of disease was accepted, many believed that tuberculosis was infectious, while others held that the disease ran in families. We know now beyond a doubt that tuberculosis is infectious, but only to those who are susceptible.

Though tuberculosis in man is not now congenital, probably it was so in prehistoric times. Children born with the actual disease in their bodies would, as a rule, be very delicate. The proportion who would live to marry would be very small, therefore in each succeeding

generation the number having the disease at birth would be less and less until the disease in the congenital form would cease.

Tuberculosis in cattle is rather different. In the great majority of cases of bovine tuberculosis the disease is chronic and non-fatal, spreading slowly and not sensibly affecting the animal's general health. The tissues of the cow have a wonderful power of surrounding and encasing minute collections of the bacilli with fibrous tissue—thus rendering them harmless. Knowing that to be so, we would naturally infer that many of the calves born with the bacilli in their bodies would survive till they became parents, and thus the disease in the congenital form would to some extent continue to be transmitted. We actually find at the present time that the disease in a small number of cases is congenital.

The progress of tuberculosis in many cases must be very slow and long continued, for we often find in aged cows large masses of tuberculous matter enclosed irregularly in capsules of fibrous tissue. This is why the disease is known in some parts of Ireland as "grapes." In a very small number of cases the disease is rapidly progressive and fatal. The disease in this form is, no doubt, gradually being eliminated by natural causes.

Many years ago a remarkable but by no means uncommon case of a bull disseminating tuberculosis came under my notice. The bull, which was a fine pedigree Shorthorn Prize winner, belonged to the Rev. —, a model farmer, not far from Newtownards. In the course of my duty as inspector I made a post mortem of two cows which had died in a dairy, of tuberculosis of the lungs, and I was informed that four other cows similarly affected had died a short time before in the same dairy. All these cows were bred from the same bull. The opinion of the farmers in the district was unanimous regarding this bull's potency to transmit tuberculosis.

At some of the meetings of the National Health Congress which took place recently in Dublin, interesting lectures were delivered on Eugenics. The views expressed by the lecturers appeared to be sound and correct. I am afraid, as far as human beings are concerned, these views could not be translated into practice. In the present state of society we cannot prevent the diseased, the degraded, or the imbecile from marrying.

I see no reason why Eugenics should not be applied to cattle. When a breeder seeks to develop a number of points or characters in a breed his task is a very difficult one. When his object is to develop one character only his task is a very simple one. It would appear to be a very simple matter to produce a strain of cattle which would, under ordinary circumstances, be capable of resisting tuberculosis. About seventy per cent. usually resist the disease. Select the seventy per cent. and breed from them. An exceedingly small per centage of the offspring may be expected to become affected. Select and breed again, and by repeating this process of weeding out, "stability" and "potency" will be produced, and new disease-resisting breeds quickly established.

Should it be considered necessary or advisable to produce a breed of cattle able to resist the disease under exceptionally unfavourable conditions (and this is unnecessary, because the science of hygiene and sanitation are progressive), let the cattle selected be kept in closer association with the diseased, and for a greater length of time, until the healthy are reduced say to fifty or twenty-five per cent. of the whole, and breed from these only.

The rules which guide breeders of stock have been gained by experience, and it is well known that any desired character or peculiarity in an animal can, by skilful breeding, be wonderfully intensified or developed.

Some say that the highest degree of insusceptibility possessed by any bovine animal is inadequate to enable it to withstand ordinary risks of infection. As a matter

of fact a large proportion of all breeds of cattle under ordinary conditions do not contract tuberculosis, no experiments are required to prove this. Veterinary surgeons can now almost infallibly point out the affected and the unaffected, and they seldom find more than one-third of a herd affected.

Excellent work is being done by private enterprise, and by officers of some local authorities in eliminating tuberculosis from dairy and other stock. Healthy cows are selected by the veterinary surgeon, generally from cattle reared and kept under most favourable conditions. The practice of selecting cattle from an extra healthy, well-kept stock will only to a small extent increase the disease-resisting power of the cattle selected, or of their progeny. The test is not severe enough to be of much service, and improvement cannot be progressive.

It has often been suggested that calves should be isolated from their dams at birth and fed on pure or on sterilised milk so that sound herds may be secured, and by careful continued isolation and constant watching that pure milk may in this way be obtained. The early isolation of calves from a mixed herd effects no improvement whatever in their ability to withstand disease, and there is always a danger of infection being accidentally introduced.

Disease-resisting stock of several breeds should be quickly established—not necessarily breeds capable of withstanding exposure to any amount of infected material for an unlimited time in close badly ventilated byres. No fire-proof building ever constructed is proof against a big conflagration. It is satisfactory to feel assured that no bacilli can generate within a healthy herd, that no accidental intrusion of the bacilli can take any appreciable effect on a well-tested and carefully selected stock, and the veterinary surgeon can easily remove at convenience any tainted animal.

Many are anxiously and hopefully looking forward to the time when tuberculosis will be eradicated from the human family. Hygienic conditions will be so much improved that our natural powers to withstand disease will be greatly increased. Centres of infection will be comparatively few, and where infection does remain it will be so diluted by scientific aerial sanitation that it will cease practically to be a factor in the causation of disease. It is all the more urgent, therefore, that something practicable should be done to eradicate the disease in cattle, in order to put a stop to the needless slaughter of the innocents, knowing as we do that the bovine bacilli are more virulent than the human, that it is the children especially who fall victims to the more virulent microbe, and that sanitary and hygienic measures cannot overcome the ingestion of large doses of the virulent infective material contained in impure milk.

The present generation can scarcely realise the good work which has been done in the past by the veterinary profession. Terrible animal scourges have already been stamped out. The field of preventive medicine is still large, and much remains to be done.

Of the many diseases that still remain with us and demand our attention, tuberculosis is the most urgent, because it is widespread and is the one common disease transmissible to mankind. Let us hope that the good work which is being done by veterinary officers of health, and by private enterprise under the guidance of the veterinary surgeon, will be continued and greatly extended. If we are to succeed effectively and expeditiously in eliminating the disease from our herds we must attack it vigorously on all sides, we must deal with it as a disease which is highly infectious and hereditary. Where there is sufficient housing accommodation, affected cattle should be separated from the healthy, and the former prepared for the butcher. In all cases small partitions should be erected at the heads of the cattle to separate one cow from another. It is lamentable to

think of cows being allowed to cough over each other's food; it is a breach of the elementary and fundamental laws of hygiene and sanitation. There could be no more speedy and effective way of disseminating disease: the infective material passes in this way directly into the lungs of the healthy cows, or is swallowed with their food. A small inexpensive drinking vessel should be provided exclusively for each cow, and each vessel numbered. Food refused by one cow should not be given to another. The trough should be cleaned out, and the attendant should wash his hands well before touching any other feeding stuff, or handling milk.

Dry excreta should not be rubbed off cows, as that causes dust, contaminates everything, and is liable to spread disease. It should rather be moistened well with some disinfecting fluid and scraped off. Where there is danger of dust rising from infective material the place should be sprinkled with a solution of commercial calcium chloride.

Dairyman and maid should wear overalls, and should be supplied with pocket handkerchiefs and instructed to use them when coughing as a result of cold or influenza, etc. The overalls and handkerchiefs should be dipped in a solution of say, five per cent. calcium chloride, and half per cent. zinc chloride, or a weak solution of glycerine, and taken out, wrung, and dried. The two chlorides are antiseptic and deliquescent. Nearly all the diseases we suffer from, and the contamination of milk are largely owing to the dust of infective material which had become dry. We cannot touch a piece of dry cloth or remove ordinary handkerchiefs from our pockets without creating dust.

The house fly is a distributor of disease. It has been observed that typhoid is more prevalent in cavalry and artillery regiments than among the infantry, and the horse manure pit is the great breeding den of the house fly. The house fly should be vigorously attacked in all its breeding places. A slight sprinkling occasionally of petroleum banishes it entirely.

The medical officer, the practitioner, the veterinary inspector, and veterinary practitioner should all wage war against flies and fleas. This (as well as a sanitary measure) would be a work of kindness, a relief to the poor, the careless, and the indifferent, and would, in a measure, mean the removal of a constant source of annoyance to our domesticated animals and a consequent monetary gain to their owners. Needless to say no person should be allowed to milk cows, or handle milk, whose hands are not kept perfectly clean.

No bull should be kept for stock purposes which has not been examined and tested by a qualified veterinary surgeon and certified as being free from tuberculosis. "Like begets like." The Boards of Agriculture and the Agricultural Department should without delay select and breed cattle which have been well exposed to, and which have resisted, the infection. They should also in every way assist breeders who would willingly co-operate, and special attention should be given to the establishing of new (preferably cross) breeds of milch cows, bearing in mind that there is milk *and* milk, and that nothing approaching good milk has yet been discovered for the cure and prevention of disease and the prevention of deformities. By selecting and establishing new disease-resisting breeds of cattle we would be doing effectively that which nature has been doing for us gradually and imperfectly for untold centuries.

The qualified veterinary surgeon being familiar with the cow in health and sickness, knowing all the diseases which are known to be communicable to man, and understanding as he does the improved structural arrangements of the dairy, as well as the correct treatment and management of cattle, is the fit and proper person to inspect and test cattle, and to give any needed instruction to the breeder and dairy keeper.

The busy practitioner cannot be expected to devote much of his time to morphology, but he can refer at any time to our veterinary colleges which are regularly engaged in research work of inestimable value.

Mr. GREGG complimented Mr. Dunlop on his paper and expressed his pleasure at seeing him once more in Belfast. The science of eugenics was one of particular interest to him owing to the fact that he was engaged in an agitation to breed up more milk in our dairy herds. If it were possible to do this it should also be possible to breed up a sound habit of body that would resist tuberculosis.

The paper gave rise to a very full discussion in which Messrs. Johnston, Smith, Gibson, Devlin, McConnell, and Jordan took part, all of whom paid high compliments to Mr. Dunlop for his very able paper.

Mr. DUNLOP having replied to the points raised by the several speakers, a hearty vote of thanks was passed on the motion of Mr. J. Ewing Johnston, seconded by Mr. J. A. Thompson, J.P.

The usual vote of thanks was passed to the Chairman, and the meeting terminated.

J. A. JORDAN, Hon. Sec.

Mechanical Lameness.—Summons Dismissed.

At Folkestone Borough Bench, before Mr. W. G. Herbert (in the chair), Councillor E. J. Bishop, Major G. E. Leggett, Messrs. J. Stainer, G. I. Swoffer, and G. Boyd, Edward Johncock was summoned for working a horse in an unfit condition.

Inspector Freeman, of the R.S.P.C.A., Dover, prosecuted, and requested that all witnesses should remain outside the court until they gave their evidence.

Mr. Myers appeared for defendant, who pleaded not guilty.

Inspector Freeman said that, in consequence of information received, he visited defendant's stable at Cheriton on the 9th of February at about 5 p.m. He saw defendant there, and said to him, "I have received complaints that you were working a horse attached to an oil van on the 5th, which was very lame, in Shorncliffe Road. Will you show me that horse?" Defendant took witness to a stable and said, "That is the one," pointing to a black gelding. Witness replied, "Why, that is the one I cautioned you about some time ago," whereupon defendant said, "Yes, that is the one. After you spoke to me I gave it a week's rest. It looked all right, so I put it to work again." Witness said, "Didn't you get the opinion of a veterinary surgeon?" He replied, "No, I didn't." As it was getting dark they arranged to examine the horse the next day. The following day witness went to a stable and examined the horse. He should say that it had been used as a carriage horse in its time. It seemed rather a superior horse. On examination he found that it was lame in both its fore feet, and the off knee was considerably swollen. The tendons of this leg were sprained and contracted, and the fetlock was overshot. The horse also had ring-bone on the side bones of the leg. He told defendant not to work the horse again, and defendant said he would not but would sell it. He said he would sell it by public auction. Defendant had done so, and witness had not seen it since. He had seen the horse in Cheriton Street on the 22nd January, and had then cautioned defendant.

Mr. Myers: Have you ever heard of mechanical lameness?

Witness: I think that only exists in a Police Court. The Inspector also said he thought the horse was 12 or 13 years old.

Miss Bertha Morris, of Hazlemere, Ashley Avenue, Cheriton, said she saw the horse in question attached to an oil van, being led by defendant, in Shorncliffe Road, on the morning of the 5th January. She noticed that it was very lame in the off fore leg. She stood and watched it for some moments until it had passed some distance on. She saw it again in the afternoon at about 4.30 in the Cheriton Road, being driven at a slow trot. On this occasion also it was very lame. She communicated with Inspector Freeman. Witness had had practical experience with horses. She had been a member of the R.S.P.C.A., but was not now. She had never been a witness in any case before this.

Mr. Johncock himself then gave evidence. He said that on January 22nd he went out with his horse and van, which was a very light one. On his round he saw Inspector Freeman, who came up to him and said, "I am afraid, Mr. Johncock, you have a lame horse there." He replied, "I don't think there is anything much the matter there"; but because of what the Inspector had said, he gave the horse a rest from January 23rd to February the 4th. On February 9th he again saw the Inspector in the evening. The following day he called again as arranged, and examined the horse. He said the horse was not lame then, but if he put it on the road it would be in ten minutes. Witness sold the horse at a public auction, and it fetched £8. He had bought it for £16, but as he had had it for three years and eight months, that was a very small depreciation; it was less than a shilling a week. He had not had much experience with horses.

Mr. Wm. Miller said he knew defendant. He saw him on February 5th, carrying on his usual business. He saw the horse nearly every day, and on the day in question he did not notice any lameness. He stood looking at the horse for about five minutes.

Mr. George Walter Ashby said that he had had five years' experience with horses in South Africa. Somewhere about 9 o'clock on the 5th February he saw the horse at the top of Park Road, walking at an ordinary pace. In his judgment it did not appear lame. Witness had been seeing the animal on his rounds about twice a week for two years.

Mr. Charles Footer, brother-in-law to defendant, said he was present on the 9th February when Inspector Freeman examined the horse. When he (Inspector Freeman) had looked at the horse he said, "It is not lame now, but if you put it on the road it would be in ten minutes. It is no more use to you now." Defendant then said, "I shall sell it."

Mr. Henry B. Eve, M.R.C.V.S., of Claremont, 86, Cheriton Road, deposed that he examined the horse on the 12th February, and then found it in good bodily condition. In 1907 the horse had a very severe accident, cutting its knee nearly to the bone. He then explained that although the knee had healed up remarkably, the tendons and muscles will never set exactly as they were before, and this caused a stiffness, and rendered the horse lame. But it was what was known as mechanical lameness. This was quite different from lameness owing to a sprain. Although a horse might have mechanical lameness, it would not suffer pain from this cause. In his opinion it would not be cruelty to put a horse to light work when it was suffering from mechanical lameness.

After a short deliberation by the Magistrates, the Chairman said they were of opinion that the evidence pointed in the favour of the defendant, and because of this they would dismiss the case, but the Inspector was quite right in taking the proceedings. They would make no order with regard to the costs.—*Folkestone Herald*.

"Mechanical Lameness"—Dismissed

Charles Cousins, 40, carman, of 140, Wickham Lane, Plumstead, was charged on remand at Woolwich Police Court on Thursday, Feb. 29th, before Mr. Symmons, with cruelty to a horse, and Henry Jacobs, of 1, Saunders Road, Plumstead, was summoned for causing the same.

Mr. F. J. Tyler appeared for the defendant.

The evidence of Police-constable McPherson was to the effect that he saw Cousins driving two horses attached to a van laden with coal, in Plumstead High Street. One of the animals was lame in both hind legs. When he saw Jacobs, he said he knew the animal was lame, and it had been like that ever since he had been there this last seven years. He maintained it was not cruelty, and if it was why did not the police veterinary say so when he examined the mare some months ago for sore shoulders. Jacobs said he did not see the horse go out, but admitted responsibility.

In reply to Mr. Tyler, the constable said he knew the horse was shod with peculiar shaped shoes, and that it walked on its toes. He thought the horse suffered from pain because it alternately rested its legs.

Mr. Byerley, F.R.C.V.S., said the mare was lame in both hind limbs from sprained and contracted tendons, and spavin, and was quite unfit for work.

Cross-examined: The lameness had existed for more than three months. It was not a case of "mechanical lameness" without pain. The lameness was partly mechanical. He was positive there was nothing the matter with the animal when he examined it in September.

For the defence, Prof. Woodruff, of the Royal Veterinary College, stated that he found the mare had two large spavins, one on each hock. The animal was in fair working condition, and had no indications of soreness. He noticed the heels of the hind feet did not come in contact with the ground, and on having the mare trotted found she was not going lame, except for the mechanical stiffness. He came to the conclusion that the spavins were years old, and as the inflammation had gone out there was no pain. The tendons of the leg were contracted. In his opinion the horse did not suffer pain and was fit for work.

Herbert Keeling Roberts, M.R.C.V.S., Bexley Heath, said the animal was suffering from enlarged spavins and slightly contracted tendons. There was no sign of pain, and the abnormalities were of old standing.

Ernest Charles Pilcher, 6 Isla Road, Plumstead, a blacksmith, said he had noticed that the animal was mechanically lame whenever he had shod it. The animal walked on its toes, and was shod with a "rolling" shoe.

Cousins said the horse had walked on its toes for seven years. The animal, which had two spavins for four years, had been in the same condition during the time he had driven it.

Jacobs also gave evidence.

Mr. Symmons said, in his opinion, the mare was suffering pain, but he was doubtful if the carman or the foreman were aware of it. The case would be dismissed.—*Kentish Independent*.

Imprisonment for Cruelty.

A bad case of cruelly ill-treating a horse came before Mr. G. H. Judd and other justices, at Brentford, on Wednesday, when Robert East, of 79, Osborne Road, South Acton, was summoned by the R.S.P.C.A. for having on divers dates cruelly ill-treated a horse by omitting to give it sufficient food, care, and attention.

P.C. 182X said that at 5.30 p.m. on January 28th he went with P.C. 163X to a field adjoining Gunnersbury Avenue, Ealing Common, and there saw a brown gelding pony, which was aged and apparently in a starved condition. He tried to lead the pony, but owing to weakness it fell down. The ground was very hard, owing to the sharp frost at the time, and there was no food or grass in the field. He informed Inspector Pleavin, of the R.S.P.C.A.

P.C. 163X corroborated, and added that the pony was nothing but a frame.

Inspector Pleavin, R.S.P.C.A., said that he went to the field and saw the pony standing against a fence. It was very old and in a poor, weak, and emaciated condition, with scarcely an ounce of flesh on its bones. It was unable to move, and was carried round to a shelter. Witness made inquiries to trace the owner, and saw his wife at Acton. She said the defendant had gone away for some days. She accompanied witness to the field, and consented to have the pony destroyed. When he returned, he found the pony had been removed about a hundred yards, and there were traces of its having been fed with hay. Subsequently defendant came to him and said things were bad with him, and he went away to try and make a bit, but gave the pony half a peck of corn before he went.

Mr. W. Hatton, veterinary surgeon, said he saw the carcass of the pony on January 29th, and made a post-mortem examination. He found a little food in the stomach, but the carcass was devoid of fat, even on the kidneys. It was also nearly bloodless. The condition of the pony, having regard to the weather, must have been extremely bad. Its coat had been cut, and he did not see how it could have kept any warmth in it. He understood the horse had been turned out since the first week in December last, and no doubt it had been getting worse since then.

The Chairman: In other words, it was starved.

Witness: Absolutely starved. A healthy horse would not have died so quickly.

Defendant said he had a fat pony and exchanged it for this one. First he kept it in a stable, and then, as it did not get on, turned it out, and that did not do it any good.

The Chairman said the Bench would be lenient, though they had the power to send defendant to prison for six months. If ever a man deserved punishment for neglecting a horse in such a disgraceful way, it was the defendant, who would have to go to prison for fourteen days with hard labour.

Royal Veterinary College.**A DEPUTATION TO GOVERNMENT.**

The President of the Board of Agriculture and Fisheries received a deputation on Monday, Feb. 25th, who asked for an increased grant from the State to assist the Royal Veterinary College. Mr. Runciman was accompanied by Lord Lucas, Sir T. Elliott, Mr. A. W. Anstruther, and Mr. Stewart Stockman. The deputation was introduced by Lord Middleton, President of the Royal Agricultural Society, and consisted of Mr. Harold Swithinbank, Mr. W. Huntin, F.R.C.V.S., Sir John M'Fadyean (Principal), and Mr. R. A. Powys (Secretary), representing the Royal Veterinary College; and the Hon. Cecil Parker, Sir R. Cooper, and Mr. Thomas McRoe, representing the Royal Agricultural Society.

Mr. Runciman and Lord Lucas, in reply, acknowledged the good work done by the College in the past and their desire to assist, as far as possible, the object of the deputation.

LINCOLNSHIRE VETERINARY MEDICAL ASSOCIATION.

The thirtieth annual meeting was held on Thursday, Feb. 15th, at "The George" Hotel, Grantham. The chair was occupied by the President, Mr. W. Grasby, M.R.C.V.S., of Daventry, and amongst those present were Messrs. F. L. Gooch, Stamford; G. Lockwood, Peterborough; T. A. Rudkin, F. Masterman, H. Sugden, Grantham; S. G. Masterman, Huntingdon; C. W. Townsend, Long Stanton, Cambs. (hon. sec. and treasurer).

The minutes were signed.

CORRESPONDENCE.

The Hon. Sec. read a letter from Prof. A. Gofton, of Edinburgh, with regard to affiliation with the National Veterinary Association, and it having been decided to take this step, Mr. F. L. Gooch and Mr. T. Rudkin, with the Hon. Sec., were appointed to represent the Lincolnshire Association on the Council of the N.V.A.

Letter from Mr. Garnet, of the National Veterinary Association, asking for individual support for the proposed International Veterinary Conference in England in 1914.

Mr. Gooch said that Sir John McFadyen had expressed the opinion, from his experience of International meetings, that it would cost £3,500, and it had been decided to apply to individual members, as well as to the District Association for subscriptions, members could spread their donations over three years. He (Mr. Gooch) would undertake to collect subscriptions, and send them on to Mr. Garnet, the Treasurer.

It was agreed that Mr. Gooch should draw up a circular, and that the Secretary should send same to members invoking their personal aid.

Letter from Mr. Faithfull Davies, of Hadleigh, Suffolk, with regard to the conference to be held in Paris in October next, in which the Meat Inspectors' Association is interested, by the Société de Pathologie Comparée.

Letters from the Royal Sanitary Institute, which has fixed its annual Congress at Scarborough from July 24th to August 3rd.

Letter from Mr. Shipley, of the Victoria Benevolent Fund, asking individual contributions. The Hon. Sec. remarking that the Association at present gave 2 guineas annually.

Mr. Gooch appealed for the sympathy of members in the matter. He was on the Council, and knew the need for the appeal, few, really, he said, knew how many deserving cases there were in the profession. He instanced the pitiable case of a widow over 70 years of age, living at Skegness, whose husband has died in a lunatic asylum. The Association were assisting her until she got her old age pension. Annual subscriptions, he said, were always deposited, the others invested.

It was decided to send the usual cheque of 2 guineas.

Mr. LANG, of Brocklesby, tendered his resignation as a member, and it was accepted.

The Secretary said Mr. Hoole, of Heckington, in sending his annual subscription, also expressed his wish to resign, but he had written him asking him to reconsider the matter. The question was left over to the next meeting, awaiting his answer.

Apologies for non-attendance were notified from Messrs. E. W. Parke, Willows, Prof. Hobday, H. C. Lalor, Prof. Penberthy, Hy. Howse, E. Wardrop, R. A. Searby, A. W. Mason, W. Hoole, T. B. Bindloss, S. G. Masterman, H. H. Truman, and R. C. Matthews.

Messrs. HY. LEACH, of Boston; R. C. MATTHEWS, of Heighington, Lincoln, and Mr. G. T. WILLOWS, Long Sutton, were balloted for as members, and duly elected.

Messrs. ERNEST WARDROP, Outwell; R. A. SEARBY, Ramsey; T. G. MOON, March, and DAVID COOPER, Saxilby, were nominated for membership by Mr. C. W. Townsend.

The Hon. Sec. said that he regretted that he had not been able to obtain a paper to be read that day. Mr. Lockwood had promised one, but, unfortunately, an attack of influenza had prevented him doing this. In its place, however, he had prepared for them a brief report of the Society's doings during the past year, which he thought might be interesting to not only those present but also to those members who had been unable to attend the other meetings of the Association held during the past year.

The Session 1911-1912 had, in his opinion, been a very favourable one, and he wished to take this opportunity of thanking the President for his valuable help and assistance, he knew that everything Mr. Grasby did for the Association was done willingly, and that he had spared nothing to make his Presidential year a success.

The members have a lot to thank Mr. Grasby for making the year such a successful one for their Association.

During the past year seven new members had been elected, and at the present meeting he had much pleasure in saying that he had the names of four more gentlemen wishing to join, so that by the next meeting he hoped to have fifty, if not more, names on the list of members. With such a number it is surprising we do not get better attendance at our meetings. He took this opportunity of asking those present to further assist him in obtaining more new members.

The following gentlemen have kindly read papers during the past year:—

Mr. A. W. Noel Pillers, "Notes of foot cases."

Mr. F. L. Gooch, "Some Instruments and their Uses."

Prof. F. Hobday, Demonstration, and paper upon Dr.

Williams' operation for roaring in horses.

I may here state that I shall be extremely grateful for promises of future papers from members.

In presenting the balance sheet for the year, he stated that the balance at Bank at commencement of year was £20 13s. 3d. Total subscriptions to end of December, 1911, amount to £19 10s. Expenditure for year was £16 19s. 4d., leaving a balance at bank of £23 3s. 11d.

Since he had made out balance sheet he had received nearly £12 for arrears and present year's subscriptions which made the present balance much bigger than at the same time last year.

Mr. Gooch proposed a hearty vote of thanks to Mr. Townsend for his assiduity, and in the course of his remarks said that 24 members of the Association did not live in Lincolnshire, but he thought they should have larger meetings. Would it be possible, he asked, to amalgamate with any neighbouring Association.

Mr. TOWNSEND said several veterinary surgeons wished to start one at Cambridge. In his district they say they are too far away to join the Eastern Counties and that the Lincoln V.M.A. meetings are held too far off for them to attend.

The PRESIDENT attributed the small attendance to apathy. A man who could find time to go hunting, if he had a soul at all, should afford three days a year for his Association.

Mr. LOCKWOOD seconded the vote of thanks, which carried with it the adoption of the report and balance sheet, the latter having been previously audited by Mr. Rudkin.

The PRESIDENT heartily supported the motion, for, he said, he had probably come in contact with the Secretary more than any other member. Mr. Townsend had been untiring in his work for the Association. He had not only tried to get members himself, but had written to him (the President) and others to get them.

It showed he had the interests of the Association at heart. His work had been done thoroughly, and he deserved the heartiest thanks of the meeting.

The resolution was carried unanimously.

ELECTION OF OFFICERS.

President.—Mr. Townsend proposed the name of Mr. H. H. TRUMAN, of March, as President for the ensuing year. If they elected him he was sure they would not be sorry. He had for years been a member of their Association, and was highly esteemed in the March district. He was a magistrate and Chairman of the Urban District Council, and he was sure he would do credit to the Association.

Mr. RUDKIN said he had great pleasure in seconding, as he had known Mr. Truman many years as a member of the Association.

The motion was carried with acclamation.

Vice-President.—Mr. W. W. GRASBY, the retiring President, was elected, Mr. G. B. Dickinson coming out of the list automatically.

Hon. Secretary.—The Chairman proposed the re-election of Mr. Townsend, and congratulated the incoming President on retaining the services of so excellent a man.

Mr. LOCKWOOD, in seconding, said it spoke volumes for Mr. Townsend's grit that he put in so much energy when they got such a small meeting as that.

Mr. TOWNSEND having been duly re-elected, said he fully appreciated the honour done him. He apologised for the small attendance that day, and said it was neither his nor the President's fault. It was a pleasure to do anything for the Association, and while he was

Secretary he would continue to do all he could for the Association and for its members. (App.)

ENLARGING THE DISTRICT.

A discussion then ensued as to changing the place of the meeting once a year, it being felt that Cambridge might be tried every other year instead of Lincoln. It was pointed out that a similar experiment had been tried, and meetings held with no greater success at Louth, Market Rasen, and Grimsby, owing to the railway facilities being so inconvenient in such a large district as the Association covers. It was pointed out that March was a convenient centre, with express trains from Lincoln, and Mr. Townsend said he could ensure a good attendance from the Cambridge side if a meeting was held there.

Eventually Mr. Gooch proposed, Mr. Lockwood seconded, Mr. Rudkin supported, and it was carried that the summer meeting on the second Thursday in June, which is usually held at Peterborough, should be held at March, subject to the President's (Mr. H. H. Truman) consent.

Mr. GOOCH gave notice that he would move at that meeting that the title of the Association should be changed to that of the "Lincolnshire and District Veterinary Medical Association."

Some interesting clinical cases were discussed, and some good specimens exhibited by Mr. Gooch, Mr. Rudkin, and Mr. Grasby, who, after a capital repast, was heartily thanked for the excellent way in which he had carried out the Presidential office during the year.

PARLIAMENTARY.

NEW BILLS.

In the House of Commons, on Wednesday, Feb. 28.

* * *

Dr. CHAPPLE (Stirlingshire, Min.)—Bill to consolidate and amend enactments relating to animals and to knackers, and to make further provision with respect thereto.

Tuesday, March 5.

Mr. BARNSTON (Cheshire, Eddisbury, Opp.)—Bill to provide for the marking of all imported meat and agricultural produce, and for the registration of dealers in such meat.

SUPPLY—ARMY ESTIMATES.

Col. SEELY (Derby, Ilkeston), in moving that the Speaker do leave the Chair for the House to go into Committee on the Army Estimates, said although he could not hope to rival his noble friend the Secretary for War in fulness of detail, he would follow his example in avoiding as far as possible bringing the affairs of the Army into what might be called party conflict.

* * *

TRANSPORT AND HORSES.

His report in regard to transport and horses was very simple. The Regular Army required 44,000 horses on mobilization, in addition to those which they already had on the peace establishment. The number at one time was 52,000, but they had saved 8,000 by adopting mechanical transport. They required 10,000 gun horses, and they knew from the census and classification which had been carried out by adjutants and remount officers that that number and much more was available. There was, however, one real difficulty. There was an ample supply of heavy draught horses, and there were just enough or rather more than just enough light horses for the purposes for which they were required on mobilization, but while there were enough horses for the guns, there did not appear to be enough in hard training. The reason for that was the disappearance of the omnibus horse. That class of horse had provided them with a vast reserve of the very kind of horse which they required. Horses would be required for the guns for many years yet, and steps would have to be taken to get over the present difficulty. He would be glad to hear any suggestions which the right hon. member for Dover might make. The classification of the 44,000 for the Regular Army was not yet as complete as they desired to make it. Arrangements would be made for the horses to be brought to the points where they would be required and as to the purchase of them. The full scheme would be completed in a very short time. The 86,000 horses which would be required for the Territorial Army would be available, but there also they would have difficulty in regard to gun horses. Arrangements were being made in regard to motor transport, and the whole scheme for mechanical transport was receiving attention.

THE ROYAL SANITARY INSTITUTE CONGRESS.

His Royal Highness Prince Arthur of Connaught, K.G., has consented to become Patron of the 27th Congress of the Royal Sanitary Institute to be held at York in July next.

Personal.

STORRAR.—On the 25th Feb. at Rowes Cottage, Great Saughall, Lizzy, wife of James Storrar, in her 51st year.

ARMY VETERINARY SERVICE.

The undermentioned officers embarked in Transport "Rohilla" on 29th February, for a tour of service in India: Captains W. E. Schofield, J. Nicholas.

Maj. W. D. Smith has been transferred from Bulford to the Curragh as Acting Administrative Veterinary Officer, and Major E. E. Martin from Woolwich to Bulford as Officer Commanding the Sections, Army Veterinary Corps, at that station.

Mr. Dales died on Feb. 23rd, from acute phthisis, Aged 43 years.

JOHN HEPTON, M.R.C.V.S., Sherburn, Yorks.
Edin: April, 1890

Death occurred on Feb. 25, at the age of 68 years, from apoplexy, ensuing on diabetes mellitus.

CORRESPONDENCE.

POLICE COURT EXPERT EVIDENCE.

Sir,
In your issue of Feb. 24th the Central Association had this question up for discussion, and they then made a recommendation and appointed a committee of their own members to go as a deputation to the Chief Commissioner of Police for London.

As the question is one affecting the whole country and all our members, it seems that the proper body to deal with the subject would be the Royal College.

It would also appear that the College would, after discussion, invite the R.S.P.C.A. and kindred societies to a round table talk on the question, and then proceed to get, if possible, an interview with the Home Secretary. This is the proper one to go to, as being the head for the whole country.

The points to be put before the Home Secretary are in my judgement as follows:—

(1) Cruelty in the "greenyards" or "pounds" permitted by the police in not allowing the animal to be properly tended and fed, and in the case of the horse groomed and bedded, and in those cases where it is possible that foot disease is present the retention of the shoe.

(2) A veterinary surgeon habitually appearing in the same Court always for the prosecution. (A diplomat will be required to put this question very carefully. It is treading on thin ice. It must be put for the sake of the profession at large. All that is wanted is that all professional opinion will be given without any regard to conviction or dismissal. A veterinary witness has nothing to do with the result of the trial. He is present to speak to the condition of an animal).

(3) The appointing of veterinary referees to assist the magistrate when evidence is given of an expert kind, no matter by whom. This is the case with doctors and also in nautical cases.

(4) The stopping of an inspection by the magistrate. By producing the animal it is assumed that the magistrate has expert knowledge. He is not a magistrate, because he is an expert in any business or profession. He is there because he is a lawyer, or, if one of the great unpaid, because he has plenty of money or has given political services. Hunting's squealing mare admirably illustrates the damned absurdity of an inspection by the magistrate. In the country the horsey magistrate is still more opinionated than even Plowden and that is saying a lot.

This is a question which will be found to affect us very closely, and more so since the new act is in force. It is one which we must tackle because of internal discipline, as well as our good relations with the outside public. I hope that your columns will contain many expressions from our members, and that the Royal College will see their way to take speedy action.—Yours truly,

ST. ELLIW.

CRUELTY CASES—POLICE OR R.S.P.C.A.

Sir,

I enclose a report printed in *The Middlesex County Times* of a prosecution for cruelty. The circumstance to which I desire to call particular attention is that two policemen found what was considered a serious case of cruelty, and instead of proceeding in the ordinary way, they informed an R.S.P.C.A. inspector.

In this case wherein does the usefulness of R.S.P.C.A. lie? Two policemen and a veterinary surgeon are surely capable of proving a case, and the question which presents itself to one mind is—does the R.S.P.C.A. take the credit for a case of this sort, when the credit is really due to the police?—Yours faithfully,

Feb. 24.

"ONLOOKER."

[The report of this case appears on p. 576.]

R.S.P.C.A. INSPECTORS IN COURT.

Sir,

I enclose two cuttings from a local paper giving accounts of two cruelty cases. In the one we are told that Inspectors of the R.S.P.C.A. are examined as to ability by a veterinary surgeon before being appointed, and that in consequence their word should in all cases be accepted, and that before that of a properly qualified veterinary surgeon. (A nice piece of bounce, indeed). And in the second case we see the low, mean style of cross examination an inspector sometimes adopts in attempting to discredit a professional witness. A conviction must be obtained at any cost in every case, or no good can possibly accrue. Persistent exaggeration and untrue suggestions are methods frequently employed. The defendant in a case of cruelty is frequently himself treated cruelly, but what odds when you are out for convictions if your fellow worm goes under, or if pain is allowed to continue as in the "greenyard" cases recently mentioned.

Defendants in cruelty cases have rights as well as defendants in other fields, and to regard all witnesses for the defence in these cases as hostile, perverters of the truth, or as being actuated by malice, or other sordid motives is monstrous.

I recently heard of an inspector who said he was sure a certain horse was in pain because in taking a load up a hill the animal took a zigzag course. He probably had never ridden a bicycle up an incline.—Yours truly,

F.R.C.V.S.

THE BENCH AND THE R.S.P.C.A.

At Columb Petty Sessions, before Mr. A. C. P. Williams (in the Chair), Col. Buchanan, Col. E. Gully Bennett, Col. Prideaux-Brune, Capt. Vyvyan, Messrs. C. E. Cardew, W. Phillips, H. J. Rowse, J. Vivian, W. H. L. Shackell, W. Harvey Wells:

The Chairman said the Bench were strongly of opinion that in cases of cruelty the evidence should be substantiated by a veterinary surgeon.

Inspector Waters: Then authority is taken from the Society and its officers. It would rather tie our hands.

The Chairman: We want independent veterinary evidence.

Inspector Waters: That means that you will not convict in cases without that evidence.

The Chairman: Yes.

Capt. Vyvyan and Mr. C. E. Cardew interposed that they did not agree to this.

The Clerk said the Bench meant that in such cases where it was desirable veterinary evidence should be brought.

Inspector Waters: But you leave it at our discretion.

Mr. H. J. Rowse said they did not mean in the cases where the evidence was plain.

Inspector Waters replied that they never knew how a man would plead until he came to Court. The inspectors were not appointed unless they could satisfy a veterinary surgeon as to their knowledge. In dozens of Courts the training of the inspectors was recognised, and their word was taken.

The Chairman said he was sorry he inferred that this was the wish of all the Bench, but he believed they all wished for some substantive evidence in these cases.

Capt. Vyvyan: We have always been ready to accept the evidence of the Inspector without the additional evidence of a veterinary surgeon.

The Chairman: Not always.

Capt. Vyvyan: The defendants have always the option of having in a veterinary if they wish to.

CRUELTY CHARGE DISMISSED.

At the East Kerrier Petty Sessions, on Wednesday, Feb. 28th, before Messrs. E. B. Beauchamp, J. D. Enys, J. S. Ford, W. F. Tremayne, and W. L. Fox, Frank Rowe, carter, of Ponsanooth, was charged with working a mare in an unfit state at St. Gluvias on February 17th, and John Martin, farmer, was charged with causing the animal to be worked.—Mr. J. G. Powell appeared for the defence.—Inspector Waters said he saw Rowe in charge of a waggon and two horses. The bay mare had two old raw wounds under the saddle, and there was blood and matter on the pad under the saddle. Rowe said he had told Mr. Martin that the mare had a bunch upon her back and asked if he should work her. Mr. Martin told him to try her in the shafts that day. Mr. Martin said the pad must have come from off another horse, and that the horse was put into the shafts because it had kicked someone the day before.—P. Bunney corroborated, saying he considered the wounds had been there for some time.

Martin said the horse was sound when it went out in the morning, and the skin was not broken. He had two other horses in the stable which he could have used. There was a small blister about the size of a pin's head on the mare's back the night before. The roads were bad, and the work of the next day caused two small wounds about the size of halfpennies.

Rowe said it was their usual practice to work the horses with pads.

Edwin Richard Smythe, veterinary surgeon, said that he inspected the animal a week afterwards. He found two abrasions, not old wounds, because there was no depth. He had treated Mr. Martin's horses for 25 years, and he was the last man who would cause cruelty to them.

Inspector Waters: They are good clients of yours?—Yes.

And your sympathies would be with them?—Certainly not.

Is it a fact that you have made observations that you would oppose me in all cases in Falmouth or Penryn?—No. I have supported you.

The Bench dismissed the case.—*The Royal Cornwall Gazette.*

MEAT INSPECTOR IN LONDON FOR AUSTRALIA.

Sir,

In this week's *Veterinary Record* I notice a paragraph under the heading "Mr. McPhail appreciated," in which it is stated that Mr. McPhail was one of two candidates selected for an appointment in London under the Australian Commonwealth. Such is not the case for, as a matter of fact, out of some seventy applicants not two but six were selected including Mr. McPhail and myself. But the post was also advertised in the Colonies at the same time as in this country, and the deciding authority—namely, the Australian Government at Melbourne—finally selected and appointed a Melbourne gentleman.—Yours faithfully,

THOMAS PARKER, F.R.C.V.S.

Newcastle-upon-Tyne.

THE 'RECORD' PRECISION SYRINGE.

The FINALITY of
Hypodermic and Serum Syringes.

"The **'Record'**" Precision Syringe is a piece of delicate mechanical workmanship well deserving its name. It meets **all requirements as regards aseptic conditions and accuracy and it is always ready for use.**

It consists of **metal and glass** only. The glass barrel is ground inside perfectly true to cylindrical form. The Nickel vacuum piston is "ground in" into the glass barrel by precision machinery so as to fit hermetically, it slides smoothly, yet tightly, **without any lubricant.**

The cover is fixed on the cylinder with a **bayonet-fastening**; for the purpose of **thorough cleaning** it is provided with a segmental incision, by means of which it can be detached from the piston-rod by sliding it off side-ways. When **completely** taken apart the Record Syringe **forms 3 parts only: cover, piston and barrel.**

The Needles are provided with the original "Progressive" flat mounts. By this arrangement a good hold is afforded to the operator.

The fixing of the needle itself in the mount, by means of a smooth longitudinal guide arranged above the screw threads prevents the needle from breaking off in the mount.

EVERY SYRINGE IS GRADUATED BOTH IN C.C. AND MINIMS.

Price with 2 Steel Needles in Metal Case—20c.c. 21/- 10c.c. 17/6. 5c.c. 15/- 2c.c. 10/- 1c.c. 9/-

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1236.

MARCH 16, 1912

VOL. XXIV.

A USEFUL PAPER.

This week we print an abstract of a lecture by Mr. Hugh Begg, which is noteworthy in more than one respect. Written for the enlightenment of the public and not of the profession, it contains nothing new to veterinary surgeons. But it was delivered before a representative agricultural audience, and has been widely circulated in the Scottish Press; and therefore it should have considerable educational effect.

It will do much to support the system of veterinary examination at horse shows. That system is such a recent introduction in Scotland that there is still not a little prejudice against it, which the lecture will help to remove. It should also tend to bring about a better appreciation of the veterinary surgeon's position amongst stockowners, and this not only in questions of soundness. It will help stockowners to realise the difficulties of diagnosis in a wider sense.

It is not often that a veterinary surgeon addressing a popular audience speaks so frankly of the difficulties and uncertainties of diagnosis as Mr. Begg did. To do so was well; to cite examples, explaining the cause of the difficulties, was better. Popular lectures on these lines show stockowners that a veterinary surgeon can see much further into a case than the untrained man. They show also that veterinary knowledge has its limitations, that veterinary judgment is not infallible, and that there are many cases in our work which will always give rise to honest divergence of opinion. In admitting and illustrating this, Mr. Begg set a good example to the profession—not only to those who appear upon platforms, but to all who are engaged in practice.

We have often written of the evils of undue dogmatism on the part of veterinary surgeons. We now suggest one effect it may have on the stockowner. Owners see veterinary surgeons who never own themselves in doubt, and never admit that an opinion contrary to their own can be worthy of regard. Owners know, also, how frequently and how widely our opinions differ. Is it surprising that this should incline some owners to think lightly of our profession? We think not; and the blame lies, not with the ignorant owner, but with the too dogmatic veterinary surgeon. If we would deal frankly with our clients, and help them to understand something of the difficulties and complexities surrounding examination for soundness and the most everyday work of diagnosis, we should find them less apt to draw unfavourable conclusions from our numerous and unavoidable differences of opinion.

THE "NEW" METHOD OF ADMINISTERING CHLOROFORM.

Attention has recently been called to a "new" method of administering chloroform to human patients, namely by passing chloroform vapour through warm water, and like most new methods has been received somewhat sceptically. It would seem, however, that its use would prove most serviceable in the case of the smaller domesticated animals. It has been said that the washing of the chloroform vapour in warm water lessened the shock of its administration on account of the consequent rise in temperature, and also removed the "toxic principles," hence its lessened toxicity. That the increased temperature lessens shock there can be no question, but with regard to the "toxic principles" one has reason to doubt the accuracy of the statement, since chloroform, in the process of manufacture from alcohol and bleaching powder, distils once with a quantity of warm water, and moreover it is commonly washed a second time to remove traces of alcohol which are present. It would seem, however, that the comparatively large amount of moisture present in the vapour after its passage through warm water, accounts to a great extent for its lessened toxicity. In some experiments which I have recently carried out it was found that 5.5 litres of air, carried by means of an aspirator through chloroform, then warm water (a little below boiling point) and finally through two weighed U tubes containing Calcium Chloride, carried over 9.6 grammes of Chloroform, and the increase in weight in the two U tubes, due to the water absorbed from the vapour was .97 grammes, whereas when air alone was passed through similar U tubes the increase in weight due to the atmospheric moisture in 5.5 litres of air was .0825 grammes, which gives an increase of .8875 grammes. Further, when air is pumped through in the ordinary manner the quantity of moisture is exactly double the above.

That the good effects of this method are due to the water seems evident, for when such vapour is administered after being passed through Calcium chloride tubes, and hence dried, although washed previously in warm water, and still warm, no difference could be noticed between the effect of this vapour and that administered without previous washing.

The advantages of the method are that one can administer chloroform to young animals or animals *in extremis* with far greater safety than by the usual method, and further the patients "go under" more quickly. In support of this statement I may

say that a fox-terrier puppy, four months old "went under" in seven minutes, remained anaesthetised for 58 minutes, and had completely recovered from the effects in ten minutes; moreover, during this time the puppy received 6.5 drachms of chloroform. Again a fox-terrier dog, nine years old, had been injured by another dog, one eye being destroyed and the other seriously injured, as a result of which he was unable to find his way out of a large garden for six days. During this time he had had but little food, if any. It was found necessary to remove the putrid eye immediately. He was chloroformed in the new way, was completely anaesthetised in four minutes, and remained so for 20 minutes, while the eye was removed and the frontal sinus curetted, pus having formed there as a result of a perforation by a tooth of the other dog. He recovered sufficiently to be placed in a kennel in 15 minutes, and continued to do well.

If space permitted I could quote numerous other instances where this method of administering chloroform has been most useful, while the results of the ordinary method would have been distinctly doubtful.

ABSTRACTS FROM FOREIGN JOURNALS.

THE ASCARIS MEGALOCEPHALA.

Wilhelm Greim, of Hof, after a study of this parasite has arrived at the following conclusions:—

(1) The presence of *Ascaris megaloccephala* may induce symptoms of disease in the horse.

(2) The ascaris irritates the intestinal mucous membrane by its movements.

(3) By the aid of its lip-apparatus, it scratches the mucous membrane and produces small wounds.

(4) Such lesions, when numerous and situated in close proximity to one another, may lead to inflammation, ulceration, and necrotic destruction of small portions of the mucous membrane.

(5) By its individual strength the ascaris cannot perforate the intestine.

(6) The parasites live free in the lumen of the intestine; and, contrary to the views repeatedly expressed hitherto, they are not able to suck from or to hook on to the intestinal mucous membrane.

(7) The *ascaris* contains toxin in its body, and disperses it into its surroundings.

(8) The effects of the toxin consist of local irritation, alteration of the nervous system, and toxic action upon the heart and blood.

(9) An affection of the kidneys in connection with the excretion of the toxin cannot be demonstrated.

(10) The pathogenic importance of the parasite renders it necessary to administer anthelmintics to the horses infected with it.—(*Berliner Tier. Woch.*)

TUBERCULOSIS IN GOATS.

Hortha, who has been studying this subject at the Hygienic Institute of the Berlin Veterinary

School, says that caprine tuberculosis is more common than is generally believed. Its percentage, on the average, amounts to 0.72 in Germany and 0.63 in Prussia. The highest percentage obtained hitherto is one of 20.73.

In respect of frequency, tuberculosis of the goat takes the third place, coming immediately after that of the ox and pig. Tuberculosis is more frequent in the goat than in the sheep. In Germany, caprine tuberculosis is generally found proportional to the bovine disease.

The lesions differ notably in their anatomico-pathological aspect from those of tuberculosis in other domestic animals. The tubercles of the goat resemble the lesions of echinococcosis—a smooth-walled capsule with fairly consistent contents, often calcified, and grey, greyish-white, or greyish-green in colour. These contents can be enucleated *in toto*.

Histologically, these tubercles show a central detritus, with peripheral giant, round, and epithelioid cells. The external boundary is constituted by a relatively large layer of fusiform cells.

The tubercle bacillus cannot be seen in either scrapings or sections, even in the case of recent lesions. On the other hand, it is regularly found in guinea-pigs which have been inoculated with the tuberculous material.

In all the author's cases the bacillus recovered has been of the bovine type.—(*Annales de Méd. Vét.*)

HUMAN ANTHRAX IN GERMANY.

In the year 1910, 287 cases of human anthrax, 9 of them in children under 14 years old, occurred in Germany. Of the patients, 257 were males and 30 females. There were 39 deaths, made up of 32 men, 6 women, and 1 child.

In 142 cases, (or 49½ per cent.) the infection proceeded from contact with living animals affected with anthrax, or animals dead of anthrax, or their flesh. Products of animal origin used in trades or manufactures led to infection in 135 cases. In one case, working with anthrax bacilli was the cause. In the remaining nine cases, the cause could not be ascertained.

The agricultural industry supplied 121 cases with 12 deaths; 92 cases with 16 deaths occurred in tanneries; and 11 cases with 1 death in horse-hair spinning establishments.—(*Berliner Tier. Woch.*)

THE DISSEMINATION AND ACTION OF THE PENTASTOMUM TENIODES.

Prof. Stefan von Ratz, of Budapest, discusses (*Allatorrosi Lapok*) this question. The developed examples of the *Pentastomum teniodes*, or, more correctly of the *Linguatula chinensis*, live in the nasal cavities of the dog, wolf, and fox; but they are also found in the same position in herbivora, and even in man.

The *larvæ* occur in the thoracic and abdominal viscera, for the most part in the liver, lungs, and mesenteric lymphatic glands, and are often found free in the pleural and peritoneal cavities of the hare, guinea-pig, goat, sheep, horse, ox, pig, deer, cat, etc., in addition to those of man.

Among the dogs subjected to post mortem examination at the Pathologico-Anatomical Institute of the Royal Veterinary High School of Hungary, the parasites were not infrequent. Usually they were found singly, and the highest number found in one dog was five.

The larvæ are not rare in guinea-pigs, hares, rabbits, deer, goats, sheep, oxen, and buffaloes. In many animals only one or two specimens are found, but the author found several hundred in one goat.

The ripe ova pass out from the host's nose on to plants, and with them into the stomach of (usually) herbivora. Here the embryos, and later the larvæ, penetrate the intestinal wall into the blood and lymph vessels, and pass in these to the different organs, where the larva (formerly known as *Linguatula serrata* or *Pentastomum denticulatum*) develops further. Afterwards it becomes encysted or wanders farther into the serous cavities.

The author's results do not support the view formerly held of the active wanderings of the *Linguatula* in the bronchi.

Infection in carnivora occurs as follows: Carnivorous animals take up the larvæ of the parasite with the lungs, liver, etc., which they devour. The larvæ wander from the stomach through the œsophagus into the mouth, and thence into the nasal cavity. Moreover, when infected food is swallowed, single free larvæ may adhere to the palate and from there migrate into the nasal cavity. Finally, the author has experimentally proved that animals may acquire young *linguatulae* in their nostrils by smelling at organs containing larvæ.

When in the nasal cavities the parasite causes bleeding. More rarely it occasions violent inflammation and nervous symptoms resembling those of rabies.—(*Berliner Tier. Woch.*).

W. R. C.

UN SOUNDNESS IN HORSES, WITH REMARKS ON THE ATTITUDE OF THE VETERINARY PROFESSION.*

By Mr. HUGH BEGG, M.R.C.V.S.

My greatest difficulty has been to determine which of the many aspects of the theme would be most suitable for consideration here. I would gladly have been relieved of the responsibility of making a choice.

To the horse-breeder or buyer, as well as the veterinary surgeon, the legal aspect of this topic, and the great question of the heredity of many forms of unsoundness, are of such vital importance that either, if dealt with in detail, would furnish more material than we could handle in the time at our disposal. And, in view of the fact that in occasional lawsuits, eminent, experienced, and trusted veterinarians are seen to give apparently contradictory opinions, I am not sure that a plebiscite of my professional brethren would have given me much encouragement to appear before you as I now do. Sleeping dogs may wake up, and the Philistines may bring the status and attitude of the profession under review, but I cannot range myself with those who are timorous for the veterinary profession in this matter. I prefer to deal openly with this very phase of the question, and and run the phantom risk of lowering our professional

dignity, in the hope that this may help to obviate on your part the harbouring of any ignorant conception of our capabilities, for I cannot believe that any portion of our repute is of material or permanent value to us, individually or collectively, that is based on any false premise.

VALUE OF VETERINARY EXPERIENCE.

My estimate of the great value of the earnest veterinary surgeon to owners and breeders of horses is already formed, and I cannot bring myself to believe that your regard or demand for his services will be lessened by a full knowledge of the limits within which he is likely to agree with his *confirères* and beyond which there is at times ample room for conscientious difference of opinion. I need not enumerate and describe the many unsoundnesses in horses in regard to the presence or value of which all veterinary surgeons are likely to agree more or less closely, but I wish you to remember that these are so much in the majority that horse buyers may rest assured that the opinion of one experienced veterinary surgeon is almost sure to be corroborated by another in 95 per cent. of all cases that come within the sphere of commercial practice, provided facilities for examination are adequate. It will be generally admitted that the members of the veterinary profession have ever been found ready to give freely their services and advice to those societies whose propaganda aims at the perfecting of our breeds of horses, and here I may incidentally remark that we are proud to be associated with the members of horse societies in this estimable work. There is, unfortunately, in the mind of a certain section of the public (the quasi-horsey) an idea that the veterinary profession is unstable in its opinions, that we readily differ in matters of unsoundness without apparent cause, and that in proportion as we differ we don't know our business. Much of this is no doubt due to the extreme publicity that is given to every case of horse litigation. Providers of copy know that, apart from any conflict of evidence that may appear, the record of a horse case interests the public almost as much as the proceedings of the Divorce Courts. Men who have never even handed a feed of oats to a horse find, in discussing the matter in the train, the office, or the restaurant, an opportunity for sandwiching in some embellished account of how, on a certain occasion, in some heroic way, their horsemanship (?) averted an appalling disaster. It has often struck me how prone many men, otherwise estimable, are to pose as horsemen, and deliberately contrive to leave a false impression on their hearers.

THE OPINIONS OF THE BENCH.

Another factor in the case is the often uncalled for remarks on veterinary evidence of many judges who, having no veterinary knowledge, can neither estimate the value of the evidence nor discern the difficulty of the problem which the veterinary surgeons have had to determine. They ought to remember that glass houses are not the peculiar property of veterinary surgeons, and that the establishment of the different Appeal Courts in the land is no testimonial to the unanimity of legal minds on their professional problems. I am not here, however, to blackguard any profession or calling, or to cast any doubt on the infinite wisdom of the Creator who gave to mankind finite minds only. But, you may ask, why is it that veterinary surgeons differ at all as to the soundness or unsoundness of an animal? With the horse before them, can these questions not be determined as confidently as you would decide whether a pane of glass be cracked? My answer is emphatically no! though, as I have already stated, almost all the difficulty can be settled at once beyond dispute. We have to remember that the examination of horses as to soundness is a highly individual affair, and that the veterinary surgeon, being only human (though the pro-

* Abstract of lecture delivered before the Glasgow and West of Scotland Agricultural Discussion Society.

fession is divine), is bound to confess that the subject must, in many of its phases, remain for ever an inexact science, affording, as it does, a wide field for disagreement, albeit the difference very often is one of degree only.

UNIFORMITY OF OPINION.

Many attempts have been made by our associations to draw up a set of rules to guide us collectively in giving opinions as to the soundness of horses. But, inasmuch as many of the problems are incapable of settlement by adamant rules, these efforts have proved more or less abortive on every occasion. But some good has resulted, and we can confidently assert that to-day the opinions of the profession are more cohesive on many points than was the case even ten years ago. Whether the debatable ground will be much further curtailed I cannot say—no doubt it will—but you may depend we will leave no stone unturned that is likely to reveal a more perfect method of diagnosis. That real difficulties exist the records of many lawsuits abundantly testify, and, in seeking to deal with this question in a general way, I shall trust you not to construe my remarks as any attempt to suggest wherein the truth lay in any given case. My objective is to essay such a demonstration of the problem as may cause you to ponder before arriving at an uncharitable conclusion. I have no doubt many of you have remarked what is unquestionably true, that horses presenting any slight abnormality or irregularity in the structure of the limbs are more likely to be rejected by the young than by the experienced practitioner. Men of fifty or sixty years of age will readily confess that many horses which they condemned twenty or thirty years ago would, if examined by them to-day, get a certificate of soundness. In his anxiety to err on the safe side, the young man is apt to reject a horse for trivial matters, while the natural effect of experience is to broaden a man's views, and make him more tolerant of many conditions of bones and joints which do not conform to his preconceived ideas of what constituted a normal limb, and conversely, it is equally true that as a man gathers experience he becomes more and more careful to detect the slightest sign of those hereditary and progressive nervous diseases that are but too common in the high quality animal of to-day. But no matter what the extent of our practical experience may be, every examination presents its own difficulties to the examiner, and yields much room for thought, for he has to be as careful not to reject a sound as he should be not to pass an unsound horse, and it is my experience, generally speaking, that more sound horses are condemned for imaginary diseases than are unsound ones passed as sound. I need not tell you that, while any qualified veterinary surgeon may be expected to advise satisfactorily in *re* the soundness of any breed of horse, it is the case that we all tend to specialise, more or less, in the classes or breeds of animals that predominate in the district where we are located. We simultaneously become more adept in the detection of abnormalities specially prone to impair their utility, and more tolerant of many defects which, if occurring in a different purpose animal, would be of serious import.

THE LIGHT-LEGGED BREEDS.

No doubt the man whose experience is confined to the lighter breed has a difficulty in accepting as from disease the well-developed wrists of some Shire and Clydesdale horses. Per contra, and probably to a lesser extent, men accustomed to examine the heavier breeds find some trouble in deciding questions of soundness in Hunters. Veterinary surgeons naturally frame their attitude to their experience, and it is because experiences differ that we find the most reputable practitioners holding contrary opinions in certain cases. They are bound to give in Court a conscientious account of their views,

unbiased by the knowledge that there will be produced in the case evidence of equally experienced men who are at variance with them. And probably, since it is the rule for men to differ in every walk of life, it is not a bad thing that it takes more than one type of mind to make up the veterinary world.

THE YOUNG VET. v. THE OLD.

No doubt it is true of some veterinary surgeons, as of people in other walks in life, that their motto is: "First get on, then get honour, and, finally, get honest." If it perplexes you that a new graduate should reject a horse that may pass muster with an older practitioner, let us consider for a moment his recent environment. You will readily believe that in order to be able to comprehend or define disease, he must first of all understand the problem of health, and so, during his collegiate course, he is primarily taught the normal structure and functions of every part of the animal economy. Herein lies a considerable part of his advantage over the horsey layman. When certified proficient in this branch, he learns next all about the diseases that affect the various structures. Concurrently, he is taught the practical work of examining a considerable variety of horses as to soundness. To the performance of this duty he carries in his mind's eye that picture of the perfectly normal structure which, as a hearer and observer, his individuality has conceived, and even here the personal equation obtrudes itself, though not so glaringly as obtains occasionally in the matter of real or apparent abnormality of structure. As he passes each part of the frame under review, paying equal regard to structure and function, he has need for a clear head, an eagle's eye, and a lady's hand, for he is expected to observe and take note of everything unusual, and if he fails to remark the slightest unsoundness, he is liable to lose marks. The anxiety to be thorough causes him in the first few years of his professional career to "crab" horses which his clients had set their hearts on, and it is only when he finds that several of these animals have subsequently been recommended by more experienced practitioners, with the best results, that the full truth and wisdom of his teacher's apparent inconsistency dawn on him with conviction. When we attempt to unravel the seeming mystery of experienced men differing in matters of soundness, we discern various factors operating according to the nature of the point at issue. Under the head "Existence or Non-existence of Defects," if we exclude "whistling" and "spavin" in light foals, "ringbone" and "sidebone" in heavy breeds, and "shivering" and "stringhalt" in both, there remain few points in which we are likely to oppose each other. Disputes as to shivering, stringhalt, and a few lamenesses are almost invariably due to the fact that these are in many instances intermittent in character, so that a man may conscientiously pass to-day the animal which he himself or another would condemn without hesitation to-morrow. This feature of the early stages of these defects demonstrates how utterly inadequate are the facilities afforded for this important veterinary duty in the saleyard, the fair, or the showyard premises. We have repeatedly, when unable to make an animal reproduce what seemed a positive suspicion of nervous trouble, had to keep it on our premises for some days before we could definitely decide. Important as this matter is in valuable animals of any breed, it is momentous in the case of young, high-quality Clydesdales intended for stud purposes, and I am sure many of you breeders can recall your feelings of disappointment when one morning your discovery of the first evidence of the insidious hereditary taint blasted the cherished prospects you held out for one of your hopefuls. To those of you who have had this unfortunate experience, I commit the task of outlining, if you have a mind, the diplomacy that is likely to succeed in excusing the absence of the favourite from the show.

yard—how the progressive monster, sometimes eluding your most alert vision for a day or two, seemed all the more evident when it did reappear, and if you care to supply statistics indicating the period of time that elapsed before the defect was so pronounced as to be always detectable, you will materially confirm or add to our knowledge of shivering and stringhalt.

NERVOUS DISEASES.

It may be due to my ignorance, but I confess that I have often had the greatest difficulty in differentiating in overgrown young animals between shivering and awkwardness in backing, and between peculiarity of action and lameness. Particularly worrying to me have been three cases in Hackneys and twice as many in two-year-old Clydesdales. In all of these one could discern, in the walk only, either on the straight or in the first effort to make a turning movement, a very occasional though scarcely appreciable abduction of one hind limb, causing the foot to describe an arc of a circle as the step was taken. In none of these cases could anything abnormal be detected in the trot or in turning when the animal was on the *qui vive*. Probably you would have had no difficulty in deciding that each of these animals was the victim of incipient stringhalt or shivering, the want of co-ordination in muscular movement being necessarily due to an exaggerated or impaired nervous impulse. If so, the subsequent history would have proved you to be right in three, but wrong in at least four cases. In these latter, the awkward peculiarity of gait was undoubtedly due to a very slight displacement of the patella (the small bone in front of the stifle), causing an instantaneous difficulty in the flexion of that joint, with the result that the step was performed with a somewhat jerky outward swing of the limb. You are doubtless aware that in young animals the features of the bones are incomplete—the ridges and grooves that make in the mature animal a safe and firm joint, capable of giving straight flexion under all conditions, are not fully developed. And when we consider that this small bone is not held in its position entirely by firm ligaments, but is much indebted to the muscles attached to it above, we need not wonder that in growing animals its position, under certain circumstances, is sufficiently insecure to cause an awkwardness in gait that simulates almost exactly the first stage of stringhalt or shivering. These are the cases that kill dogmatism, and breed caution and charity in the mind of the practitioner. And when we come to a consideration of spavin and ringbone we find that in an occasional case it is extremely difficult to say what is soundness or unsoundness, provided the animal is moving sound and has free and full action of the joints. Conditions the result of disease in one animal so closely simulate what is but a desirable development of the bones in another, and *vice versa*, that it is not to be wondered at that men arrive at different conclusions, and that no amount of discussion can settle the matter.

RINGBONE, SPAVIN, AND SIDEBONE.

The starting point at which to condemn for ringbone, spavin, or sidebone is difficult to settle, being entirely a matter of opinion. The factors in your personality that lead you straight to the truth in the case of to-day will lead you to a wrong decision in the case of to-morrow, though at the time you don't think so, and it is a blessing that these "border-line" cases are not being sold and bought every day between men of litigious temperament. No doubt, where there is any decided difference in two hocks or two pasterns, we must condemn, but if the difference is only just appreciable or doubtful (and we know that the mass of hair and very often thickened skin at the coronets are baffling to our tactile sense), the horse should have the benefit of the doubt, if going sound. Thus we see that human expe-

rience at times proves a fickle jade, and "it ill becomes even the best of us" to decry the man who takes his stand on the other side of the hedge. In such controversial cases, hocks are either rough or spavined, and pasterns either coarse or ringboned, according to the individual opinion of the examiner, and when a case of this kind goes to Court, the conflict continues, each man strengthening his own edifice in the manner of a politician. A timeous post mortem discloses more truth than a seven days' lawsuit, but we are seldom afforded the opportunity of deciding the issue in this way. But surely many of these disputed cases could be settled with much less expense than obtains at present. When it happens that several men of equal professional calibre are at loggerheads, I would suggest to horsemen with a bent for law that instead of having recourse to the Law Courts, where the issue is as uncertain as the toss of a penny, they should consider the propriety of mutually agreeing to appoint three experienced and neutral veterinary surgeons, who, after hearing the available evidence, could make a personal examination of the animal, and settle the matter. This would be equally conducive to truth, and economical financially to the interested parties. Failing this, I think the money squandered in expensive litigation could be more wisely utilised in putting the animal down and committing the issue to the tribunal of three neutral veterinary surgeons, who could absolutely decide the truth with the open book of the bare bones in front of them. In the case of "sidebones" the difficulty arises only when a horse has rather rigid cartilages, and the ossification, or turning of the cartilage into bone, is not complete. Although very common in our mature draught animals, sidebones are not of great economical significance; they are of more importance—though less often met with—in hunters, hacks, and harness horses. It is surprising how many cart horses have sidebone—something approaching 50 per cent.—but in seven or eight-year-old animals this seldom produces lameness if unaccompanied by weak feet, and it is rarely met in young, unbroken animals. In Ireland and other hunting countries the bone of contention is "whistler or not," and this is due to the fact, so often verified, that the sound animal of to-day may be a whistler to-morrow, and so one man may pass as "sound of wind" the horse which a novice would reject a few days later. There is some controversy as to the amount of latitude which should be extended to fat stallions that "grunt" more or less to the stick. Those who put little stress on this are esteemed by the men who own these animals, but our experience is that the tolerance of many owners varies with the needs of their animals year by year, and they are to be likened to a not unworthy client of mine—a show official—who, trusting to a shortness of memory on my part as measurer, would counsel me one year that an inch or two was neither here nor there, and that big classes were the objective of the committee, while the next year, when it transpired that his own goods were likely to pass the standard, he would expatiate on the need for paying strict regard to my duty as measurer. "Grunting" is by no means a positive sign of unsound wind, and the great majority of big, fat horses that grunt to the stick are quite free from disease of the larynx. Many horses grunt from fear or habit when in perfect health, and the sound is often emitted by animals suffering from painful chest complaints. And experience has shown that it is foolishness to think that you can feed large horses to fat condition with heavy, bulky food and not have a great number of them become grunTERS.

Though grunting is always to be looked on with suspicion, because the roarer or whistler almost invariably grunts, and though the various gradations are somewhat difficult to estimate, we usually find that what is known as a "bull grunter" proves to be a roarer. Every animal that grunts to the stick should be further

tested for his wind, and if he passes successfully the orthodox tests for roaring, he may safely be considered as sound of wind. And, since fatness is no sign of condition or tone, but usually the reverse, we have to be careful not to confuse the breathlessness and louder respiration that result from the enforced exercise of any test with the signs of roaring or other unsoundnesses of the respiratory organs. When a veterinary surgeon finds that a horse otherwise sound makes a noise to the stick, it is sufficient for him to mention the fact for his own protection. We have always to bear in mind that either grunting or broken wind may develop quite suddenly.

BOG SPAVIN OR THOROUGHPIN.

When we come to consider bog spavin and thoroughpin, we find in some Clydesdales that the hereditary predisposition to these conditions is strongly marked. A degree of puffiness in the well-shaped hocks of a heavy entire is to be excused, since it is very often the result of the severe stress to which these joints are put when a heavy animal is serving. But there is some ground for controversy when we encounter young animals, excellent in every other detail, possessed of those extremely straight hocks that are bulging and sometimes fleshy ere yet they have begun to do service. This faulty conformation is very undesirable, and we would readily ban any animal whose unduly straight hocks were showing such evidence of wear as would lead to the conclusion that they would soon fail him. But though the veterinary inspector cannot condemn till the hocks show evidence of disease, we are often surprised that judges, in making their awards, do not deduct more marks for such faulty conformation.

HEREDITY.

In considering the question of the "heredity of unsoundness," we have always to remember the dual parentage. Soundness is important both in sire and dam, but since he may beget fifty foals per annum, while she produces only one, his individual influence on our future horse population is proportionately greater, but the soundness of the mare is none the less necessary, seeing that her get of to-day may be the stud horse of to-morrow. I have often been surprised at the rush that is made occasionally by farmers to secure the service for their brood mare of the flashy two or three-year-old that has gained the honours of the day. Compared with the use of the aged, sound, and proved stallion who may have lost the bloom and agility of youth, the investment is distinctly speculative. Commend us to the use of the old horse whose proclivity for begetting sound, good type animals has become, as it were, standardised. In the dependence which may be placed on him to beget what you desire, he is comparable to the patent drugs now produced by manufacturing chemists which have had their therapeutic action tested and standardised by actual experiment, thus materially increasing their reliability. In the case of the sire that has not lived long enough to be so standardised, we should demand more than his individual freedom from recognisable hereditary disease. If he is to assist in the war against unsoundness, he must be the product of sound stock, and the weakness of much of the present-day endeavour to improve our stock lies in our want of jurisdiction over the mother, or it may be the father or grandparents of the animal in question. Indeed, the sound horse of unsound parentage is much less desirable as a sire than the unsound animal begot of a sound race, for the latter may conceivably produce the sounder stock. It is the blood that tells. Much depends on the immediate ancestors, and we have occasionally seen how a sire exceeding in bone and stature any of his race begat animals of inferior size, and we have seen the pigmy of a line produce gets worthy of his bigger kindred. Indeed, the sport of any

genealogical tree may be fairly depended on to reproduce animals worthy of his parents, unless he is mated to a mare that is potent to neutralise the outstanding features of his race. And, since the Stud-Book, from the standpoint of hereditary unsoundness, contains many undesirables, I leave it to you to decide whether it would not be advantageous and practicable to found a new and emancipated register of Clydesdales, free from the taint of hereditary unsoundness, so far as this object is possible to the wit and co-operation of mere men.

THE EXPORT TRADE.

In these latter days, when so many of our choicest Clydesdales are bought by Colonials and foreigners, who, generally speaking and so far as they know, accept only those that are sound, leaving the rejected to swell the proportion of unsound animals in these isles, need we wonder why there is not a sufficiency of sound animals to go round those firms that are willing to pay a good price for them, and that the veterinary surgeon's duty is not confined within the narrow limits of the question sound or unsound, but embraces in the choice of even high-priced animals a discrimination between unsoundness of different sorts, according to the purpose for which the animals are intended. This state of the market, while it offers a broader sphere of usefulness for the advising veterinary surgeon, is regrettable on account of the loss of value in horse flesh which it represents. Horse-breeders ought to discern in the yearly increasing utility, durability, and dependence to be placed in motor vehicles their strongest incentive to breed from sound animals of sound pedigree only, so as to reduce to a minimum the number of horses that, in the user's hands, become prematurely unfit from hereditary unsoundness. And, besides endeavouring to eradicate hereditary disease, they should aim at producing a class of animals likely to wear well in hard city work.

Mark the progress of events in our Colonies. The horse that has not a certificate of soundness there is banned both in the showyard and the market. And in their choice of the Shire to the Clydesdale in our Southern Colonies, we see an example of a progressive movement which will sooner or later call a halt to our cultivation in the Clydesdale of those points which considerably constitute the fancy, and which, though difficult to produce, often count for little in the utility of an animal.

Finally, gentlemen, let me say that your patience has been admirable. I hope you will have a good discussion, and if you make it plain that I have dealt with the subject in a defective manner, please remember that it is not the theme I would voluntarily have chosen to address you on. My main endeavour has been to present you with an unvarnished tale of the almost insuperable difficulties that at times confront us in the work of examining horses as to soundness, in the hope that a fuller understanding may breed in your minds that charity that forbids scathful remarks, and that there may be an increase of your faith in us as a body of men who, whatever our limitations are, are conscientiously endeavouring to read clearly our allotted portion of Nature's infinite book of secrecy.

[Mr. Begg had a cordial reception, and was loudly applauded at the termination of his paper.]

DISCUSSION.

Mr. JOHN FINDLAY, Springhill, Baillieston, said there was one thing Mr. Begg had impressed upon him, and that was the difficulties which beset veterinary surgeons in trying to see whether a horse was sound or not. Mr. Begg had admitted that veterinary surgeons could make mistakes, and he seemed to indicate that it would only be after a veterinary surgeon had come to the age of forty years that he would be of any real practical

use in deciding whether a horse was fit to pass the test or not. That, Mr. Findlay thought, was a little hard on the young veterinary surgeons. They could not all wait till they were forty years of age before beginning to vet. horses. It was many years since animals were vetted in the show rings. The Highland and Agricultural Society had taken it up years ago, but it did not work well, and only brought confusion, and consequently the society reverted to the old system of securing the best judges. With all deference to veterinary surgeons, he thought competent farmers who often acted as judges were entitled to very great credit for the high position the Clydesdale occupied for soundness. (Applause.)

Mr. WILLIAM ROBB, F.R.C.V.S., Glasgow, thought it was not a question for the veterinary surgeons at all, but for the breeders and users of Clydesdale stallions. It lay with them as to whether there should be examination or not. According to some it was not necessary, while according to others it ought to have been done long ago. Speaking as a veterinary surgeon, he said the longer they did without examination it only brought in more grist to the mill. (Laughter and applause.) From a financial and business point of view, it lay with the breeders. If they decided to have examination, he asked who was going to do it? They read the works of eminent writers, so they should employ eminent veterinary surgeons. Mr. Findlay referred to the judges' opinion. The examination was largely limited to the hoof-head, but occasionally they found that a horse had sidebone, and they seldom got beyond that. Judges should judge type only, and if there were to be examination, let it be all round. Whether a veterinary surgeon was the best party to carry out that was a matter of opinion. If they waited till the veterinary surgeon was perfect they should give it up. That official was only human, and some had escaped jail in their time, while others had been jailed. (Laughter.) Taking the case of the Shire horse, he remarked breeders of that class of horses had said that vetting had been of wonderful benefit in eradicating unsoundness in horses. Proceeding, he said the greatest stumbling-block to many of the stallion owners was the question of roaring. It was expected that once a stallion had been fed he must roar. That was not correct. He (Mr. Robb) had passed a nine-year-old after a severe test—not during his season, but when he was standing idle—as absolutely sound of wind, while, again, he had condemned a three-year-old without much provocation. He agreed with Mr. Begg in the difficulties of showyard examination. They were more likely to make errors there of omission than commission. In conclusion, he said he could mention the names of premium horses which were shiverers, and others which had sidebones, and the result had been disastrous to all who used them.

Mr. JAMES SNODGRASS, Millig, Helensburgh, thought all stud horses should be examined. The poacher was a great danger to be avoided. Horses which were not good enough to be used as stud horses at home were sent to poach in the country districts, and very often they were unsound. They usually got a good number of mares, and the produce were all unsound. It was very hard on the man who bought a young horse, and, after keeping him for a year or two, discovered that he was developing "hackney" action. (Laughter.) All stallions should be examined and passed as sound.

Mr. DAVID ALLAN, V.S., Clarkston, said the matter of unsoundness had been a very great question all along, but there was difficulty in defining soundness from unsoundness. A horse might have an abnormal formation which would be put down as a disease. That was not fair, and unless horses had a disease they ought not to be condemned. In hereditary unsoundness they had a most difficult thing to contend with. He thought breeders should be very particular in breeding from

both mares and sires which were free from hereditary disease. Veterinary surgeons were often blamed for passing horses as sound where there was disease. It was a very wise arrangement, he thought, to have all horses examined which were competing for premium prizes. Concluding, he said there were plenty of horses condemned as shiverers whereas it was simply luxation of the patella, the small bone in front of the stifle.

Mr. JOSEPH ROUTLEDGE, 42 Grant Street, Glasgow, remarked that the great question of unsoundness had been brought lately to an acute stage on account of the diversity of opinions which existed amongst the highest authorities in the veterinary profession. The difficulty, of course, was with the aged horse. The question was whether a certificate of soundness should be given to a three-year-old or four-year old horse, and then, when six years of age, to give him a fresh certificate for life. Breeders and farmers ought to take up the matter seriously. The advice given in the lecture as to how breeders should choose their sires would do a great deal to eradicate the question of unsoundness.

Mr. Arch. MacNeillage, hon. sec., thought that Mr. Begg's lecture was largely an apologia for the veterinary surgeons. He did not think such a thing was necessary, but those who read the evidence in the recent Dumfries filly case might have arrived at the conclusion that some kind of apology for the profession was required. After all, veterinary surgeons were like their brethren in the medical profession. He would like to ask even the most confirmed unbeliever in the veterinary surgeon's diagnosis if he would be prepared, in the case of critical illness of a human subject closely related to him, to adopt the principles which he advocated in regard to disease amongst animals. Medical men often gave contrary opinions regarding diseases. Under these circumstances, when a member of a family was seriously ill, would they expect that the mother, who was the best experienced in the house, was better fitted to give advice on the subject than two or three men who had made a special study of the disease? He was sure no one would adopt such an attitude. Mr. Findlay had argued that judges in the showyard were quite competent to decide whether animals were sound or otherwise for all practical purposes. He was prepared to admit that there were many men who acted as judges who were well qualified to express opinions on the matter of practical unsoundness. In over thirty years' experience and observation, reporting in the show ring, he had heard the excuse advanced time and again, when animals which were unsound were promoted to the highest places, that the judges were not veterinary surgeons, and that they were not there to judge soundness, but type. That being so, who was to judge soundness? There was only one qualified judge, and that was the man in the profession trained for that purpose. Reference had been made to the fact that the Clydesdale breed was exceptionally sound. He admitted that, but on what data was he to base his claim if challenged to prove it? If a man made that claim on behalf of the Shire horse he showed figures to the effect for thirty-four years. These figures could be allowed to speak for themselves. He had data based on ascertained facts covering a period of thirty-four years. As regards the Clydesdale, they had no such data. They had only the examinations at the Royal of the comparatively few Clydesdales shown there, and the examination for the Cawdor Cups during the past three or four years. He was pleased to be able to say, on the authority of Principal McCall, that on Tuesday seventeen stallions were examined, and only one failed to pass. Except for that, he had no data to go upon in support of the contention that the Clydesdale was an exceptionally sound breed. If they were to stand against the world and battle with the other breeds, they must have inspection. The classification of the horses at the London Shire Show was a masterpiece. There were

classes provided for yearlings, two-year-olds, three-year-olds, four year-olds, and then from five to nine, and next a class for stallions ten years old and upwards, and those in the last named class were subjected to the same test as in the younger classes. The whole matter was a breeder's question, and not a horse owner's or a veterinary surgeon's question. The breeder was the man who paid for the use of unsound stallions, and it was the breeder who lost the money when the produce were unfit. He had never known judges in the showyard, with one exception only, put into effect their skill in judging horses for soundness. The exception was at the Inverness Highland Show in 1883, when three judges placed what was admittedly the best horse in the class in the corner of the ring, and never gave it a ticket. On another occasion, at Perth in 1887, the judges put a horse which was temporarily lame out of the awards. Although only temporarily, it was lame, which was enough for them. A year ago on Tuesday, when inspection was in progress in the Scotstoun showyard, the late Mr. David Riddell had said to the inspectors, in the hearing of a company of which he (the speaker) was one—"Gang on with your work, men, it is a step in the right direction." He thought that testimony of a stallion owner with fully fifty years' experience was worthy of being put on record. (Applause).

The CHAIRMAN, in moving a vote of thanks to the lecturer, advised them to remember their customers, and always send their best goods to the market, or they would lose their customers.

Mr. BEGG, in reply, said that Mr. Findlay had scarcely caught the actual meaning of his phrase. He did not wish to decry the ability of the young practitioner, but he was only trying to show that the capability of a veterinary surgeon was increased through long practice, as his views were broadened. Of course, age did not always mean experience, because a young man might be quite experienced after a year or two's practice.—*The Scottish Farmer*.

PHYSIOLOGY AS A FUNDAMENTAL IN VETERINARY EDUCATION.*

Education, like nature, should be orderly—a development from the simple to the complex. The development of the morphologically simple cell into the complex adult animal organism proceeds in an orderly way. The cell is the morphological unit and the mature animal consists of innumerable units, some of which have undergone a very great modification as to form. The cell cannot be accepted as the physiological unit. What is apparently simple as to form is not necessarily simple as to function. The activities of the cell are but partially understood. The physiological unit, around which centre these activities, is, like the atom of chemistry, invisible, but its power is unquestioned. Function is concealed in structure. Function is not often revealed without search and, indeed, research. In some instances it may be so superficial as to be easily recognised: in others it may lie so deeply that the keenest intellect is baffled in demonstrating its presence in a satisfactory manner.

The relation of Physiology to the biological sciences is most intimate. It is not a question of independence, but of interdependence. Many more or less plausible arguments may be advanced that one particular science may have a greater relative value than others. Chemistry and physics are concerned with matter and we ordinarily associate them with unorganised bodies. Physiology is restricted to *living* matter, or organised bodies. We

cannot consider inorganic material in physiological terms. Yet chemistry and physics are intricately involved in physiological processes and the question arises, perhaps, in the minds of some if, under the proper combination of conditions and of environment, life is not evolved from chemical reactions. Chemical action is constantly occurring in living tissue. Does it control the living tissue or does the living tissue control it? In the processes of filtration, diffusion and osmosis, physics occupies a relationship scarcely less intimate than chemistry. Solutions of crystallizable substances of unequal concentration separated by an animal membrane will ultimately become uniform. Physics has demonstrated this. Is there any difference in the results if the animal membrane be living or dead? In some instances it has been shown that it does. Waymouth Reid introduced into the intestine of a living animal a certain amount of its own blood serum. The epithelial cells of the alimentary tract were therefore in contact on the one side with this blood serum and on the other with capillary vessels containing blood, the fluid of which had the same composition as the serum in the intestine. If the intestinal wall acted like an ordinary dead membrane there could be no passage of the serum from the intestine to the blood by diffusion or osmosis. It was found that the serum was rapidly absorbed. This could not be due to ordinary filtration because the pressure in the intestine was less than in the capillaries. The conclusion was reached that while known physical forces play a certain part in absorption, there remains an unexplained factor. Some, however, regard this unexplained factor as the living cell, and that because of its living condition two separate fluids of uniform composition were made to unite against pressure.

A somewhat similar example occurring in the kidney may be referred to. Urine contains a much higher percentage of urea than does the blood, but in spite of that the extremely weak solution of the urea in the blood gives up its urea to the more concentrated solution in the urine. Physical law will permit the passage of a substance from the stronger to the weaker solution, but not the reverse.

Co-operation is the key-note of physiology. In no other science, perhaps, do we have such striking examples. Since the time of Sir Charles Bell, physiologists have recognised the importance of the nervous system in co-ordinating and regulating the various bodily functions. In comparatively recent years the realisation has grown that the harmonious adjustment of the various tissues is not confined entirely to the numerous reflexes through the nervous system, but that there is in addition a regulation by chemical means through the blood and other fluids of the body. The development of our knowledge of the internal secretions led Brown-Sequard to the generalisation that every tissue in the body in the course of its normal function gave material to the blood which was of use in regulating the activity of other tissues. This idea has been supported by facts brought out in connection with the study of the ductless glands of the body. The generalisation of Brown-Sequard has been confirmed in a definite way by the investigations of Bayliss and Starling upon secretin. They have demonstrated that when hydrochloric acid is brought in contact with the epithelial cells of the duodenum a substance (secretin) is produced which passes into the blood and is carried to the pancreas and stimulates it to secrete the pancreatic juice. This is a definite example of a substance which, originating in one tissue, is of direct aid in the function of another tissue in a chemical way. Such a substance has been designated by Starling as a "hormone."

The epithelial cells of the duodenum co-operate in still another very striking manner. When the pancreatic juice is secreted its proteolytic enzyme is in the form of

* Presented at the meeting of the Association of Veterinary Faculties and Examining Boards of North America, at Toronto, Canada, Aug., 1911.

trypsinogen—an inert substance. As soon as it comes in contact with the duodenum, the trypsinogen is activated or converted into trypsin, which has the power of acting vigorously upon proteid material. The substance which causes this activation is known as enterokinase. It would thus appear that the duodenal cells are doubly co-operative in assisting other tissues in a chemical way. The secretin which they produce is comparable to an internal secretion, since it is turned into the blood and stimulates the pancreas to perform its function; the enterokinase, on the other hand, is comparable to an external secretion, since it is turned into the intestinal cavity and thereby activates one of the important constituents of the pancreatic secretion.

An interesting co-operative cycle is apparently established around the duodenum. In the stomach, pepsinogen is secreted by certain cells in the gastric glands; this presumably is activated to pepsin by the hydrochloric acid formed by another type of cell in the gastric glands. The gastric chyme with its hydrochloric acid, on reaching the duodenum, stimulates the production of secretin, which in turn stimulates the flow of the pancreatic juice. The pancreatic secretion on reaching the duodenum induces the production of enterokinase by which its trypsinogen is activated to trypsin.

Because of the considerable amount of carbohydrate in the diet, it might naturally be expected to find a vigorous diastatic enzyme in the saliva of the horse, if in any animal. Yet the saliva taken from the duct of the parotid gland is unable to convert a starch mixture into a reducing sugar except to a very limited extent and after a considerable period of time. Is there an absence of the diastatic enzyme, except such as may filter through to the secretion from the blood, or is there an inert ptyalinogen which meets its activator further down the tract and is there converted into the active ptyalin?

Other examples of co-operation may be mentioned in connection with the pituitary body of the brain, and the thyroid and suprarenal glands. Although not provided with ducts, an internal secretion is nevertheless formed which is turned into the blood and lymph and exerts an influence upon the other tissues of the body so important that if the glands become diseased or removed, serious or fatal consequences result.

One of the most interesting examples of an internal secretion which is not necessary to life but which yet profoundly affects the chemical changes occurring in the body is that of the ovaries. It has long been familiar to stockmen and others that the removal of the ovaries increases considerably the rapidity with which fat is laid on. According to the researches of Loewy and Richter, of Berlin, the explanation is that the ovaries produce a substance which hastens the oxidation of the tissues and the food. When this substance is injected under the skin of animals in which the ovaries have been removed, the tissue waste is markedly increased.

Since physiology is concerned with living matter and that alone, the border lines between it and other biological sciences must of necessity be indefinite and more or less overlapping. This is peculiarly true as to its relation with pathology, medicine and therapeutics. The chief function of the living tissues is change—metabolism. Changes of composition, form or even structure are pertinent to physiology if they occur in the living tissue. The activity of the tissues may be increased or decreased for a greater or less time and the conditions still remain within normal limits. There may be a lack of co-operation for a time without abnormal results. The dividing line between the normal and the abnormal is at the outset imperceptible. Bacteria are present in the normal body and are more or less concerned with the normal functions of the alimentary tract.

Physiology stands for co-operation, pathology deals with a disturbed co-operation. A tissue unduly excited

will, in time, disturb the harmonious adjustment of certain other tissues, producing a chain of results which induces an abnormal or pathological effect upon the organism, as a whole, and medical science is invoked to alleviate the disturbed condition and to restore the normal adjustment. In other instances the hyperexcitability may be localized in a given tissue, as with a benignant tumour without apparent interference with the normal functions of the other parts. Pathology is physiology gone wrong and, although it has been emphasized before, it is well to emphasize it again: that to understand the abnormal, it is necessary to have as complete a knowledge as possible of the normal organism.

If it is the province of pathology to point out the differences between the normal and abnormal, it is the very important duty of medical science to attempt the restoration of the abnormal to the normal. If it is important for the surgeon to know thoroughly the form and structure of the tissues in order that abnormal or diseased parts may be removed with the hope of bringing about a normal condition again; then is it equally important for the medical practitioner to know thoroughly the functions of the tissues and their system of co-operation, if he is to restore the diseased organism to its normal physiological standard. Therapeutics must be invoked with a knowledge of those agents which will stimulate the weakened parts to their normal tone, or which will soothe the overirritable or overexcited tissues to their natural calm. Without anatomy we may assume there could not be proper surgical procedure; we may equally assume that without physiology there could not be satisfactory medical practise. Indeed, the practitioner's service is but an extended laboratory course in physiology.

Diseases are due to a disturbance of physiological co-operation either internally through the interrelationship of the different tissues, or externally from the introduction of material foreign to the organism. In veterinary practice there is perhaps no more striking example of disturbed co-operation than in azoturia. Why should renewed work after a day or two of idleness cause such a physiological upheaval in the horse as to make it necessary to record so large a percentage of fatalities? The answer will probably be found in the disturbed adjustment of the circulation, muscular and renal tissues, caused, perhaps, through chemical substances introduced through the digestive system and influenced more or less by external conditions. Why are other domesticated animals exempt from this affection? The hydrocephalic dummy, parturient paresis in cattle, and many other diseases when finally worked out may be found to be due to the production of some chemical substance developed in one tissue, which, circulating to other tissues, excites them directly or reflexly to such an extent that the whole adjustment is thrown into more or less disorder.

In the urine of man, more than a trace of indican is pathological. Why should the relatively large amount of this substance usually found in the urine of the horse be regarded as a normal condition?

In order to solve the problems of the normal as well as the abnormal, it would appear essential to work out the physiology of each species of the domesticated animal distinctly. While many of the conditions may be fundamental to all, there are some characters which are peculiar to each type. Physiology is not all internal; external conditions must be reckoned with. Diet, habit and environment all contribute to the harmonious adjustment of the internal mechanism.

The practitioner should not be blamed too severely for a certain amount of empiricism. Physiology has not yet solved all of its problems, and until the solution is forthcoming a strictly rational treatment of all diseases is impossible.

If my meaning has been clearly expressed, it should be apparent that physiology is a *living* science and is concerned with the manifestations of life; its action is co-operative, not only to the tissues in an individual organism, but in a broader sense to the other biological sciences; it is fundamental especially to pathology and medicine, and, co-operating with them, seeks to conserve the general health of animals and man.

PIERRE A. FISH.

Cornell University.

LANCASHIRE VETERINARY MEDICAL ASSOCIATION.

The fiftieth annual meeting was held at the Grand Hotel, Manchester, on Feb. 16th. The President, J. W. Brittlebank, Esq., in the chair.

The minutes of the last annual meeting were taken as read, on the proposition of Mr. Taylor, seconded by Mr. Munro.

Election of Members. Messrs. W. H. BRIDGE, Bolton; E. R. EDWARDS, Board of Agriculture; A. RICHARDSON, Liverpool; J. SPREULL, Manchester; and H. A. TURNER, Manchester, were unanimously elected members of the Association on the proposition of Mr. Locke, seconded by Mr. Brittlebank.

Nominations. Mr. T. O. RICHARDSON, Tarporley, was nominated for membership by the President, as also was Mr. HEYES, Wigan, by Mr. Sumner.

Correspondence. The Secretary submitted a letter, dated Dec. 15th last, stating that a Congress arranged by the Société de Pathologie Comparée will be held in Paris in October. Fuller details are given on page 720 of the December issue of *The Journal of Meat and Milk Hygiene*.

A letter from Mr. Gofton, Hon. Sec. of the Organising Committee, N.V.A., under date of Jan. 20th. This contained a request as to the decision of the Lancashire V.M.A. in regard to affiliation with the N.V.A. Also, in the event of the decision being favourable, as to the names of the representatives chosen in accordance with rule 36.

It was pointed out that the Society had passed a resolution approving of the scheme at their quarterly meeting of April 6th last.

Mr. WOODS formally moved that the Lancashire V.M.A. affiliate with the National Veterinary Association. Mr. Sumner seconded, and it was carried.

The selection of representatives was referred to the Council for consideration and report to next quarterly meeting.

Council Election of R.C.V.S. Mr. TAYLOR moved that Mr. Packman be the nominee. Mr. Lawson seconded, and it was carried.

Mr. LOCKE proposed that the Lancashire V.M.A. unite with the Yorkshire, Eastern Counties, and Liverpool Societies in the forthcoming election. This was seconded by Mr. Pillers and carried.

Balance Sheet. Mr. STENT submitted the balance sheet for the year 1911. This had already been printed and circulated to members. It showed a balance of £11, the membership remaining about the same.

The PRESIDENT proposed, and Mr. Lawson seconded, that the balance sheet be adopted. Carried.

Mr. LOCKE drew attention to the number of members in arrear, and moved that the matter be referred to the Council. Mr. Lawson seconded, and it was adopted.

Alteration to Rule 3. In the absence of Mr. Lloyd, Mr. Locke proposed an alteration to rule 3 in regard to the date of the first quarterly meeting, viz., "First Thursday in April to read third Thursday in March." Mr. Wolstenholme seconded the proposal, and it was carried.

Mr. LOCKE announced that he had received promises of twenty guineas towards the entertainment fund in connection with the visit of the N.V.A. to Manchester in July next. He appealed to members for promise of support.

Mr. LAWSON reminded the meeting of the National Congress to be held in London in 1914, and the necessity for their Association doing its utmost to assist in the success of that Congress.

The PRESIDENT said he thought it could be taken for granted that that would be done. He promised to bring the matter before the Council.

PRESIDENTIAL ADDRESS.

Mr. J. W. BRITTLEBANK, M.R.C.V.S., Manchester.

Gentlemen,—May I first of all extend to you all my very sincere thanks for again conferring upon me the honour of electing me your President for the coming year, particularly do I appreciate the distinction when I look back upon the year which is past and remember the many courtesies and kindnesses which I have received, and, I need scarcely add, the unswerving loyalty of you all.

I do not propose to inflict upon you anything in the way of a lengthy address; I do not think it can be expected of me; but I should like to briefly refer to one or two matters which are of interest to us.

In the first place the National Veterinary Association have accepted the invitation which you extended to them to come to Lancashire; and it is now up to us to do all we can, collectively and individually, to make their visit a memorable one.

Now that the amalgamation of the Societies is an accomplished fact we may hope that the common interests for the welfare of the profession will in no way suffer. I believe that the amalgamation cannot help but become a powerful factor in advancing the future of the profession, whether it be in a political sense, in which direction I am convinced that we have at last an opportunity of bringing our College motto, *Vis unita fortior*, into actual practice, or in the scientific sense. The example which the unity of the medical profession has recently set us is surely some indication of the great power which a profession can exercise in bringing pressure to bear, so that they may secure those rights to which they are entitled.

I do not for an instant wish to suggest such an organisation should be at any time made the medium of promoting discord and bad citizenship. But I am perfectly satisfied in my own mind that we as a profession have occupied quite long enough the subsidiary place in which we find ourselves partly, no doubt, due to our own fault—and that the time is not far distant when we should be able to secure those positions to which we have a right as a professional body.

In the scientific world also there are vast possibilities open to us, the field of research is ever calling, and we can only hope that the advance in the scientific history of veterinary medicine will be even more marked in the next fifty years than in the half century which is past.

I have purposely referred in the previous paragraph to the half-century, not with the idea of bringing before you the fact that this is the 50th year of existence of the Lancashire Veterinary Medical Association or that the progress of veterinary science commenced at the inception of this Society, but I do claim that societies such as ours have played no mean part in the advancement which has been made in our knowledge of the pathology and prevention, and, shall I add, the treatment of disease in the lower animals. These periodical meetings have caused many exchanges of views, have been the avenues through which new ideas occurred, petty jealousies have been dissipated, and so they have helped to consolidate

the profession, and have served their purpose manfully through the years which are past. The future we may safely leave to itself, having one solid purpose before us which can be briefly summarised into the one word, Progress.

I regret deeply the delay, due, I think, to the unnecessary interference of a minority of our profession in the passage of the Bill through Parliament. All legislation in the past has shown that it is quite impossible to devise measures which will satisfy everyone, and that it is the minority who must give way; but surely in our case it was not very difficult for any man who ever pretended to have the higher interests of his calling at heart to see that money was, and is, urgently needed, if the Royal College of Veterinary Surgeons is to be preserved as a licensing and disciplinary body, and the encroachment of other educational bodies are to be kept at bay.

As is known to many of you, the International Veterinary Congress is to be held in London in 1914, and a considerable sum of money will be required in order to extend toward those who come from over the seas that hospitality which has been for centuries a source of pride to us as a nation.

That the organisation will lack nothing we are assured, for we have Sir John McFadyen at the head, and I do hope that he will have no reason to say that we as a profession have fallen short in extending to him that support in carrying this Congress to a successful issue, both scientifically and socially, which it is his right as the leader to expect.

I may be excused for referring briefly to the field of veterinary work in which I am engaged as one before which there are vast possibilities for our profession. I venture to prophesy that the time will come when the Veterinary State Officer will become just as essential a portion of the preventive medicine service as the Medical Officer of Health is to-day, and I feel sure that there is no need for much of the pessimism evident with regard to our future. The graduates of the future will find many avenues opening to them, and those responsible for the education of the embryo veterinarian will do well to bear this in mind, and to provide accordingly.

I must thank our Secretary, Mr. Locke, for his kindness to me during the year which is past, and can only say that with the same measure of support extended to us during the coming session we hope to carry even higher the prosperity of the Lancashire Veterinary Medical Association.

Mr. LAWSON proposed a vote of thanks to the President for his address.

Mr. McKENNA, in seconding, said the coming year would be one of great interest to the Lancashire V.M.A., and very many duties would devolve upon the President.

The PRESIDENT thanked the meeting, and said that with the help of the members the Society would in no way be disgraced in the coming year.

THE JUBILEE DINNER.

The attendance included the President, Messrs. Garnett, Lawson, Burndred, Noar, Munro, McKinna, Pillers, Stent, Taylor, Wolstenholme, Woods, Priestner, Whitehead, Turner, Sumner, Ingram, Michaelis and Locke.

The guests of the evening were Aldermen Turnbull and Dixon, Councillors Kay and Jones (Manchester City Council), Prof. Delépine, Dr. Sergeant, Dr. Dearden, Dr. Arnold, Dr. Cryer, Dr. Rothwell, Major Stonier, Major Mason, Messrs. Clarkson, Heap, Roberts, Allinson, Houghton, Weir, Cantrill, Mallinson, Cecil Taylor, H. Sumner, junr., Wadsworth and White.

Apologies for absence were received from Messrs. Abson, Share-Jones, Packman, Faulkner, Hughes, Bartrum.

The PRESIDENT, in giving the toast "The King," thought he need say little, except to say that all were glad to welcome his Majesty safely back again. The toast was given with musical honours.

The PRESIDENT also gave the toast to "The Queen, Queen Alexandra, H.R.H. the Prince of Wales and the other members of the Royal Family."

"The Imperial Forces." Mr. STENT said that without doubt the most important branch was the Navy, our first and foremost line of defence. He believed it to be the most powerful this world had ever known. But even the best of ships are of little use unless you have the right men in them, and in this respect we had the finest set of men of any nation. It was difficult for a civilian to speak of the condition of affairs in the Army, but he was inclined to agree with Lord Roberts, that some form of compulsory service is necessary, if only for the physical development of the nation. These questions should be non-political, and to his mind it was a scandal to be otherwise. He had great hopes of the Boy-scout movement, but had hesitancy in speaking of the Territorials.

Major A. W. MASON, in responding, said he had borne His Majesty's uniform since 1874. He agreed with Mr. Stent that our men in the Navy were the finest force in the world. The Army were small, but very good. As to the Territorials there was much difference of opinion, and a great deal of politics in regard to the force. The force certainly did not get enough money to equip itself properly, and the question of horse supply was a serious one. If mobilisation were required to-morrow it could not be done. He believed the Army Veterinary Corps to be pre-eminent, and also considered that the Boy-scout movement would prove a useful adjunct to the higher branches of the forces.

Mr. WOLSTENHOLME proposed "The Medical Profession." He felt highly honoured that this important toast was given to him to propose, but regretted that Prof. Share-Jones was not present to fulfil the task as arranged. To his mind the medical profession is the highest calling that a human being can engage in. It is calculated and capable of bringing into activity the finest qualities that any man can possess. No man needs a greater quality of courage than the surgeon. No man needs a more supreme delicacy of touch than the surgeon, and really no man more needs—and in most cases they possess—the tender heart of a woman. He might say on behalf of his profession there is no section of the community of these islands that more reverences and admires the sister branch of their profession—the medical profession—than the veterinary profession. They knew something of the qualities necessary and had something of the ability to recognise those qualities when brought into play by the surgeon.

Casting the eye back, as he could, on the changes which had taken place in medical practice, he believed it to be remarkable. In his recollection the pigs of the district regaled themselves largely on poultices from patients in the Royal Infirmary of Manchester. In his time deaths from Erysipelas in some of the operating theatres of this country were alarming, and the deaths from Puerperal fever appalling.

He referred to the accuracy with which diagnosis could now be made. How many people, he asked, had been diagnosed to have pneumonia or inflammation of the cerebellum when all the time they had typhoid fever. There need be no mistake about typhoid fever to-day. Similarly with the diagnosis of diphtheria. He referred to the late Mr. Bradley, who used to do an amputation of the thigh and finish off in half-an-hour. The surgeon is now no longer seeking the minimum time in which to do an operation, but is seeking and attaining such a percentage of recoveries that the surgeon of those days never dreamt of. The first great link in the surgery of

to-day passed many years ago. The brilliant surgical mind that brought antiseptic surgery to poor suffering humanity has just passed away. The results obtained by this have been marvels of science. The surgeon has added many years to the life of the community, but far beyond the advantage of years, surgery has decreased the amount of physical pain in an infinite degree. He was, he said, in love with his profession, but if he had the opportunity to exchange he would become a surgeon.

The veterinary profession as a whole was languishing, so his town *confrères* said, but he had always been an optimist. What are wanted are highly trained veterinary surgeons doing original work for the alleviation and obliteration of diseases in animals, and also with the higher object of helping the surgeon to solve many problems which still present themselves in human medicine.

In the public health service even a greater change, if possible, has come over these islands. He looked forward to an era of greater change when the lives of the workers and their health—their only stock-in-trade—will be better safeguarded, more carefully looked after and preserved, and that by the State, than it ever has been done.

Prof. DELEPINE, in response, said it was gratifying to hear words of appreciation of the medical profession at a time of so much uncertainty as to their position. There is no doubt that the strife now taking place between some part of the State and the medical profession must be one of great interest to the profession.

The veterinary profession is a sister profession indeed, and he hoped that in the future they would both work still more in unison. It is difficult in the distribution of official duties to always do what is right at the beginning, but as matters progress both professions would find their right places.

His profession had been praised for the progress it had made in regard to surgery, but they aimed at something better than that, and that is to prevent the need for operations. This appeared suicidal, but the field of preventive medicine will become more and more important.

"The City of Manchester." Mr. Woods said that whilst London was nominally the capital of England, Manchester was the capital of the world so far as cotton was concerned. No doubt the burgesses grumbled from time to time about the high rates, and he often thought that the gentlemen who gave their services free and did very onerous work often got more kicks than pence. The improvement in sanitation, and the consequent improvement in the health of the country was equal to the whole of the rates. It was not so much a question of how much in the pound the rates are, but what is the ability to pay, and that was what they had in Manchester. He coupled with the toast the names of four very respected members of the Manchester City Council, regarding whom he had heard many flattering things.

Alderman DIXON wished they had more persons in Manchester in the same mind as Mr. Woods in regard to the spending of the rates. Speaking as Chairman of the Cleansing Committee he claimed that the cleansing of the City was second to none in the country. As regards officials they had got the best, and despite the cry about raising salaries he believed that when they had good men they should pay them well. He pointed out that they were now paying a rate of 2/6 to 3/- for interest on borrowed money and expressed the opinion that money was too readily borrowed for big schemes. He went on to refer to the late Mr. King's appointment as Veterinary Inspector to the Markets Department, and to the valuable assistance rendered by him. This work had proved so valuable that now they had three qualified assistants to the Chief Veterinary Inspector. Then the Sanitary Committee appointed the President of the Lancashire V.M.A. to safeguard the milk supply,

on which the health of infants so much depended. The death rate was much less than formerly and would, he believed, go down still further.

Councillor KAY also responded. He was sure that money spent in veterinary inspection was not thrown away, but sufficient was not spent. He thought they did not go far enough with the powers they had, and also with the notification of various diseases prevalent in the country. He was afraid the citizens did not appreciate the great benefits received from the assistance of the veterinary profession in the good health of the city. Whatever was done in building up health was money well spent.

Mr. HEAP, ex-President of the National Federation of Meat Traders of Great Britain, proposed "The Veterinary Profession." He proposed the toast with great sincerity, because the trade which he represented has a very close and intimate connection with the veterinary profession. It is hoped that the connection will become more intimate. He congratulated the Councils of Manchester and Salford on having such efficient staffs of inspectors.

As meat traders they had confidence in the inspectors, and thought the confidence was reciprocated; the result being that not only did their trade benefit but the community benefitted to a greater extent. Unfortunately for their trade this district is an exception, and meat inspection in the country is a farce and a disgrace. They had appealed to the Local Government Board to get uniform inspection of meat.

They would probably remember that two years ago an effort was made to obtain a warranty when buying cattle, but failed. It was not fair play after having bought cattle apparently sound to find after slaughter that they were diseased and that they had to bear the loss. The meat traders invited the veterinary profession to assist in getting this altered, and in obtaining efficient inspection throughout the country. He went on to refer to the inspection of meat by sanitary inspectors, and said that the work should be only in the hands of those who had made diseases of animals their special study. He also took exception to medical men doing this work.

The inspection carried on in regard to the milk supply was a wise provision. As meat traders they had some reason, however, for objection in this regard. They had known cases where medical officers on finding cattle suspected to have tuberculosis of the udder had stopped the use of the milk and advised that the animal should be fed up and sold to the butcher. The butcher may then find that what he had paid full price for may be entirely condemned, and he had no redress. The butcher should not be so penalised. The cattle found to be giving tuberculous milk should be branded in such a manner that could not be effaced. It was merely playing with the situation to stop tuberculous milk and let a man sell tuberculous meat.

Mr. GARNETT thanked Mr. Heap for his remarks, and said that nothing but good could come from friendly exchange of views. He thought the veterinary profession as a whole would support Mr. Heap. They all deplored that men who understood drain pipes should have to inspect meat also; and because a medical man had been appointed an inspector he should presume to understand the inspection of meat. That was an injustice to the public.

"The President of the Lancashire V.M.A." Mr. TAYLOR said the toast allotted to him was that of the chief officer of the Society. In looking through the records of the history of the Society he was disappointed in not being able to trace names of the Presidents of the various years of its existence. Fifty years—half a century—was a long time, yet he could claim to have been cognisant of the birth of the Society. As a lad in his teens he was his father's satellite at many of their earlier

meetings. It would be unfair to attempt to extol one President at the expense of another, but he could assure them from a personal knowledge of the whole lot that the Association never had a better President than the man who occupies the position at the present time.

Fifty years ago a handful of veterinary surgeons met, he could not say where, but possibly their first meetings were held at the Brunswick Hotel. The Association had existed for fifty years, and what has it done? Has it done good, or has it done ill to the inhabitants of the city and to the profession itself. He ventured to assert, without fear of contradiction, that it has done good to the profession and to the public. The Association was chiefly instrumental, through the late lamented Sam Locke, who was then a member of the City Council, in bringing forward the importance of the inspection of meat in that city. Through their representation, and through Mr. Locke, Mr. King was appointed to the position when Mr. Atkinson relinquished it. In that respect Manchester was fortunate in getting such a good man. Manchester had again been fortunate in Mr. King's successor, and it was evident that the City Council think so, inasmuch as they have appointed three assistants. He also ventured to think their Association had done good by drawing the attention of public health authorities to the serious consequences of the consumption of tuberculous milk and tuberculous meat.

On the success which followed the appointment of veterinary surgeons as meat inspectors, the City Council chose to appoint a gentleman (the President) as assistant to the Medical Officer of Health of the City of Manchester, and it was their bare duty to thank Mr. Brittlebank for the services he had rendered to the profession and to the City.

It had been said that medicine was assuming different phases, and we now have to look to the prevention of disease almost as much, if not more than, to the cause both in man and animals. That was the situation of the veterinary profession as a result of the advent of motor traction. That position had been clearly seen years ago, and the education of the veterinary student had been pursued on different lines. Now they possessed men fully qualified in every sense to be appointed as State Veterinary Surgeons in public health matters, and young men will have to look to these posts in the future as probably more remunerative than those of ordinary practitioners.

If the State calls upon those who are in power to do everything to prevent disease then, he contended, the State should see that the laws they make are carried out in their entirety throughout the country—that their Acts should not be permissive but obligatory. As to compensation that should never be allowed to become a personal matter. Public health is a national matter, and the nation ought to pay for it.

Once more he wished to allude to the services performed by the President in his position in the City, and to the able manner in which the business of the Association had been conducted during the past twelve months. So well had this been done that he had been re-elected. During the ensuing year the National Veterinary Association will meet in Manchester. On the occasion of the last visit they were entertained by the then Lord Mayor, and they ventured to hope that in the coming visit the City Council would see their way to receive and pay respects to a useful National Association.

The toast was followed by singing "He's a jolly good fellow."

The PRESIDENT, in reply, said he hardly knew how to thank them for the kindly manner in which they had received the toast so kindly proposed by his dear old friend, Mr. Taylor. Little did he think some eleven years ago when he came to Manchester (he might say

that one of his first duties was to become a member of the Lancashire V.M.A.) that he would stand before them as President on the jubilee celebration. He need hardly say how proud he was to be President of an Association which had taken such a prominent part in the active life of the veterinary profession.

Mr. Taylor had referred to their very long history and he echoed the sentiments of all present in congratulating Mr. Taylor in being able to recount so many years of history of the old Association. They were proud to see Mr. Taylor back amongst them looking better, and they hoped he had finished with the operator and that he may permanently resume that position himself.

On entering upon the duties twelve months ago he asked for their kindly indulgence and this had been granted to the very fullest extent. It was a most gratifying feature to have the unswerving loyalty of every member, and whilst that loyalty exists in an Association such as theirs, bound together by the common needs of the profession, the duties of President will not be onerous. Mr. Heap had referred in a very kindly manner to the veterinary profession, and he (the President) thanked him for his personal reference.

The President said that the part he played in the field of municipal life or preventive medicine is but a small one. It is hoped that as years go on the field will extend, and that we shall ultimately get uniformity of action throughout the country both as regards meat and milk.

He felt bound to refer to Mr. Heap's remarks regarding the disposal of cattle whose milk has been condemned. When cows were found to be giving tuberculous milk and were condemned they were not sent into the market if it could be avoided. In the year 1910, in his own experience, he succeeded in getting slaughtered in his presence every cow which he had condemned as suffering from tuberculosis, and each cow was inspected on the conditions laid down by the Local Government Board as to whether the meat was fit for food or not. If fit for food every facility was given in the way of disposing of it. The offence, so far as Manchester is concerned, is not so much a question of a man having a tuberculous cow as not deciding to kill it.

With regard to the appointment of municipal veterinary officers, it was gratifying to know the part which the society had played. They must also thank their friends—the medical profession—for their help. Some twenty years ago a deputation from the Medico-Ethical Society waited upon the City Council and impressed upon them the necessity of appointing a veterinary officer. The Chairman of the Society at that time was the late Dr. Ashby, who was a keen and sincere admirer of the veterinary profession in all its phases. There was present with them that night in Prof. Delépine an admirer of the profession whose work on their behalf they could never fully thank him for. He felt sure that the Professor's interest in the profession would never wane.

In conclusion, he wished to remind members of the coming visit to Manchester of the National Veterinary Association, and their duty in making the visit a complete success.

The usual toasts to "The Visitors" and "The Ladies" concluded the list.

The *Ottawa Evening Journal* of Feb. 6 says: "It is learned that Hon. J. G. Rutherford, Chief Dominion Veterinarian, has handed in his resignation to Hon. Martin Burrell, and will go to British Columbia. It was thought that Dr. Rutherford would reconsider his determination to drop out of the service; however he has decided to retire to private life. Dr. Rutherford has been a valuable servant to Canada, and his retirement will be generally regretted."

PARLIAMENTARY.

VIVISECTION OF DOGS.

In the House of Commons on Monday, March 10th.

Sir F. BANBURY (City of London, Opp.), moved:—
 "That in the opinion of this House no operation for the purpose of vivisection should be performed on dogs." The hon. baronet said he was not opposed to vivisection on other animals, but his contention was that the dog, as peculiarly the friend of man above all other animals, should be immune from the torture of experiments. He quoted from the Report of the Royal Commission to show that there was not a consensus of opinion among eminent surgeons and physicians that it was either right or necessary to use dogs for this purpose.

Col. LOCKWOOD (Essex, Epping, Opp.) seconded the motion. As a member of the Royal Commission he said that he was one of those who objected to dogs being used for the purposes of vivisection. He laid stress on the fact that the evidence submitted to the Commission showed the wide diversity of opinion prevailing among doctors and scientific men as to the need for carrying out experiments on dogs. He maintained that the evidence of distinguished physiologists went to show that though the House might be slightly in advance of scientific opinion if they passed the resolution of the hon. baronet, the great preponderance of opinion was in favour of exempting dogs. The House would, in his opinion, be acting well within its province if it adopted the resolution.

Mr. McKENNA said that a Royal Commission had been investigating this subject for six years, and its report had appeared for the first time that morning.

He had only had an opportunity of perusing that report very cursorily, and he told the House at once that the motion placed him in great difficulty, for he was asked to agree to an expression of opinion which would lead to a reversal of the policy of his predecessors for a great many years past. If he could be convinced upon the evidence, considered in the light of such advice as he could obtain from the experts at the Home Office, he did not know that he should hesitate to support a Bill having for its object the carrying out of the hon. baronet's policy. To accept or reject the motion would be to prejudge the report of the Royal Commission. He hoped the hon. baronet would not press his motion, but, if he did, he could neither vote for nor against it. Whatever the decision the House came to it should be understood that the motion only dealt with the limited question whether dogs should or should not be excluded from vivisection.

Mr. GUINNESS (Bury St. Edmunds, Opp.) said the evidence was overwhelmingly in favour of dogs being allowed to be the subjects of vivisection subject to the present restrictions.

Wednesday, March 13th.

THE BOARD OF AGRICULTURE.

On the report of the Vote for the salaries and expenses of the Board of Agriculture and Fisheries.

Mr. MOUNT (Berks, Newbury, Opp.) complained of the delay in making the grants to agricultural colleges and institutions and the hindrance thereby caused to experiments and research being carried out.

Capt. JESSEL (St. Pancras, S., Opp.) drew attention to the financial difficulties of the Royal Veterinary College, and pleaded for more substantial support from

the Government in the interests of students and the treatment of animal diseases.

Mr. A. HERBERT (Somerset, S., Opp.), as representing a constituency which had suffered severely from the disease urged that hard and fast regulations should give way to exceptional circumstances in the situation of a farm. The fifteen miles radius was not always a necessary safeguard.

Mr. RUNCIMAN (Dewsbury), in replying to several questions, mentioned that the amount of the grant for research work to the Royal Veterinary College was £1390. He had recently received a deputation from the College, and the views put forward were under consideration.

THE REGISTER FOR 1912.

We may commence a brief notice of this year's Register by saying that it continues to show the steady extension and improvement which we are now accustomed to expect and to see in it. For the third year in succession, it is published from the office of the R.C.V.S., and its price is the same as before, 3/6, post free. But it has increased somewhat in size—442 pages as against 424 last year—and there are several noteworthy additions. One is quite a novelty—viz., copies of all the written questions set at the three professional examinations held in 1911; and it is possible that this new feature may lead some students to become purchasers.

The other additions are all legal in character. There are copies of the Diseases of Animals Act, 1909, and the Notification of Diseases Order, 1910; and also two short extracts from the Protection of Animals Act, 1911, and the Coal Mines Act, 1911, respectively.

All these are of real importance to the working practitioner.

As usual, the lists have been revised, and we have now only 3417 members against 3423 last year. The number of registered practitioners is 226 against 244 last year—a surprising small reduction, considering the age that most of them must have reached. One or two minor improvements in connection with the lists should be mentioned—a useful explanatory note at the head of the members' list (p. 131), and a more valuable piece of information above the Canadian list (p. 355) to the effect that certain provinces of the Dominion impose a special examination upon veterinary surgeons before permitting them.

Last, but not least, these are fully twenty-four names listed under "Addresses wanted." All these names, in default of information, will be removed from next year's Register; and thirteen have been thus removed from the present one. We call the attention of members sharply to this; we cannot do more.

A MANUAL OF POISONOUS PLANTS. Chiefly of Eastern North America, with Brief Notes on Economic and Medicinal Plants, and numerous illustrations. By L. H. PAMMEL, PH.D., Professor of Botany, Iowa State College of Agriculture and Mechanic Arts. In two Parts. Pp. x + 977. (The Torch Press, Cedar Rapids, Iowa).

Botanical toxicology has so far not received its due meed of attention from authors writing from the veterinary point of view. Most text books upon veterinary medicine devote some space to it, but necessarily not much. A fair amount of matter relating to it is scattered throughout the scientific journals of the world; but the bulk of this is quite inaccessible to the ordinary reader. Hitherto we have had no single large treatise

devoted exclusively to the subject; and the work before us therefore comes to meet a real need. We may at once add that it does so more than adequately.

The work is divided into two volumes of very unequal size, the first containing 150 and the second more than 800 pages. The first might fairly be called a comprehensive survey of botanical toxicology, and the second an encyclopedia of toxicological botany. The first volume commences with a historical review, and then proceeds to deal in detail with the toxicology of the different classes of plants, concluding with chapters upon the classification of poisons, symptoms, and antidotes, the chemistry of vegetable toxicology, and a catalogue of the chief poisonous plants of the United States and Canada.

The second volume naturally opens with a key to the plant kingdom; and this is followed by some 640 pages describing the various families from Myxothallophyta upwards, with special attention to poisonous or injurious species. The classification is arranged in the order given by Engler and Prantl in their work *Die Pflanzenfamilien*, and flowering plants are described more fully than the lower forms. Some 60 pages are then occupied by a catalogue of the poisonous plants of the world, and then with an excellent bibliography and index, both necessarily very long, conclude the work.

It will thus be seen that the author has undertaken a stupendous task, and he has increased its magnitude by placing the widest interpretation upon the word "poisonous," and including many plants of doubtful or only occasional toxicity. This is an error upon the right side, but it greatly increases the size and complexity of the work, as does also the inclusion of many microscopic organisms such as bacteria, aspergilli, and dermatophytes. In fact, the book covers so vast an amount of ground, and represents so much reading and research, that it is best to treat it as a whole, and so summarise its value without any criticism of details. Admittedly it is largely a compilation. Hundreds of authors, chiefly American and German, have been freely drawn upon and quoted; and similarly the very numerous illustrations—about 17 plates and some 500 figures—are largely derived from other reliable American and Continental sources, though a good many are original.

A great deal of borrowing, however, is imperative in such a work; and we may say broadly that extracts and figures are well chosen, and that the original portion of the text is excellent in every respect—well arranged, clearly and concisely written, and not overburdened with technicalities.

On the whole, then, we may thank Prof. Pammel and the numerous collaborators whose help he acknowledges for the best book of its kind which we know of in this language. We have many good books upon botany pure and simple, but not upon toxicological botany; and we need only add that the present one, giving very special attention to the subject from the veterinary standpoint, will be much more useful to the veterinarian than to the physician. One factor which may militate against its success is that its scope may be thought to exceed the requirements of the general practitioner—but that, again, is an error upon the right side.

W. R. C.

There is some talk about establishing a national testing station for cattle intended for export. One would have thought the health of the people at home would have received priority of consideration, especially when medical officers of health are so insistent in dinning into our ears the awful terrors of unsound meat. Untested, uncertificated, unwarranted animals are good enough to sell to the British butcher.—M. T. J.

Watered Oats.

At Croydon a special sitting was held for the hearing of summonses taken out by the Board of Agriculture against Henry Leslie Hall, of Whitehorse Road, Croydon, for applying and causing to be applied a false trade description to 100 quarters of 40 lb. Plate oats to which an amount of water had been added, and for selling the cereal to Messrs. Hall and Co., Croydon, Ltd. Mr. Graham Campbell (instructed by Mr. Percy Nicholls) appeared for the Board of Agriculture; and Mr. J. George Joseph (instructed by Councillor Wood Roberts) defended.

Mr. Campbell told the magistrates that the defendant was a corn and forage contractor, and it was alleged that he had committed an offence under Section 2 of the Merchandise Marks Act, 1887. In two summonses it was alleged that the defendant applied to certain goods a false trade description, and in another that he caused to be applied a false description by describing, in an invoice despatched to the buyer, certain oats, which were properly known as damped or watered oats, or prepared oats, as 40 lb. Plate oats. The penalty was a term of imprisonment not exceeding four months, or a fine not exceeding £20. The case was one of considerable importance; large quantities of oats were imported into this country from the River Plate district of South America, and either sold in their natural state, in which case they were properly described as Plate oats, or 40 lb. Plate oats—40 lb. meaning weight per bushel—or if water was added it was the custom of the trade that they should be described as damped, watered, or prepared oats. Messrs. Hall and Co., Croydon, sent to defendant an order for 100 quarters of best Plate oats at 20s. 9d. per quarter, and the oats were received, followed by invoices describing the purchase as Plate oats.

In a letter to the Board of Agriculture defendant admitted that the oats were damped Plate oats. In ordering oats counsel said defendant asked for "Plate oats," which he suggested meant prepared oats, and then invoiced them as 40 lb. Plate oats. Samples analysed contained from $4\frac{1}{2}$ to 5 per cent. more water than sample genuine Plate oats. Therefore, Messrs. Hall and Co. really got ninety-five quarters of oats and five quarters of water.

Mr. George Walter Roffey, a member of the committee of arbitration of the Corn Traders' Association, said oats grown in the River Plate district sold in this country in an artificial state were described as Plate oats, and such oats artificially prepared as watered or damped oats.

Cross-examined: It was common to wash cereals coming into this country. He did not sell washed oats. He admitted that Egyptian oats arrived with a great deal of earth upon them, and that Russian oats contained more water than Plate oats.

Albert Daniell Howell, of Messrs. Howell and Co., corn merchants, of Bankside, S.E., of twenty-eight years' experience, said dealers sold damped oats to make larger profits, and he warned customers against buying them.

A delivery clerk in the employ of Messrs. Vogan and Co., of Dockhead, said in January defendant was buying damped Plate oats of them. They were undoubtedly very much better for feeding horses, and River Plate were preferred in that way.

Mr. Joseph submitted that there was no case to answer. It was admitted that the defendant supplied Plate oats, and that they were 40 lbs to the bushel. Would it be a false description of himself, asked counsel, to say his name was not Joseph, because he had had a bath that morning? (Laughter.)

The Bench decided that the case must proceed.

Defendant, giving evidence, said his price showed a profit of 6d. per quarter. His price for unwashed oats would have been 22s. He found his customers preferred damped oats. It had been held in a previous case that these were River Plate oats, and he thought it was a right description.

The Bench decided to convict, and fined defendant £5, with taxed costs.

Notice of appeal was given.

A pedestrian who is tossed by a cow has no redress. This dictum was laid down at Grimsby last week in a judgment arising out of a claim for damages against a local butcher by a cycle maker who was tossed by a cow and sustained concussion of the spine and other injuries. His Honour said he found that the weight of cases favoured the butcher. There were two kinds of animals; those of a fierce nature and those of a quiet nature. In the latter class were included cows, oxen, horses, and most domestic animals, and the law entitled the owner to drive them along the streets without taking any special precautions against their doing evil. The law dated from purely agricultural days, but in modern times the public thoroughfares had become busy and various kinds of vehicles had been introduced. He had, however, to interpret the law as he found it, and it was with regret he gave judgment for the defendant.—*N. B. A.*

PRACTICES FOR DISPOSAL

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains : reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises. Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

EAST COAST. Agricultural practice returning £600 per ann. Good house containing 2 recept. 4 bedrooms, bath, kitchens, etc. Stabling for 4 horses, coach-house, kennels, etc. Price required for house and practice £1300, of which £400 can remain on mortgage, or vendor would sell practice for £500 and would let house on lease at £45 per annum.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

HOME COUNTY. Practice returning £350 to £400 per ann. In present hands nearly 20 years. Small house with 3 acre garden and good stabling. Rent £35. Premium £200.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended.

Southern Counties Veterinary Society

THE ANNUAL Meeting of the Society, which it was intended to hold at Brighton on Thursday next, 28th inst. has been postponed to a later date, of which due notice will be given. J. ALEX. TODD, Hon. Sec.

As Assistant

RECENTLY Qualified Man requires post as Assistant in a good class, busy, country practice. Served pupilage. Ride, drive, and cycle. Good references. Address, 1037 V.R., 20 Fulham Road, S.W.

Qualified Assistant Wanted

IN country practice, must be capable and reliable. Ride, drive and cycle when required. State salary required to live out. Sign usual bond. Address, 4036 V.R., 20 Fulham Road, London, S.W.

As Locum, Assistant, or Branch Manager

M.R.C.V.S. (36) desires position as locum, assistant or branch manager. Highest references. Address, M. Cahill, c/o Mr. F. T. Harvey, F.R.C.V.S., St. Columb, Cornwall.

Wanted

GOOD assistantship by post graduate, in sound country practice, Midlands preferred. Excellent references. Address, 4032 V.R., 20 Fulham Road, S.W.

Assistantship Wanted

QUALIFIED assistant desires assistantship in good country practice, with or without view to succession Address, 4033 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

MEMBERS of the Royal College requiring a town and country practice, an exceptional opportunity. Must be practical, well up in parturition, and castrate standing. Only married men need apply. Good residence, stabling, surgery, and every convenience; on the main road. Assistantship would be entertained for a reasonable time if required. Abstainer. Reply, stating age and salary. Interview at the town on receipt of letter Address, 4031 V.R., 20 Fulham Rd., London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,
Locum:

73 Victoria Mansions,
South Lambeth Road, S.W.

HUGH R. SINGLETON, M.R.C.V.S.
Locum Tenens.

44, St. Michael's Road.
Bedford.

Locum Tenens

MR. WALTER G. GREEN, M.R.C.V.S.

"Rosenheim,"
Boscombe Park,
Bournemouth.

To Veterinary Surgeons

PRACTICAL Veterinary Surgeon wants assistantship with elderly practitioner, with view to succession. Address, 4034 V.R., 20 Fulham Road, London, S.W.

For Disposal

USEFUL practice near London. Mixed, chiefly canine. Good premises, average returns £1000. Open to full investigation. References given and required. Only those with capital need apply. Address, 7403 V.R. 20 Fulham Road, London, S.W.

As Manager or Assistant

M.R.C.V.S. desires engagement. Extensive experience city and country practice: Expert castrator (standing) and obstetrician; abstainer. Excellent references. Address, 4037 V.R., 20 Fulham Road, S.W.

Assistant Unqualified

DISENGAGED. Long experiences, castration and parturition, etc. Excellent references. Address, 4035 V.R., 20 Fulham Road, London, S.W.

Assistant Wanted

QUALIFIED or unqualified, for a country practice. State age, experience, and salary required to live out, with references. Address, 4039 V.R., 20 Fulham Road, London, S.W.

As Assistant

FINAL year student, up in July, wants to see good-class country practice for any period until end of April. Has had considerable experience in stock-farming in the Colonies, and seen practice in England and Scotland. Kindly write, stating terms, to "Colonial," Royal Vety. Coll., Camden Town, N.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

Shoeing Smith

CAN any member of the profession recommend a first-class farrier, to act as foreman in veterinary surgeon's forge, in country town, Surrey. The work is principally light, (hunter and harness horses). Must be a good and reliable workman, of regular and temperate habits. Married man and R.S.S. preferred. Address, 5403 V.R., 20 Fulham Road, London, S.W.

Assistant Wanted

UNQUALIFIED assistant wanted for horse and dog practice. State age, experience, references, and salary required, to 6403 V.R., 20 Fulham Road, S.W.

As Assistant or Locum

UNQUALIFIED, 28, seeks situation as assistant or locum, good all-round man: excellent references. Address, 4038 V.R., 20 Fulham Road, London, S.W.

As Assistant or Locum

EXPERIENCED M.R.C.V.S., town and country, requires situation from March 23rd to May 1st, or for any period between. Ride and drive, horse or car. Excellent references. Address, 3032 V.R., 20 Fulham Road, London, S.W.

Agent, or Inspector

M.R.C.V.S., with large experience in the exportation of horses to the Continent, and just returned from the Argentine, having a knowledge of Spanish and served a special course of meat inspection, would like an engagement at home or in one of the South American Republics, to look after the interests of live stock exporters. Address, 3034 V.R., 20 Fulham Road, S.W.

Partner Wanted.

WANTED a practical qualified partner in a large horse and dog practice in the South. Premium for half-share £300, or by instalment. Every investigation allowed to bona-fide Applicants. Address, 3035 V.R. 20 Fulham Road, London, S.W.

Wanted to Purchase

GENUINE good-class, old established, town and country practice in Midlands or North of England, returning £600 to £800. Must bear strict investigation. Full particulars in confidence to 3036 V.R., 20 Fulham Road, London, S.W.

For Disposal

THROUGH ill-health, an old established good-class town and country practice, in Lancashire. Been in family over 53 years. With excellent house, surgery, stables, etc. Further particulars and introduction given to bona-fide would-be purchasers. Address, 2038 V.R. 20 Fulham Road, London, S.W.

To Purchasers

PRACTICES & PARTNERSHIPS for Sale. Messrs Peacock and Hadley, Veterinary Transfer Agents, 19 Craven Street, Strand, W.C., will be pleased to forward to intending purchasers, who register their requirements, full particulars of anything suitable on their books. No charge to purchasers or for inquiries.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

Wanted

FULL Particulars of Practice for Sale in good agricultural and residential district returning up to or over £700 per annum. Advertiser has sufficient capital to purchase outright. Address, 1039 V.R., 20 Fulham Road, S.W.

Partner Wanted

WANTED practical qualified Partner in large London horse and dog practice, with view to ultimate succession. Good contracts. Moderate capital required. Full particulars in strict confidence. Address, 2034 V.R., 20 Fulham Rd., London, S.W.

As Assistant

THIRD year student, hard worker and having previous experience, offers services in busy country practice for any period between March 16th and May 1st. Any offer will be accepted. Address, R. G., Royal Vet. College, London, N.W.

CHEAP BOTTLES.

3oz. and 4oz. 6/- per gross, 6oz. and 8oz. 7/-, 10oz and 12oz. 9/-, 1oz. W. F. Vials 4/- 1½oz. d o. 4/6, 2oz. do. 5/- per gross. Cash with order. All sizes in Poison and other bottles and jars quoted for, also a quantity of 4, 6, and 8oz. named medicals 5/6, 12, and 16oz. 7/- per gross. Carriage paid on orders within 70 miles.

Royal Veterinary College, London.

(Founded 1791.)

Principal and Dean : Professor **SIR JOHN M'FADYEAN, M.R.C.V.S., M.B., B.Sc.**

Membership Diploma of the Royal College of Veterinary Surgeons :

Complete Courses of Instruction are conducted in all the Subjects of the Examinations for this Diploma. The facilities, etc., afforded for the Practical Training of Students are unrivalled.

Bachelor of Science Degree, University of London.

The Professors of Chemistry, Biology, Anatomy, Physiology, Hygiene, and Pathology, are Recognised Teachers of the University, and conduct in their respective subjects courses which qualify for the Science Degree (B.Sc.), which may be taken concurrently with the above Diploma.

POST GRADUATE COURSES.

These Courses in Veterinary Pathology and Bacteriology are conducted under the supervision of the Principal and are specially adapted to the requirements of officers of the Army Veterinary Department, Colonial Veterinary Surgeons, Veterinary Inspectors under the Contagious Diseases of Animals Acts, and Candidates for the Fellowship Diploma of the Royal College of Veterinary Surgeons.

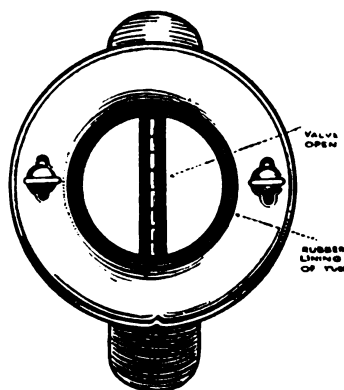

The number of places for these Courses is limited and early application must therefore be made to prevent disappointment. The next Course will begin on Monday, October 7th, and terminate on Friday, November 29th, 1912.

The College Calendar, containing full particulars, will be forwarded on application to

The Secretary,

Royal Veterinary College, Camden Town, N.W.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1237.

MARCH 23, 1912

VOL. XXIV.

GENERAL ANÆSTHESIA.

Mr. J. Basil Buxton's recent article upon the "new" method of administering chloroform by passing chloroform vapour through warm water should be noted by the profession. The mere idea of administering chloroform vapour in the heated condition is not extremely new; but the present somewhat elaborate technique and apparatus for the procedure are recent developments. The method is still quite in the experimental stage as applied to animals; but Mr. Buxton's results certainly seem highly encouraging, and it is well for us to pay serious attention to this and every other modern development of the methods of anæsthetising human beings.

The subject of general anæsthesia has advanced a great deal during recent years within the medical profession. The dangers of anæsthesia are better understood and more carefully guarded against, and the technique of the procedure is more minute and accurate than ever before. Naturally this has entailed an increased demand upon the skill and knowledge of the individual anæsthetist. Anæsthesiation is becoming more and more a specialty amongst medical men, and now affords employment to an increasing number of graduates who are justly called professional anæsthetists. For obvious reasons, we are not likely to possess a similar body of veterinary anæsthetists. In our work the practitioner is more often forced to superintend the anæsthesia and operate at the same time than able to engage a colleague to anæsthetise for him. For that reason alone it is incumbent upon every man in practice to follow the latest developments of anæsthesia in the hands of its specialists in the medical profession.

Probably the application of this particular method to animals will be best worked out inside a veterinary school, and it is a hopeful augury that Mr. Buxton is working under those conditions. Further results may be very valuable, for there seems to be no reason why the method should not be adopted in most veterinary practices, in the case of the smaller animals at least. Its one disadvantage, viz., that its technique and apparatus are more complex than those of older methods—should not be insuperable; and it seems to have very real recommendations on the score of efficiency and safety.

Perhaps, also, it may permit of some simplification in its adaptation to veterinary use; though it will always be more complicated than the old procedures. As it stands now, it certainly merits much more than passing notice; and, when full details of its technique are before the profession, it ought to have a careful and extended trial in general practice.

A CASE—TREATED WITH ANTI-STREPTOCOCCAL SERUM.

By E. ALFRED WEST, F.R.C.V.S.

Subject.—A chestnut, four-year-old gelding, of the Yorkshire coach horse type, purchased in that County by a well-known firm of whisky distillers in London for their town vans.

Upon arrival from the country the animal was found to be off feed, and to have a temperature of 104. The stable superintendent treated it for some days before I was called in, about the middle of last month.

I found the patient listless, with no appetite, a temperature of 105, a very markedly yellow discolouration of the visible mucous membranes, more particularly the conjunctivæ, and a laminitic lameness of both front feet. The respirations were normal, and I could detect no abnormal chest or heart sounds, nor was there any cough or nasal discharge.

For four weeks these symptoms persisted. Every day I looked for some concomitant or sequel, expecting hydrothorax or lung gangrene, pericarditis, or cardiac muscle failure. There was, however, little or no change until the end of the fourth week, when the patient began to show signs of emaciation and exhaustion.

The treatment during the whole of the four weeks was stereotyped, and included poulticing of the feet, salines, salicylates of soda, digitalis, and quinine. Nourishment in the form of whisky, or stout, and eggs, were given regularly, and fortunately the patient was an easy one to drench.

About this time two or three small swellings appeared in the submaxillary space, and I endeavoured in the usual way to encourage suppuration of them. But they matured slowly and unsatisfactorily, and my hopes of the case resolving itself into one of strangles were not completely realised. My diagnosis was one that everyone would have made—that the patient was suffering from streptococcal infection. I therefore procured two doses of anti-streptococcus serum and administered two at intervals of forty-eight hours. The effect was magical. The temperature which for five weeks had ranged from 105 to 106 dropped 12 hours after the first injection to 102, and two days later, or 24 hours after the second injection, to normal, the lameness disappeared and the appetite returned. A week later my patient was fresh and well. This case, it seems to me, is sufficiently encouraging to record.

I seldom have treated one whose temperature remained so high for so long without some untoward

result, and it must be remembered that it was at the most critical stage of its life; at the period when its system was undergoing those mysterious changes which are associated with transition from country to town. It bore, too, evidences of having been specially prepared for sale, but must, I take it, have had more than its share of inherited or acquired vitality.

INVAGINATION OF THE STOMACH AND SPLEEN IN THE ŒSOPHAGUS.

By WM. PAUER, M.R.C.V.S., Blackwater.

Subject.—Newfoundland dog, two years old.

Previous History.—Had been in owner's possession from a small puppy; at which time I had treated him for gastritis in consequence of his frequent attacks of vomiting. Ever since vomiting had seemed habitual to the dog; and had not appeared to interfere with his condition and spirits. On Feb. 28th he was in his usual health, and the following morning was found dead in his kennel.

Post mortem.—As poison was suspected I opened the abdomen to examine the stomach, and was much surprised at not being able to find it. I thereupon concluded that there was a rupture or hernia of the diaphragm, and that the organ would be found in the chest cavity. On dividing the sternum and exposing the heart and lungs, a large cylindrical swelling was observed, which, on closer examination, proved to be the œsophagus with the stomach turned inside out and the spleen inside it. The stomach itself was black in colour from strangulation, and so much swollen that traction from the duodenum would not withdraw it. The entire œsophagus was removed and slit up, and the width measurements were as follows: Four inches pharyngeal end and nine and-a-half inches at a distance of ten inches from the cardiac end, where it again measured four inches.

Remarks.—The case is in my experience unique, the dog having actually "brought his stomach up." Dilatation of the œsophagus had evidently been in existence for some considerable time; but, whether this condition accounted for his constant vomiting, or whether it was caused by chronic gastric catarrh I am unable to say, as the extreme discolouration of the mucous membrane made any hypothesis merely supposititious.

ABSTRACTS FROM FOREIGN JOURNALS

THE DIGESTION OF CASEIN.

Gaucher, who has previously shown by experiments upon dogs with fistulæ, that the casein of the milk passes through the stomach without undergoing peptonisation there, has been able to check his results by observations upon a human subject, fourteen years old, who was affected with a fistula in the jejunum. He now reports (*Le Mouvement hygienique*) the result of these latter observations, which are as follows:—

The milk arrives in the jejunum twenty minutes after being swallowed. At first it flows in the natural condition; then, after some minutes, in the form of whey mixed with large clots of casein. Forty minutes after ingestion the clots gradually become smaller, and the liquid speedily becomes homogeneous. At this moment it holds in suspension the particles of casein which the stomach has first coagulated and afterwards finely divided. Moreover, the hitherto white liquid is now coloured yellow by bile, which appears and continues to flow abundantly, carrying with it the last drops of milk.

These three phases are those already described by the author in the digestion of milk in the dog, and lead to the same conclusions, which are as follows:—

(1) The milk arriving in the stomach is only coagulated there a moment afterwards, where the gastric juice has been secreted. A portion of it passes the stomach in the liquid condition; the remainder coagulates in the stomach, and the clots thus formed are gradually dissociated and reduced to very fine particles by the contractions of the organ. This is, it seems, the sole role of the stomach. Peptonisation only takes place in the intestine, and even there only after the duodenum has been passed.

(2) The coagulation of the milk in the stomach is not necessary to its digestion. It even appears to be merely accidental, for a portion only of the milk is coagulated there. Far from being useful, the process may be injurious to digestion when the stomach is not capable of effecting the contractile movements imposed upon it.—(*Annales de Méd. Vét.*)

LUMBAR PUNCTURE IN THE DOG.

An article by Lepinay (*Revue de Pathologie Comparée*) is devoted to this subject. Lumbar puncture has become a common operation in human medicine, but not in veterinary medicine. Nevertheless, the results obtained in man from evacuator punctures and the intra-rachidian injection of therapeutic agents warrant the hope that these measures may be very valuable in canine medicine in the meningeal or medullary complications of distemper.

The technique based upon anatomical data is as follows: The puncture may be made without any apprehension in the lumbo-sacral space, and also, with some precautions, in the sixth lumbar intervertebral space. In the case of a large dog, in which the rachidian canal has a sufficiently great supero-inferior diameter, and in consequence a dural sac large enough to contain the orifice of the needle in its entirety, the sixth intervertebral space is chosen. When, on the contrary, the dog is small, the lumbo-sacral space is punctured.

The apparatus consists of two syringes (which should be of glass to facilitate the immediate examination of the liquid which is withdrawn), one serving for aspiration and one for injection, and two needles or trocars having a diameter of less than a millimetre and a length of from 6 to 7 centimetres (= 2 2-5th- 2 4-5th inch). All these must be sterilised.

The position in which the animal is placed varies with its size. A large dog is placed on its side upon the table, and is held with the spine arched. A small one is placed in a sitting position by holding the hind quarters. This position has the advantage of assuring the escape of the cephalo-rachidian liquid without the necessity for aspirating it. Immobility being a condition essential to success, the operative region may be subjected to local anæsthesia.

To perform the operation the surgeon places himself behind the dog, and paints the previously shaved lumbo-sacral region with tincture of iodine. With the left hand he feels the seventh lumbar vertebra, and then, with one finger, he localises the depression situated above or below it, according to his projected plan of operation. If he intends to penetrate the sixth intervertebral space, he drives in the trocar vertically to arrive directly upon it. If it is well directed, only a slight resistance (offered by the intervertebral ligaments) is encountered. The trocar is driven in from 4 to 5 centimetres (= 1 3-5th to 2 inches) in large dogs, and from 2 to 3 centimetres (= 4-5th to 1 1-5th inch) in small ones. The lumbo-sacral puncture varies a little in its procedure from the foregoing. The surgeon feels the small spinous apophysis of the first sacral vertebra, and drives in the trocar at this point, but very obliquely.

The quantity of liquid withdrawn varies with the age and size of the subject, and with the disease. In practice the author has never exceeded 10 c.c. (= about 5iiss).

When a fluid is to be injected a certain portion of the cephalo-rachidian liquid is always withdrawn. This is mixed in the syringe with the agent to be injected, and then the injection is made slowly. After the operation is completed the needle is withdrawn, and tincture of iodine is applied to the puncture-wound.

The accidents which may occur during or after the puncture are as follows:—

(1) The needle or trocar may break in the case of refractory animals.

(2) If too much liquid is withdrawn, or a larger quantity is injected than has been withdrawn, torpor or agitation may follow.

(3) Slight lesions of the rachidian nerves may cause symptoms of paresis of the hind-quarters.

The indications of lumbar puncture and of rachidian injections are many. The operation should always be practised when cerebral or medullary disturbances are met with. The evacuatory puncture will not only be an excellent diagnostic procedure (permitting cytological and bacteriological examinations), but it may also bring about a sensible amelioration, either by the elimination of toxic liquid or by the injection of modifying agents.—(*Annales de Méd. Vét.*) W. R. C.

SEQUELÆ OF GUNSHOT WOUND.

A policeman believing a St. Bernard dog was rabid, shot it, afterwards some passers-by beat it with sticks as it lay. The bullet passed through the upper jaw, the entrance was between the eyes

and the nose, and the exit at the root of a front tooth which was shattered by it, the bullet penetrating the lower jaw and breaking a tooth. There was slight hæmorrhage from the nose, there was a hands-breadth of swelling round the wound. The dog was comatose with open eyes, it groaned and whined as if dreaming. Temperature normal. It was roused with difficulty and looked around in a vacant manner. It did not respond to its name, it fell after going two steps and could not rise, and quickly fell asleep. It swallowed milk from a bottle and defæcation was normal. Probably there was concussion of the brain from blows on the head, while the shot was not dangerous.

Treatment—snow to the hot head, laxatives, and coffee. After two days sleepy condition it began to recover.

V.S. N. Foss, Ufa, Russia.

(Ex. *The Social Veterinary Record* from the author's original Esperanto).

F. E. P.

CENTRAL VETERINARY SOCIETY.

An ordinary meeting was held at the Royal College of Veterinary Surgeons, 10 Red Lion Square, on Thursday, March 7th, Mr. R. J. Foreman in the chair. The following Fellows signed the attendance book:—Messrs. F. C. Mahon, A. Payne, N. Almond, P. W. D. Smith, W. Perryman, R. A. Philp, D. Hamilton Wood, F. H. Sanderson, Guy Sutton, H. D. Jones, J. W. McIntosh, Prof. G. H. Wooldridge, James Rowe, D. Stewart, F. O. Parsons, H. Gray, R. Eaglesham, J. Willett, W. Hunting, S. H. Slocock, J. A. G. Gosling, W. Willis, W. D. Hallhead, R. F. Wall, Profs. J. Macqueen, H. A. Woodruff, and Hugh A. MacCormack, Hon. Sec. Visitors. Messrs. S. L. Slocock and P. V. Nicholas.

The minutes of the last meeting were taken as read and confirmed.

Letters regretting inability to be present were received from Messrs. Angwin and Coleman.

A letter was received from the Royal Counties Veterinary Medical Association, as follows:

"At the last meeting of the Royal Counties V.M.A. at Reading on Feb. 9th, the following resolution was proposed by Mr. Coleman, seconded by Mr. Willett, and was carried unanimously:—"That the Royal Counties V.M.A. most cordially support the Central Veterinary Society in the steps they suggest taking with the object of obtaining more justice in cruelty to animals prosecutions, especially in so far as such cases affect the professional evidence for the defence. They also heartily approve of a deputation waiting upon the Home Secretary and the Chief Commissioner of Police in the matter."

The PRESIDENT pointed out a slight mistake had been made in the letter as the deputation was not to wait on the Home Secretary, but on the Council of the R.S.P.C.A.

SPECIMENS.

The PRESIDENT exhibited the bladder of a bitch packed tightly with stones. There had been very little trouble until the last few days. He was called in, diagnosed the case, and the animal not being very valuable was destroyed. He tried hexamethalin-etetramine which was satisfactory to a slight extent.

He also exhibited a piece of stout wire that had been bent into a circle of about 7in. or 8in. in diameter that

had been found around the hind quarters of a dog from front of the prepuce to between anus and root of tail. It was completely buried under the skin right to the front of the flanks. The owners had been away, and the dog had been in the habit of jumping over the fence into the neighbour's garden. Owner's opinion was that the neighbours had put the wire upon the dog to prevent it doing this.

Mr. PAYNE said it had all the appearance to him of a snare, and he mentioned a case he had had in which the wire was between the foot and the next joint, and the case had been treated by two veterinary surgeons for six months.

The PRESIDENT said that in a snare there was a slip, but in this case the wire had been tightened up, twisted, and cut off.

Mr. PERRYMAN showed a fractured pedal bone from a mare which he was called in to see for an injury to the opposite foot. The feet were very brittle and shell-like. There was no suggestion whatever in the hoof of any great damage at any particular time. The mare had itchy legs and the accident was probably due to stamping. There was a fracture at the base with very complete union. Evidently the injury had taken place some long time since.

He also exhibited the os coronæ, broken transversely, from a horse which had gone lame. It was evidently foot lameness. As the animal was not worth prolonged treatment it was destroyed. There was no history of the case except that it fell suddenly lame.

ELECTIONS AND NOMINATIONS.

Messrs. W. E. BLACKWELL, M.R.C.V.S., Towcester; and T. W. LLOYD, M.R.C.V.S., Aldershot, were unanimously elected Fellows of the Society.

Messrs. A. E. SANGSTER, H. KEELING-ROBERTS, and H. ANDREWS were nominated for Fellowship.

TREATMENT OF VETERINARY SURGEONS AT POLICE COURTS.

The SECRETARY read the letters drafted by the Committee appointed at the last meeting, and the replies received from Sir Edward Henry and the Secretary of the R.S.P.C.A. as follows:

"In reply to your request Sir Edward Henry desires me to say that he will have pleasure in receiving a small deputation on Wednesday next the 13th inst., at 3 p.m. if day and time will be convenient to you."

"I beg to acknowledge the letter from yourself and other Fellows of the Central Veterinary Society, with reference to our Inspectors, addressed to the Council of this Society. I shall have much pleasure in laying the matter before the Council at their next meeting on 13th March and will write to you further on the matter."

The PRESIDENT thought the replies were very satisfactory, and that the Committee should appoint a deputation to see Sir Edward Henry. He had thought the Council of the R.C.V.S. might be approached on the matter, and also be asked to take action regarding the conflict of professional evidence, but it had been decided to leave it over to see what came of the action already taken.

It was agreed the Committee should appoint a deputation of its own members to wait upon Sir Edward Henry.

STATE ACTION WITH REGARD TO TUBERCULOUS MEAT AND MILK.

There was an item on the agenda to consider certain resolutions with regard to State action in connection with Tuberculous Meat and Milk, contained in a circular forwarded by the Association of Veterinary Officers of Health.

The PRESIDENT said Mr. Mulvey, who asked for the matter to be placed on the agenda, was not present. The Association asked for the support of the Society in the matter. It was such an important thing that he thought support ought to be given wholeheartedly.

Mr. PAYNE thought the most important thing was left out of the resolutions, namely, the destruction of all old cowsheds. He proposed that the resolutions should be supported.

The PRESIDENT thought that destruction of old cowsheds was covered by Clause 3.

Mr. McINTOSH was prepared to second the resolution with the proviso that the support should be confined to the principle and not to the details, because he thought there were certain sweeping suggestions in the resolutions which some Fellows might not agree with.

Mr. HUNTING said he would second the motion if the mover would leave out Clause 3 which provided for the building of sanitary buildings, which was far too big a job to take on.

Mr. PAYNE did not see how anything could be done unless proper buildings were put up in substitution for the old ones.

Prof. MACQUEEN moved to proceed to the next business.

The PRESIDENT said that meant the communication would lie on the table.

Mr. J. WILLETT said he would second the motion. Clause 3 was a controversial matter, but the resolution was all right.

On the motion being put it was carried.

SOME EFFUSIONS AND TRANSUDES COMMONLY MET WITH.

By GUY SUTTON, F.R.C.V.S.

Transudates and exudates are of very common occurrence, and I venture to think a discussion of their treatment may be profitable. In horse practice "fluid within the chest" is common, always alarming, and its range of treatment somewhat varied, and prognosis may fairly be described as speculation. The onset is insidious and I have a genuine respect for the ability of the veterinary practitioner who can diagnose the condition in its early stages. Many cases undoubtedly subside and clear up under the influence of anti-febrile and counter-irritant treatment. Some don't. Now, gentlemen, having early diagnosed the presence of fluid within the chest, what would you advise? Is it best to puncture promptly before much accumulation has taken place, and so endeavour to limit the intra-thoracic disturbances and displacements which ensue? or shall we wait, watching the general symptoms carefully.

Ten years of clinical work, many spent in a practice where tapping was fairly frequent, has taught me that the chest is capable of putting up with a fair amount of surgical interference.

Paracentesis thoracis performed with a trocar and canula of fine calibre and sufficient length, suitably sterilised (boiling on the harness room fire seems as good a method as any) and introduced through the chest wall, which has previously been freely painted with tincture of iodine, is undoubtedly the surest way of diagnosing the presence of fluid, and in my experience can be performed with impunity.

In favourable cases, and I speak with records of nearly twenty, the removal of fluid varying in amount from a few pints to over two stable bucketsfull is followed by the immediate onset of favourable symptoms. The animal's condition steadily improves, and we have probably all met with cases of perfect restoration followed by years of hard work and activity. Sometimes even a second or third puncture may be followed by re-

covery, but our prognosis in all cases where a re-accumulation takes place is grave.

Why is it that our percentage of death in horses suffering from thoracic effusions is so high?—and I think it will be readily admitted that it is high.

What improvements can we make in our treatment? Are we, as a rule, rather too late in attempting to drain off the fluid—would earlier tapping prove more beneficial?

What is the essential element which determines whether our patients will recover after the removal of fluid or, as an alternative, ordains its persistent re-accumulation?

Sir James Barr advocates the injection of adrenaline solution into the pleural cavity after the removal of fluid. I have tried this, but have noticed no marked effect, but must admit not having adopted the treatment systematically. I have also injected a drachm of Lugol's solution of Iodine through the canula before withdrawing the fluid, but after having positively ascertained its presence in abundance, and allowing ten or fifteen minutes to elapse to ensure distribution through the fluid before withdrawal. This, as far as I could see, was well tolerated, but again I have not made it a routine practice. Möller's surgery mentions washing out the pleural cavity. Has any member tried this?

Personally, I think our cases of satisfactory recovery will generally be found to be those in which the pleurisy is primary, and not those secondary to or associated with pneumonia. The latter are distinctly disappointing.

In the dog the presence of fluid within the chest is not quite so alarming. Possibly because it may the more readily be confined to one side of the chest, and also that even a partial restoration to activity will completely satisfy the majority of owners. A marked symptom in the dog is the backward displacement of the apex beat of the heart, but the surest means of diagnosis is undoubtedly with a fine aseptic canula or hypodermic needle, with the usual precautions—and the owner's consent. The dog stands repeated tapping well. Injections of adrenaline are distinctly beneficial. Personally I have always used the Parke-Davis preparation, allowing it to be diluted by the fluid left within the chest, which I find it is impossible to entirely empty by the usual methods employed.

I should say a primary pleurisy unaccompanied by pneumonia is the more common in the dog. The reverse being the case in the horse.

Empyema is, as far as I know, always fatal in the horse, but perhaps there are some unrecorded cases of traumatic origin that have recovered. The dog is capable of recovery from punctured wounds into the chest, and it is hard to imagine these can have occurred without suppuration, but it is doubtful whether many recover when the infection spreads from the lung.

The British Medical Journal has lately published a report of 40 cases of pleurisy with effusion treated by means of a drug called Maretin; perhaps we shall hear reports of this treatment in Veterinary practice. The article in question was quite encouraging. As a profession we are distinctly handicapped in this disease, for undoubtedly its early diagnosis offers distinct difficulties.

Why is it that Ascites is so rarely seen in the horse, though fairly common in the dog? At the Berlin Clinique one in every two hundred of all canine patients were affected in this way. Equines appear to be liable to practically all the pathological conditions capable of giving rise to abdominal dropsy. Yet it is extremely rare, and the theory of cause and effect appears to be incomplete in their case. Possibly it is a distinction between the species due to their method of feeding. During the second half of the dog's life Ascites is frequent, and undoubtedly arises from several distinct causes. Tapping gives immediate relief; recurrence is

however only too common, and if a cure is effected the cause must have subsided or efficient compensation has taken place.

Cadiot says the chief cause of Ascites in the dog is tuberculosis. I am not in a position to deny this, but, with all respect, find it impossible to readily accept with regard to our London dogs.

The human surgeon when confronted with Ascites has in some recent cases obtained a check of the recurrence after tapping by bringing about an adhesion of the omentum to the abdominal wall, so promoting an anastomotic circulation, and allowing a free passage of blood from the portal into the systemic circulation, relieving the former of a considerable portion of its work. This operation is fully reported in a recent article as having been performed in Holland and in England by Messrs. Drummond and Morison. It is not successful in all cases, and in a few the operation was rapidly followed by an acute and fatal jaundice. I believe Mr. Henry Gray has operated in this way upon cats, and I have no doubt it will be frequently performed, but most of our patients with this complaint are old favourites, and one is loth to be too heroic in dealing with them.

Given a case of Ascites in the dog, What are we to do besides "tap"? I believe that in man great benefit is often derived from prolonged courses of digitalis. This, I think, is advised by Dr. Mitchell Bruce. Is there any evidence that Potassium Iodide, so often given, is of any real benefit?

There are several "areas of effusion" of traumatic origin occurring in horses which often cause us much annoyance, as frequently we are unable to restore the parts to an entirely satisfactory condition. I refer to capped elbow, capped hock, bumped knee, serous abscess, etc.

Why is it that the horse is so liable to throw out these effusions, and what is the best way of dealing with them? Capped hocks are most annoying, and clients are often at a loss to appreciate our difficulties in dealing with them. At one time I thought I had adopted a neat and correct treatment by keeping the patient standing, aseptically puncturing the swelling with a hypodermic needle of fine calibre, and enveloping the whole posterior aspect of the joint in a charge of Plaster of Paris. This process is certainly useful, and reduces the swelling, but does not completely take it away as I had hoped. Blistering the hock appears to be clumsy and is seldom entirely successful, whilst the insertion of a drainage tube is accompanied by some danger, and is pretty certain to leave at least cutaneous thickening. It is not a popular treatment, but I believe it to be good surgery.

Badly bumped knees, and the callosed enlargements on the outer side of the knee are also often most intractable. In the former I am sure a drainage tube is generally justifiable. Unfortunately with working horses it is often impossible to allow the necessary abstinence from work, the tumour is allowed to remain, and a most unsightly disfigurement it is.

What are we to do with the distention of the sheath of the lateral extensors often seen on the outer aspect of the knee. I have never been bold enough to operate in these cases, but have an uneasy feeling that a more energetic treatment would be justified, and might give better results than the palliation measures adopted by most of us.

Why is it that the Serous abscess so commonly met with in the horse as a result of falls, etc., practically always requires to be freely opened. However nicely and aseptically we remove the fluid with a canula of fine bore, it seems to always reaccumulate in the absence of efficient drainage.

I trust, gentlemen, you will give us the benefit of

your experiences and advise on the many debatable points I have mentioned, and will supplement this short and inadequate paper by an energetic discussion—generally the most welcome portion of the evening's proceedings.

DISCUSSION.

The PRESIDENT said about three weeks ago he was asked to look at a horse's teeth as it was falling off in condition. He found the teeth very uneven and cheeks lacerated, but nothing to lead him to suspect lung trouble. He had found that day (although horse worked on previous day) that there was a very great deal of effusion in the pleural sac.

In the treatment of dropsy he had found digitalis and iron to be of value, although incompatible, and it was a very old favourite with medical men. In his opinion it was as good as iodide of potassium.

Mr. H. GRAY considered the paper a concise and lucid exposition of the practice of tapping, and agreed with most of the remarks made, with one or two exceptions. Tapping was not always such an easy matter as Mr. Sutton seemed to infer. He himself had tapped two horses daily for a fortnight and been successful. If the fluid was clear and not putrid there was a very good chance of success, provided the operation was performed early. In some cases when a trocar was passed in and no fluid came out he pushed the canula towards the diaphragm, and that generally produced the fluid at once if any was there. He had failed in some cases to draw off fluid from dogs or cats, and yet post mortem had shown that fluid was there. With regard to ascites in the dog, he tapped two dogs for about two years once a fortnight, and towards the end found a difficulty in getting any fluid out of the peritoneal cavity. An interesting question was whether the pleural sacs of the horse communicated; he had seen several cases with pus or reddish fluid on one side of the chest and clear amber-coloured fluid on the other. The paper did not say anything of pericardial effusion, which was not uncommon in the dog. In his experience the majority of cases of the pleuritic, pericardial, and abdominal effusions in the dog and cat were due to tuberculosis. Chylous ascites was another effusion not mentioned in the paper. He had recorded a case in a cat sixteen or seventeen years ago, and had seen several cases since. The case recorded was sent to Sir John M'Fadyen, who could not find anything in the lacteal system to account for it. The fluid could only be told from milk by the fact that on centrifugalising it no cream was obtained. Five or six years ago, at a Veterinary meeting in Ireland several practitioners came to the conclusion that Chylous ascites was the commonest dropsical condition in the cat, but he could not say that was his experience. It also occurred in the dog, and was not rare in man. He did not paint iodine on the side of the chest or boil his trocar and canula; he merely put his instruments into a 5 per cent. solution of carbolic acid, which he found was quite sufficient to sterilise them; at least he had never seen any ill effects resulting from that simple practice.

Prof. WOOLDRIDGE asked whether Mr. Gray had any information to give on the operation producing anastomosis.

Mr. GRAY said his method was to cut into the abdomen, draw the omentum into the wound and stitch it there. It had been performed on the Continent by several veterinary surgeons, though it might be new in human practice in this country.

With regard to traumatic pericarditis in cattle, he had had a case in the country in which he wanted to take a piece of the rib out and to bring the pericardial sac to the wound and stitch it there. Unfortunately he could not borrow any instruments at the time, but he had an exploring trocar with him and ran it into the chest and showed there was a stinking fluid there, and he asked

for consent to do what he liked with the cow. Consent being given he ran a knife through the ribs into the pericardial sac and let out a lot of dirty, foetid greenish white fluid. He could not get his hand in to take out the piece of wire from the pericardial sac. The cow died four or five days after, and on post mortem he took the piece of wire out of the pericardial sac. He noticed nothing amiss with the pleural cavity, except an attempt on the part of the pleural and pericardial sacs to unite to the chest wall by an apparently healthy fibrinous adhesion. There was no fluid remaining in the pericardial or pleural sacs. With proper instruments and technique he thought such an operation would be successful.

Mr. PHILP asked which rib would he cut out.

Mr. GRAY said he would not cut the whole rib out, but only a portion, making a window. He did not think it mattered which rib it was so long as it was immediately over the region of the pericardial sac.

Prof. MACQUEEN asked how he would close the window.

Mr. GRAY said he would not cut away any of the soft parts or the pleural membrane. He would bring the remaining soft structures together, put in a drainage and then a pad over the wound, so that there was no inspiration of air.

He passed round for the inspection of the meeting the trocar and canula he used for tapping the chest of the horse, and even tapping the chest and abdomen of large dogs; also a finer exploring trocar used for the same purpose in the cat and dog. He condemned the large calibre instrument hitherto used in this country, and considered it accounted for many of the bad results formerly obtained.

Mr. SLOCOCK thought the paper was a most instructive one and would give rise to much thought. He had been specially interested in the remarks on the operation in the chest for the exudate. His cases perhaps had been unfortunate, but for several years past he had given up tapping the chest in the horse. He might have left it too late, as Mr. Sutton said. There was certainly a wonderful recovery for a few days when the fluid was removed, but the effusion started afresh. Directly he had a case he gave syrup of ferri iodide alternately with other medicines, perhaps a couple of doses daily, and in that way he thought he had warded off many bad cases of hydrothorax. He did not get the quantity of fluid in the chest he used to get, nor the number of bad cases. He thought the cases outside London, where there was plenty of fresh air, did better than those in closer quarters. He had adopted very much the same treatment in the case of the dog, but without very good results.

Prof. WOOLDRIDGE asked what dose of iodide of iron was given.

Mr. SLOCOCK said one ounce dose of the syrup, but he did not know the strength of the syrup. It was given in the drinking water, as he never drenched after the first.

Mr. GRAY said in his successful cases in contract practice he merely gave a placebo and the cases got well.

Prof. WOOLDRIDGE agreed with Mr. Slocock in connection with the tapping of the chest of a horse; the cases he had thought necessary to tap had nearly always proved fatal, and he had consequently lost faith in the treatment. Perhaps he had left it too late, but in any case his results were not encouraging. He had not met with a case of ascites in the horse that necessitated tapping at any time. With regard to dropsy in the dog, his experience did not coincide with that of Mr. Sutton, inasmuch as in the majority of his cases, where they had eventually come to post mortem, tuberculosis had been the cause in by far the majority of cases and generally associated with extensive liver affection. An exception had come under his notice during the past

week. A fox terrier, whose abdomen was tapped in December and well over a quart of fluid taken away, and which was treated with a purgative, and potassium iodide and digitalis, had no recurrence of the dropsy, but gradually lost condition, and was brought to him early in the present week to be destroyed. A post mortem was made afterwards and no trace of tuberculosis found in either cavity, but there was an old-standing interstitial nephritis, which he presumed was the cause of the ascites in the first place.

The treatment of ascites by producing anastomosis of the abdominal viscera with the parietal peritoneum was not new; it was performed on the human subject to his knowledge ten years ago. The cases in which he had been interested were due to cirrhosis of the liver and the anastomosis was produced between the anterior face of the liver and the posterior face of the diaphragm. The abdominal cavity was opened and the face of the liver scarified by an instrument that could almost be described as being like sandpaper. The margins of the liver were then sutured to the posterior face of the diaphragm and adhesion produced. Very considerable relief was reported to have been afforded by that operation in the human subject.

He had not attempted the operation in the dog. In two instances, where he thought it might be done, on opening into the abdominal cavity, he found extensive tuberculosis of the liver, and consequently regarded the operation as absolutely useless, and destroyed the dog. With regard to potassium iodide in the case of dropsy in the cavities of the body, he thought it would undoubtedly be of service if given in sufficient doses, in that it reduced the sensation of thirst and therefore reduced the intake of water. If potassium iodide had also the antiseptic action ascribed to it, since the dropical fluids were sometimes due to organisms of some kind or other it might have additional action in that way.

He had been interested in a considerable number of cases of local serous abscesses in the horse due to bruises, where there was no breach of the skin and yet there was pus in the cavities. Nothing but extensive opening appeared to be of service. What appeared to be pus in the majority of cases he thought was aseptic material due to the breakdown of connective tissue of the part from bruising, and the fluid was often due to extravasation of blood or plasma into the cavity. Sometimes it was possible to take out a piece of fibrinous lymph, occasionally bloodstained and occasionally not. In some cases he thought the fibrin of the coagulum was left and the fluid separated from it. One had to run the risk of sepsis by opening the cases rather than expect to reduce them by counter-irritation. He wished to thank Mr. Sutton for his concise, interesting and eminently practical paper.

Mr. W. HUNTING said he had no information to give except a confession of a series of failures, because every horse with hydrothorax he had tapped had died within three days. If it was a case of not tapping early enough the difficulty was to know what was early enough. It seemed to him there were two different effusions in the chest. One was a sort of passive effusion which did not show on post-mortem the bright scarlet appearance of the pleura which was found in acute inflammatory cases. He had thought that might be a more favourable case for tapping than others, but it was not. He took out on two consecutive days about a pailful of perfectly clear fluid and the animal died. In some cases the post-mortem showed that tapping or anything else could do no good. A horse might be found with his ribs covered with an inch of thick leathery exudate, and at the bottom of the chest floating in discoloured effusion there would be a number of pieces of tough fibrinous material sufficient to fill half a pail. He knew very little about ascites, which was due to two or three

very distinct causes. He had something to do with a stud of horses all of which got fatty livers before they died, and it would be thought that such a condition would be about as compressive upon the blood vessels as a cirrhotic liver, but in no case was there ever ascites accompanying the liver trouble. The cause of death in nearly all those cases was rupture of the liver. In every case all the ruptured livers were fatty to begin with.

Local serous swellings were most awkward things to cure: they could not be pressed sufficiently to cause them to absorb, and if opened they generally produced a very big leg. He had seen a windgall opened with a vertical incision aseptically, and the animal had a leg as big as four for over a month. He had seen a large leg result from the opening and setoning of a capped hock. How was it that serous abscesses always occurred on the thigh, just behind the stifle? They were simple to cure if treated by being slit from top to bottom, and very little deformity resulted.

Prof. MACQUEEN congratulated Mr. Sutton on directing attention to one or two points in general practice, and especially the treatment of effusion into the chest, because the line taken in the paper was much neglected in practice. He did not agree with the speakers who looked upon tapping the chest with disfavour, believing that the operation of tapping in most cases was too long delayed. There was a tendency in the veterinary profession to respect the chest too much. It used to be common teaching that when puncturing if air entered the chest it would produce collapse of the lung, but it did nothing of the kind, and the precautions very often observed in tapping the chest were entirely superfluous as far as air was concerned.

He would like to have heard explained a little more fully the various kinds of effusion met with in chest cases. He had never met with anything that could be called dropsy of the chest, pure transudation, not exudation. He also wished to know what variations might be met with in the character of the exudate which was found in the pleural sac. He desired to ascertain as far as possible what kind of fluid Mr. Sutton looked upon as most favourable in the practice of tapping. When he obtained a clear fluid did he consider that that was likely to be a hopeful case, or when the fluid was quite opaque, not pus, was that a hopeful sign? There was another condition—when there was difficulty in withdrawing fluid from the chest even by means of an aspirator, and pus was obtained. He presumed Mr. Sutton would consider that case beyond remedy. Many years ago, when he was more inclined to do extraordinary things, he was in the habit of washing out the horse's chest by making two openings. He tapped the chest about 9 in. behind the point of the elbow, and after withdrawing the fluid he made a second puncture as close to the spine as possible on the same side. In the upper opening he introduced a disinfecting fluid. At one time he used a solution of iodine and thought it rather a good remedy, but unfortunately the animals died. After substituting other agents he came to the conclusion that washing out the chest was not an entire success. With regard to the ordinary case, no doubt many Fellows recalled the story which used to be related by the late Dr. Fleming, who was an enthusiast in puncturing the chest. On one occasion he punctured a horse and removed three gallons of fluid, and the horse was ridden thirty miles after the operation. Dr. Fleming used to look upon tapping as quite a successful operation which everyone should attempt when fluid was in the chest—and he noted with considerable pleasure that Mr. Sutton said the only certain way of knowing when fluid was in the chest was by making an exploratory puncture. That was a commendable statement. Without tapping one could not say that the treatment of hydrothorax has been exhausted. If cases

of effusion into the chest were usually fatal, the mere tapping of the chest under aseptic precautions was not calculated to accelerate death: it was more likely to prolong life; and there was no doubt it frequently succeeded in saving life.

With regard to superficial swellings, such as capped hock and synovial distensions, there was no doubt that aseptic puncture was practised, but it was attended with a great deal of risk, and unless the patient was particularly tractable there was great difficulty in maintaining the part in the proper condition. The patience of the owner or of the veterinary surgeon had also to be considered. If one punctured a distended bursa and removed the fluid, closed up the puncture, and applied a compress or plaster, it must not be expected that there would be an immediate change for the better. The horse was bound to show some reaction at the seat of puncture, and for several weeks there would be no improvement, and in some cases no change would be seen before the end of the second month. After that, unless some complication had arisen, such as suppuration, there would be a marked change observed. The operation for chronic distensions had not met with the support it deserved, it was quite a useful operation provided the owner was told that there would be some delay before any great improvement could be expected. Practitioners who were in the habit of puncturing in a rough and ready manner seemed to succeed with nearly all their cases. They even punctured bog-spavin, which was really a penetration of the tibio-tarsal joint. Puncture of bumped knee was not always beneficial unless the horse could be kept in slings. The same remark applied to puncture of capped hock. The surgical features of the operation were not at all objectionable, but unfortunately, owing to the difficulty of keeping the horse perfectly still, there was not always immediate closure. Infection and movement were dangerous, and there was also a danger of recurrence of the bruising. With regard to puncturing the chest of the cow, he had been very much amused by Mr. Gray's statement of how he proposed to deal with a cow suffering from traumatic pericarditis with pus in the pericardium. He had no doubt the operation could be performed, but it would be better performed on the dead subject.

Mr. ALMOND said his experience of exploring the chest was not very extensive and he had met with varying success, but he was not altogether sure that it was really a matter of operating too late. He should not expect success from operating during the active stage of the disease. In cases where the active inflammatory condition had subsided, and fluid remained, successful puncturing might be employed. Cases of acute pleurisy followed by a fatal issue would probably have proved fatal whether operated upon or not. He thought the extensive effusions were far rarer than they were formerly, but whether that was due to lower intensity of the virus or to a different way of treating the case he did not know. He had only had one serious case of effusion into the horse's chest in the last few years, although he had had many cases of pleurisy which he had treated successfully. In pleurisy he always put the animal on to four ounces of Epsom salts every six hours; the medicine was generally given in the drinking water, and the effect was almost invariably to reduce the temperature within a few days, and the case went on its normal way towards recovery. A very important feature was to provide a long period of convalescence before putting the animal to work.

Mr. WILLETT asked whether Mr. Sutton had noticed any particular temperature indicative of effusion of the chest. He had found effusion in cases where a temperature of 103 had been stationary for about two or three days. Personally he could not say he had any success in tapping.

Mr. SUTTON, in reply, said that tapping was not always easy. Sometimes on first puncturing no fluid came out, but by persevering fluid was obtained. He thought that was due to the canula becoming plugged. It was quite possible to tap a case every other day for a fortnight and have recovery, but he thought in the majority of favourable cases only one tapping was done. Fluid seemed to accumulate more towards the diaphragm. With regard to Mr. Gray's case, he himself had a case now on hand which had been tapped every three weeks for four months. Probably Mr. Gray's case was not tuberculosis. He thought the chest of the horse did communicate.

Mr. GRAY said he had two cases for two years and they were undoubtedly tuberculosis.

Mr. SUTTON: With regard to pericarditis in the dog, he remembered a case of a dog in London which went on for the best part of a year after tapping, but whether the animal had tubercle or not he could not say. By using an antiseptic for the chest, in painting the side, one closed all doors to anyone saying we were negligent if anything fatal happened.

The anastomotic operation was reported as new in *The British Medical Journal*, but it had been performed in Holland and in Italy, and, like most surgical operations, probably was performed years ago. The simpler the anastomosis was made between the two systems the better. The omentum was said to be richly supplied with blood and if it was attached to the abdominal wall it would be doing all that was required, and one was not justified in scarifying the liver.

The operation for traumatic pericarditis in cattle he thought was feasible, and the viscera of the chest could be handled a great deal more than was commonly thought. He was sorry to hear Mr. Slocock did not tap. He could give authentic cases where horses of all descriptions had been serviceable long afterwards. In any case he did not think tapping would do any harm. He could not say much about tubercle as he was not a pathologist. Interstitial nephritis was a very common thing in old dogs; practically all of them had hard kidneys.

Potassium iodide was very useful as a thirst checker and so was Vichy water.

As to serous abscesses, if drained there was a recurrence unless the whole thing was slashed open. He did not agree that when fibrinous lymph was found it was an old standing case. Some men had the gift of diagnosing fluid in the chest early, and probably they were men with a good musical ear. He always looked upon fluid in the chest as most serious. He did not think for a moment that a good percentage of horses recovered, but there would be some if more were tapped. He had been interested in Mr. Hunting's remarks as to fatty liver, and he knew of a stud where all the old horses had fatty degeneration of the liver, horses which were fed on a good deal of corn. In opening capped hock and such-like conditions, supposing the leg did swell up, it would still be a good operation if in three months time the animal was well again. He was not educated enough to differentiate the kinds of effusion; the pathology of the chest was almost a closed book to the ordinary practitioner. He had known horses recover when the fluid that came out was hæmorrhagic, deep saffron, or light in colour, and he rather thought the lighter-coloured fluid was the better, but he would not like to say much about it. If he had a horse of his own with fluid in the chest he would tap him and inject Lugol's solution of iodine into the fluid, and wait a little before drawing it off. He thought that was beneficial. With all respect to Mr. Almond, he thought the operation should be performed in the early stages. With regard to effusions being rarer now, they were so in his own case, but then his horse practice was rarer. As to the four ounces of Epsom salts, that was used when he was a pupil as fever

powders, and very profitable they were. He looked upon a temperature of 103 as the most dangerous temperature in a horse, far more dangerous than 106.

Mr. HUNTING asked whether Mr. Sutton thought the pulse remaining at about 56 indicated anything.

Mr. SUTTON said yes. The pulse found to accompany most cases of pleurisy with effusion had nothing very startling to identify it.

On the motion of Mr. J. Willett, seconded by Mr. Hunting, a hearty vote of thanks was accorded to Mr. Sutton for his Paper.

HUGH A. MACCORMACK, Hon. Sec.

SCOTTISH METROPOLITAN VETERINARY MEDICAL SOCIETY.

The annual meeting was held in the Reading Room of the Royal (Dick) Veterinary College, Edinburgh, February 10th. In the absence of the President, Mr. James Peddie, F.R.C.V.S., through illness, Mr. Riddoch was called to the chair on the motion of Mr. Baird, seconded by Prof. Dewar. Present: Messrs. Wilson, Lanark; A. Matthew, Selkirk; Borthwick, Kirkliston; Aitken, Dalkeith; Prof. Dewar, Principal Bradley, Prof. Wilson, Prof. Gofton, J. B. Buxton, A. Baird, and Jas. Henderson, Edinburgh; J. C. McGregor, Greenock; W. Doughty, Ayton; J. Cameron, senr., Berwick-on-Tweed; R. Reid, Cupar; A. Mackenzie, Kirkcaldy.

Visitors: Messrs. Macfarlane, Glasgow; Macfarlane, junr., Doune; Anderson, Cupar; Trotter, Glasgow; W. M. Mitchell, Drs. McGowan and Mitchell, Edinburgh; Connochie, Galashiels.

The SECRETARY (Prof. Gofton) intimated apologies for absence from Messrs. Wallace, Richard Rutherford, Young, Mitchell, Reynard, Prof. John McCall, Principal McCall, and the President.

The minutes of the last meeting were read and confirmed.

Correspondence.—The Secretary read a letter from Mr. T. Faithfull Davies, on behalf of the Société de Pathologie Comparée, intimating that a Congress had been arranged to be held in Paris in October next.

Also a letter from the Royal Sanitary Institute asking the appointment of a delegate to a Congress to be held at York from July 29th to August 3.

A letter from the Association of Veterinary Officers of Health with regard to the question of tuberculosis. The Council, Prof. Gofton explained, had agreed to ask Mr. A. M. Trotter, to submit the letter and a resolution from the Association of Veterinary Officers in connection with his paper on the subject.

Mr. CAMERON read an extract from the report of a delegate to last year's Sanitary Congress, and said that illustrated the necessity, and very forcibly, the value of sending representatives of the veterinary profession to such meetings. One did not get everything they would like to get at these meetings, but it was necessary to have someone there to see they were not trampled on, and to lend their assistance. He proposed that a delegate be sent.

Dr. BRADLEY seconded, and suggested the Secretary as their delegate, which was agreed to.

TREASURER'S STATEMENT.

Prof. GOFTON submitted the Treasurer's statement of accounts. They commenced last year with a balance in hand of £11 5s. 2d. During the year they had received £10 17s. 6d., in subscriptions, and the expenditure had been £10 5s. 6d., leaving a balance in hand of £11 15s. 2d., The accounts were accepted.

THE NATIONAL VETERINARY ASSOCIATION.

Prof. GOFTON read the circular letter from himself with regard to the election of representatives to the

Council of the National Veterinary Association in accordance with rule 36. The number of representatives to which they were entitled was two, in addition to himself as Secretary. The Council recommended that the President should be one of the representatives, and, in view of the active part Dr. Bradley had taken in the movement, that that gentleman should be appointed the second representative on the Council of the National Veterinary Association. He moved the appointment of their President (Mr. Peddie) and Dr. Bradley.

Mr. MCGREGOR seconded, and the motion was adopted.

ELECTIONS AND NOMINATION.

Prof. AINSWORTH WILSON, F.R.C.V.S., Edinburgh; Messrs. J. BASIL BUXTON, M.R.C.V.S., D.V.H., Edinburgh; A. MATTHEW, M.R.C.V.S., Selkirk; A. MACKENZIE, M.R.C.V.S., Kirkcaldy; D. S. DAVIDSON, Edinburgh, having been duly nominated, were elected members of the Society, on the motion of the Secretary, seconded by Mr. Cameron.

Mr. MACFARLANE, junr., Doune, was nominated by Dr. Bradley, seconded by Mr. Baird.

Prof. GOFTON said that before reading the address prepared by their President, he wished to move that the members present send to Mr. Peddie an expression of their regret that he was not able to be with them, and expressing a hope that he might soon be restored to health and fit to resume duties again. (Carried).

PRESIDENTIAL ADDRESS.

JAS. PEDDIE, F.R.C.V.S., Dundee.

Gentlemen,—My first duty must be to thank you for the honour conferred by re-electing me as your President for another year. I am deeply conscious of the compliment, and although I was somewhat reluctant to retain the position, it was not, I assure you, from want of appreciation of your confidence in me, or the honour you desired to convey, but rather that I felt this honour should go round, and that I might be unable to devote as much time to the interests of the Society as seemed to me necessary for one occupying the Presidential chair. I trust, however, with your active assistance and co-operation, that this year's work will be more successful and interesting to the members generally, and I shall do everything in my power to make it so. We are truly fortunate in having in Prof. Gofton such an energetic and indefatigable secretary, and all that is required to make the year's progress a huge success, is that each individual member should take an active and earnest interest in the Society, doing everything in his power to attend the meetings, to interest his professional friends and induce those of them who are not members to join our Society. I specially plead with you to assist me in the attainment of this ideal.

I have, as many of you are aware, very frequently advocated the immense advantages to be obtained from attendance at the various meetings of our societies. The papers submitted on a wide variety of subjects and their discussion are of undoubted educational value and assistance to practitioners. Then we have interesting cases and specimens of the highest clinical value. There is also an advantage to be gained by seizing the opportunity presented by those meetings to discuss with our professional friends points of difficulty or interest constantly arising in the course of our practice. We are all more or less creatures of environment, our experience as individuals, even in busy practices, is more or less limited, and it is only by mixing freely with our *confrères* and comparing notes that any true and real progress can be made.

There is a further point of great importance—that such meetings tend greatly to improve our social relationships by breaking down petty jealousies and ill-feelings which are so apt to evolve between practitioners,

and thus make for happier and better understandings between individuals and greater solidarity as a professional body. I do not think there ever has been a time in the history of our profession when there was a greater need for our absolute unity.

There is an old Greek proverb—"Know thyself," which evidently summed up the ancients' ideas of the fundamental basis of true wisdom. Well, gentlemen, I cannot help thinking that if we try to know ourselves properly, we must often feel how sadly deficient in knowledge we are.

Science in all branches has made enormous advances in recent years, and the science of veterinary medicine and surgery is no exception; it is truly a very wide field. Personally, I confess that the more I come in contact with members of my profession, the more is my lack of knowledge on so many points brought home to me, and the inestimable advantage of our conferences demonstrated.

It is customary in the course of a Presidential address to discuss the politics and other matters of interest before the profession, but in doing this I shall, I think, best consult your interests by carrying it out in the briefest possible manner.

The most unsatisfactory position of the finances of the Royal College of Veterinary Surgeons is a matter which I feel sure we all very much regret. I also think there is now a very strong and widespread feeling that the Veterinary Act Amendment Bill should be entered on the Statute Book, and I trust in the interests of the profession that day is not far distant. The passing of this Bill into law would, I am satisfied, be in the highest interests of the profession, and I am firmly convinced we would not have long to wait for evidence of the many benefits and advantages which would follow.

Thanks to the untiring and most zealous efforts of Principal Bradley and Prof. Gorton, the amalgamation of our various societies is now practically *un fait accompli*. That such an amalgamation will benefit the profession I have no doubt, for we can under the new scheme present a more solid front to all questions adversely affecting the interests of our profession.

The tendency to day is towards co-operation. We see many examples of it around us, and it is a matter for regret that in the veterinary profession at the present day there should be so much cutting of fees and other practices of a most injurious character. Especially is this so regarding contracts, many of which are taken at prices which are absolutely ridiculous.

The unfortunate thing is that this is a matter which could be so easily rectified if members of the profession would stick out solidly for their just and lawful rights. Personally I hold it is much better for a man to do less work and be reasonably paid for it so that he can do it well, rather than kill himself doing work for which he is improperly paid and which when everything is considered he cannot possibly do well, no matter in what interest it may be viewed.

The College Crest case has been won and lost, but personally I do not think the profession is much, if any, poorer as the result of the decision.

The efforts which have been made during the past year to obviate the great conflict of veterinary evidence which so often occurs are of the most praiseworthy character. It is to be hoped that the discussions on this subject which have taken place will lead to the results so earnestly desired in the interest of the profession.

I will not weary you with further remarks, but will conclude by again asking your very active co-operation and assistance in carrying on the work of this Society and by expressing the hope that we shall have a very satisfactory and prosperous record to show for the work of the current year.

The CHAIRMAN said they were all in agreement with Mr. Peddie's address. They hoped he might soon be restored to health and be present at their meetings.

"BOVINE TUBERCULOSIS; ITS INTERCOMMUNICABILITY AND DANGER TO MAN."—By A. M. TROTTER, Glasgow.

[This appeared in our issue of Feb. 10, p. 504].

Mr. TROTTER said: The Secretary has asked me to submit a resolution which was passed at the Annual Meeting of the Association of the Veterinary Officers of Health on October 13th, 1911, which was attended by Veterinary Surgeons holding appointments under the Public Health Acts and by representatives of Local Authorities. The resolution was the outcome of two papers which were read, one by Prof. Delépine, of Manchester, dealing with tuberculosis and the milk supply; the other by Mr. John Lindsay, Town Clerk Depute and Solicitor, Glasgow, who took up the legislation dealing with the milk supply. Mr. Lindsay as the result of his experience found that the legislation was quite inadequate to protect man, and he outlined a scheme whereby his idea was that the supervision and control of the milk supply should be placed in the hands of a central authority, preferably the Board of Agriculture, and that they should issue a concise and comprehensive code of regulations dealing with licensing of dairies and dairymen. The resolution passed was as follows:—

"The delegates and members assembled at the Annual Meeting of the Association of Veterinary Officers of Health, held at Edinburgh on October 13th, 1911, recognising the danger to the public owing to the prevalence of tuberculosis amongst animals, and particularly by the consumption of the meat and milk of such animals, respectfully and urgently call upon the Government to take immediate steps to control the disease by:

(1) Scheduling tuberculosis as a contagious disease under the Diseases of Animals Act, with partial compensation for all tuberculous animals and carcasses notified and condemned, payable out of State funds for a limited period.

(2) Offering financial assistance to all owners and breeders of stock who are willing to take the necessary action to breed tubercle free herds.

(3) Compelling owners of property to provide sanitary buildings in which to house healthy animals, by means of State loans, if necessary—the occupants of such buildings to keep them in a cleanly condition.

(4) Taking such further action as may be considered necessary in the future to completely eradicate tuberculosis from the midst of farm animals.

(5) Placing under adequate control sea-borne supplies of meat and milk.

I think I need hardly say more in support of this resolution; it must appeal to everyone of us.

The CHAIRMAN: We are exceedingly obliged to Mr. Trotter for bringing before us such an interesting paper, which we now will have an opportunity of discussing.

DISCUSSION.

Prof. GORTON: I cannot say I feel altogether comfortable in opening the discussion, and it might be as well to explain how I came to be chosen for the purpose. Instead of acting on my own responsibility a little while ago, and finding someone to open the discussion, I was foolish enough to consult the President. The result is that I am here.

I cannot add much to what has been said. I feel considerable sympathy with Mr. Trotter in attacking this subject, because it has been dealt with so frequently and approached from so many sides that it is exceed-

ingly difficult to put the matter forward in a new light or find anything new to say. Looking over the paper I divided it roughly into three sections. The first section deals with the subject from a historical aspect, leading up to the appointment of the Royal Commission following Koch's statement in London in 1901. In the second place Mr. Trotter deals with the results accomplished by the Royal Commission. Thirdly, he criticises fairly but strongly the powers that exist for dealing with inspection of cows, and the efforts that have been made to prevent the infection of milk with tuberculosis. Beginning with Koch's statement in 1901, it is quite clear that statement created one impression, whether it was the intention or not of Koch—that neither bovine tuberculosis was communicable to man nor human tuberculosis to animals to a degree which was at all material so far as the health of either was concerned. I think there is an omission in Mr. Trotter's paper in this connection, and the fact concerned is one which has been so obvious to Mr. Trotter that he has not appreciated the necessity of mentioning it. He makes no reference to the relationship between bovine tuberculosis and human tuberculosis. He speaks of the human disease and the bovine disease, and of the differences which exist between them, and their respective causal organisms, but he does not indicate any relationship. He gives us clearly to understand that bovine tubercle bacilli are capable of causing disease in man, but he does not say what relationship exists between the two types of bacilli, whether they are essentially different or merely divergent types and closely related. Mr. Trotter will agree with the following quotation from the Royal Commission report: "We prefer to regard the two types as manifestations of the same disease." I do not think that view would at the present time be seriously disputed by anyone. Although we do recognise that there are certain differences by which it is possible to distinguish the bovine from the human type of bacilli with almost absolute certainty, I do not think anyone would dispute that a close relationship exists between them, and that they are probably descended from what one might say was a common ancestor.

Following on this section Mr. Trotter deals with the sources of bovine infection. He deals with two. Milk from a cow with a tubercular udder, and milk from a cow with tuberculosis independently of a tubercular udder. It is a question if tubercular milk is actually secreted by cows unless the disease is present in the udder. The Royal Commission, I know, were unable to find any lesion microscopically of the udder of certain tubercular cows giving tubercular milk. It does not necessarily follow from that that the udder was not tubercular. I cannot help thinking that except in cases of generalized tuberculosis you do not get tubercle bacilli in the milk unless the udder is affected. It might not be recognisable by ordinary examination, microscopic or otherwise, but I think it is there in probably its earlier stages. There is another source of infection of milk from cattle. I refer to uterine discharges and to faeces. Those who are associated with dairies and the inspection of milk know that it too frequently happens that parts of faeces and other similar materials find their way into the milk. It has been demonstrated repeatedly that the faeces from cattle affected with open tuberculosis are capable of infecting other animals. Such faeces finding their way into the milk constitutes danger which is not negligible, although some people rather minimise that source of infection as of no moment. One is obliged to regard all tubercular cows as at least potential sources of infection of milk. All cows with open tuberculosis are a material source of infections, and even though one could recognise and secure all cases of open tuberculosis there would be a fresh crop of tubercular udders every year so long as there were tubercular cows, and the position of each year would be practically a repetition of that of previous years.

In dealing with the best means of protecting the milk, Mr. Trotter says that one of the first procedures to adopt must necessarily be the seizure and destruction of all cows with open tuberculosis. With that I agree, but it falls far short of what is necessary to protect the public from infection of tuberculosis by means of milk. Even though one started a campaign for the eradication of all cows with open tuberculosis, a considerable number of cows with open tuberculosis would not be suspected. On a good many occasions it has been observed that cows apparently fit—fat, and sleek in their coats, and to all appearances in the best of health, have been eliminating and have continued to eliminate for considerable periods, sometimes for years, large quantities of tubercle bacilli in their faeces. In the majority, the lungs have been the seats of the disease. It would thus be difficult to make progress if action were limited exclusively to recognisable cases of open tuberculosis. Infection of milk might be reduced, but no real advance would be made unless uniform action were taken throughout the country. Any steps taken must have for their ultimate object the complete eradication of tuberculosis. The task is not by any means one that can be regarded lightly. It is of considerable dimensions, can only be accomplished gradually, and it will take many years before success is reached, but that it can be successfully brought to a conclusion, I am convinced, if proper steps are taken. In the meantime much valuable work might be done if public bodies encouraged and assisted voluntary efforts to establish tubercle free herds.

Mr. Trotter criticises the existing laws controlling the inspection of cows and milk fairly severely, and I think rightly, because one must realise the utter hopelessness of dealing even with tuberculosis of the udder by means of the existing legislation. We know the laws are very unequally enforced. I was speaking two days ago to a gentleman from the north of Scotland with regard to inspection in his particular part, and asked him what inspection existed. He said, "I have been appointed Inspector for the Burgh, but the only time I am asked to inspect is when the Sanitary Inspector seizes a piece of meat and comes to me for my opinion. That is the case not only in the burgh, but throughout the county." "What are the byres like?" I asked. He smiled and said, "Many of them are primitive." It is well known that that is the state of affairs.

Mr. Trotter attempts to estimate the number of cows which are affected with tuberculosis of the udder, and bases his calculations on the result of certain inspections during the six years from 1900 to 1905 inclusive. These figures are somewhat misleading, and indicate a somewhat better state of matters than really exists. Mr. Trotter gives the reason in his paper. When a cow is condemned in town for tuberculosis of the udder, with few exceptions, where they have additional powers, that cow is sent elsewhere. You consequently get a reduced number of cows affected with tuberculosis of the udder in the areas submitted to inspection, and a proportionately greater number in the areas not subject to inspection.

Many cases of tuberculosis of the udder occur in cows in byres subject to inspection, of which the inspector never hears a word. I know two recent instances in the city of Edinburgh where that occurred, in one case I was asked to examine the cow the remark being made that it was time for a visit from our friend Mr. Riddoch. I demonstrated tubercle bacilli in the milk. The other case was on an identical footing. Mr. Riddoch never saw the cows. One was sold in open market as a milk cow. Where inspection is carried out efficiently the dairymen—I do not say all, but some of them—have experience sufficient to enable them to suspect when a cow is in all probability subject to disease likely to result in its being seized, or the sale of the milk arrested. The result is that they do not give an opportunity for the cows to be

caught; they shift them. I am sure that as an indication of the extent throughout the country of tuberculosis of the udder, the figures are misleading.

With reference to Mr. Trotter's remark as to the appointment of a Commission by the Secretary for Scotland, when I first heard of the suggestion I was inclined to think it was very desirable. I am still inclined to think it would do good if the proposal was somewhat modified. I think a Commission which consisted of agriculturists, representatives of Local Authorities, Town and County Clerks, medical and veterinary officers and sanitary inspectors, would be a Commission with too many conflicting interests, and the best results would not be obtained. I suggest that a modification of that would be of material improvement, namely the appointment of an impartial Commission to confer with all the parties concerned, and to draft a Bill mapping out the best lines of procedure. I would go further and say that if it be possible they should take steps to ensure that the Bill should be carried forward, because too often the reports of Royal and other Commissions which make recommendations are simply pigeon-holed, and there is nothing done. Unless steps are taken to ensure legislation, we might as well save the time and trouble of suggesting a Commission or assisting in its deliberations.

Mr. CAMERON: In writing a paper on this subject there is now a large amount of reliable material to choose from besides one's own personal experience. But the difficulty always exists of choosing the most suitable and in putting all together in one consecutive, harmonious whole. It is also a benefit, if a subject is one of great public interest, that it should be treated on a plan and in language which the public can easily understand. These difficulties have been most successfully overcome by Mr. Trotter, and we are greatly indebted to him for so excellent a paper on this important and pressing subject.

It is many years now since I first took part in discussing a paper on this subject at the National, and since that time the subject has been repeated. The Scottish Metropolitan has done justice to it on various occasions (twice I have taken a leading part at our meetings on it). The other Provincial Veterinary Associations have also done their part. Yes, if the medical profession had given a fraction of the attention and efforts which the veterinary profession has done towards getting this dire scourge of man and beast put under control we would have had to-day many spared lives—healthy lives and millions of money which we do not now possess.

The powers that be, both National and Municipal, have not yet learned the alphabet of the subject—to attack and remove the cause, and the bad effects will cease. There would then be no need to spend so many millions on sanatoria to cure what should have been, and could be prevented.

The excellence of this paper leaves little or no room for criticism. I am pleased that he alluded to the great achievement which our illustrious member, Sir John M'Fadyean, accomplished in such a short and critical space of time. I thought it was 24 hours. I was present and heard both champions. Sir John's victory was magnificent, not only for himself but also for the veterinary profession. At the early meeting of the National to which I have already alluded I mentioned that there was one thing wanting, viz. a public exhibition and demonstration of the diseased subjects which so often supply our milk and sometimes meat. At the 3 days' Tuberculosis Conference which was held in London 4 years ago that defect was supplied on a liberal scale, and was explained to the public audience by the late Mr. King and other London Veterinary Inspectors. I also addressed the audience, pointing out how a number of our large towns and cities who could afford it had got improved laws on their milk and meat supply

put through Parliament. But all the other portions of the country have been left alone, continuing to produce the disease—and allowing the medical profession, as one of their leading members has admitted—to reap a profitable golden harvest. We should have had a public demonstration of diseased subjects and specimens. Until we get the public educated on the subject and have them backing up our demands for reform, I fear that our efforts may be shuffled and shelved. It is, however, clearly our duty to put Mr. Trotter's finishing suggestion into operation. Also that we send a copy of our request to the National and the other Provincial Associations, and that we request these Associations to take an early opportunity of reciprocating our procedure. Another thing we should do—we should subscribe specially and have an edition of some 1,000 copies of this paper printed and distributed to every reading room, library and otherwise throughout the Kingdom. It is specially suitable for educating the public and leading them to give us their active assistance. I am persuaded if the public read this paper and the papers by Prof. Delépine and Mr. Lindsay, and saw the shocking diseased conditions of some cows whose milk is consumed by the public, they would then understand why there is an increase of abdominal tuberculosis. They would also then be both able and willing to assist us in getting the necessary reforms.

They had, he added, expressed their pious opinions on this subject long enough. He thought it was high time that they were taking action on the lines suggested in the concluding part of Mr. Trotter's paper. He proposed that the President and office-bearers of the Association be instructed to prepare a memorial on the subject and forward it to the Secretary for Scotland. He thought it would not be the Commission but Government which would draft the Bill. The Commission would give Parliament the best advice.

Prof. DEWAR thanked Mr. Trotter for the trouble he had taken to bring such an excellent paper before them. They were all greatly indebted to him, and congratulated him on the amount of information he had put into such a limited space. He did not, however, altogether agree with some of his conclusions, but he presumed Mr. Trotter meant the last paragraph of his paper to be superseded by the resolution passed by the Veterinary Officers of Health.

Mr. TROTTER: I think they are both to go together.

Prof. DEWAR said they were not exactly the same, and it would be as well to know where they were in regard to them. This showed how differently things might strike the reader who knew a little of the subject. He was surprised that Mr. Trotter did not refer to the fact that the Board of Agriculture issued a tuberculosis Order a year and-a-half ago, and that the Order was distributed throughout the country. After a time the Order was withdrawn, chiefly due to the fact that compensation for the animals to be seized and destroyed under the Order had to be paid for out of local funds. Mr. Trotter, in his recommendations, avoided that stumbling block, and suggested that the money should be obtained from Imperial funds. At the time when the Order was issued the Treasury was not prepared to meet the Bill, and that was why the Order was withdrawn. Even with the two Orders put together he did not think they got to the root of the matter. They must, as Mr. Cameron said, begin at the beginning, and if they did not meet with tuberculosis at the breeding farms, they would not meet it at the dairy. They must attack it at its fountain head. Most of them knew that the Board of Agriculture had passed an Order in connection with the registration of entires. It was a permissive order by which owners could submit their animals to be examined by Government Officers, and if they received a certificate of fitness they were put on a register as passed by the Government Officers. A leaf

might be taken from that book in regard to tuberculosis, and the Government might do something in regard to bulls. Suppose the Government made it permissive at first to register all bulls that passed the tuberculin test; after a year or two they might make it illegal that bulls should be exposed for sale at public auctions unless they had been submitted to the tuberculin test and been declared free. This would take a little time, but it would be on the same principle as was done with stallions. In future years steps would be taken to prevent stallions going about that were not sound; and in the case of bulls it might be provided that if found infected with tuberculosis within three months they could be returned to the seller if the buyer wished. That would go far to eradicate tuberculosis at the fountain head. If the disease was eradicated at the breeding farm they would soon eradicate it in the town. In reference to the Secretary's remarks about their friend Mr. Riddoch, an anxious servant who was trying to do his duty, he thought it was Prof. Gofton's duty to give Mr. Riddoch a hint that the cow should be looked after.

He was at one with Mr. Trotter as to the scheduling of tuberculosis as a contagious disease. He did not agree with offering financial assistance to breeders of stock. The Government only offered financial assistance to breeders of stock when they compelled owners and breeders to assist themselves. How was financial assistance to be given in any other way? With regard to the suggestion as to compelling owners of property to provide sanitary buildings for the animals, that might be done in towns, but it would be rather difficult in country districts. In some cases cattle in England were hardly housed at all.

Dr. BRADLEY—There was not the slightest question that tuberculosis in the human subject would be very much less were it possible to stop infection by the alimentary canal. One could hardly doubt that if one had experience in the out-patient department of a large hospital or in connection with a children's hospital. The number of cases in connection with neck-glands, tubercular glands in the neck in children, was astonishing. They were given to understand that that was largely due to bovine origin through drinking milk. Mr. Trotter had possibly been, if anything, too lenient when he said 31 per 1000 children were infected with tubercle derived from bovine source. He thought the percentage was probably considerably higher.

PROFESSOR WILSON said he had read the paper with the greatest interest, and congratulated Mr. Trotter on placing the facts before them so concisely. He confessed, however, to a feeling of disappointment not with the subject-matter, but with the particular portion of the subject he had chosen. He hoped that Mr. Trotter would have given them some of his own practical experience of the disease, and not simply a *résumé* of the research of the past ten years. The first portion of the paper was entirely historical. Unfortunately—or fortunately, the paper did not admit of criticism. He could not find anything with which he was in disagreement, except in regard to a matter of minor importance.

Referring to a cow with tuberculosis in the udder he says "Such an animal is of no value for milking purposes." In a sense Mr. Trotter was right; in another sense he was wrong. Many an animal with tuberculosis in the udder had a distinct value to the owner. He knew a large number of such cows which had given 8, 12, or 16 quarts of milk daily for six weeks or two months after he had detected bacilli in the milk, and after the appearance of distinct physical symptoms in the udder. These were cases which, if general regulations were enforced, would not be permitted; the point was, that a number of cows with distinct lesions might give a quantity of milk for some time, and the milk was often used because its appearance did not alter.

Another point which had not been mentioned was the prevalence of latent tuberculosis in the udder. Some cows developed a small indurated nodule, it might be microscopic, or in the mucous membrane of the ducts. The cases he wished particularly to refer to were those quarters of the udder which were chronically enlarged, firmer than normal, and which nevertheless gave the most milk. He did not mean those cases of compensatory hypertrophy due to a slight quarter. In his experience, it had been there two years, during which time he had suspected the cow, taken frequent samples of the milk, and had been unable to detect the bacilli, but eventually it was slaughtered for tuberculosis of the udder. These cows had been inspected every month, and records had been kept. These were cases where no distinct tuberculous character existed, but which eventually developed into acute tuberculosis mastitis. If milk from these cows had been taken at certain times during the two years, inoculation would no doubt have produced positive results. An indurated tuberculous nodule might also exist in a latent or quiescent form for a considerable time, especially near the base of the teat, here again, both tests might fail, until the lesions became active.

Mr. Trotter had taken a broad and comprehensive view of the disease in man and animals, and carefully reviewed the figures as to infection of man from the bovine source. The figures as to children were particularly striking. With regard to his suggestion that the majority of the proposed Commission should consist of those interested in agriculture—this raised the question as to the appointment of whole-time veterinary inspectors. No man could serve two masters. He had experience under the Public Health Acts and the Board of Agriculture, and knew that in country districts where the whole of the members of the local authority, or the majority of them, were dairy farmers, the local veterinary surgeon who was appointed to inspect the cows had rather a difficult task. A very good bill had been drafted by the Right Hon. John Burns, President of the Local Government Board some years ago, for the control of the sale of milk, and it seemed to him to be the thin end of the wedge. When they touched so many interests as they would in dealing with this disease they must proceed by degrees. They ought to commence work on the lines of the Milk Bill and the Order of the Board of Agriculture which was printed at the same time. Unfortunately they have not become law.

The CHAIRMAN said this subject was of enormous importance wherever cows were kept for milk production. The fact that the disease was communicable from cows to man ought to stimulate Local Authorities to take steps to prevent milk affected by tuberculosis from being sold to the public. He had pointed out a cow with tuberculosis in the udder, and the dairyman said it was the best milker in the herd. There would therefore be a hardship sometimes. The great drawback to action was the provision of compensation in cases of slaughter. The cost of compensation prevented Lord Pentland's Bill from becoming law, and resulted in the withdrawal of the Board of Agriculture's Order. They could not very well slay these animals without giving compensation. Glasgow was the first city to procure a Bill to enable Local Authorities to remove diseased cows from premises. Edinburgh followed that example, but they did not go far enough. They had no control as to destination. The result was that most of the cows removed from Edinburgh byres went to the north of England; some were sent a few miles from Edinburgh, and their milk was sent back to Edinburgh. He thought a clause ought to be added to the Glasgow Act to enable inspectors to brand infected cows sent from town dairies. If that were done no dairy

men would allow them into their premises. If Glasgow adopted such a step Edinburgh would soon follow their example.

Mr. TROTTER, in reply, said he was sorry they had not given him a great deal more criticism. Prof. Wilson had taken exception to his statement that animals affected with tuberculosis were of no value for milking purposes. He still adhered to that statement. Such an animal was of no value. He did not care whether it gave five gills or five gallons. It was perfectly unfit to yield milk, and ought to go. He agreed with Prof. Wilson and Mr. Riddoch that certain cows would have tuberculosis of the udder remaining localised for a long time. These cows should also go. As for Glasgow always being in the front, he agreed, but he was not in favour of branding the cows. He would brand them with a poleaxe. That was the only effectual way of dealing with a tubercular cow. An honest class of dairymen would not take a tubercular cow, but another class would take any kind of cow that yielded milk.

Mr. Cameron raised a very good point. With the National Insurance Bill they are going to provide money for sanatoria. Well, they ought to provide a little money for the veterinary profession to prevent the disease. "Prevention is better than cure" was as true to-day as it was twenty or thirty years ago. They ought to have a veterinary force weeding out the old cows and preventing the propagation of the disease and sanatoria being filled with patients. It would be far cheaper in the end. In regard to Lord Pentland's Bill and Mr. John Burn's Bill, he could not agree with those who supported these Bills, because they placed the veterinary surgeons under the Medical Officer of Health. As educated men they ought to take a strong position, and say that they were scientific men, and held as good a qualification as a Medical Officer of Health, and they could not guide them in their work or advise them, and therefore they were going to take their own place in the fight. He knew the Medical Officer of Health. He was a very good chap if everything was going well. He took all the credit and said "Look at my work; I control the veterinary surgeons' work; here is his report." And when the Medical Officer of Health asked an advance of salary he put forward the work of the veterinary surgeon as a plea why he should get an increase, and the veterinary surgeon was placed in the back ground. But if anything went wrong he would say "Here is the culprit; this is the veterinary surgeon who did it." Now if they were to take the blame when anything went wrong they ought to get the credit when everything went right. Referring to the specimens of tuberculosis exhibited, he would pass round a case of tuberculosis of the eye. Recently they had six cases. That was a case of infection from a neighbouring cow which was suffering from tuberculosis in the lung, and through coughing had communicated the disease to the eye of its neighbour.

The SECRETARY said that arising out of this paper he would submit a motion on the lines suggested by Mr. Trotter in the last paragraph of his paper, Mr. Cameron's motion had not been seconded—

"That the Secretary for Scotland be asked to receive a deputation with the object of urging the desirability of appointing an impartial Commission to confer with agriculturists, medical veterinary officers, sanitary inspectors and other interested bodies, and to draft a Bill for submission to Parliament having for its object the protection of the public health and the eradication of all animal diseases communicable to man through the milk supply." The difference between the motions and the suggestion contained in the paper was that whereas in the paper it was suggested the Commission should consist of agriculturists, etc., he suggested that the Secretary for Scotland should be asked to appoint an impartial Commission to confer with the

bodies instead of the Commission being composed of those particular bodies. Mr. Cameron's motion said a document was to be prepared and submitted to the Secretary for Scotland.

Mr. CAMERON said he would withdraw his motion and second the Secretary's.

PROFESSOR DEWAR proposed an amendment. He said he was thoroughly in favour of the object of the motion, but it was too unwieldy. They should not go to Lord Pentland, and tell him what he ought to do. He suggested they should send a memorial to Lord Pentland to impress on him the necessity of the Government doing something in the way the motion pointed to, through the Local Government Board or the Board of Agriculture, with the view of combatting tuberculosis and preventing the sale of milk to the public.

Mr. ANDERSON said he understood this motion dealt not only with tuberculosis but other diseases. The subject was big enough and important in itself for special legislation. Mr. Trotter had spoken of the readiness with which a Medical Officer of Health was superseding the veterinary surgeon in everything. They were giving the Medical Officer of Health a wide door to walk in. Apart from that the subject was serious and important. Delay would be an error, and to ask for the appointment of a Commission or of a deputation prior to drafting a Bill would tend towards delay. The question came to be one of practical politics. It seemed to him advisable to accept Bills that had been proposed and were at present in the offing, such as the Rt. Hon. John Burns' Milk Bill and endeavour to alter this so that the things they desired as a profession might be secured. The Milk Bill was likely to be re-introduced, and it was unlikely that any Government would listen to a proposal that it should be cast aside for anything fresh, even if it came from a deputation or Committee composed so generally as was proposed. They ought to regard that Bill as likely to become law, and should endeavour to get it altered so that their present position might be preserved. There would be more success in that direction.

In reply to a request to submit his amendment in writing, Prof. DEWAR said his amendment would be that the Office Bearers of this Association be asked to draw up a Memorandum and submit it to Lord Pentland pressing on him the necessity for legislation in connection with a restriction of tuberculosis especially as affecting dairy cows.

Prof. WILSON seconded.

Mr. CAMERON suggested that they should not limit inspection to any variety of animal.

Prof. DEWAR said that Mr. Cameron might rest assured that no legislation would be passed in this direction that was not on a broad basis.

Prof. GORTON said he sympathised with Prof. Dewar's attitude that it might be desirable to word the motion in such a way that they left it open as to who should be consulted, but that they should impress on the Secretary for Scotland the desirability of taking active steps with the object in view. If they asked for a deputation to be received they would go a step further than was suggested by Prof. Dewar. To write and ask for a deputation to be received would have the same effect as Prof. Dewar's motion. If a deputation were received they would get a second chance of promoting their object. With the consent of the Chairman and of the meeting he suggested an alteration of the motion to the effect that the Secretary for Scotland be asked to receive a deputation to urge on him the desirability of introducing legislation and taking adequate steps for the protection of the public health and the eradication of animal diseases communicable to man through the milk supply. If that motion would be carried unanimously he would withdraw the original one in its favour.

Prof. DEWAR said he knew that busy Parliamentary men did not like to be troubled too much, and he did

not think a deputation would do more good than a memorandum sent from this Association. If the meeting, however, was of opinion that a deputation should be sent he would withdraw his amendment, but he still adhered to his idea as to who should be consulted, and as to taking in all disease. If they took in one disease it would take in all the others.

Dr. BRADLEY said that a memorandum would be pigeon-holed; a deputation was better.

Prof. DEWAR said that if the meeting wished it he agreed to a deputation being sent to the office in Edinburgh.

A motion was finally adjusted and carried unanimously to the effect "That the Secretary for Scotland be asked to receive a deputation from the Society, and that the deputation should impress on the Secretary for Scotland the urgent necessity for the Government dealing with tuberculosis, more particularly as affecting dairy stock, at the earliest possible moment."

A vote of thanks was given to the Chairman for presiding, and the proceedings terminated.

Prof. GORTON, Hon. Sec.

DISEASES OF THE DOG AND THEIR TREATMENT.—By Dr. GEORG MÜLLER, Professor Director of the Clinic for Small Animals at the Veterinary High School at Dresden, and ALEXANDER GLASS, A.M., V.S. (McGill), Lecturer on Canine Pathology in the Veterinary Department, University of Pennsylvania. Third illustrated edition, revised and enlarged. Royal 8vo., pp. xviii + 506; 178 illustrations and 14 full paged plates, some of which are coloured. (Published by Baillière, Tindall & Cox, 8 Henrietta St., Covent Garden, London. Price 25s. net.)

Two editions in the original German language and three editions in English of this work have appeared within a few years. This is in itself an indication that the book is appreciated and demanded by those who take an active interest in the diseases of the dog. Canine pathology during the last decade or two has become of great importance to practising veterinary surgeons, not only in Great Britain, but also in the majority of Continental States and in the United States of America.

This book is a great improvement, both in text and in illustration on the former editions and supplies a great want to those who require a reliable guide or work of reference to canine pathology, surgery and therapeutics. It is printed in good type and on good paper. The illustrations, although not very artistic in many instances, are well selected and will no doubt assist the student and junior practitioner, and even the more experienced practitioner in recognising certain rarer morbid conditions, hitherto not always understood by the observer. As much cannot be said of the illustrations in some dog-books and which serve no useful purpose to the reader. A great feature in this edition over the former ones is the space given to nervous disorders, especially of some of the disorders of the motor nerves, which have generally been much neglected in this country, and also to the skin diseases, a good knowledge of which is of very great importance to every practitioner and from which he derives a fair amount of his income.

There is, however, fault to be found with the too frequent mis-spelling of the names of authorities and of ordinary words, but although this is of minor importance it goes to show that a certain amount of carelessness has been displayed on the part of the proof readers. Another, and still more serious fault is that many of the figures, borrowed or copied from other works, have not been acknowledged. There is, furthermore, now and again some incomprehensible sentences which are likely to puzzle the reader. For instance, we

quote from p. 304 the following: "The kidneys are frequently the seat of more or less tubercular deposits, and in twelve cases scattered granulations were found in the *spinal* (?) and membranous substance, but cheesy abscesses and centres were also found."

Notwithstanding these faults the work is the best of its kind and we strongly recommend all those in canine practice or those who are not to purchase it not with the idea of ornamenting their bookshelves, but of digesting and of assimilating its contents thoroughly. The publishers, who are well known to be good caterers for the literary wants of the profession, deserve praise for their share of the work and for presenting it to British readers.

OBITUARY.

WILLIAM APPLETON, M.R.C.V.S., Shanklin, Isle of Wight. Graduated, Edin: May, 1859.

Mr. Appleton died at his residence on March 11, from bronchitis. Aged 79 years.

JAMES BRODIE GRESSWELL, F.R.C.V.S., Louth, Lincs. Lond: March, 1882: July, 1888.

Mr. Gresswell's death took place at Karnak House, Worthing, on Sunday, March 17, from diabetes mellitus, at the age of 51.

Mr. Gresswell was the son of the late Alderman D. Gresswell, F.R.C.V.S., of Louth, and was late Examiner for the FitzWygram Prizes at the Royal College of Veterinary Surgeons and Lecturer in Veterinary Science under the Lindsey County Council. He was the author of various works on veterinary science, including the "Manual of Equine Medicine," "Diseases and Disorders of the Horse," and "Equine and Bovine Prescribers," and also collaborated in a work on Comparative Medicine with his brothers, Dr. Albert Gresswell and Dr. George Gresswell, of Louth. He was Examiner for the Royal Cart Horse Show in 1890, and Veterinary Inspector under the Contagious Diseases (Animals) Act. Formerly he was a Captain of the 1st Lincolnshire Royal Volunteer Artillery. He was a Freemason, and a member of the Mark Degree.

* Counties affected, animals attacked : London 2, Middlesex 1.

Board of Agriculture and Fisheries, Mar. 19, 1912.

AN APPEAL FOR OUR DUMB FRIENDS.

Sir,

It has given me great pleasure to read in your columns of the passing of the new Act for the prevention of cruelty to our animals, and also from time to time the evidence of the keen interest which so many of the profession are taking in this direction.

While I am willing to admit the cruelty of working an animal suffering from some foot trouble or wound of the skin, it is my honest opinion that the practice which I now condemn is much more unjust to our horses—and that is the working of an animal on an insufficient diet for such work as he is called upon to perform. My remarks apply essentially to horseowners of the poorer classes, for with a few exceptions we cannot help admiring the condition in which the horses of the wealthy and of most commercial stables are kept.

My reason for bringing this question to the notice of your readers is that I could find no provision for this in the new Act, and the only mention of feeding was in Clause 7, which provides for the proper feeding of the animal while in pound. It is my belief that in the majority of alleged cases of cruelty the carman concerned was guilty of thoughtlessness and possibly ignorance, rather than intentional cruelty, but in his case I find it hard to ascribe his manner of feeding his horse to anything but sheer ignorance. Can we wonder at the fact if such a man should not have the slightest idea of animal management? We all know that the huntsman who runs his horse to death is almost on all sides proudly spoken of as a true sportsman and hard rider, but writing in the interests of animals one can only deprecate such action! Such wanton cruelty is not the poor man's offence, and not realising the folly of it, he tries to get too much work from an animal in proportion to the amount of food he gives him. His great object is to be as economical as possible, and being ignorant of the principles of economic feeding he fails to foresee that his economy will come more expensive to him in the end. Every one of your readers must have noticed, at some time or the other, a poor, ill-conditioned horse struggling with a load which, although it would by no means be a heavy load for him when in good condition, is far more than he can manage in his present state. Quite recently I noticed a horse in the poorest of condition trotting with a heavy load down hill. He showed nothing of that bright, fresh look which we associate with health, but seemed quite listless and apparently capable of very little more energy than it required to put one foot in front of the other. I reflected with a pang what that animal would suffer when he came to a slight hill if he should do so before the cart was unloaded.

Knowing how willingly the majority of horses are to

bring forth their best powers of endurance, should not we, who have so much interest in them, use all the means in our power to see that they at least get fair play? For some time I have given this matter a great deal of attention and thought, and at present I must admit that it is difficult to arrive at a satisfactory method of remedying this evil.

For lack of a better plan I would suggest that a society be formed of veterinary surgeons interested in the matter for inquiring into such cases, or perhaps we could persuade the R.S.P.C.A. to undertake this. I suggested veterinary surgeons, for I am sure that they would be quite willing to give any advice that might alleviate an animal's suffering without wishing to take a fee from a man who was obviously unable to pay one.

In the first instance, if an animal was seen in a very bad condition, and the most inexperienced layman knows the appearance presented by an underfed animal, it would be taken for granted that such an animal was either overworked in proportion to his diet or that he was affected with some wasting disease, *e.g.*, Tuberculosis; or perhaps bad teeth. His bad condition might be due to extreme old age. There are, of course, some animals which never fatten, but these would be easily distinguished by their general appearance. I would strongly suggest that at this juncture no arrests should be made, for if owners came to regard their case as being criminal they could, by giving false information, place great obstacles in the way of anyone making inquiries. The owner's name and address should be taken, and an expert should be sent (at the expense of R.S.P.C.A.?) to inquire into the case. He would then first examine the horse as to his general health, and if this were found good, he should then proceed to make inquiries as to the animal's food and feeding.

In my opinion, the expert would be the right man in the right place, not only because he would be able to detect disease if there was any, but owing to his college training, he would be in a position to advise the most economic fodder and the best manner of feeding for the class of horse. I think that in the majority of cases the owners would soon perceive that the expert was doing his best to help him and would accordingly be willing to do all in his power to make the inquirer's task an easy one.

If, after these proceedings, the owner did not dispose of his animal, and either from indifference or lack of means made no attempt to improve the animal's condition, he should be liable to have such an animal taken from him, and, if possible, sold. After all expenses had been deducted the balance of the money received from such a sale should be handed over to him. It may be that the foregoing suggestions would not be found practicable, and so I should be glad to have the opinions of others of your readers who may be interested in this subject.—I am, Sir, yours truly,

R. G.

BLACKLEG

(QUARTER-EVIL. SYMPTOMATIC ANTHRAX.)

The New Zealand Official Report on Blackleg shows that the mortality from this disease has been reduced by 75 per cent. since vaccination was made compulsory. The vaccine is supplied in convenient form under the name of

"BLACKLEGIDS."

"Blacklegoids" are easily administered by means of the "Blacklegoid" Injector.

Extract from a letter which appeared in *The Veterinary Record*, January 25, 1908: "About five years ago I commenced to inoculate with Parke, Davis & Co.'s 'Black legoids,' and since then I have lost only one, and that was this year, out of over 900 inoculated since I commenced. I may mention that I have no interest in Parke, Davis and Co.'s preparations."

Co. Kilkenny, December 28th, 1907.

The Stock Inspector of the Pastures Protection Board, Singleton, Australia, when ordering (May 17, 1907) 200 doses of "Blacklegoids," stated: "This is the third year I have used your 'Blacklegoids,' with a result far better than I or the owners of the cattle ever anticipated. I do not know of an instance where it did not act as an immediate preventive."

Further particulars will be sent on request by

THE ‘RECORD’ PRECISION SYRINGE.

The FINALITY of
Hypodermic and Serum Syringes.

“The “Record” Precision Syringe is a piece of delicate mechanical workmanship well deserving its name. It meets **all requirements as regards aseptic conditions and accuracy and it is always ready for use.**

It consists of **metal and glass** only. The glass barrel is ground inside perfectly true to cylindric form. The Nickel vacuum piston is “ground in” into the glass barrel by precision machinery so as to fit hermetically, it slides smoothly, yet tightly, **without any lubricant.**

The cover is fixed on the cylinder with a **bayonet-fastening**; for the purpose of **thorough cleaning** it is provided with a segmental incision, by means of which it can be detached from the piston-rod by sliding it off side-ways. When **completely** taken apart the Record Syringe **forms 3 parts only: cover, piston and barrel.**

The **Needles** are provided with the original “Progressive” flat mounts. By this arrangement a good hold is afforded to the operator.

The fixing of the needle itself in the mount, by means of a smooth longitudinal guide arranged above the screw threads prevents the needle from breaking off in the mount.

EVERY SYRINGE IS GRADUATED BOTH IN C.C. AND MINIMS.

PRACTICES FOR DISPOSAL

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains : reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises. Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

EAST COAST. Agricultural practice returning £600 per ann. Good house containing 2 recept. 4 bedrooms, bath, kitchens, etc. Stabling for 4 horses, coach-house, kennels, etc. Price required for house and practice £1300, of which £400 can remain on mortgage, or vendor would sell practice for £500 and would let house on lease at £45 per annum.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

HOME COUNTY. Practice returning £350 to £400 per ann. In present hands nearly 20 years. Small house with $\frac{1}{2}$ acre garden and good stabling. Rent £35. Premium £200.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended

WILLOWS, FRANCIS, BUTLER & THOMPSON.
LIMITED,

Wholesale Druggists,

40 ALDERSGATE STREET, LONDON, E.C.

Professional Advertisements.

These will be received up to Thursday morning.
Five lines or under 2/6 (exclusive of heading): for two insertions 4/-; for three 5/-; after three 1/- each.
Each line above five—first insertion 6d; after first 3d.
Average—seven words in a line.

These Advertisements will not be inserted unless prepaid, and if replies are to be received at this office an extra sixpence must be included.

Notice.—Good Friday.

NEXT week, advertisements for this column must reach this office on Wednesday (instead of Thursday), 2 p.m. latest.

The Central Veterinary Society

A GENERAL Meeting will be held at 10 Red Lion Square, W.C., on Thursday, April 4th, 1912, at 7 o'clock, prompt. Agenda: Routine business: "An Improved Method of Treatment of Canker of the Horse's Foot," by A. W. Noël Pillers, F.R.C.V.S.
HUGH A. MAC CORMACK, Hon. Sec.

Wanted

ASSISTANTSHIP (or Locum) by M.R.C.V.S., thoroughly practical and reliable, experienced town and country practice. Good references. Address, 5032 V.R., 20 Fulham Road, London, S.W.

Assistantship

M.R.C.V.S., practical, experienced town and country, abstainer, disengaged. Permanency or locum. Good references. Moderate salary. Address, 5031 V.R., 20 Fulham Road, London, S.W.

Wanted

QUALIFIED assistant, used to country work, must have references. Salary £150, live out, sign usual bond. A. C. Stewart, Veterinary Surgeon, Cardiff.

Partner Wanted

VETERINARY Surgeon in a good-class agricultural and residential district, wants a practical, qualified partner. Must be a gentleman with capital at command. For particulars, in strict confidence, apply to 5033 V.R., 20 Fulham Road, London, S.W.

For Disposal

GENUINE unopposed practice, Midlands, Agricultural, Hunting, £200. Wide scope, good operator. Small Capital. Easily worked cycle. Immediate possession. Small premium. Drugs, fixtures. Address, 5635 V.R., 20 Fulham Road, London, S.W.

As Assistant or Locum

VETERINARY surgeon desires permanency in good class country practice. Experienced, bloodstock, cattle, reliable, hard worker, used to taking charge, good obstetrician, horseman, single, 35, excellent references. Address, 5038 V.R., 20 Fulham Rd., London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,

LOCUM:

73 Victoria Mansions,
South Lambeth Road, S.W.

HUGH R. SINGLETON, M.R.C.V.S.

LOCUM TENENS.

44, St. Michael's Road.
Bedford.

Locum Tenens

MR. WALTER G. GREEN, M.R.C.V.S.

"Rosenheim,"
Boscombe Park,
Bournemouth.

For Sale

SET P.G.C. also Class C. Pathology Notes, London, typed ready for binding, £1 10s. 0d. Address, 5036 V.R., 20 Fulham Road, London, S.W.

Under Exceptional Circumstances.

ASPORTING and Agricultural Practice, well-established in a favourite County. Returns last twelve years from £350 to £420. All kinds of sport in immediate neighbourhood, and great inducements to those fond of rural life. Price very moderate to quick buyer, Address, 5037 V.R., 20 Fulham Road, London, S.W.

Vacancy

IN a good mixed practice for student who is practical and a good dispenser. Required middle of April. Indoors. Also for a pupil or student requiring to see practice. Address, 5034 V.R., 20 Fulham Road, S.W.

For Disposal

USEFUL practice near London. Mixed, chiefly canine. Good premises, average returns £1000. Open to full investigation. References given and required. Only those with capital need apply. Address, 7403 V.R., 20 Fulham Road, London, S.W.

Assistant Unqualified

DISENGAGED. Long experiences, castration and parturition, etc. Excellent references. Address, 4035 V.R., 20 Fulham Road, London, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

The Journal of The Board of Agriculture

ISSUED on the 15th of each month. Twelve months 4/-, three months 1/-, or single copies 4d., direct from the Board of Agriculture and Fisheries, 4 Whitehall Place, London, S.W., or through any bookseller.

New Parturition Instrument.

ILLUSTRATED description of same in actual use, and testimonials sent on application. Removal of limb and dissection made easy. Orders for this season must be sent early. Address, W. J. Fletcher, M.R.C.V.S., Wrexham.

Assistant Wanted

UNQUALIFIED assistant wanted for horse and dog practice. State age, experience, references, and salary required, to 6403 V.R., 20 Fulham Road, S.W.

Agent, or Inspector

M.R.C.V.S., with large experience in the exportation of horses to the Continent, and just returned from the Argentine, having a knowledge of Spanish and served a special course of meat inspection, would like an engagement at home or in one of the South American Republics, to look after the interests of live stock exporters. Address, 3034 V.R., 20 Fulham Road, S.W.

Wanted to Purchase

GENUINE good-class, old established, town and country practice in Midlands or North of England, returning £600 to £800. Must bear strict investigation. Full particulars in confidence to 3036 V.R., 20 Fulham Road, London, S.W.

Wanted

FULL Particulars of Practice for Sale in good agricultural and residential district returning up to or over £700 per annum. Advertiser has sufficient capital to purchase outright. Address, 1039 V.R., 20 Fulham Road, S.W.

To Vendors.

WANTED Veterinary Practices and Partnerships. Surgeons wishing to sell the whole or a share of their practices are invited to communicate with Messrs. Peacock & Hadley, Veterinary Transfer Agents, 19, Craven Street, Strand, W.C., who will be pleased to introduce likely purchasers. No charge whatever made unless a sale be effected.

Replies to Numbered Advertisements

WHEN replies to several of these advertisements are sent to this office at one despatch, it is not necessary that they should be stamped separately: they may be enclosed in one envelope, but should be marked outside "Replies."

Missing Numbers

OWING to claims for missing numbers reaching us often many weeks after date of issue, we have to notify that claims for non-delivery will not be accepted if the date of origin is later than four weeks from date of due delivery in the case of foreign subscribers, or more than fourteen days after printed date in the case of inland subscribers.

H. & W. BROWN.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

CHEAP BOTTLES.

A large quantity of named medical bottles (these have various chemists' names on and washed ready for use)
2oz., 3oz., 4oz., 6oz. and 8oz. at 5/6 a gross.
10oz., 12oz., and 16oz. at 7/- a gross.
Cash with order. Carriage paid on £3 orders within 70 miles, and on £5 orders any distance.
Other bottles and jars quoted for.

THE FARRIERS' JOURNAL.

A Monthly Magazine for Horse Shoers.
The only paper devoted to the interest of the Shocing Smith.

Price 2d., by post 2½d.

Published by G. WILD, 62 Mount Street,
Ashton-under-Lyne.

**Non-Poisonous,
Non-Corrosive,
Soluble in Cold Water.**

CHINOSOL

**Active Antiseptic,
Strong Deodorant,
Powerful Germicide.**

Practical experience for years past proves that Chinosol in solution or ointment readily penetrates diseased tissue, thoroughly cleanses and keeps healthy all kinds of wounds, favours granulation and speedy healing, mostly without a scar, and promotes the growth of hair. Chinosol is supplied in

POWDER.

CHINOSOL PURE POWDER for therapeutical preparations used *INTERNALLY*.

CHINOSOL VETERINARY POWDER for lotions, ointments, etc., for *EXTERNAL* use.

CHINOSOL CRUDE GRANULAR FORM } for prompt production of disinfecting fluids for odourless disinfection.

CHINOSOL CRUDE POWDER F }

CHINOSOL SPRINKLING POWDERS for disinfecting and deodorizing stables, sheds, styres, kennels, fowl-houses, etc.

Also **ANTISEPTIC DRESSINGS, OINTMENTS, SOAPS, PESSARIES, CHINOSOL BORACIC DUSTING POWDER VETERINARY EQUIPMENT, etc.**

Write for full Price List, also for **POCKET CIRCULAR** for *VETERINARY PRACTICE* giving full particulars of treatment of **MILK FEVER, ABORTION, INFECTIOUS VAGINAL CATARRH** in *COWS*, and a great number of approved formulae.

NOTE.—Buyers of our preparations should in their own interest insist in receiving *ORIGINAL PACKAGES* bearing our trade mark with name and address of the Company and full directions inside, they should reject all packages not answering above description *AS NOT GENUINE* and inform us when such are offered.

Sold by Messrs. **Hewlett & Son, Ltd., London;** **Willows, Francis & Co., London;**
Wyleys, Ltd., Coventry. **Woolley & Co. Ltd., Manchester.**

And all **WHOLESALE CHEMISTS** dealing in *VETERINARY MEDICINES*.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1238.

MARCH 30, 1912.

VOL. XXIV.

THE ROYAL COMMISSION ON VIVISECTION.

After sitting for 5½ years and holding more than 70 meetings, this Commission has at last issued its Report, which may quite fairly be called, as it has already been called "on the whole a complete vindication of vivisection." It is important to note that the main Report is signed by all the eight surviving members of the Commission, though three have only signed it subject to special reservations set forth in appended Memoranda. All three of these members—Col. Lockwood, Sir William Collins, and Dr. George Wilson—sign the first Memorandum of 8 pages long; the second and much longer one is signed by Dr. Wilson alone.

Almost all that need be said of Dr. Wilson's independent report is that he is much less inclined to attach value to the results of animal experimentation than his fellow-Commissioners. This is not surprising, as he also disbelieves in the utility of the diphtheria anti-toxin, and considers the germ or microbial theory of acute infectious disease, as well as the serum and vaccine treatment based upon it, illogical. But even Dr. Wilson's pathological views have not prevented him from signing the main Report with his colleagues.

That main report covers so much ground that we can only very briefly summarise its chief findings. First the history of the present Act and its working, and the accusations of anti-vivisectionists against the latter, are considered. Certain specific charges are weighed and found wanting, the charitably expressed conclusion being "that the witnesses have either misapprehended or inaccurately described the facts of the experiments." The Commissioners find that "with rare exceptions" the experimenters have conscientiously endeavoured to abide by the law; and then, after a stricture upon the misleading character of many anti-vivisectional descriptions and illustrations, it is plainly said "To represent that animals subjected to experiments in this country are wantonly tortured would, in our opinion, be absolutely false." Considering how constantly that very representation is made, this unanimous sentence is significant in the extreme.

Turning to the utility of vivisection, the Commissioners conclude that it has yielded valuable knowledge which probably could have been acquired in no other way, and may be expected to continue to do so. This conclusion of facts leads them to the opinion that "experiments upon animals, adequately safe-guarded by law, faithfully administered, are morally justifiable and should not be prohibited by legislation." Finally, they consider the means of minimising the animal suffering attendant upon experimentation; and, while opining that the present Act has been "so worked as to secure a large degree of protection to animals subject to experiment, and at the same time so as not to hamper or impede research," they submit a series of recommenda-

tions as further safeguards. These comprise an increase in the inspectorate (up to four whole-time inspectors for Great Britain), further and stricter provisions regarding the now little used curare, the definition and practice of pithing, and the destruction of suffering animals, with some changes in the constitution of the Advisory Body to the Secretary of State, and provision for special records by experimenters in certain cases. Not one is revolutionary.

The short Lockwood-Collins-Wilson Reservation Memorandum only differs from the main Report in a few particulars. The memorandists recommend that the responsibility of the Secretary of State be increased (making it an undivided responsibility) and that the "pain condition"—the obligation to destroy suffering animals—be made still more stringent. These—their chief points, they think require a new Act of Parliament, but they add two or three minor ones, one of which we emphatically endorse. The main Report holds it essential that Inspectors under the Act should be qualified medical men. The memorandum would extend eligibility to men qualified in veterinary medicine and science. Certainly veterinarians should make as efficient inspectors as medical men, and, in the case of some experimental animals, much more so.

Upon the whole the Report proposes to alter very little. Study of the history of more than thirty years experimentation has naturally suggested some improvements to the Commissioners. These, if acted upon, will probably save some animal suffering, without at all impeding research. But the most striking feature in the Report is its crushing disproof of the allegations of popular anti-vivisectionism—a disproof all the more complete from the known anti-vivisection leanings of some of the Commissioners.

MILK AND MILK PRODUCTS.

The whole question of the composition of milk, and the products which can be manufactured from it, and the problems arising from its easily destructible nature forms an interesting subject.

Several of the foods of which milk is the basis, such as cheese, have probably been known ever since man first domesticated milk-yielding animals, but during the last few years scientific research has enabled modified and new food substances to be manufactured from milk.

Average composition of cow's milk. The following is the percentage composition of an average sample of good milk, calculated from the results of 200,000 analyses made in the laboratory of the Aylesbury Dairy Co., London.

Water	87.2
Fat	3.9
Milk sugar	4.75
Proteids	3.4
Ash	.75

Occasionally wide variations are found ranging in the case of the fat from a maximum of 12.52 per cent. to a minimum of 1.04 per cent., and in

the case of solids other than fat, 10·6 per cent. to 4·9 per cent.

These examples must be taken as very abnormal milks; but such possibilities, nevertheless, render it very difficult to determine whether any particular sample has or has not been adulterated.

Legal standard. Under the Sale of Food and Drugs Acts the Board of Agriculture and Fisheries was given power to fix limits for the composition of milk, and in 1901 the Board issued regulations by which a sample of milk which contains less than 3 per cent. of fat or less than 8·5 per cent. of non-fatty solids shall be presumed for the purposes of the Acts, until the contrary is proved, to be not genuine, by reason of the abstraction of milk fat or non-fatty solids (as the case may be), or the addition of water.

The physical composition of milk is of considerable interest, particularly in regard to the fat. It exists in the form of spherical particles. It has been suggested that each particle is surrounded by a slight membrane, and another suggestion is that no real membrane exists, but that a gelatinous skin surrounds the particles. The fat is obtained from milk either by allowing it to stand, when a mixture much richer in fat is obtained, or by the employment of a separator.

The separator is a modern invention, which by rapid revolution forces the heavier portions of the milk towards the wall of the receptacle, leaving the lighter portion—the cream—in the centre. The separated fluids are run off while the machine is in motion—the rate being about 6000 revolutions per minute. The separator, however, does more than merely separate the cream from the milk, for it does much towards ridding the milk of solid impurities. What is called separator slime is formed on the walls of the revolving cylinder, and this consists of hair, dust, cobwebs, pieces of straw, particles of cow dung, micro-organisms—in fact scraps of every sort possible in a cowshed. To strip off the tough, elastic layer from the metal, it is necessary to use a strong scraper.

It forms part of the duties of the Sheffield veterinary officials to regularly inspect the separators that are being used in the city.

After separation the milk and cream can be, and are often re-mixed. The removal of the impurities increases the keeping qualities of the milk, and the reasons for this may be that during the process the non-germinal dirt removes mechanically a large percentage of bacteria, or that the dirt removed reduces the nutrient quality of the medium.

Whichever may be the cause of the better "keeping," one fact stands out prominently, viz., the ordinary cowshed or dairy sieve does not remove any but the major varieties of dust particles.

The composition of separated milk is as follows:

Water	per cent.	90·0
Fat		·2
Casein		3·5
Albumen		·5
Milk sugar		5·0
Mineral matter		·8

In some districts farmers and dairymen consider separated milk an excellent food for animals.

The only actual dairy product made from separated milk is a poor type of cheese, made on very much the same lines as the Dutch Gouda or Edam; but even then it is more general to return a small proportion of the fat to the milk before renneting.

Starters are usually made by stirring the culture powder into pasteurised separated milk.

Biscuit makers and bakers use separated milk and the price they usually pay is 3d per gallon.

Casein is the important nitrogenous matter in milk, and is prepared in the following manner. The milk is warmed, and the curd is precipitated by the addition of dilute sulphuric acid or acetic acid, after which it is treated by one of two processes. The acid is syphoned off, the curd thoroughly washed, and the liquid decanted. The curd or casein is then heavily pressed, and afterwards removed to a drum with several revolving beaters inside, which speedily reduce the damp mass of curd to small fragments. These are again removed, and are desiccated at about 150 deg. for 24 hours. The result is a light yellow powder, very similar to maize flour.

By the alternative method, after the curd has been precipitated, it is washed and redissolved in a small quantity of an alkaline solution. It can then either be dried at once or again precipitated by acid, and once more dissolved in an alkali, afterwards being evaporated as before. The powdered casein can be used, like milk powder, for the manufacture of cakes or bread.

It is also the chief component of such quasi-medical products as Plasmon, Nutrose, Sanatogen, Tilia, Enlactol and Bucasin, which proves to a certain extent that it is a nutritious food.

Prepared with formaldehyde, after being precipitated by metallic salts, instead of acids, a very durable substance known as Galalith or Lactoform, is produced, which is used as a substitute for bone, ivory, shell, horn and even celluloid, while it lacks the inflammable characteristics of the latter.

Lacterin is another casein product, but is generally prepared from buttermilk. It is used dissolved in ammonia, for fixing the colours in calico-printing. The American "cheese-paint" is also prepared from casein mixed with lime, and is said to make a very powerful whitewash. Casein powder is sometimes used in the manufacture of paper.

Casein can be rendered soluble by means of a little sodium carbonate, and as its food value is weight for weight four or five times that of the best beef, it is extremely valuable as an addition to many dishes.

When casein can be made more cheaply it will, from considerations of transport, probably form an important part of campaigning rations, for it is the most concentrated nitrogenous food with which we are acquainted.

Cheese is closely allied to casein. In fact, a cheese from skim milk is only an impure form of casein, ordinary cheese being a mixture of casein

and cream, the sugar having been eliminated from the milk.

What is known as "cream cheese" is merely cheese made from milk which has had extra cream added to it, and so contains a larger proportion of fat.

Butter.—Amongst other products derived from milk, butter is perhaps the most prominent and the best known.

What is known as butter-milk is simply the liquid which is left when the fat of the cream has been churned into butter. The globules of the fat have coalesced and left the liquid behind which contains some casein and sugar.

Condensed milk was first prepared by the American, Gail Borden, in 1856. It is obtained by boiling down milk so as to remove a large proportion of the water it contains. The operation is carried out at a temperature of 40° to 50° C., and the evaporation goes on till the volume is reduced to a third or a fourth of the original. Great care is exercised in the evaporation, for otherwise the milk sugar crystallizes out, and this causes the condensed milk to feel "sandy" on the tongue. On the market there are sweetened and unsweetened condensed milks, ordinary cane sugar or glucose being used if the former state is desired.

The manufacture of condensed separated milk has been going on for some time, and this material is sold in large quantities in this country. There being little cream in this condensed separated milk the product is of corresponding lower value.

In the course of his duties as a food inspector the present writer sees a very large number of tins of condensed milk which are unfit for human food, and considers that it would be in the interest of the public health if the makers of condensed milk were compelled to label their products "Unfit for the food of infants." It would also be advisable to place the date of manufacture on the label.

Dried milk or milk powder is prepared by evaporating milk to dryness. It contains all the constituents of milk except the water. A good dried milk when stirred with water ought to give a fluid which, in taste and appearance as well as in its chemical and physical properties exactly resembles milk. Up to the present, separated milk has been used in far larger quantities for this preparation than whole milk, for the material made from the latter has not found such a ready sale. In order to give a greater stability to the emulsion which is formed on dissolving milk powder prepared from whole milk in water, either 1 to 3 per cent. Sodium Bicarbonate, or 2 per cent. sugar is added.

Other milk products.—In addition to the products described above there are others which are used for special dietetic purposes.

One of these, Koumiss, was originally made from mares' milk by the Tartars. It is produced by a set of fermentations, including the alcoholic fermentation of the milk sugar, together with the ordinary souring of milk. There are various kinds of Koumiss and the substance is claimed to be a food and stimulant at the same time. It is given in cases where practically no other food can be absorbed.

Kephir is a similar preparation to Koumiss, but the fermentations necessary in its manufacture are set up in milk by grains of kephir. Freudenreich, of Bern, has isolated four micro-organisms in grains of kephir and states that none of these microbes is alone able to bring about the kephir fermentation. There is clearly a true symbiosis amongst the four different organisms.

In Armenia a thick substance called "Mazoun" is made which appears to be sour milk mixed with cream.

"Leben" is the name applied to a sour milk beverage prepared in Egypt.

A milk preparation called "Yoghurt" has come into prominence recently because of the *Bacillus Bulgaricus* which it contains. This organism is a very powerful exciter of lactic acid fermentation and, according to Metschnikoff, it acts as a sort of disinfectant in the large intestine, and thereby checks the chronic toxic poisoning caused by the putrefactive organisms. Metschnikoff, who is of the opinion that the putrefactive fermentation which usually takes place in the large intestine tends to shorten life, and that if these putrefactive changes could be checked human life would be prolonged, recommends the use of milk containing the *Bacillus Bulgaricus*. The unusually long life enjoyed by many of the Bulgarian country population would thus be explained, for they are known to consume large quantities of Yoghurt daily. Cultures of the micro-organisms present in Yoghurt can now be bought. By allowing the milk to become partially sour, and then adding some of the culture, Yoghurt can be obtained in a few hours if the temperature is kept at about 40° C.

W. JACKSON YOUNG, F.R.C.V.S., D.V.S.M. (Vict)
Sheffield.

ABSTRACTS FROM FOREIGN JOURNALS.

THE VALUE OF OIL IN PERITONEAL SURGERY.

Glimm, by experiments on dogs and guinea-pigs, has demonstrated the favourable effect of oil upon the course of peritonitis. Olive oil and other oils, in peritonitis caused by the *Bact. coli*, check in a high degree the resorption of bacteria into the circulation, while the oil is well tolerated by the peritoneum.

Glimm's results have induced Hirschel, at the surgical clinique at Heidelberg, to use camphor-oil (1 per cent.) intra-peritoneally after the performance of laparotomy in some severe cases of peritonitis in human beings. His results have been excellent. His procedure is first to remove the masses of peritonitic exudate by means of pieces of gauze, either dry or moistened with saline solution.

He then introduces camphor-oil up to a quantity of 100 grammes (about 3 1-3rd oz.) into the peritoneal cavity; and distributes and spreads it everywhere (viscerally and parietally) by means of pieces of lint.

In the most recent times, oil therapy of the peritoneum has assumed great importance. One report by Kolb, who used it in 53 cases of lapa-

rotomy, is exceedingly favourable; for only one of these cases terminated fatally.

Prof. Karl Keller, of Vienna, now reports (*Zeitschrift für Tiermedizin*) his experience of the method in three bitches, in all of which laparotomy was necessary. The first case was one of torsion of the uterus with peritonitis. The second was a case of extensive peritonitis arising from metritis, and was further complicated during the operation (extirpation of the uterus) by a purulent infection of the peritoneal cavity. All three cases were thus severe ones. All three recovered, and in each case Keller attributes the favourable result to the oil treatment.

In a fourth case the treatment proved useless; the patient, a bitch, being *in extremis* when operated upon. Section of the abdomen was followed by the escape of a large quantity of greenish-brown, turbid, foul-smelling liquid, mixed with shreds of placenta. The uterus contained putrid pups and was gangrenous in various places, at one of which rupture had occurred. The bitch died six hours after operation.

In addition to its effect in checking resorption, the oil introduced into the peritoneal cavity always creates a nidus unfavourable to the growth of pathogenic bacteria. Keller considers that paraffin oil in particular, on account of its chemical composition, possesses this special effect. He therefore uses paraffin oil sterilised by heat, employing about 50 grammes (approximately 1 2-3rd oz.) for each case.—(*Berliner Tier. Woch.*)

A PRACTICAL METHOD OF INDUCING HORSES TO SWALLOW FLUIDS.

The administration of fluid medicines to the horse is always a laborious task. Very often the animal resists swallowing the liquid, so that the greater part escapes again from the mouth. Combarret commends (*Bullet. de la Soc. Cent. de Méd. Vét.*) a method which he has now used for a long time, and which has always rendered him good service.

The horse's head is held up in the usual manner; and the administrator, standing upon an elevation, pours in the fluid from the side, introducing the neck of the drenching bottle over the tongue. As soon as a certain quantity of fluid is in the mouth and the horse refuses to swallow, a very little clean, lukewarm water is poured into one of the nostrils. The water, by its contact with the nasal mucous membrane, immediately induces a reflex action which causes the horse to swallow the mouthful. This manipulation is repeated until the whole draught is swallowed, and the result is that not a drop is lost.

It is important to take only a very little water—about three to four tablespoonsful—and to discontinue its instillation into the nostril immediately the horse has swallowed.—(*Berliner Tier. Woch.*)

W. R. C.

[We all know the difficulty of inducing some horses to swallow draughts. I have never heard of this method of combating it before, and think it would be worth trying. But it seems to me—and the author seems indirectly to admit—that it is not altogether a safe method in the hands of stable attendants.—*Transl.*]

VETERINARY ASSOCIATION OF MANITOBA.

The annual meeting was held in the Council Chamber of the City Hall, Brandon, on Tuesday, March 5th, at 9 a.m. The President, Dr. S. A. Coxe, occupied the chair, and the following members were present: Messrs. S. Robinson, W. E. Martin, W. R. Taylor, J. McDougall, W. H. T. Lee, M. B. Stiver, J. J. Kelliher, M. J. Preston, W. Leslie, J. Mack, W. A. Dunbar, C. D. McGilvray, I. B. Irwin, F. Torrance, H. Bradshaw, W. H. Smith, J. Young and F. M. Coombs.

The reports of the auditors and of the Secretary-Treasurer and Registrar showed that the affairs of the Association were progressing satisfactorily in most respects, but that the reserve fund had been seriously depleted by several unusual expenditures during the past three years. Some discussion ensued as to how this state of affairs could best be remedied, and it was finally decided that the annual fee should be raised from two dollars to four dollars.

The election of officers resulted as follows:—

President.—Dr. W. R. Taylor, Portage-la-Prairie.

Vice-President.—Dr. C. D. McGilvray, Winnipeg.

Secretary-Treasurer and Registrar.—Dr. F. Torrance, Winnipeg.

Examiners.—Drs. W. E. Martin, C. D. McGilvray, and F. Torrance.

Members of the Council.—Drs. S. A. Coxe, T. C. Lee, and Henry Bradshaw, in addition to the above.

Auditors.—Drs. Woods and Little were appointed for the ensuing year.

It was decided to hold the semi-annual meeting in the City of Winnipeg, in the Agricultural College, during the Midsummer Fair. The annual meeting will also be held during the coming year in Winnipeg.

Dr. LEE brought to the notice of the members a recent experience in which he had accidentally used sulphuric ether instead of cocaine solution when injecting a local anæsthetic for the operation of firing. The horse stood the operation much better than is usually found when cocaine is injected. There was absolutely no indication of feeling in the part, and the Doctor was surprised to find out that it was not cocaine he had been using.

A paper by Dr. Stanley Martin on "Enterectomy and Anastomosis of the Intestine of the Dog" was, in absence of the essayist, read by Dr. Dunbar.

Dr. MCGILVRAY presented an interesting paper upon "Hog Cholera," in which he described outbreaks that he had seen and measures taken to suppress them.

The members discussed the subject very thoroughly and some interesting points in connection with the diagnosis of the disease were elicited.

Dr. MARTIN asked if the essayist considered that the outbreak of disease had any connection with the invasion of rats.

Dr. MCGILVRAY did not think that rats would have been responsible for the recent outbreak, the fact that there were no rats known to be at Kenora, where there was an outbreak, renders this theory entirely untenable.

Dr. COXE asked if there was any one diagnostic symptom that could be depended upon? Any lesion that was always present? He also suggested that it might be well if the Department of Agriculture would notify the practitioners of any outbreaks of disease.

Dr. MCGILVRAY replied that as a servant of the Department he was obliged to carry out the policy that was imposed by those above, and although he might feel disposed to give information that was possible, still he had to recognize the fact that publicity was not always desirable. The Live stock industry might easily be affected by rumours originating from information carelessly given out. As to diagnostic symptoms, no one lesion could be depended upon with the exception of

the characteristic ulceration of the bowels, but, unfortunately, this condition is not seen except in chronic cases. The speckled colour of the kidneys is also an indication, but he considered the appearance of the lymphatic glands more characteristic than this. These were swollen and dark red, and had been likened to "strawberries with pimples on them." Ulceration of the bowels is usually found about the ileo-caecal valve, and the observer must not be confused by the appearance of the group of glands surrounding this part. Diagnosis is difficult in many cases, sometimes it is necessary to quarantine for a time before a diagnosis can be reached.

Dr. DUNBAR said that he had listened with great interest to the remarks that had been made, and congratulated the essayist upon the excellence of the paper which he had presented to the meeting. He had seen the first outbreak of hog cholera in Manitoba 26 years ago. He was then acting for the Dominion Government. The outbreak occurred in a piggery in Kildonan, where the owner had 350 hogs kept under the most filthy conditions imaginable. The food on which these animals subsisted was of the most horrible kind that can be imagined, even night-soil being included. The owner was unwilling to do anything, and the outbreak finally resulted in him losing all of his pigs but 50. Ulceration of the bowels was the chief lesion. This is a very important question to Manitoba, and veterinarians cannot be too well informed thereon. He had much pleasure in moving a vote of thanks to Dr. McGilvray.

Dr. MARTIN seconded the motion, and asked whether the Department advocated the use of serum.

Dr. MCGILVRAY replied that the Department does not advise the use of serum. This is a matter of policy—the slaughter of hog cholera cases was decided upon as best policy for Canada, as the outbreaks were not widespread and were confined to certain limits. Serum is used largely in the United States as a palliative and preventive measure.

Dr. I. B. IRWIN, of Stonewall, reported an interesting case of a cow which developed at intervals a very peculiar chain of symptoms, indicating some peculiar condition affecting the central nervous system. During attacks the animal would walk around in a circle, and in the intervals between attacks appeared to be perfectly normal. The cow made a recovery.

The members present suggested various possible causes.

Dr. COXE was of the opinion that it might have been a case of strychnine poisoning.

Dr. MARTIN suggested that it might have been caused by indigestion, the symptoms developing from toxins produced by decomposing ingesta.

Dr. LESLIE had seen a similar case in a horse. Poisoned wheat had been distributed round a field for poisoning gophers, and the horse had eaten some of this. This horse had spasms every hour for about twelve hours and finally died.

Dr. LEE had seen a similar case in a cow, but in this case it was strychnine poisoning. Spasms occurred about an hour apart and the cow finally recovered.

Dr. TORRANCE congratulated the essayist upon the way in which he had presented the paper. He considered that as a literary production it was one of great excellence. He thought that one of the symptoms presented by the cow could hardly be explained on the grounds of strychnine poisoning, that was the circular movements of the cow. As a rule strychnine poisoning did not produce this circular progression. He had much pleasure in moving a vote of thanks to Dr. Irwin, which was seconded by Dr. Coxe, and carried.

Dr. COXE introduced the question of the desirability of sewing accidental wound. In his opinion a wound must be a bad one and in a bad place, or he would not

sew it up. He finds that wounds do better if not stitched. Dr. Martin was of opinion that the average wound would do as well unstitched, but there are many wounds that require stitching. The owner in most cases imagines the veterinarian is not doing his duty if he does not stitch the wound. If we don't do it someone else will, and in many cases the wound is stitched for the reason that the owner expects it to be done. Stitches retain secretions, and in many cases do more harm than good.

Dr. DUNBAR thought that wounds did as well without stitches, horizontal wounds especially are much better without stitches. Stitches, however, are often necessary, and owners are hard to persuade of the uselessness of stitches.

Dr. COXE did not allow the owner to dictate to him how a case was to be treated. If he thought a wound was better without stitches, it didn't matter what the owner said, he wouldn't stitch it. He considered in most cases stitches were unnecessary.

Dr. LESLIE related an experience in which he used hair pulled out of the mane in order to stitch a wound, to which he had been called and discovered that he had no suture material. The wound did remarkably well, but three weeks later the owner wanted to know why grey scars had marked out the place of each stitch!

Dr. MCGILVRAY was of opinion that the best time to stitch was not immediately after the infliction of the wound, but from 12 to 14 hours later.

The following resolutions were adopted:—

"Whereas the Veterinary Association of Manitoba has learned with regret of the resignation of Dr. Rutherford from the position of Veterinary Director-General and Live Stock Commissioner of Canada, be it resolved that this meeting place on record its appreciation of the great services that Dr. Rutherford has rendered to Canada in the departments over which he has presided, and also to the veterinary profession. Copy of this resolution to be sent to him and also to the Minister of Agriculture."

"Resolved that this Association tender a very hearty vote of thanks to the Mayor and City Council of the City of Brandon for their courtesy in allowing the use of the Council Chamber for this meeting."

In the evening a very enjoyable banquet was held in the Hotel Cecil, Mayor Fleming presiding. A large number of members and friends were present, and enjoyed a very pleasant evening, enlivened by vocal music and speeches.

SOUTH DURHAM AND NORTH YORKSHIRE VETERINARY MEDICAL ASSOCIATION.

A meeting was held in the Imperial Hotel, Darlington, on Friday, March 1st. Mr. W. Awde, Stockton-on-Tees, President, in the chair. There were also present: Messrs. A. C. Forbes, Bishop Auckland; E. H. Pratt, Northallerton; W. N. Dobbing, C. G. Hill, and J. H. Taylor, Darlington.

In presenting the minutes of the last meeting the Secretary stated that in addition to those which had appeared in *The Veterinary Record* there was a minute which for reasons which he now explained he had not included in those published. This minute related to the expulsion of a member from the Association, and he had included it in the minutes now before the members.

It was proposed by Mr. Dobbing, seconded by Mr. Hill, and carried unanimously, that the minutes now presented, after a slight alteration, be taken as read and confirmed.

Mr. Blackburn sent a post-card regretting his inability to be present.

A communication was read from Mr. T. Faithfull-Davies with reference to an International Congress of Comparative Pathology to be held in Paris in October this year.

Several letters were read which the members had received from Members of Parliament with reference to the Coal Mines Bill, the Secretary stated that he had written to Capt. Jessel, M.P., thanking him in the name of the Association for the great service he had rendered the profession when the Bill reached the report stage.

The circular letter from Prof. Gofton was read asking the Association to appoint representatives in accordance with rule 36 of the National Association, to act as their representatives on that Council, and it was proposed by Mr. Hill, seconded by Mr. Forbes, and carried unanimously, that the President and Secretary for the time being each year be appointed by the Association.

CLINICAL CASES.

AZOTURIA.

Mr. PRATT said that he had at present under treatment a case of azoturia in a hackney mare. She had not been taken out of the stable for a few days previous to the attack, and was taken ill on the road. On returning home she went down in the box and showed the usual symptoms. Her temperature was 101°, and the urine was of a dark coffee colour. The treatment he had adopted was a dose of physic, hot fomentations to loins, injections of adrenalin, oil of turpentine, and ferri perchlor. He had passed the catheter night and morning, and that day the urine was much clearer and the mare was sitting up on her breast: she had not been able to rise yet, but he thought that she very soon would, and intended lifting her in slings if she could not manage alone.

The physic ball did not act, and he had given four injections of adrenalin in all. He did not put her into slings at the commencement of her attack as she seemed so comfortable lying, and he thought on that account she would be better resting.

Mr. AWDE said that he had recently had a case of the same disease in a mare who previous to the attack had not been out of the stable for three days. She was brought to his house, and he ordered her home at once, her stable not being far away, and she soon went down when she got there, and showed acute symptoms. The treatment he had adopted was hot fomentations to loins, sedatives, spirits æther nit., linseed oil, and stimulating liniment to loins, and of course he passed the catheter often. The next day as the mare wanted to be up he assisted her up with slings, and she stood for three hours and was then let down again. She, however, could never stand again; nothing in the way of treatment seemed to do her any good, and she died in a few days. The urine remained a dark colour all the time she was ill.

TETANUS.

Mr. AWDE said that he had recently had under treatment a rulley horse suffering from tetanus. Three weeks previous to becoming ill the horse was cut on the quarter with a "ship's plate," and the wound appeared to heal up alright. When first seen the horse was very nervous, jaws almost locked, and symptoms of tetanus well marked. He was put into slings in a dark box and treated with tetanin, one injection being given daily for eight days. The horse gradually improved, and was now having walking exercise and would soon be alright again.

Mr. Awde remarked that he always treated the disease with tetanin serum, and had been more successful with this treatment than any other he had tried. He had records of many successful cases.

Mr. FORBES said that he used to have a lot of very acute cases when he commenced practice at Bishop Auckland, and all died, but the last five cases he had treated had all recovered. He had treated two cases on one farm which were due to foot injuries caused, he thought, by the horses pricking the foot through having to drink from a dirty beck. Both these cases died, and quite recently on the same farm a horse had died from no particular cause, but from what the farmer told him it certainly pointed to another case of tetanus. He did not see this animal, but was told that it had a prick in the foot which was treated by the blacksmith. The horse got sound in a few days and went to work, went a little stiff behind, and died quite suddenly during the night.

It was not long before there was another case on the same farm, and when Mr. Forbes was called in the horse was working. This had similar symptoms to the last case, the farmer said. The serum treatment was adopted in conjunction with extract of belladonna and the case did well. He always advocated slings, a dark box, and belladonna, along with tetanin in these cases.

NUCLEIN.

Mr. FORBES said that at the last meeting the value of nuclein in the treatment of certain diseases was mentioned, and that recently he had employed it during an outbreak of influenza amongst horses where the temperatures of six of them were 106° to 107°. The temperatures came down rapidly after injecting nuclein. He had found, however, that in many cases the temperature went up again. He recently treated two horses on one farm with nuclein, both animals having pneumonia, but they both died, and on post-mortem gangrene of the lungs was found.

Mr. AWDE had tried nuclein with good results, but he was very fond of using glycerol heroin in cases of influenza accompanied with high temperature, and found its use most beneficial.

Mr. PRATT had tried nuclein on a case of mammitis in a mare which got cold in the autumn of last year. The mare was turned out to grass and mammitis developed, but in spite of every care she died.

Mr. HILL had used nuclein in cases of septic poisoning in cows caused by retention of the fetal membranes. He recently had a very bad case of septic poisoning in a cow which he had treated in the usual way by irrigating the uterus, and carbonate of ammonia and quinine. The case did not submit to this treatment, and looked like going the wrong way, but after injecting nuclein the cow commenced to pick up and eventually made a good recovery. He considered it most useful in canine distemper, after the febrile stage, as it seemed to pick the patients up, so to speak. In the case of the cow he had mentioned he gave her two injections, one the day he saw her and one two days afterwards.

He would like to record a very interesting case of tuberculosis in a dog which had recently been under his notice. The dog had been suffering from diarrhoea for two or three months previous to being seen by him. It took its food well, was very lively, the temperature was normal, but in spite of all the treatment he employed the diarrhoea continued. Suspecting tuberculosis, he injected tuberculin and got a splendid reaction, the temperature going up to 106° at the 12th hour after inoculation. He made a post mortem and found the mesenteric glands, lungs, and spleen all badly affected with tuberculosis.

Mr. FORBES said that the case of septic poisoning in the cow mentioned by Mr. Hill had reminded him of a similar case he treated a short time ago. This was in a heifer which he attended at calving, she having a very big calf, and he had to remove two fore legs before he could deliver. The heifer did well for three days and looked like making a good recovery, but she then took

a turn for the worse, commenced to blow, and looked like dying very soon from septic mischief. He used nuclein and the effect was certainly remarkable, as her temperature dropped, and in two days she was almost well again. He certainly gave nuclein the credit for the heifer's recovery.

SOME AFTER EFFECTS OF PARTURITION.

By C. G. HILL, M.R.C.V.S.

Mr. Chairman and Gentlemen,—After a little persuasion from our President I consented to open this discussion, this appearing to be a fitting subject after the paper which Mr. Blackburn read at one of our meetings a little time ago.

First of all I should like to mention accidental injuries to the vagina after a normal and unaided delivery. How often we country practitioners are called to a cow who is straining so much that one is afraid the uterus will become everted. On examination we find a tear of the mucous membrane of the vagina. We attend to it by antiseptic irrigation, put on a clamp and give strong sedative doses. Some cases will soon yield to treatment, while others continue to strain until they exhaust themselves, and you find the clamp producing sloughing of the lips of the vulva. No medicine seems to have any effect on the straining. I have tried Chlorodyne, Chloral Hydrate, Cannabis Indica, without the slightest effect. On post mortem you find the vagina with a nasty sloughing of the mucous membrane where the injury has been. Never in my experience have I had the same trouble in cases where injuries have taken place in difficult deliveries.

Retention of the Placenta.—The more one sees of these cases the more one is at sea as to whether the after-birth should be removed at once or given a little time. While one animal will retain the after-birth for a considerable time without any bad effects, another in 12 hours will show evidence of septic poisoning. In the case of cows, in my opinion, no placenta should be interfered with under 12 to 24 hours after a natural and normal delivery, as in the uncontracted uterus it is utterly impossible to reach all the cotyledons to separate the placenta.

In the mare and bitch experience teaches us otherwise, and the placenta should not be allowed to remain longer than 12 hours. Both these animals are very susceptible to septic poisoning from the uterus. Every practitioner has his own particular way of removing the placenta, so I will not go into details as to which is the best way, but I think you all agree with me when I hazard the opinion that weights attached to the after-birth cannot be too strongly condemned.

As to treatment to assist the expulsion of the after-birth, do drugs have any effect? I think it is a fair question, and I am of the opinion that they are useless. Ergot may have some action on the muscular coat of the uterus, but to my mind the only means is removed by manipulation, followed by antiseptic irrigations. The very best antiseptic for this purpose is, I think, Chinosol. You do not get the straining or irritable condition with Chinosol that you get with Hyd. Perchlor, Izal, or any of the tar derivatives.

I have also used pessaries which have been introduced for the last two or three years, but I cannot say they are the success that some veterinary surgeons give to them. I would particularly like the opinion of the members present on their uses, and what the base is of the pessaries they use, whether gelatine or cocoa butter.

In septic conditions of the uterus I think there is nothing better than daily washing out the uterus with a bucketful of Chinosol solution. I have seen this reduce the temperature of cows 2 degrees in 3 or 4 hours. This treatment, with internal administration of stimulants and tonics, I find the best.

In the bitch septic conditions of the uterus is nearly always fatal, and you cannot be too careful in the treatment during parturition. It is surprising, however, what a bitch will go through so long as you keep the uterus in an aseptic condition. There is a condition of the bitch, "endo-metritis," which reminds one of white heifer disease. I have had a good number of cases of this disease. The history you generally get is that the bed in the morning is wet, and there is a slight discharge from the vulva, and as time goes on the hind parts become scalded, and the abdomen distended, as though she is in whelp. No systemic disturbance is noticed until the uterus gets very dilated. The only treatment in these cases is surgical. It is no good trying to empty the uterus by the os, for if you succeed, which is most unlikely, the uterus will only fill up again. I have never hesitated, once I have made the diagnosis, but removed the uterus and the ovaries. In removing the uterus great care has to be taken, as the coats are very thin and easily ruptured, and you will flood the abdomen.

In mentioning this condition it is not exactly correct to call it one of the after effects of parturition, for I have seen it in a maiden bitch.

Post partum Hemorrhage.—This is a most alarming condition, and it has been my experience to be present at about six cases. The first case I saw was in a mare in my pupil days. The mare had been delivered by my preceptor of a live foal, and immediately the blood poured out of her just like out of a bucket and she died in less than five minutes.

My second was in a cow, but fortunately there was a bucketful of cold water and a roller towel standing in the cow byre. I immediately plunged the towel in the water and introduced it into the uterus and began swabbing the walls of the uterus, and it contracted and the hæmorrhage became arrested. The cow was very weak, but ultimately made a good recovery.

About two years ago I was called to a mare to remove the placenta. On introducing my hand I found the uterus full of clotted blood. I began to remove the clots when all at once the mare commenced to bleed, so I immediately had recourse to the towel and cold water, and the uterus began to contract, and I could feel it closing on my hand, and while this was going on the placenta dropped out. This mare made a good recovery. In these cases I think that is all you have time to do, as no hæmostatics have time to act.

There are many more conditions one could profitably enter into but time, I am afraid, will not permit. Any one of these already mentioned might have afforded a good paper, which would perhaps have been better than passing them over in an imperfect manner as I have done.

Before closing I should like to call your attention to a paper which has appeared recently in *The Veterinary Record* on the retention of the placenta, and the discussion thereon. It is a very good paper, dealing in a very practical manner with the subject. What appeals to me is the various opinions on the etiology of the subject. It is my privilege to attend the cattle market here, where every week some twenty to fifty cows give birth under, what I might say, most unnatural conditions. After taking long railway journeys, some give birth in open cattle trucks in their journey to the mart, they are knocked about, take pot luck in every way, whilst in the majority of cases they come from farms where everything is quiet, to a noisy, hustling condition, which is quite foreign to them. Under these conditions you would naturally expect you would get a number with retained placenta. This is not the case, for I get very few indeed. They never hurry a cow when calving, but give her plenty of time, in fact, nearly all calve without any assistance, and to my mind this answers the cause of a lot of these cases. If the cow were given more time during the act of parturition I think these

retentions would not be so numerous, except in cases of abortion and premature birth.

For these few disjointed remarks I ask your indulgences, and hope they will cause some profitable discussion on a matter which to all of us in our daily practice is one of ceaseless worry and anxiety. I thank you, gentlemen, for your patient hearing.

DISCUSSION.

Mr. PRATT thanked Mr. Hill for his very practical paper. He agreed with Mr. Hill with reference to the removal of the foetal membranes in cows and mares, and never allowed the membranes to remain longer than 12 hours in a mare. Of course, if he attended a mare during parturition he always removed the membranes after delivering the foal. He certainly liked pessaries in retention of the after birth, and made his own by putting half-an-ounce of salol in a gelatine capsule, and after mixing salol in vaseline and smearing it on his hands and arms found this an excellent practice when removing foetal membranes. He always used pessaries in conjunction with irrigation of the uterus and found this method of treatment the best. He remembered a case of post partum hæmorrhage in a heifer due to a slit in the vagina, where he packed the passage well and put on a clamp. On removing the clamp and packing in two days he found the artery bleeding, so took it up with the artery forceps and allowed them to remain there for four days, when they were removed, and there was no more trouble, and the patient did well.

He had had a few cases of dropsy of the uterus, but these cases usually did not do much good. About a couple of weeks ago he had rather an interesting post mortem on a sow which had been reported as a suspected case of swine fever. The uterus was full of yellow fluid and there would be quite two gallons of it, and in it were three pigs in a good state of preservation. The sow had a litter of pigs last September, and these pigs had been in the uterus since.

Mr. FORBES wished to thank Mr. Hill for his paper, which at this time of the year was of great importance. He agreed with the previous speaker that the sooner the membranes were removed after parturition in the mare the better. He liked pessaries best and had almost given up irrigation of the uterus. He did not think any medicines had any effect in removing the foetal membranes, but at the same time thought that until they came away, or were removed, it was advisable to keep the bowels acting well in the cow by giving aperients. He agreed that in these cases of violent straining in cows sedatives seemed to be useless. This was well illustrated by a case of eversion of the uterus in a cow which he had some time ago. It was a most difficult case to return the uterus, and took him fully one-and-a-half hours to get the uterus back in position, as it was so hard and swollen, and the cow strained so much. He got it back once, and on removing his hand out it came again, but eventually he was successful after lifting the cow by her hind legs with blocks. After putting on a clamp he raised the cow a good two feet behind. Her pains were most violent, and two ounce doses of Chloral hydrate were given at intervals during the night, but the drug was absolutely useless, the cow straining continually, and the uterus could be seen to be in the vagina and ready to be again everted if the clamp was removed. He gave the case up as hopeless after seeing her the next day, and was surprised to hear in a week or so that the cow was still living. He again went to see her and found her standing in the byre eating hay, and was informed that the straining, although present at times, was not so bad as it had been. As there now appeared some chance of her recovery he had her removed to a box, took off the clamp and out came the uterus. It had, however, now contracted to the size of a football, but was most offensive. As it was out of the question to

attempt to return the organ, amputation was adopted, and this was effected by means of the écraseur, after injecting eucaïne. No ligature was put on, and there were no after effects, the cow eventually doing well, and was sold as fat to the butcher.

Mr. DOBBING thanked the essayist for his interesting and practical paper. He agreed with the previous speakers as to the advisability of removing the placenta in the mare as soon as possible after parturition. In the case of the cow, however, he thought that they were better left, providing the animal was well otherwise, as one could not well remove all the attachments if the membranes were removed too early. He certainly liked the use of pessaries, and had found them most useful, and used them in conjunction with irrigations of the uterus. He once had a case of eversion of the uterus in a mare. The uterus was well washed with antiseptic solution before it was returned and a clamp applied to the vulva. It looked a bad case, and the prognosis was very unfavourable, but word came the next morning that the mare was living, and she eventually made a good recovery.

The SECRETARY had nothing to add to what the previous speakers had said, but had much pleasure in adding his thanks to Mr. Hill for kindly coming forward and giving them such an instructive and practical paper.

Mr. AWDE had come across cases in cows when the straining was most violent, and often no remedies seemed to be effectual in stopping the violent straining. He did not think that any medicinal agents were much good in assisting the expulsion of the foetal membranes. He had tried most of those which were recommended for that purpose, but with no satisfactory results.

He certainly liked irrigating the uterus in these cases, and found solution of chinisol the best agent to employ. Generally in cases of post-partum hæmorrhage you were not there in time to save your patient. He remembered a case of a heifer where there was a bad tear in the vagina, and he found that with dressing with chinisol the case made a good recovery.

He had very much pleasure in proposing a hearty vote of thanks to Mr. Hill for his paper which had been full of interest, this was seconded by Mr. Pratt, and carried unanimously.

Mr. HILL suitably replied. The members afterwards had tea together.

J. H. TAYLOR, Hon. Sec.

Contagious or Non-contagious Abortion: Claim for Damages.

On Monday at the conclusion of the criminal business of the Kilkenny Assizes, the Lord Chief Baron took up the hearing of a record case in which Mr. J. Cooper Chadwick, Fanningstown, in the south end of that county, sought to recover damages from Mr. Richard Gorman, Curraghmore, Kilkenny.

Mr. Chaytor in opening the case, said the action was brought to recover £500 damages for injury to plaintiff's cattle, caused, as they said by the excessive driving of those cattle by defendant. The plaintiff in the action, Mr. Cooper Chadwick, was a Tipperary man, who a few years ago bought a property in County Kilkenny. In 1909 he bought a house and farm at a place called Fanningstown, and started there a business of his own in connection with the feeding and selling of cattle. What he used to do was to buy young heifers in the spring, get them put in calf, and sell them at the end of the year. In the spring of 1910 he wanted to increase his business, and he took the grazing, an eleven month's agistment letting, of lands belonging to a Mr. Hearne, which comprised about fifty odd acres, and for which he

paid a rent of £60 a year. His idea in taking this land was that he would stock it with a lot of young heifers. He would then bring a bull in on the lands, get the heifers put in calf, and sell them at the end of the year. In the month of April 1910, he put on those lands which he had taken from Mr. Hearne some 52 young heifers. The heifers were then in perfect health and condition. That was at the end of April or the beginning of May 1910. Adjoining those lands which he had taken from Mr. Hearne was the farm of Mr. Gorman the defendant. The two sets of lands were separated the one from the other by one of those raised sod fences, with a barbed wire fence on top of it. There was only one stretch of wire fence on top of the sod fence that separated the two sets of lands. Where lands were close to each other like that there was always, naturally, a little trespass, and in the month of May there was a little trespass on both sides. Some of Mr. Cooper Chadwick's heifers got on to Mr. Gorman's land, and Mr. Gorman's bull got on to the plaintiffs land, and they made a complaint about it.

It was on the 5th of September that the circumstances arose that gave rise to the action which they had to try now. On that night 39 of the 52 heifers got into Mr. Gorman's land by means of a gap in the fence that separated the two farms. He did not know anything about Mr. Gorman, but on this particular morning he was very angry that these 39 heifers had got on his lands again. What the defendant did was about as wanton and illegal an act as was ever done between one man and another. He got his little boy of twelve or fourteen years of age, and two sheep dogs, and told this little boy to take the 39 young in-calf heifers and drive them along the public road to Mr. Cooper Chadwick's house, a distance of about 3½ miles away. He need not describe to them at any length the condition of these cattle when they got to Mr. Cooper Chadwick's house. They were blowing and perspiring, and some of them lay on the ground. They were in a shocking condition, distressed beyond measure, and one of them had one of her teats actually bitten off, evidently by a dog. Having seen the cattle, Mr. Chadwick immediately sat down and wrote a letter to defendant, which he gave to the boy to bring to his father. The next morning plaintiff went to his solicitor, who wrote defendant a letter pointing out exactly what had occurred, and complaining bitterly of it. In consequence of the ill-treatment to the heifers 11 out of the 39 heifers slung their calves. Not only that but it would be proved that the remainder of the 39 that were driven were in a miserable and poor condition and that they were worth nothing to plaintiff, considering that it had got abroad that some of them had slung their calves and the others had been seriously injured.

The plaintiff, sworn, corroborated his counsel's statement. One of the teats of one of the heifers was completely cut off, as if bitten. Eleven heifers slung their calves; eight were born alive, but all of them were born prematurely. He never had a heifer that slung her calf at Fanningstown, and he knew nothing about contagious abortion. In January last he commenced giving special feeding to these cattle to keep them in some sort of good condition, and though he had expended a considerable sum of money in that way he did not think he could sell the beasts presently. He estimated his entire loss at £500. His loss was made up as follows—by depreciation of cattle in value and in extra feeding. In reply to Mr. Carrigan, K.C., he stated that by the terms of the letting agreement in connection with the 50 acres Mr. John Hearne was not to be responsible for any trespass or sickness or death, but he was to pay a man to count the cattle on the place daily and report if any were missing. That was the extent of Mr. Hearne's responsibility under the agreement. The first stock he put on those lands consisted of 26 bullocks, and these were put on those lands on the 19th April, 1910. He then gave evi-

dence as to purchases of two and a half year old heifers, the total number being 63 and most of those, he believed, were sent to the land at Curraghmore.

Mr. Carrigan—You purchased those heifers at an average price of £8 10s apiece or less. Would you describe them now as they have been described yesterday? Wouldn't you consider them to be second-class heifers at best?

Plaintiff said of course the cattle were not of the very best quality, but he considered they were good value for the price he paid for them. In the letter which he wrote to defendant on the morning that the cattle were driven to his house he mentioned that there was only one dog with the boy, but when he was after giving the letter to the boy he saw the two dogs. He admitted that his cattle trespassed on Gorman's land and that he sent up his man to repair the fence. On the 1st Jan. last, for the purpose of seeing how he stood for the year, he valued the 55 in-calf heifers at £10 each.

Re-examined by Mr. Chaytor—I gave the other side all the information required without any order from the court; I kept nothing from them. I never had any difficulty in identifying the 39 cattle that were driven from the rest. I sold two calves of the 39 heifers and only got 25s. each for them. The average price for good calves on the occasion on which I sold these two was about from 45s. to 50s. each. The two calves that I sold were not developed.

Dennis Keefe stated that he was in the employ of plaintiff as herd and steward. Witness visited the lands of Curraghmore and made an inspection of the fence. He saw where the bank had slipped away, and he saw the marks of the cattle in the gap. The wire on the top of the gap was bent up somewhat, and it was under it that the cattle got into Mr. Gorman's land. If the cattle had not been driven as described and that they could be sold in the ordinary way, he believed they would fetch on an average £12 10s. apiece.

By Mr. Carrigan—I ascribe all this misfortune to the fact that these cattle were driven on that morning by a boy and two dogs. If I were driving those cattle myself I would have divided them into three lots, because it would be necessary to do so on a narrow road like that.

Mr. A. Dobbyn, V.S., Waterford, in reply to Mr. de Renzy, stated that on the 8th September he went to Fanningstown and was shown 39 heifers. They seemed dejected, tired, and out of sorts. Four of them were lame. The whole of them seemed to have a slight springing of the udder. Hardship or driving would have caused or produced the symptoms he observed. He had been attending the cattle since. Some of the cattle—thirteen—were more injured than the others, and those thirteen were kept separate from the rest of the 39. He noticed on his first inspection of the cattle that one of the teats of one of the heifers was completely cut off. It was a clean cut, and did not present the appearance of having been caused by barbed wire. The bite of a dog would have cut off the teat in the manner described. Witness then proceeded to give evidence as to his examination of the heifers and the calves which they had slung. To the driving, which caused the cattle to be in the condition described on the 5th September, witness attributed the premature births and abortions. Since witness saw the heifers on the 8th September there had been no improvement made in their condition, and the driving, as he had heard it described, would have been sufficient in itself to prevent them improving in condition. They were still in a miserable condition, and if they were sent to a fair at the present time he did not think it would be possible to sell them; it would, at all events, be very hard to get a purchaser for them.

Cross-examined by Mr. Swayne, B.L., witness said that it would strike him that the number of cattle grazing on the lands of Curraghmore was rather large, con-

sidering the acreage and the dryness of the weather ; he would not expect them to thrive very much on it. His theory was that it was the exertion which the cattle went through that brought about the abortions. The time that would elapse between the time of an injury and abortion would all depend upon the character of the injury. In the case of a blow he would expect abortion to take place soon afterwards. The facts of the case would not be consistent with contagious abortion. Usually when abortion was brought about by violence marks were apparent on the fetus, but there were no marks on the fetus in this case. He recommended no treatment for the 39 cattle when he saw them on the 8th September. He did not know how they would get on at the time, and he suggested that they should be kept separate from the other cattle. It would be an unusual thing for a sheep dog in the habit of being kept about cattle to bite their teats. He did not at any time entertain the idea of contagious abortion in regard to those heifers.

Re-examined by Mr. de Renzy : The length of time a cow would continue to carry her calf after she being injured would depend upon the nature of the injury, the animal's constitution, and other circumstances. One of the symptoms of contagious abortion was the ease with which the calf would be expelled, and difficulty in that respect, as had been stated to have accompanied the birth of those calves, would be inconsistent with contagious abortion. He had not seen any symptoms of contagious abortion on this examination of the heifers. There was no truth in the suggestion that he had at any time suspected the presence of contagious abortion amongst the cattle.

Mr. John F. Healy, V.S., an inspector under the Board of Agriculture, gave evidence to the effect that on the 11th February he was called into consultation with Mr. Dobbryn in connection with these cattle. Thirteen of the cattle which he saw on that occasion on plaintiff's farm moved very stiffly and were worth only about £4 or £5 apiece. The other 26 cattle he was shown were in fair condition, but of course if he were selling them he would hesitate about giving any guarantee as to the time they would calve, etc. Assuming that such a warranty could not be given, the value of the 26 heifers on the day he saw them would be £8 or £9 apiece. If any of the cattle were infected with contagious abortion the disease would have spread through the whole herd.

By Mr. Carrigan : The drive was sufficient to cause the stiffness which he noticed on the cattle. When he went there 26 were in one field, 11 in another, and two in the stall. If the 26 heifers could be sold with a warranty their value would be about £13 or £14 apiece. He would not call them first-class cattle. The warranty that was usually given at the sale of an in-calf heifer was that she would calve within a certain period. He was not told that the other cattle served by the same bull as these cattle were served by had aborted.

Sir John M'Fadyean, London, Chairman of the Departmental Committee appointed by the Board of Agriculture to inquire into matters in relation to abortion in cattle, was the next witness. He said that he received a sample for examination of the after-birth of a heifer belonging to Mr. Cooper Chadwick. He did not examine that sample because he thought it was not in a condition to be examined. His reply in regard to that sample to Mr. Dobbryn, V.S., was that if he would take the trouble to send him a sample of blood from the heifer he could give his judgment as to whether it was a case of contagious abortion or not. On the 7th March he received a sample of blood. He examined the blood and subjected it to a test—a very reliable test. The result of the test was that he was able to say that the animal to which the sample of blood belonged was not affected with contagious abortion. He subsequently wrote to

Mr. Dobbryn asking him to send him samples from three other cows that had aborted or calved prematurely, and last week he received three samples. He subjected these samples to the same test as the other sample had undergone, and in each case the test indicated that the cow in question was not affected with contagious abortion. His opinion was positive with regard to these four cases that they were not affected with contagious abortion, and though it might be probable that the other cattle were not affected with it he could not swear that they were not. It was quite impossible to predict, if contagious abortion were introduced into a herd of cattle, how many in the herd would abort. It was a fact well known to everybody that, as a rule, the fetus in cases of abortion came away without practically any assistance. Even considering that 39 heifers were driven and that only 11 aborted, the facts, as stated in the case, strongly suggested that the driving had to do with the abortion. He was quite positive that it was not contagious abortion. One had to find an explanation, and having listened to the evidence given in court and having regard to the special questions, he could see no other explanation of the abortion than overdriving.

Replying to Mr. Ringwood (a juror), who asked why it was that the abortions extended over some months and did not occur very soon after the alleged overdriving, the witness said there was a little difficulty in explaining that, but the explanation which suggested itself to him was that the abortion was not the immediate or direct consequence of overdriving but the indirect consequence of it.

Mr. Gorey (foreman) : In other words, you could not trace the abortion that took place to the driving of the cattle ?

Witness : It was the indirect cause.

Mr. Gorey asked the witness how he accounted for the abortion taking place in December and January, and in some cases in February and March, when this overdriving was alleged to have taken place on September 5th.

Witness : I feel bound to accept the evidence I have heard in this court, that as a consequence of this overdriving the general health of these cattle have been most severely injured.

Mr. Gorey, on behalf of the jury, said they were satisfied to accept the evidence that there was not contagious abortion.

Prof. Mettam, Principal of the Royal Veterinary College, Dublin, gave evidence as to having examined an after-birth of a cow belonging to plaintiff that calved on the 25th February. He made a very careful examination and the result was absolutely negative. He found no trace whatever of contagious abortion. That these abortions extended over a rather long period might, he thought, be accounted for by the fact that the cattle, as in health, lost their tone, and were reduced to a state of general debility.

Patrick O'Brien gave evidence as to having sold a bull to Mr. Cooper Chadwick. The bull had served some of witness's cows and they calved all right.

DEFENCE.

Mr. Carrigan, K.C., in an able speech having stated the case for the defence.

The defendant, Mr. Gorman, was then examined by Mr. Swaync. He stated he lived at Curraghmore, where he held 175 acres of land. The fence which divided his land from that held by the plaintiff was a sod fence with barbed wire railing on top. There was a big dyke on his side of the fence nearly the whole way through except for a distance of about 100 yards. In parts the fence at plaintiff's side was only 2 feet high, and in other parts it was 6 or 7 feet high. In the months of April and May plaintiff's cattle trespassed on his lands, and after that the fence was repaired by putting up new stakes, with barbed wire. On the 4th September

he was at the fair of Clonmel and did not return until about 10 or 11 o'clock that night. The fields of his joining the land held by plaintiff, and which consisted of about 11 acres, were under aftergrass. He did not see the cattle on the morning of the 5th September. When he came home on the previous night he was informed by his son that there were 47 or 48 cattle on the aftergrass and that owing to the gates being locked the cattle could not be put in on Mr. Chadwick's land and that he left them on the road. His son told him the following morning that the cattle were in on his land again. That was about 6 o'clock a.m., and he told his son to drive them home to Mr. Chadwick or they would kill themselves going over the fence when he could not open the gate to let them in. He (defendant) had only one sheep dog, which was about ten years old and which was used to cattle from being about them every day. He never saw the dog catch a beast in his life; in fact, that was the only objection he had to him. Apart from waste and the portion he was keeping for meadowing, Mr. Chadwick had about 30 acres of pasture at this place, and considering the dryness of the year and the scarcity of grass he would not think there was grass enough for the stock Mr. Chadwick had on the land. To his knowledge the cattle were breaking out on other lands around the place. He saw the two gaps through which the cattle got into his land. The bank was broken down, one of the posts was broken, and the wire was pulled into his (defendant's) field. The gripe at his side of the fence would be about 6 feet wide. He also found marks on the fence dividing plaintiff's land from the road, showing that the cattle effected an entrance from the road on the night of the 4th September. Chadwick's cattle were a thin, poor class of cattle, and appeared to be of a very inferior class. They showed signs of want of proper feeding. He saw at Fanningstown six calves which were represented to him as being calves of some of the cattle that were driven; three of them were very fair, one was very good, and another was very small. He never saw half as much stock on the land at Curraghmore as Mr. Chadwick had on it during that year.

Mr. Chaytor: Isn't it rather strange that these very poor, thin cows should produce these very good calves?

Defendant: No, it is not strange.

Did you say at the quarter sessions in Piltown when a case of trespass was being heard that these heifers were in very good condition?—No.

Isn't it a strange thing that when you got those letters from Mr. Chadwick and his solicitors you never took the trouble to go look at these cattle until the present month?—I had nothing to see on them. My son told me that one of them had one of her teats cut, and that a white heifer was blowing.

Continuing, the defendant said the letter his son brought him from Mr. Chadwick and the letter he received from the plaintiff's solicitors told him about the other cattle. He did not believe what Mr. Chadwick said in his letter.

Asked by Mr. Chaytor why he did not send his workman, John Butler, to look after the cattle that morning with his son, defendant said Butler was not at work at the time his son went to see after the cattle. Even if Butler were at work and that he sent him to look after the cattle, he would not have anyone to milk his own cows. He did not swear at Piltown that he sent Butler with the cattle. He never saw the man Kenny on the land. He did not know that Kenny was supposed to be looking after Mr. Chadwick's cattle. He often saw Kenny crossing Curraghmore across his (defendant's) own land. Kenny had charge of a farm further on than Curraghmore. He never saw anyone looking after the cattle there but Keefe.

Richard Gorman, son of defendant, gave evidence of driving home the cattle on the morning in question. When he arrived at Mr. Chadwick's one of the men

employed by the latter pointed out to witness one heifer that had one of her teats cut off. He hadn't noticed the heifer bleeding until then. He had only one dog with him, and he was an old, quiet dog. He did not see the dog snap at any of the cattle. He did not use any violence towards the cattle, or drive them fast or beyond the ordinary pace. The dog made no attack on the cattle, and he drove the cattle with ordinary care.

By Mr. de Renzy: He didn't know the heifers were in calf at the time. When he came down to his father the cattle were on the road, and they remained there while he was taking his breakfast. The white heifer was bleeding because she was in better condition than the others. None of the cattle lay down at Chadwick's while witness was there.

Patrick Byrne said he saw young Gorman driving the cattle the same as anyone would drive them. The cattle were going along quietly. Young Gorman had only one dog; the dog was not worrying the cattle in any way.

Mr. James Craig, Professor in the Royal Veterinary College of Ireland, Dublin, in reply to Mr. Swayne, said that presuming that there was violence used and if the abortion was directly attributable to that violence, it would take place a short time after the violence had been inflicted. If overdriving was the direct cause of this abortion, then it should have occurred within a short time after the overdriving.

Mr. Chaytor: Supposing, now, that the abortion was not directly caused by the overdriving, but that the overdriving caused the condition and constitution of the heifers to be lowered, would that account for the abortion extending over several months?—In my opinion, it would not. The effect of the overdriving would only be temporary.

Mr. Michael Quirke, of a firm of Carrick auctioneers, who was summoned by subpoena, gave evidence as to having carried out an auction of cattle for plaintiff at Carrick fair on the 28th December. He sold three cattle for £12, £11 10s. and £11 each, and as there was a reserve price of £11 each put on the other sixteen by Mr. Chadwick they were not sold. He got bids up to £10 for some of them but no more. He got no bid for some of them—perhaps two out of the five that he put up for sale, besides the three that were sold.

In reply to his lordship witness said that although Mr. Chadwick said they should get about £11 each for the sixteen cattle, witness knew that they were not worth that figure. He would consider that they would be dear at ten guineas each.

Mr. Gorey (foreman) said that before the case proceeded any further some of the jury desired him to say that it was their wish that the counsel on both sides would come together with a view to arriving at some agreement. That was not the unanimous wish of the jury, but of a section of it.

His Lordship said he was sure counsel on both sides would consider the suggestion. He would rise for a quarter of an hour to give counsel an opportunity of coming together. He hoped they would succeed in effecting a satisfactory settlement, but his hopes were not always realised.

Counsel on both sides then left the court, and after an absence of some minutes returned, when Mr. Chaytor announced that it was impossible to arrive at a settlement. They had done their best, and he was sorry that they could not effect a settlement.

John Walsh, farmer, Castletown, stated that on the 24th March and 12th April, 1911, he sent a heifer to be served by Patrick Brien's bull. The heifer slung calf on the 15th November, to the best of his opinion. The heifer had slung calf in December, 1910, she having been served in that year by a bull belonging to a man named Dywer. Witness was at Carrick on the 28th December when Mr. Chadwick's cattle were put up for

sale. He heard a bid of £12 being made for one of them, and £10 10s. for another. He did not think the latter bid was accepted.

Mr. T. A. Mulcahy, V.S., Clonmel, stated that on the 15th January he visited Mr. Chadwick's place at Fanningstown. He saw there three heifers which he was told had slung calf in a house; he also saw two heifers with calves, both alive, a heifer that calved on the 3rd January, and another that had calved on the morning that witness arrived. He was pointed three heifers that had aborted. The cattle were of a bad class, West Cork cattle. They were small, inferior cattle. He was pointed out thirty-five other cattle, alleged to have been driven. They were all inferior cattle. He saw the land at Curraghmore, and he considered that the pasture there was not sufficient to keep fifty-eight cattle during last summer. There were about ten acres of it fairly good, but the rest of it was bad. His opinion was that only three of the heifers aborted, and that these were suffering from contagious abortion.

Continuing, the witness said that if the cattle had aborted the day after the drive then there would be grounds for supposing that the drive had something to do with it. In his opinion, and considering the space of time between the day they were driven and the 11th October, when the first one slung calf, it was ridiculous to connect it with the driving. He said that three had only aborted, and the calves that he saw on the grounds were, in his judgment full-time calves. He did not admit to the plaintiff that the calves were premature calves, and Mr. Chadwick would be making a mistake if he said that witness made such an admission. The after-birth that Professor Mettam tested was that of a healthy cow that had calved up to her time. Asked if he could reconcile his statement that the calves he saw were full-time calves and the period during which the bull ran amongst the herd, witness said that plaintiff had no knowledge that the heifers, or some of them, had not been bulled at the time he bought them. A decent in-calf heifer would cost £17 or £18.

Mr. Gorey asked the witness which, in his opinion, the

leaping over the fences on the night of the 4th September or the driving as described would be most likely conducive to abortion?

Witness: The leaping over the fence of course, but they would sling that night or next day.

Mr. Gorey asked if two or three cows in a herd aborted without any of the circumstances stated being present at all, would that be a due or undue proportion to abort?

Witness: It would be but usual. An odd heifer slings in every herd.

This closed the evidence, and Mr. Swayne and Mr. de Renzy then addressed the jury at considerable length.

His Lordship then reviewed the evidence and said the only direction in law that he had to give the jury with reference to the entire case was, that the onus of proving to their satisfaction that the injury to the cattle was caused by the driving home, to the plaintiff. The questions his Lordship submitted to the jury were:—Were the manner in which and the speed at which plaintiff's cattle were driven from Curraghmore to Fanningstown by defendant's son reasonable? (2) If not, did such unreasonable driving injure plaintiff's cattle or any of them? The third question left to the jury was that of assessing the plaintiff's damages. His Lordship said that if they were of opinion that the cattle were driven in a reasonable way they would find a verdict for defendant, because the real cause of the action was driving them in an unreasonable way.

In reply to a question asked by Mr. Bloomfield, his Lordship explained that the defendant was not responsible for anything that took place on the night of the 4th September. The boy was entitled to turn the cattle out of his father's aftergrass on to the road, and nothing had been proved to show that he used undue force, or anything of that sort. All the jury had to consider was the drive of the 5th September.

The jury then retired, and after an absence of close on an hour and a half, returned, when the foreman announced that there was no possibility of an agreement.

The jury was then discharged.

Vivisection and the Veterinary Profession.

To the Editor of "The Referee."

Sir,—Are those people who rage against vivisection aware of the terrible cruelty that is going on in this country every day? I allude to the operations performed on animals by unqualified men whose only qualification is, in many cases, that they are cheaper than the properly qualified man who has spent about six hundred pounds and four or five years of study to acquire his knowledge. The unqualified men are generally ignorant of the first rudiments of anatomy, yet they cut and hack animals and the law allows it. If a man loses his temper and beats a horse unmercifully, or a coster works his lame donkey, he is punished, but one of these unqualified men may castrate an aged stallion, unnerve a horse, perform tracheotomy, or cut down to the bone the shoulders of an animal without using an anæsthetic, and the law allows it.

Surely no man who is not properly qualified should be allowed to use a knife in major operations, and certain of the operations which cause great pain and which could easily be scheduled by experts should not be allowed to be done, save under an anæsthetic, by anyone. The extra cost would be a few shillings more.

And then the use of drugs by unqualified men is too absurd for words. They mix drugs together and administer them to the wretched animals under their charge. But they are absolutely ignorant as to the effect the drugs have on the animal. They pour into the stomach of the beast, of which they know nothing, noxious mixtures, of which they know less.

The Royal College of Veterinary Surgeons does not allow a man to style himself a veterinary surgeon unless

he is qualified, but the individual may call himself a horse doctor. Yet in the place he practises in he is known only by the name of "Vet."

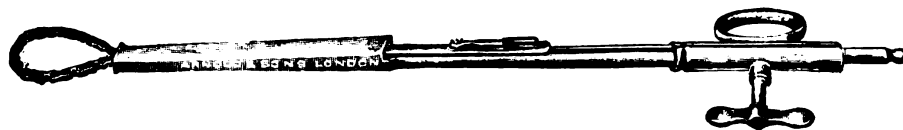

The R.C.V.S. does not allow a qualified man to employ an unqualified assistant, but this law is hardly ever enforced, as dozens of qualified "vets." do not send their sons to college now because, they argue, it is useless to spend five or six hundred pounds on the education of a lad when he can practise for nothing, and when a blacksmith or groom, or anyone else, in fact, can carry out all the duties of a qualified man, and the law does not interfere.

This is proved, for at the present time there are only 180 students at the Veterinary College in Camden Town. A few years ago there were three or four hundred, and yet there are as many men acting as veterinary surgeons as ever there were. The funds of the College are in a very low state, the place out of repair, and lacking many things that are absolutely necessary. Unless something is done quickly we shall soon have no qualified men, and shall drift back to the animal doctor of a hundred years ago.

If the public realised what was going on in this necessary profession it would force legislation to alter this abominable state of affairs, for there is far more brutality perpetrated on dumb animals every day in England by men acting as veterinary surgeons, sanctioned by the law, than could occur with vivisection in a hundred years. I have no axe to grind with regard to the veterinary profession, as I am a tradesman, but I have stated facts which cannot be contradicted and which are a blot on England's humanity.—I am, sir, yours, etc.

PATE, J.P.

County of London Magistrates' Club.

AN ÉCRASEUR FOR OVARIOTOMY OF THE MARE OR COW.

So far as I am aware, there has not yet been brought before the notice of the veterinary profession, an écraseur which is equally suitable for spaying mares or cows, and this one here illustrated, is the result of several models, which have been made at my request, by Messrs. Arnold and Sons, of Giltspur Street, E.C.

I have thoroughly tested the Instrument on a large number of dairy cows, and over fifty vicious mares, and claim for it the advantage that, with the handle in the position here depicted, there is much greater facility for working conveniently: and that in the cases in which one meets with an unusually tough pedicle (a very common occurrence in a vicious mare) there is no difficulty whatever in removing the ovary, even with the most blunt-edged chain.

FREDERICK HOBDAV, F.R.C.V.S.

Kensington.

Mendelian Experiments with Thoroughbred Horses.—Details of a New Scheme.

We are in a position to state that, thanks to a generous gift to the Board of Agriculture and Fisheries by Capt. Dealtry C. Part, of the 21st Lancers, for the purpose of carrying out experiments on Mendelian lines, it has been possible to inaugurate one of the most important experiments ever undertaken in the history of horse breeding.

Since the discovery in 1900 of the Abbot Mendel's long-lost memoir on heredity a large number of experiments on Mendelian lines have been carried out with the smaller domesticated animal and in other directions with most successful results. So far, however, owing largely to lack of resources, no serious attempt has been made to experiment with horses on an adequate scale. Capt. Part's gift comes therefore at a most opportune moment, and, in view of the intrinsic value and paramount usefulness of the British thoroughbred as a foundation stock all over the world, it is particularly fitting that scientific experiments should be begun with this ancient and highly-specialized breed.

With the concurrence of the Board of Agriculture the scientific direction of the experiments has been entrusted by Capt. Part to Maj. C. C. Hurst, F.L.S., Director of the Burbage Experiment Station and a member of the Advisory Council on Horse Breeding. As one of the leading authorities on Mendelism, and the first to apply the Mendelian principles of heredity to the thoroughbred horse, Major Hurst is naturally fitted for the scientific direction of Capt. Part's experiments. Mr. F. W. Carter, Superintending Inspector of the Board of Agriculture, who is largely responsible for the Board's light horse-breeding scheme, has been detailed by the Board to watch and assist the experiments on their behalf, and, in conjunction with Capt. Part, has completed arrangements in time for the present breeding season.

OBJECTS.

Notwithstanding the remarkable differences of opinion existing in regard to horse-breeding in general, most people seem to be agreed on two points—first, that the best type of light horse for purposes of general utility

is the weight-carrying hunter; second, that the best foundation stock for crossing purposes is the thoroughbred. The practical object of Capt. Part's experiments, therefore, is to utilize the recently-discovered Mendelian principles of heredity in order to make, if possible, a true breeding race of speedy, staying, weight-carrying thoroughbreds possessing the necessary jumping temperament which will enable them to hold their own across country. In other words, an attempt is being made to segregate out of the present thoroughbred a distinct breed with the qualities of a weight-carrying hunter; a breed that may not only be relied upon to breed true, but which will at the same time give more uniform and definite results when used for crossing purposes.

For the country generally this latter point is the most important of all, for the stallions of such a breed might with advantage take the place of the present Premium stallions, which, by reason of their variable nature, at present necessarily yield such mixed results, to the disappointment and loss of all concerned.

METHODS.

A careful study of the parents and relatives of weight-carrying winners of long-distance steeplechases in England and Ireland during the last few years led Major Hurst to the discovery that the material for such a breed is already in existence. This discovery of the true breeding 'chaser' was announced at the Portsmouth meeting of the British Association for the Advancement of Science in August last, and also at the International Conference of Genetics held in Paris in September. A detailed account of these researches is being published in the report of the Burbage Experiment Station for 1911.

PURCHASES.

Little difficulty has been found in securing the true-breeding females required for the experiment, and the following animals have been purchased:—

Ballymacarney (Royal Meath—Cinnamon).

Frigate (Red Prince II.—Athela).

Breemount's Pride (Kendal—Mavourneen).

Revolving Light (Red Prince II.—Hawkeye).

A two-year-old filly out of a Hackler mare by Creangate.

A yearling colt out of a Hackler mare by Creangate.

A yearling colt out of Breemount's Pride by Missel Thrush.

Two of the brood mares will be with Major Hurst at the Burbage experiment station, Leicestershire; and the remainder with Captain Part at Haresfoot, Berkhamsted, Hertfordshire.

In regard to the true-breeding males a temporary difficulty has arisen, because, owing to the common practice of cutting the colts put to chasing, it has been found impossible to find a true-breeding stallion for this season's services. Such suitable true-breeding males as Cackler (since dead), Rathnally, Jenkinstown, Ballymacad, Ballymadun, Ballyhist, Carder, Covertcoat, Flaxseed, and Shanawan are all unfortunately unavailable, for the simple reason that they have been added to the list of geldings. For the present season, therefore, the true-breeding females will have to go to the alternative stallions, St. Aidan and Perigord; these matings may be expected to give about one-half of the foals of the kind required.

An interesting point may be noted that a leading feature of the scheme is that all the stock bred in Captain Part's experiments will be trained and raced in

order that the progeny may be tested thoroughly and practically.

The operations and results of this experiment will be more than interesting; they will be instructive, and even if in time to come they prove abortive, the experiment will have been well worth making, if it only demonstrates that Mendelism is inapplicable for the purposes in view. If, however, success follows, then an opening will be provided to breed for definite results on a larger scale.

Rapid Detection of Negri Corpuscles.

Martiri (*Rif. Med.*, June 5th, 1911) recommends the following method: A small piece of the cornu ammonis, either fresh or fixed in alcohol, is placed in a small porcelain dish, triturated with six or seven drops of pure neutral glycerine until it attains the consistency of a homogeneous paste. To this paste is added two drops of 0.30 per cent. solution of marine blue in absolute methylic alcohol, and the whole mixed, and a few seconds later one drop of a saturated ethylic alcohol solution of eosin is added. The preparation is then creamed in the usual way; the Negri corpuscles show up as violet objects inside the blue nervous cells. —B. M. J.

The Effect of Calcium upon growth of Bacteria

Kindborg, of Bonn, has been investigating the possible effect of calcium upon the growth of certain bacteria, and reports (*Berlin. Klin. Wochenschr.*) his results. He has introduced calcium in varying proportions into the culture media (glycerine agar) in which the organisms were grown; and has found that pneumococci, staphylococci, and coli, typhoid, tubercle, and diphtheria bacilli grew distinctly more luxuriantly upon media containing calcium than upon ordinary media. This increase in the luxuriance of growth was most marked in the media containing the highest proportions of calcium.

The author remarks that if, as is maintained in the case of tuberculosis, the assimilation of calcium by the patient exercises a favourable influence upon the course of the disease, this must be attributed to the effect of calcium upon the body tissues, not upon the bacteria. He concludes that, in the cultivation of bacteria which grow feebly upon the usual media, an attempt with a medium to which calcium has been added is advisable. —(*Berliner Tier. Woch.*)

Donations to R.C.V.S.

The Secretary of the Royal College of Veterinary Surgeons begs to acknowledge the receipt of the following donation to the College funds from:

Mr. A. W. Reid, Bromley, Kent	£1 1 0
Amount previously acknowledged	9 9 0
	£10 10 0

Nearly all those people who are interested in keeping, breeding and handling live stock use from time to time various disinfectants, insecticides, taeniafuges, anthelmintics and medicines, and those who wish to keep their stock healthy may well consult the Izal Veterinary Handbook. This small book gives an account of the precautions necessary to avert or remedy the ills which beset stable, kennel and poultry yard. It is frankly an advertisement of the various Izal disinfectant preparations, which have gained the highest awards obtainable in open competition, but it is something more than that, and readers will find in it much useful information. It will be forwarded free of charge to any address on receipt of a postcard, addressed to Messrs. Newton, Chambers and Co., Thorncliffe, near Sheffield.

BIBBY'S BOOK ON MILK. SECTION IV. BOVINE TUBERCULOSIS: CAUSE, CURE, AND ERADICATION. A Summation of Material Facts and Eminent Opinions for the Use of Farmers, Cattle-owners, Milk Producers, Veterinarians, Students, and Others. With appendices on the diseases which simulate tuberculosis, actinomycosis and Johne's disease; also appendices on calf mortality and the destruction of rats, and a glossary of technical words. With 80 illustrations, including 11 full-page coloured plates and 35 portraits of eminent authorities. First Edition. Pp. xvj. + 459. Price ten shillings net. Published by J. Bibby and Sons, Feeding Experts, Liverpool.

This volume being suited for popular rather than professional readers, does not call for a lengthy review. It is one section of a series of seven volumes which Messrs. Bibby, the well-known manufacturers of feeding stuffs, are preparing; the whole being designed to form a complete guide to the large and very complicated question of milk production. Tuberculosis is certainly well worthy of a separate volume in such a series; and the volume now issued will be a very valuable popular educator upon the subject.

The nature of the book is well indicated by its voluminous subtitles. It is not so much an original work as a careful and comprehensive compilation of the views of the chief authorities of the world upon bovine tuberculosis. Every department of the subject is covered upon broad lines—the causation and importance of the disease, the relationship of human and bovine tuberculosis, the symptoms and lesions of the disease in cattle especially; the infection of dairy products, the communicability of bovine tuberculosis to man, the economic aspect of the bovine disease, and the measures for its limitation and eradication, the last being dealt with especially fully.

The work of selection and arrangement has been well done; and the whole work forms an excellent survey of modern knowledge and opinion of the subject. It will be valuable to many readers, and perhaps most so to the educated man who, with no professional knowledge of the subject, is keenly interested in it. Though remarkably free from abstruse technicalities, it nevertheless takes the reader more deeply into the subject than many laymen will care to go. On the other hand, so much of its matter is common knowledge within our profession that its chief use to the veterinarian is that he may not otherwise possess the same amount of fact and opinion enclosed within one cover. It is pre-eminently a book for the educated non-professional reader; and there are many such who will find it invaluable. Its publication is a welcome sign of the times.

SET P.G.C. also Class C. Pathology Notes, London, typed ready for binding, £1 10s. 0d. Address, 5036, V.R., 20 Fulham Road, London, S.W.

Under Exceptional Circumstances.

A SPORTING and Agricultural Practice, well-established in a favourite County. Returns last twelve years from £350 to £420. All kinds of sport in immediate neighbourhood, and great inducements to those fond of rural life. Price very moderate to quick buyer, Address, 5037 V.R., 20 Fulham Road, London, S.W.

For Disposal

USEFUL practice near London. Mixed, chiefly canine Good premises, average returns £1000. Open to full investigation. References given and required. Only those with capital need apply. Address, 7403 V.R. 20 Fulham Road, London, S.W.

Assistant Unqualified

DISENGAGED. Long experiences, castration and parturition, etc. Excellent references. Address, 4035 V.R., 20 Fulham Road, London, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

Victoria Veterinary Benevolent Fund

President:

W. F. BARRETT, Esq., Fountain Court, Temple, E.C.

FUND is urgently needed to enable the Society to extend its relief to distressed Members of the Profession, or to widows and orphans of deceased veterinary surgeons. Annual subscriptions, or donations will be gratefully acknowledged by the Hon. Sec. and Treas.

W. SHIPLEY, Southtown, Great Yarmouth

The Journal of The Board of Agriculture

ISSUED on the 15th of each month. Twelve months 4/-, three months 1/-, or single copies 4d., direct from the Board of Agriculture and Fisheries, 4 Whitehall Place, London, S.W., or through any bookseller.

New Parturition Instrument.

ILLUSTRATED description of same in actual use, and testimonials sent on application. Removal of limb and dissection made easy. Orders for this season must be sent early. Address, W. J. Fletcher, M.R.C.V.S., Wrexham.

Assistant Wanted

UNQUALIFIED assistant wanted for horse and dog practice. State age, experience, references, and salary required, to 6403 V.R., 20 Fulham Road, S.W.

Wanted

FULL Particulars of Practice for Sale in good agricultural and residential district returning up to or over £700 per annum. Advertiser has sufficient capital to purchase outright. Address, 1039 V.R., 20 Fulham Road, S.W.

To Purchasers

PRACTICES & PARTNERSHIPS for Sale. Messrs Peacock and Hadley, Veterinary Transfer Agents, 19 Craven Street, Strand, W.C., will be pleased to forward to intending purchasers, who register their requirements, full particulars of anything suitable on their books. No charge to purchasers or for inquiries.

Replies to Numbered Advertisements

WHEN replies to several of these advertisements are sent to this office at one despatch, it is not necessary that they should be stamped separately: they may be enclosed in one envelope, but should be marked outside "Replies."

Missing Numbers

OWING to claims for missing numbers reaching us often many weeks after date of issue, we have to notify that claims for non-delivery will not be accepted if the date of origin is later than four weeks from date of due delivery in the case of foreign subscribers, or more than fourteen days after printed date in the case of inland subscribers.

CHINOSOL

**Active Antiseptic,
Strong Deodorant,
Powerful Germicide.**

Practical experience for years past proves that Chinosol in solution or ointment readily penetrates diseased tissue, thoroughly cleanses and keeps healthy all kinds of wounds, favours granulation and speedy healing, mostly without a scar, and promotes the growth of hair. Chinosol is supplied in

POWDER.

CHINOSOL PURE POWDER for therapeutical preparations used *INTERNALLY*.

CHINOSOL VETERINARY POWDER for lotions, ointments, etc., for *EXTERNAL* use.

CHINOSOL CRUDE GRANULAR FORM } for prompt production of disinfecting fluids for odourless disinfection.
CHINOSOL CRUDE POWDER F }

CHINOSOL SPRINKLING POWDERS for disinfecting and deodorizing stables, sheds, styres, kennels, fowl-houses, etc.

Also **ANTISEPTIC DRESSINGS, OINTMENTS, SOAPS, PESSARIES, CHINOSOL BORACIC DUSTING POWDER VETERINARY EQUIPMENT, etc.**

Write for full Price List, also for **POCKET CIRCULAR** for *VETERINARY PRACTICE* giving full particulars of treatment of **MILK FEVER, ABORTION, INFECTIOUS VAGINAL CATARRH** in *COWS*, and a great number of approved formulae.

NOTE.—Buyers of our preparations should in their own interest insist in receiving **ORIGINAL PACKAGES** bearing our trade mark with name and address of the Company and full directions inside, they should reject all packages not answering above description *AS NOT GENUINE* and inform us when such are offered.

Sold by Messrs. **Hewlett & Son, Ltd., London;** **Willows, Francis & Co., London;**
Wyleys, Ltd., Coventry. **Woolley & Co. Ltd., Manchester.**

And all **WHOLESALE CHEMISTS** dealing in *VETERINARY MEDICINES*.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1239.

APRIL 6, 1912.

VOL. XXIV.

"THE PRIVATE HORSE MART."

No. 2 of this new publication has been sent us with a marked paragraph of interest to the veterinary profession. The paper consists of some pages of advertisements of horses. The descriptions of the animals are somewhat imaginative, but a footnote says "The Editor does not hold himself responsible for errors, inaccurate descriptions or alterations of prices." The front page is occupied with Editorial notes, and this is one of them:—

"One correspondent made a most valuable suggestion, namely, that an alphabetical list of towns should be given in "The Mart," and in each one of them the name and address of a Veterinary Surgeon mentioned. Intending buyers could then communicate with a Veterinary Surgeon in the district, and obtain, at a reasonable price, a report on a horse advertised before either inspecting it, or sending a groom to do so. This idea we have vigorously taken up, and the Hunt Secretaries are now being asked to name the Vet. who has the largest practice with the followers of his Hunt. The Secretaries are most kindly giving us this information, and we hope very shortly to publish such a list, the utility of which is likely to be great."

We have no doubt that if this proposal is really put into practice, it will meet with universal objection from all practising veterinarians. Hunt Secretaries may be honest gentlemen, but this new function of "naming the Vet." is one we hope they will decline without pressure from our Registration Committee.

A QUESTION FOR IRISH VETERINARY INSPECTORS.

The following paragraph was contributed to last week's *Lancet* by its "Own Correspondent" from Ireland:—

"On March 21st, at Newtown Stewart Petty Sessions, a farmer summoned a servant for leaving his work before his period of hired service was completed. The evidence showed that about Feb. 18th one of the complainant's cows became sick and was brought into the kitchen, where it calved. It remained there for nine days when it died. The milk, which was sent to the creamery, passed through this kitchen, and the servant actually had to sleep in this kitchen. The servant said he had not been in good health, but put up with it as long as he could. The case was dismissed, the defendant being allowed 10s. costs. What is the use of veterinary inspectors when such a state of affairs is tolerated?"

We are insufficiently acquainted with Irish regulations to know whether the sanitary condi-

tions of farm kitchens come under veterinary inspection or under medical and sanitary officers, but we think the question forming the last sentence is irrelevant if not spiteful.

PROF. J. A. GILRUTH.

All veterinary surgeons in the United Kingdom will be more than interested to hear that Prof. Gilruth is leaving his tutorial chair at Melbourne University to take up the far wider and more important responsibilities of Administrator of the Northern Territory. To a certain extent there is something to be regretted in the appointment; for it means that a man who has done good work in our profession, and would have done much more had he remained in it, has probably ended his veterinary career. That career, including as it has done the foundation of the State Veterinary Service in New Zealand, has been so brilliant and fruitful that we should have been glad to have retained Gilruth within our own ranks. As that is impossible, we shall all join in giving him our congratulations and best wishes in his new sphere—and it may be added that he has already shown himself possessed of qualities which should ensure his success in it. His past record is that of an able and successful leader and administrator; we anticipate that his future one will be the same.

MENDELIAN EXPERIMENTS.

Mendelism, as applied to horse-breeding, is to form the subject of an investigation under Government auspices. The results may prove of the highest importance; but the task will certainly be a difficult one, and some time must elapse before it is possible to estimate the progress which is being made. At best, the application of Mendelian principles to animals is much more difficult and complex than in the case of plants—to which Mendel's own work was confined. Again, the great bulk of Mendelian work upon animals has hitherto been limited to the small and quickly breeding species. So far as the larger animals are concerned, such study of Mendelism as relates to them has been much more in the direction of examining existing breeding records than of deliberate and direct experiment. Mendelism, as a whole, is still in its infancy; as regards horses and cattle it is all but untrodden ground, with the added fact that the length of gestation in these animals must render progress comparatively slow. Still, the ultimate possibilities of Mendelism are so great—even with regard to the horse alone—that the importance of the experiments can hardly be overestimated. In any case, they cannot be without scientific value. They may, in addition, prove of inestimable material value, by initiating a new era of exact and prescient horse-breeding.

OESOPHAGOTOMY IN A DOG.

By H. C. GANGULI, Junr.,

Hospital Surgeon, Bengal Vet. Coll., Calcutta.

About the middle of January of last year a red-and-white terrier dog belonging to a lady was brought into this College Hospital for treatment.

History.—The owner reported that two days prior to its admission it stopped eating suddenly in the course of its usual evening meal (rice and meat) without any appreciable cause, and afterwards continued restless, making frequent attempts to vomit, as though something had stuck in the throat. Next day a swelling in the region of the throat was noticed, the animal did not attempt to take anything and was very restless. It was then taken by the owner to a medical practitioner. Suspecting that it was choked, the practitioner applied a little Tincture of Iodine on the swollen area.

Symptoms.—On admission the animal was extremely dull, and howled, especially when trying to swallow. On examination of the throat it was found to be inflamed, swollen and the surrounding tissues infiltrated with an oedematous exudation, but no obstruction could be felt, nevertheless it was decided to operate and find out the cause of the swelling, as obstruction of the oesophagus was still suspected.

Modus Operandi.—The animal was secured on the operation table in the latericumbent position, the hair of the part was clipped and well asepticated with alcohol. Under A.C.E. mixture a clean incision of about an inch-and-a-half long was made in the skin of the superior third of the neck, which exposed the jugular vein and the carotid artery. Retracting them and detaching the oesophageal fascia the gullet was exposed, while another incision of an inch long made in its muscular and mucous coats laid open the oesophagus. Instead of finding any ingested matter, a corroded suture needle of about two inches in length, with a thread of about a foot and a half attached, was found lying in the lumen, and the point was commencing to pierce its way through the coats. After the object was removed with a pair of fine forceps, the mucous coat was first sutured with fine silk, the lips being inverted, the muscular coat with catgut and the skin with silk. The sutures were painted with collodion and boracic powder, and the part protected by bandages. After recovering from the anæsthetic the animal seemed much relieved, and a dose of $\mathfrak{z}\text{ij}$. of Vinum gallici with aqua $\mathfrak{z}\text{ij}$. was administered to overcome weakness and exhaustion. The diet was confined to milk and beef-tea.

Next day there was neither rise of temperature nor discharge from the wound. The part was simply bathed with boric lotion, a little boracic powder was dusted over, and bandaged.

On the following day all the skin sutures were removed, leaving a thin line of demarcation between the lips, the part was thoroughly cleansed with 1:1000 of Cyllin solution, and was afterwards dusted over with a little boric acid; the animal

seemed much brighter and regaining his normal health.

On the third day the animal was notified as ready to leave, but was not removed by the owner until a few days later, when it had apparently quite recovered.

THE TRANSMISSION OF GALL-SICKNESS BY TICKS.

By Dr. A. THEILER, C.M.G.,

Acting Director of Veterinary Research.

In this paper I understand under gall-sickness the disease of cattle caused by parasites of the red corpuscles, which I called "anaplasmas," in analogy to the cause of redwater, known as "piroplasms."

In a previous article* I called it gall-sickness of imported cattle, because in our experience imported cattle suffer from it most frequently, and such cattle, when inoculated against this disease and redwater can be turned out to graze without the risk of contracting more diseases than the native Africander cattle would do, thus indicating that these two diseases are the main sources of losses under ordinary conditions. It is almost superfluous to repeat that Africander cattle are also found to suffer from this disease, but attention must be drawn to the fact that not all the diseases called "gall-sickness" are identical with the one under discussion.

The name "anaplasma" is meant to indicate more than a simple analogy to "piroplasma," it should also indicate that these two parasites are somewhat related, although they are a distinct species. This closer relationship exists in the fact that animals which have recovered from an attack of anaplasmosis (gall-sickness) remain permanently infected, and act as reservoirs just as a "redwater immune animal" does with *Piroplasma bigeminum*. Since such close relationship exists between the two, coupled with the fact that the latter is transmitted by the progeny of the blue ticks (i.e. larvae originating from mothers feeding on immune or sick animals) it had rightly to be expected that the anaplasmosis would also be transmitted by ticks, and it remained to demonstrate this surmise by actual experiments.

The first investigations of Kilborne and Smith in connection with Texas fever (which disease embraces both redwater and gall-sickness) showed clearly that the latter disease (which was usually complicated with the former one) was transmitted by ticks; according to our present knowledge we must conclude that the same batch of the same species of ticks at one and the same time is capable of transmitting the two diseases, the redwater with its shorter incubation time appearing first, and the gall-sickness following at a later date.

The subsequent experiments will show that also in South Africa the same thing happens with our blue tick (*Rhipicephalus boophilus*), and that with this and another species of ticks, the black-pitted tick (*R. simus*), pure infections with anaplasmosis are possible.

I.

EXPERIMENTS TO CONVEY REDWATER AND GALL-SICKNESS INTO A SUSCEPTIBLE ENGLISH HEIFER BY MEANS OF BLUE TICK LARVÆ COLLECTED FROM CATTLE IMMUNE TO REDWATER AND GALL-SICKNESS.

Origin of Ticks.—The mother ticks were collected off Africander cattle running on the pasture adjoining the Laboratory, which animals have to be considered to be immune both to redwater and gall-sickness.

* *Union Agricultural Journal*, January, 1912: "Gall-Sickness of Imported Cattle and the Protective Inoculation against this Disease."

Heifer 787.—An imported Sussex heifer had been kept stabled and tick-free since the date of her arrival (February 20th, 1909). On May 15th, 1909, this animal was infested with a limited number of blue larvæ, the progeny of the above-mentioned adult ticks. Only about 100 larval ticks were placed on the heifer, in order to prevent a gross infestation and a resulting severe attack of redwater.

The larvæ underwent their usual course of development. On the 11th and 12th days after tick infestation the morning temperature stood at 104° F. and 105° F. respectively, but no parasites were found. The redwater parasites were only found on the 26th day and again on the 48th day.

The parasites of gall-sickness (*Anaplasma marginale*) appeared on the 75th day, infecting on this date 4.5 per cent. of the red corpuscles. They increased daily in number, and amounted on the 86th day to 15.4 per cent. A regular fever reaction ensued from the 85th day onwards, lasting to about the 100th day, during which time the lesions of anaemia became very pronounced. The animal finally recovered.

NOTE.—In this animal we have in the first instance an infection of redwater which was only a slight one; it was succeeded by an infection of gall-sickness (*Anaplasmosis*), having a long incubation period (75 days).

II.

EXPERIMENTS TO CONVEY GALL-SICKNESS INTO ENGLISH HEIFERS IMMUNE TO REDWATER BY MEANS OF TICKS COLLECTED FROM A HEIFER IMMUNE TO REDWATER AND GALL-SICKNESS.

(2) **Heifer 922.**—The following is the history of this animal in England:—

Heifer 922.—On 16th October, 1909, this heifer received subcutaneously 10 c.c. of blood from calf 211. The temperature in the morning and evening varied only within physiological limits until the morning of 21st October, when it rose to 105° F. Blood smears taken at this time showed no parasites.

The animal immediately received subcutaneously 1 gramme of trypan blue dissolved in 150 c.c. of water. On the evening of the 21st October the temperature was still 105° F. and the blood smears were negative. On the morning of the 22nd October the temperature had fallen to 102.6° F. In the evening of the same day it was 102° F., and from this time onwards until the 5th November it varied only between 101.2° F. and 102.2° F. Blood smears were examined daily, but no piroplasms could be found until the 28th October, that is to say, twelve days after inoculation and seven days after the rise of temperature. On the morning of the 28th October a very few red-water parasites were present in the blood smears; temperature, 102° F.

No piroplasms were present in the blood smears taken on the 2nd November. A few were found in blood withdrawn on the morning of the 3rd November. They could not be found in the smears of blood withdrawn in the evening of the same day. From that time up to the 5th November the examination of this heifer's blood gave negative results.

NOTE.—Heifer 922 was subsequently exported to South Africa, and arrived at the Laboratory on the 13th December 1909. She was immediately placed in a tick-free stable and temperatured twice daily.

No abnormal records were noted during this observation period.

Treatment.—On the 1st March, 1910 (seventy-seven days after arrival, heifer 922 was infested with a considerable number of blue tick larvæ, the mothers of which had been collected off cattle in Natal; the eggs from which the larvæ emerged were laid at the Laboratory

Remarks.—After an incubation time of ten days, a slight reaction occurred lasting for four days, with a maximum evening record of 104° F. Redwater parasites were noted on one occasion only, and then only in exceedingly rare numbers. Some irregular records were noted subsequently, but all blood examinations proved negative.

On the 55th day a reaction started, lasting for 18 days, with high temperatures in the early part of the reaction (105° F. and over), and averaging between 103°–104° F. during the rest of the time. On the 55th day microscopical examination of the blood showed a very few gall-sickness parasites; they were still rare the following day. Two days later their number had reached 8 to 9 per cent. The following day a remission was noted to 2.4 per cent.; they were still rare on the 60th day.

On the 61st day they had increased to 18.8 per cent. and they decreased to 16.3 per cent. the following day. Their number now dwindled down again rapidly, and a corresponding remission in the temperature occurred.

The anaplasms had the character of the variety *centrale*, and the anaemic lesions in the blood were in no way marked; the anaemia was characterized by a slight basophilia, which remained for seven days.

Tests.—Heifer 922 was tested subsequently on two occasions with blood of animals which had recovered from gall-sickness, namely, on the 20th May, 1910, when it was injected with 10 c.c. blood of heifer 928 (an animal immune against red-water and anaplasmosis, variety *centrale*) without any results, and again on the 28th June, 1910, no reaction followed the injection of 10 c.c. blood of heifer 934 (an animal immune to anaplasmosis, variety *marginale*).

NOTE.—The infestation of ticks produced a slight temperature reaction during which a very few redwater parasites were seen. After an incubation period of fifty-five days, a distinct reaction started with anaplasms in rare numbers.

(3) **Sussex Heifer 925.**—The following is the history of this animal in England.

On the 16th October, 1909, heifer 925 received subcutaneously 10 c.c. of blood from calf 211. The temperature varied only within physiological limits until the evening of the 21st October when it rose to 103.8° F. Smears, however, were negative. From the 22nd October to the 1st November the redwater parasites were seen in the blood daily.

NOTE.—Heifer 925 arrived at the Laboratory on the 13th December, 1909; she was immediately placed in a tick-free stable and temperatured twice daily.

Treatment.—On the 1st March, 1910—seventy-seven days after arrival—this heifer was infected with blue larval ticks belonging to the same batch as used on heifer 922 (*vide* previous animal); a fairly heavy infestation was made in this instance.

Remarks.—There was a temperature reaction from the 9th day immediately succeeded by a second reaction, but of an irregular character, lasting up to the 30th day. A few redwater parasites were noted on the 12th day only.

A high reaction set in from the 45th day, with evening temperatures reaching 105.8° F., and followed by irregular records. The blood was frequently examined during this period, but, with the exception of a slight anaemia, it was found quite normal.

It was not until the 114th day that another reaction occurred, when a few anaplasms of the type *centrale* were found.

Test.—Heifer 925 was tested on the 8th August with blood of heifer 934, an animal immune to redwater and gall-sickness.

A reaction followed, lasting from the 20th until the 40th day, with exacerbations over 105° F., and during which time anaplasms, variety *marginale*, were found in

large numbers for a few days; they then slowly disappeared, corresponding with the fall of the temperature; the symptoms of anæmia were never strongly pronounced the animal recovering quickly.

The animal was sent to Potchefstroom on the 5th November, 1910, and was still alive on the 31st December, 1911.

NOTE.—In this instance the infestation of ticks produced a reaction during which redwater parasites were noted on one occasion. The irregular reaction was, however, not typical of a redwater infection.

It is possible that the heavy infestation of ticks caused a re-infection with *Piroplasma bigeminum*, from which the animal easily recovered.

In this particular instance the first gall-sickness infection was very slight, and would have passed unnoticed if the examination of the blood had not been continued over a long period. Gall-sickness parasites were found in rare numbers and after a long incubation time of over 100 days. The subsequent injection of blood of heifer 934 (which contained *Anaplasma marginale*) produced a fever reaction accompanied with a large number of parasites.

III.

EXPERIMENTS TO CONVEY ANAPLASMOSIS TO CLEAN SUSCEPTIBLE HEIFERS BY MEANS OF BLUE TICKS ORIGINATING FROM A PURE CASE OF ANAPLASMOSIS.

Origin of the Pure Strain of Anaplasmosis.

Heifer 934.—This animal had been used previously, when as a result of the injection of blood 917 it developed the disease due to *Anaplasma marginale*. Later, as the result of a second injection with blood of heifer 926, heifer 934 developed an attack of redwater, it having been clearly shown that gall-sickness was not complicated by redwater.

Accordingly I expected that by infesting this animal, previous to the appearance of redwater parasites, with blue ticks which were free of any infection, they would only become infected with gall-sickness and would then transmit this disease alone.

On the 27th May, 1911, heifer 934 was infested with blue tick larvæ collected from heifer 931 (heifer 931 was an English beast which had been infested on the 23rd February, 1910, with blue tick larvæ collected from horses; no disease developed in 931 as a result of this infestation, proving that these blue larval ticks were clean).

The infestation of heifer 934 was a fairly heavy one; the engorged females dropped between the 21st and 29th days, and were collected in great numbers.

(4) *African Calf 1168.*—Born in the Laboratory stables on the 7th November, 1910, and kept tick-free.

Treatment.—Infested on the 12th Nov., 1910, with the progeny of the blue ticks which had developed on heifer 934, and whose mothers had dropped from the 17th to 24th June, 1910.

Remarks.—Nothing unusual occurred after this infestation. The engorged ticks commenced to drop on the 24th day; the blood was occasionally examined during this time but with negative results.

On the 52nd day a temperature reaction started, continuing for eighteen days. Although this reaction was well marked, with evening records of occasionally 104° F. it could not be called severe.

Gall-sickness parasites appeared with the rise of temperature, being present in the greatest numbers at the onset of the fever, i.e., infesting 3.3 per cent. on the first day, 7.8 per cent. the second day, 4.7 per cent. the fourth day, 3.1 per cent. the fifth day, 2.2 per cent. the sixth day, 1.9 per cent. the seventh day, 1.2 per cent. the eighth day, and remaining at about 1 per cent. throughout the remainder of the reaction.

NOTE.—As was expected in this case, a pure in-

fection of gall-sickness was transmitted by means of the ticks.

In order to prove that calf 1168 was a pure infection, unaccompanied by anything else, the calf was tapped and 5 c.c. of fresh blood was injected into English heifer 1217.

Test of blood of Calf 1168.

Heifer 1217 arrived at the Laboratory from England on the 9th January, 1911, and was immediately placed in a tick-free stable. The temperature remained within physiological limits during the time of observation.

Treatment.—Injected on the 25th January, 1911, (sixteen days after arrival) with 5 c.c. blood of calf 1168.

Remarks.—A temperature reaction set in from the 22nd day, with evening exacerbations to 105° F. on the 25th and 26th days, and returning to normal on the 31st day; gall-sickness parasites were noted on the 22nd day, increasing in numbers during the succeeding days.

On the 26th and 27th days the lesions of anæmia were noticed. From the 27th until the 44th day anaplasmas were found in rare numbers.

Test for Redwater Immunity.

Injected on the 24th April, 1911, with 5 c.c. blood of heifer 1216, an imported heifer belonging to the same batch as 1217, and which developed a pure attack of redwater as the result of the injection of blood of heifer 926 on the 23rd January, 1911.

Remarks.—There was a sharp rise on the 6th day, reaching 104° F. on the 8th day; redwater parasites were noted in fair numbers on the 7th day. The animal was injected with a 1 per cent. solution of trypan blue on the 8th day, and the temperature dropped to normal the following morning.

Conclusions.—The subsequent inoculation experiments prove that the ticks transmitted a pure infection of *Anaplasma marginale* into calf 1168.

(5) *Sussex heifer 1218.*—An English heifer which arrived at the Laboratory on the 9th January, 1911: she was immediately placed in a tick-free stable and temperatured twice daily. No deviations from a normal record were noted.

Treatment.—Infested on the 25th January, 1911 (sixteen days after arrival), with blue larval ticks from heifer 934.

Remarks.—The adult females were collected from the 21st to 28th day in great numbers; there was one sharp rise of temperature to 103.8° F. on the 22nd day, but blood examinations proved negative. Seventy days after infestation a slight but definite reaction, lasting about fifteen days, ensued. Gall-sickness parasites were noted in the blood for the first time on the 70th day and remained present throughout the reaction.

Test for Redwater Immunity.

On the 24th April, 1911 (eighty-nine days after the tick infestation) heifer 1218 was injected with 5 c.c. blood of heifer 1216 (immune to redwater, *vide* previous test).

Remarks.—A temperature reaction set in from the 8th day, and on the following three days microscopical examination of the blood showed the presence of redwater parasites. The animal was injected with trypan blue on the latter date, when the temperature returned to normal and the blood regained its healthy appearance.

Tests of blood of Heifer 1218.

NOTE.—In order to prove that heifer 1218 was a pure infection of gall-sickness, it was tapped on the 24th April, 1911, and 10 c.c. fresh blood were injected into English heifer 1224.

Heifer 1224 arrived at the Laboratory from England on the 9th January, 1911, and was immediately placed in a tick-free stable. No abnormal temperatures were noted during this observation time.

Treatment.—Injected on the 24th April (105 days after arrival) subcutaneously with 10 c.c. blood of heifer 1218.

Remarks.—On the 18th and following days gall-sickness parasites were detected in the blood, coinciding with the fever reaction which lasted from the 16th to 35th days.

Conclusions.—This case also proves that the ticks transmitted a pure infection of anaplasmosis into heifer 1218.

IV.

EXPERIMENT TO CONVEY ANAPLASMOSIS BY MEANS OF THE BLACK-PITTED TICK.

(6). *Sussex Heifer 930.*—This heifer belonged to the same batch as 922 and 925, but had not been treated in England. She arrived at the Laboratory on the 13th December, 1909, and was immediately placed in a tick-free stable. The temperature was taken twice daily, and no abnormal records were noted.

Treatment.—Infected on the 30th March, 1910 (107 days after arrival), with black pitted larvae, the mothers of which were collected in Natal.

NOTE.—Black-pitted larvae do not readily become attached on cattle, but nevertheless a small number were found hanging to the ears the following day.

Remarks.—Nothing unusual occurred in the temperature until about the 75th day, when a gradual rise was noted, developing into a typical curve, and lasting until the 100th day; the fever was at its height between the 83rd and 92nd days, with evening records reaching 105° F. Gall-sickness parasites appeared with the rise of temperature, increasing and decreasing in numbers corresponding with the course of the fever; counting was not undertaken in this instance.

The symptoms of anaemia appeared on the 86th day. Nothing further happened with this animal, and in order to prove that it was a pure infection of gall-sickness, it was tapped on the 23rd January, 1911, and 50 c.c. fresh blood was injected into heifer 1213.

Test of Blood of Heifer 930.

Sussex heifer 1213.—An English heifer which arrived at the Laboratory on the 9th January, 1911, and was kept in a tick-free stable.

Treatment.—Injected as above (fourteen days after arrival).

Remarks.—A severe temperature reaction commenced on the 16th day, with evening rises to over 105° F., and lasting until the 30th day.

During this period gall-sickness parasites appeared in great numbers, and all the symptoms of anaemia developed. The heifer showed visible symptoms of illness, with pale mucous membranes, refused to feed, frequently lay down, showed hurried respirations, and lost condition.

She was treated, and eventually recovered.

Conclusion.—The black-pitted ticks transmitted a pure infection of anaplasmosis to heifer 930, as proved by the injection of a large quantity of its blood into heifer 1213.

Summary of Conclusions.

Five English heifers and one stable-born Africander calf were used for the experiments; they were all susceptible to gall-sickness (anaplasmosis), two were immune to redwater, having been inoculated against this disease in England.

In all six instances gall-sickness was transmitted. In the first instance both diseases (redwater and gall-sickness) were transmitted to the susceptible heifer by ticks

infested with both diseases; in the second instance the ticks transmitted gall-sickness to heifers immune to redwater, and in the third instance ticks were used which originated in the first place from horses, and thereby were freed from any infection of redwater and gall-sickness; these ticks were infected with a pure infection of anaplasmosis, and this pure infection was transmitted to susceptible heifers; the blood of these latter heifers was tested by inoculation, and found to really represent a pure anaplasmosis or gall-sickness infection.

Attention must be drawn to the long incubation time of gall-sickness after tick infection, contrary to a relatively short incubation time after inoculation of the same parasite, of which fact full advantage was taken for inoculation purposes, as indicated in my last article.

This paper should form another illustration of the importance of ticks as a carrier of disease, a disease which attacks practically all cattle born and bred in South Africa, and is responsible for the death of a great number of imported animals. Although I have been able in my previous article to show that it is possible to inoculate against this disease, and thus convey a great amount of immunity, so that such inoculation may be made use of for practical purposes, yet I do not consider that such inoculation is the solution of the problem under discussion. The destruction of the ticks will get at the root of this evil, and the foregoing notes may be considered as a further support of our recommendation for the destruction of all tick life.

MIDLAND COUNTIES' VETERINARY MEDICAL ASSOCIATION.

The annual meeting was held at Birmingham, on Friday, Feb. 23rd, the President, Mr. H. L. Pemberton, of Bridgnorth, occupying the chair. There were also present: Messrs. W. S. Carless, F. L. Gooch, J. A. Gold, W. Ison, F. J. Taylor, L. C. Tipper, R. Cockburn, R. Hughes, W. H. Brooke, F. W. Barling, T. Slipper, J. Malcolm, R. C. Trigger, P. Murray, A. B. Forsyth, J. Martin, B. Devine, Burndred, J. Young, Thompson, J. J. Burchnall, G. Smith, and the Hon. Sec., Mr. H. J. Dawes.

The visitors present were Dr. O. Charnock Bradley, Edinburgh; and Mr. Brittlebank, Manchester.

Apologies for unavoidable absence were announced from Sir John M'Fadyean; Professors Mettam, McCall, Macqueen, Dewar, Penberthy, and Hobday; Dr. Manley and Dr. Gilbert Barling; Messrs. W. Woods, T. H. Hobson, R. L. Forrest, A. Over, W. T. Brookes, H. B. Hiles, W. Hunting, F. H. Gibbings, J. R. Carless, S. J. Marriott, A. W. Mason, W. G. Bowes, A. McCarmick, W. H. Brown, E. Ringer, W. S. Mulvey, T. Chambers, T. J. Brain, A. S. Reynolds, W. W. Grashy, C. E. Dayus, E. O'Neill, C. J. Byner, F. B. Gresham, J. Clarkson, J. Blakeway, J. W. Coe, L. W. Heelis, G. Wartnaby, F. V. Steward, and others.

MEETING OF THE COUNCIL.

Previous to the general meeting, a meeting was held of the Council. Mr. Pemberton presided, and the others present were: Messrs. Carless, Martin, Gold, Gooch, Burchnall, Trigger, Brooke, Malcolm, and the Hon. Sec. They drew up the following report for presentation to the general meeting:—

"The Hon. Sec. reported that he had written to members in arrears with their subscription, as ordered at the last quarterly meeting. The result was partly satisfactory. It was resolved that the names of members

who had made no response to this final appeal be read out publicly and struck off the membership roll of the Association. It was further resolved to take steps to recover the arrears. It was also agreed that members in arrear be not allowed in future the use of the Association's instruments.

A letter on the subject of the National Veterinary Association was referred to the general meeting.

It was resolved that the undivided support of the members of the Association be invited on behalf of the candidature of Mr. R. C. Trigger, who is seeking re-election as a member of the Council of the Royal College of Veterinary Surgeons.

Recommendations for the election of officers were considered. In consequence of the indisposition of Mr. H. Thackeray, who is the senior Vice-president, it was recommended that Mr. W. H. Brooke, the junior Vice-president, be elected President, and that a letter be sent to Mr. Thackeray expressing the hope that he may be restored to health and allow himself to be nominated for the chair next year. Other recommendations for office were: Vice-presidents—Messrs. H. Thackeray and J. Martin; Treasurer—Mr. J. J. Burchnall; Hon. Sec.—Mr. H. J. Dawes; Auditors—Messrs. W. S. Carless and R. C. Trigger.

It was resolved that the two senior members of the Council retire each year, and not to be immediately eligible for re-election. Messrs. Malcolm and Trigger would accordingly stand down this time, and it was recommended that Messrs. Ison and Devine be elected.

Mr. Brennan Devine has kindly consented to read a paper on "John's Disease" at the next meeting.

It was resolved that the next quarterly meeting be held at Stafford.

The minutes of the last general meeting were confirmed.

NEW MEMBERS.

Mr. RALPH L. C. FORREST, of Alcester, on the motion of Mr. Gold, seconded by Mr. Taylor; and Mr. G. THORNTON, of Leicester, by the Hon. Sec. (on behalf of Mr. T. H. Hobson), seconded by Mr. Cockburn, were elected members.

Mr. W. G. THOMPSON, of Stafford, was nominated by Mr. Murray for membership. His name will be submitted to the next quarterly meeting.

DEFAULTING MEMBERS.

Arising out of the report of the Council, the Hon. Sec. was ordered to read the names of those members who were several years in arrear with their subscriptions, and who had made no response to a final appeal for payment.

The PRESIDENT said it was his unpleasant duty to move that those gentlemen be struck off the membership roll. This was seconded by Mr. Burchnall and carried.

THE NEW NATIONAL COUNCIL.

The HON. SEC. read a letter from the National Veterinary Association, to which this Association has become affiliated, requesting the appointment of representatives to serve on the Council. Each affiliated Society was entitled to be represented by its Secretary and one representative for every 25 members, so that this Association was entitled to elect five representatives in addition to the Secretary.

On the motion of Mr. Tipper, seconded by Mr. Gooch, the Midland representatives were elected as follows:—Messrs. Malcolm, Brooke, Gold, Hughes, and W. S. Carless, together with the Hon. Sec.

MR. TRIGGER'S CANDIDATURE.

The PRESIDENT moved that Mr. Trigger be again nominated as the representative of this Association on the Council of the Royal College of Veterinary Surgeons.

Mr. Trigger had represented them well and faithfully for a good many years, and he was a man in whom the entire profession had the utmost confidence.

The HON. SEC. said he could personally testify to the valuable work which Mr. Trigger had done, and he had therefore the greatest pleasure in seconding the motion. It was the custom of this Association at one time to unite with other Associations for election purposes, but it was a practice with which Mr. Trigger did not agree, because he thought it put the Association to unnecessary expense.

Mr. Gooch having supported the motion in enthusiastic terms, it was carried unanimously.

Mr. TRIGGER, in acknowledgment, said that this May he would have completed 21 years service as a member of the Council, and under ordinary circumstances he should have asked them to relieve him of the office and give a younger man a chance, but he did not want to retire until the Bill which the Council had in hand was passed, and he was prepared to devote a little more time to fighting in that cause. It was more essential now than ever it was that something should be done to put the Royal College on a better footing financially. They had been obliged to sell more Consols to pay their way, and they continued to have a diminishing income. The inroads which the motor car was making upon private practice was not likely to improve the situation. He regarded it as a very high compliment that he should be the nominee of an influential Association like the Midland, but he did not want them to spend any money on his candidature. He thought the recommendation of the Midland Association, together with his own length of service, would secure his re-election, and except when there was any burning question before the profession he failed to see the wisdom of amalgamating with other societies for election purposes.

VOTES OF CONDOLENCE.

The HON. SEC. reported that since the last meeting of the Association, they had sustained a great loss by the death of Mr. Butler, of Evesham. He was a man whom everyone respected and looked up to. Their friend Mr. W. S. Carless had also suffered a great bereavement in the death of his son, and he moved that they express to the two families their heartfelt sympathy in their sorrow.

Mr. GOLD seconded. He said he once managed Mr. Butler's practice, and he had ample opportunities of recognising his many good qualities.

The vote of condolence was adopted *sub silentio*, and in Mr. Carless's case, he briefly but feelingly acknowledged it.

TREASURER'S REPORT.

The HON. SEC., Mr. J. J. Burchnall, presented his accounts, which had been duly audited. The total receipts during the past year amounted to £217 14s. 9d. the items being: balance from previous year £163 8d. 3d., members' subscriptions £51; and bank interest £3 6s. 6d. On the expenditure side, the chief items were: annual subscription to the Veterinary Benevolent Fund £5 5s.; and Hon. Secretary's outgoings £26 12s. 10d.; the balance to carry forward standing at £178 3d. 2d.

Mr. BURCHNALL said the balance in hand had increased more than usual during the year, but that was because the expenses had fallen off.

On the motion of Mr. Tipper, seconded by Mr. Gold, the accounts were passed, the meeting expressing the opinion that the finances of the Association were in a very satisfactory condition.

ELECTION OF OFFICERS.

Mr. TRIGGER claimed the privilege, as the oldest member present, to nominate a gentleman for the position of President, and one who, he promised, would do

credit to the Association. He referred to Mr. Brooke. In the ordinary course, their friend Mr. Thackeray, as the senior Vice-president, would have been nominated, but his health at the present time was not as good as it might be, and it was felt by those who knew Mr. Thackeray best that it would be doing him a kindness to defer his appointment to the chair for another year, by which time they sincerely hoped he would be well and strong again. However, it was a matter of satisfaction to them to know that failing Mr. Thackeray they had such a suitable candidate for the office as Mr. Brooke, who was well known to all of them, who was one of the most regular attenders at the meetings of the Association, and who would be able to command the respect and confidence of the whole of the members. (Applause).

The Hon. Sec. said he should like to second the resolution. He had known Mr. Brooke longer, perhaps, than anyone else in the room, for they were near neighbours, and a more honourable opponent in business it would be impossible to find. [That motion was heartily carried].

Mr. BROOKE said he was deeply sensible of the honour the Association had conferred upon him, and he would do his best to maintain the prestige of the office, but as he was single-handed in business he might have to fall back on the assistance of other officers, though he was sure he would not be likely to make an appeal in that direction in vain.

Vice-Presidents: Messrs. Thackeray and J. Martin were appointed, on the motion of Mr. Gold, seconded by Mr. Taylor.

Hon. Treasurer: Mr. J. J. Burchnall was re-elected.

Auditors: Messrs. W. S. Careless and R. C. Trigger were elected.

Hon. Sec.: Mr. BROOKE said that as the President-elect, he would like to have the opportunity of proposing that Mr. H. J. Dawes be re-elected. He knew he would have to rely upon that gentleman for guidance during his year of office and it was an agreeable reflection that the affairs of the Association were in such capable hands. The motion was seconded by Mr. Martin and carried.

Mr. DAWES in accepting the office again, said it would be 21 years that he had acted as Hon. Sec. and he had enjoyed the work, but whether there would be as much to do now that they were affiliated within the National Association remained to be seen.

The recommendation of the Council that two of their number should retire each year without being eligible for immediate re-election was agreed to.

Messrs. Ison and Devine were accordingly appointed under the new rule, to succeed Messrs. Malcolm and Trigger.

Other recommendation of the Council, as to the subject for discussion at the next meeting, and where it shall be held were also endorsed.

SALES FOR AGRICULTURAL PURPOSES BILL.

Mr. L. C. TIPPER drew attention to certain clauses in this Bill, which he suggested would prejudicially affect the veterinary surgeon. He said that although it was a matter of importance to the profession, probably few members of the Association were aware that it was in contemplation.

Mr. TRIGGER said he had read the clauses to which Mr. Tipper took exception, and so far as he could see they would not affect the ordinary practitioner in the least. It was food, and not medicine such as a duly qualified veterinary surgeon would prescribe, that was intended. The vendor of food for cattle would have to disclose the nature of, and although the expression "food" in the Bill was meant to include "any condiment or substance used to admix with ordinary feeding stuffs," it could surely not mean medicine or anything

intended as medicine for an animal that was sick. So far as he (Mr. Trigger) could see it was a proper Bill to go through. Still it might be well to safeguard their position and try to get an addendum to the Bill specifying that medicines prescribed by a duly qualified veterinary surgeon were not included. He thought that was as far as they could go.

Mr. TIPPER: We might ask that any veterinary surgeon should be exempt from its provisions.

Mr. TRIGGER: No, I don't think so. The moment a veterinary surgeon begins selling food stuffs to anyone who will buy them he becomes a tradesman, and he ought not to be exempted from a food Bill any more than any other tradesman. (Hear, hear).

Mr. GOLD said he supported the remarks of Mr. Trigger. As far as he could see, this Bill was not intended to apply to the *bona fide* veterinary practitioner, who prescribed a particular food for an animal in special circumstances. It was meant to apply to the man who sold cattle foods at random, and who was in that way a tradesman pure and simple. It might be a good thing, however, if they asked Mr. Trigger to bring the matter before the Council so that these clauses might be watched during the progress of the measure through the House of Commons. By that means they might be sure that the position of the genuine veterinary practitioner would be safeguarded. (Hear, hear).

Mr. TRIGGER said it would not be necessary for him to mention the matter to the Council, for their solicitor let nothing of that kind escape his notice and they might be sure he had already had this Bill under observation. He had never found their solicitor asleep yet.

Mr. FORSYTH said if a man advertised food stuffs for sale it was quite right that the public should know what they were buying, but he could not conceive that the ordinary practitioner who prescribed this or that diet in a particular case that he was attending would be brought within the provisions of the Bill. (Applause).

On the motion of Mr. Gooch, seconded by Mr. Martin, it was resolved to leave the question to the Council of Royal College of Veterinary Surgeons, who would be alive to anything that affected the profession in the way suggested.

HEREDITY.

Dr. O. CHARNOCK BRADLEY, Principal of the Royal (Dick) Veterinary College, Edinburgh, delivered an address on the subject of heredity. He said that when he was asked to speak at this meeting on the subject he hesitated for two reasons. In the first place it appeared to him that so specific and complex a subject as that of heredity should be dealt with by someone who had given it that special study which it deserved. Secondly, the subject was such an enormous one that it seemed impossible to deal with it in any degree adequately in a single address.

Two problems alone were sufficient to illustrate the importance of heredity to the veterinary surgeon. What was the relationship of heredity to disease? and how far might acquired characters be transmitted?

Before attempting to make answer to the first question, it was necessary to decide exactly what was meant by "disease." The term was extremely difficult of definition, for the same process might be ranked as a disease under certain circumstances, while under different conditions it would be regarded as normal.

The transmissibility of acquired characters was a matter upon which there had been, and there still was a considerable divergence of opinion. Until it had been definitely decided that the germ-cells were absolutely uninfluenced by the body which acts as their host—and all scientists were not by any means in agreement upon that point—it was dangerous to dogmatise upon the transmissibility or otherwise of acquired characters.

One respect in which breeders and others were liable to fall into error was in the direction of forming conclusions from too scanty data. Laws could be most securely founded upon the collation and analysis of extensive statistics. Masses rather than individuals were of value in the formulation of laws. There could be little question that breeders and others attached undue and dangerous importance to individual cases.

It was because of a lack of sufficient and reliable statistics that genetics could speak with so little assurance regarding many points of heredity as it affected domestic animals. Farm-stock, moreover, offered difficulties inasmuch as there were so few sharply defined characters, and such a diverse mixture of latent strains. Because genetics hesitated in answering many problems related to farm-stock, the science need not be condemned as useless. Genetics was young and had a great future.

One matter of enormous importance upon which much work had been done, and much remained to be done, was that of deciding in how far the capacity for "performance" was heritable. In Denmark, in particular, it was held that cows capable of giving a large milk-yield could transmit this capacity to their offspring. On the other hand, certain recent observations conducted by Raymond Pearl on the egg-laying capacity of hens, did not point so certainly to the transmissibility of capacity for performance.

Inheritance might manifest itself in three, or possibly four, main ways. In the first place there was the mode of "blended inheritance," by which the characters of both parents were so transmitted that the offspring presented characters almost or quite equally compounded of those of the two parents. Blended inheritance was not necessarily stable; but it might be so, as instanced by certain cross-bred sheep which breed true.

The mode of "exclusive inheritance" resulted in the production of offspring which resembled one parent (absolutely prepotent) to the exclusion of the other. It did not follow, however, that the so-called excluded character was not present in the offspring. It might be merely dormant, and capable of re-appearance in the next generation.

"Particulate inheritance" was illustrated in the old English sheep-dog, where one eye might be paternal, the other maternal. Here both parental characters were present but had not mixed.

Regressive inheritance and filial regression were of prime importance to the breeder, for it had been shown that there was a constant tendency to return to the mean. Exceptional parents do not necessarily produce exceptional offspring, because of this innate inclination towards the mean.

From this point Dr. Bradley continued his address with the aid of lantern-slides, which illustrated the history of the germ-cells, their behaviour in development and their relation to heredity.

Mr. MALCOLM said that as it was at his suggestion that Dr. Bradley had come to address them on that most interesting topic, he considered the members present were under a debt of gratitude to him. He was much interested in what Dr. Bradley had said about the possibility of the inheritance of acquired character. It was a most important point. A veterinary surgeon examined horses, and it became very often a question whether the characters they saw were solely the result of heredity. A great many of their leading sociologists seemed to follow Weissmann, and others shared with Professor Bradley the view that it was possible for the influence of environment to be so reflected on the germ cells that characters acquired during the life time of the parents may be transmitted to the offspring. Professor Bradley also touched on the question of performance, referring especially to eggs and milk. He (Mr. Malcolm) was no authority on poultry, but he had paid a great deal of attention to the question of milk production, and he was

one of those who thoroughly believed that there was as much evidence of heredity in milk production as in anything else. The inheritance of milking qualities was a matter of practical value to the farmer, and he believed that if they got a cow of a very good milking strain, even if she was not one of the best milkers herself, she would follow into line and produce good milking stock. The truth of that had been proved by the Danes, who had paid a great deal of attention to the question in recent years, with the result that they were now taking the lead in the dairying world. By the process of careful selection, the Danes had made their milking cows equal, if not superior to any in the world, breeding only from those that came up to a certain standard. He was interested to observe that Dr. Bradley was not so wholehearted a believer in Weissmann as many Edinburgh people in the past had been. Dr. Bradley had told them that the subject was such an immense one that he had been obliged to leave many aspects of it untouched. He only hoped, therefore, that he would be able to find time to come among them again and complete his remarks, for they had all listened to the address that day with the deepest interest. (Applause).

Mr. GOOCH said he could go all the way with Mr. Malcolm with regard to heredity in cattle so far as their milking qualities were concerned. With regard to the four modes of heredity specified by Dr. Bradley, the breeding of pigs furnished them with good illustrations. It was a known fact that if they got a pure white gilt and mated it with a pure white boar the offspring was pure white, but if they mated it with a black boar they could never in future get anything but mixed colours. With regard to performance, he thought it had been very much emphasised in the report just issued in the Shire Horse Society's Stud Book, where they had the number of prize winners put down. If they took Lockinge Forest King, they would see that 98 of his progeny took prizes in the Show ring. Other noted sires with quite as good mares had not produced anything like that number of prize-winning foals, proving what Dr. Bradley had said—that exceptional parents did not necessarily produce exceptional progeny.

Mr. TRIGGER said he should like to add his meed of praise to what had already been said regarding Dr. Bradley's excellent paper. He agreed with those who held the view that the milking qualities in certain strains of cattle were re-producible. Amongst stock there were certain characteristics derived from the parent, and he remembered when he was a boy he could tell which were the offspring of certain dams among the sheep at home. He believed shepherds could tell the different sheep on pretty much the same lines. There was something about the appearance of animals which reminded one of their parents, and he himself had surprised clients before now by telling them what the sire was when he was not supposed to know. The knowledge of eugenics was very important, as it helped them to avoid breeding from unsuitable animals, and the study of it was one which was not only of practical value to the veterinary surgeon and the stock owner generally, but also of absorbing interest. He had very much enjoyed Dr. Bradley's address.

Mr. ISON moved a vote of thanks to Dr. Bradley for his kindness in preparing the lecture for the Association. He said he should like to hear him go still more fully into the subject on some future occasion.

Mr. HUGHES seconded and said Dr. Bradley was known throughout the profession as one of the most capable teachers they had. He went very carefully into everything he undertook, and he had communicated to them that afternoon much valuable information on a subject of the highest importance.

The vote of thanks was heartily carried, and briefly acknowledged by Dr. Bradley.

VOTE OF THANKS TO THE OFFICERS.

Mr. DEVINE said that before they separated they ought to make some acknowledgement of their indebtedness to the Officers of the Association for their services during the past year. Their affairs were in excellent hands, and under its present management the Association was doing much good work among practitioners in the Midlands. He moved that the Officers be accorded a vote of thanks.

This was seconded by Mr. Barling and carried, the President and the Hon. Sec. suitably returning thanks.

THE ANNUAL DINNER.

The meeting was followed by the Annual Dinner, over which Mr. Pemberton again presided. A short toast list was honoured, "The King" being first of all drunk.

Mr. BROOKE gave "The Imperial Forces."

Mr. DEVINE proposed "The Royal College of Veterinary Surgeons." He said they were well represented in Dr. Bradley and Mr. Trigger, who were both held in the very highest esteem in the profession.

Mr. TRIGGER said there was nothing new to tell them so far as the College was concerned. He thought the members knew the position, and in a financial sense it was far from satisfactory. They had £7,500 in Consols and they cost far more than they would realize if they were sold to day. He was really ashamed to be continually parading the poverty of the College before them, but he hoped they all realised that something would have to be done soon if they were to re-habilitate themselves, as the Council hoped they would.

Dr. BRADLEY said he had not been a member of the Council long enough to say much on that subject, but he was pleased to fall in with the President's suggestion that he should propose the next toast, namely, "The Midland Counties' Veterinary Medical Association." He had seen sufficient that day to satisfy him that this Association was in a most flourishing condition, and he believed that if it was conducted on the same lines as at present it would go forward to greater things.

The President and the Hon. Sec. responded in terms that were brief, and the other toast was the "The Visitors," proposed by Mr. Malcolm and responded to by Mr. Brittlebank.

H. J. DAWES, F.R.C.V.S., Hon. Sec.

Mendelian Breeding of the Racehorse.

From a special article to the *Sporting Chronicle* by "Mankato" we take the following extract. The whole article is most interesting, and will be found in our contemporary's issue of March 23rd :-

"It is announced that Captain Dealtrey C. Part, of the 21st Lancers, has recently placed £10,000 at the disposal of that Department for the purpose of carrying out Mendelian experiments in light horse breeding. With the concurrence of the Board of Agriculture, Captain Part has entrusted Mr. C. C. Hurst, of Burbage, with the arrangement of the details, and it is understood that Mr. F. W. Carter, Superintending Inspector of the Board, will watch the proceedings on behalf of that body. Mr. Hurst, who is better known to horticulturists than to bloodstock breeders and racing men, it would appear, has, after consultation with Professor Cossar Ewart, come to the conclusion that to be in a position to breed light horses with economy, and suitable for military purposes, it will be necessary to form at least one pure breeding (homozygous) strain of thoroughbreds of hunter type, which shall possess speed, weight-carrying ability, and the jumping temperament, and (2) to form at least one pure breeding strain with the characteristics of the old Irish draught or of the old English pack horse. It would appear that, after the true breeding thoroughbred

and the true breeding pack horse have been obtained, the two species are to be crossed, and the expectation is that the resulting hybrids will be exactly the material required for military purposes; that is to say, the offspring will be uniform and intermediate for every character present in the respective pure-bred parents. Presumably these hybrids are not to be crossed *inter se*, or mated with either of the parent forms, lest, being themselves mongrels, they should break up or segregate in various ways, giving a diversity of offspring.

It will, therefore, be seen that the initial part of the scheme falls into two sections. The first, or thoroughbred portion, is generously financed by Captain Part, and, as already stated, is under the direction of Mr. C. C. Hurst. The Irish draught section has for some little time independently engaged the attention of the Department for Agriculture and Technical Instruction for Ireland; whilst the work of resuscitating the Devon pack horse, now on the point of extinction, has been undertaken by Colonel Stavely, of Holbeton, Plymouth, from whose monograph in the *Journal of the Royal Agricultural Society* it would seem that it is the intention to cross the few remaining Devon pack mares with Norfolk hackneys, and thus evolve a pure breeding animal of pack horse stamp. Taking the hackney at his value as assessed by our Irish friends, it is not easy to gather how any breed evolved with his assistance can be of use for crossing with the thoroughbred, even if the latter be of Mr. Hurst's proposed new brand. And here for the present we will leave the weightier end of the scheme for breeding army horses, and give a little consideration to the portion relating to the thoroughbred.

TRUE-BREEDING SIRE.

I should first explain that at the meeting of the British Association held at Portsmouth in August Mr. Hurst announced that he had discovered three stallions and four mares which when bred together had given nothing but horses of the 'chaser type, as tested on the racecourse and at the stud. In view of this find he advised the Board of Agriculture to purchase some of the offspring of these animals, with the idea of multiplying the supposed pure 'chaser line. He hoped that in this way he would solve the problem of manufacturing a pure-breeding race of thoroughbred hunters to take the place of the present Premium stallions, which, in his view and Professor Cossar Ewart's, are little more than mongrels, and for this reason unsuitable for siring half-bred stock.

It subsequently transpired that the homozygous or true-breeding sires "discovered" were Red Prince II., Hackler, and Bushey Park, and the true-breeding mares Circe (Play Actor—Mount Royal), Cinnamon (Concha—Mount Royal), Faithful Lassie (Ascetic—Faith), and Athela (Atheling—Aileen Ogue). Well, it should not have entailed a great amount of research to find out that a proportion of the stock of Red Prince II., Hackler, and Bushey Park have won jump races; that is a matter of common knowledge. Then, in regard to the mares, every pedigree student knows that Flaxman, Old Fairyhouse, Cackler, Flaxseed, and Distaff are by Hackler out of Circe. But he is also aware that Distaff, like her three half-sisters, by Bushey Park, Laveno, and Ireland respectively, have never won, a circumstance to which Mr. Hurst makes no reference. Nor does he explain why Brown Hackle by Hackler out of Cinnamon, should have been able to win little steeplechases whilst her unnamed sister has never seen a racecourse; or, again, why there should have been such noticeable variability in the offspring of Red Prince II. and Athela.

MISCONCEPTION.

We have been led to understand that the labours of Professor Cossar Ewart and Mr. Hurst, in their search through the Stud Book and "Racing Calendar," re-

sulted in the elimination of many hundreds of heterozygous (not true-breeding) and doubtful animals. But I suggest that the weeding out process might have been carried a little further. To write of replacing the King's Premium horses with animals of the calibre of the produce of Red Prince II. and Athela reveals a lack of practical knowledge, and, to be perfectly candid, it seems that the scheme is founded on a series of misconceptions.

In the first place, it has been assumed that steeplechasers are of a uniform type as regards conformation, whereas the skeleton varies very greatly in different individuals which have been seen in the front rank as jumpers. Cloister, Manifesto, Ambush II., Why Not, Moifaa, and Father O'Flynn, for example, bore no resemblance to each other whatever. Yet they were all Grand National winners. Again, though the gross bulk of the muscles of locomotion is closely related to the size and shape of the bones to which they are attached, the special physiological properties of the individual fibres of which a muscle is composed are not associated with any special skeletal conformation; that is to say, mere make and shape are no evidence whatever of stamina.

Another mistaken notion is that jumping ability or instinct is represented by a specific Mendelian character. A little reflection will show the falseness of this view. Ability to jump depends not on one but on many characters, and these are transmitted quite independently of each other. It is true that a quick and safe jumper must possess the faculty of rapidly co-ordinating various muscular movements. But this co-ordination is more an acquired than an hereditary character. In other words, if you want "homozygous jumpers," you must have "homozygous jockeys" and "homozygous trainers." Some men can turn any thoroughbred which is not an absolute weed or cripple into a steeple-chaser.

It is not quite clear what part the two-year-old filly and the two yearling colts are to play in the scheme. But the information in regard to the brood mares is more definite. These "true-breeding" females are to be put either to St. Aidan or Perigord, with the expectation that about one-half the foals will be of the kind required.

In sending the mares to Perigord or St. Aidan no very original steps have been taken. Seeing that no fewer than 35 of St. Simon's sons were returned as sires of winners of jumping races last year, it is not improbable that a little of the St. Simon "nerve force" and stamina may pass to the offspring of the matrons in question. The unique position in France of St. Simon's son, St. Damien, as a sire of jumpers, taken into consideration with the English records, rather looks as though the Welbeck prince of stallions were entitled to be considered a "true-breeding hunter." Further, as many of Galopin's sons—St. Gris, to wit—have sired very high-class chasers and hurdlers, he, too, must come in the same category. So, in the nett result, if you want to breed jumpers, either in England, France, or Australia, it is well to tap the Galopin—St. Simon lines.

It is a little unfortunate that in the foreword to the to the scheme it has been somewhat egotistically stated that if in time to come the experiments prove abortive, it will only demonstrate that Mendelism is inapplicable to horse-breeding. In this connection the old proverb concerning catching your hare before cooking it should not be forgotten. Mr. Hurst has not yet "caught" his Mendelian characters in his "homozygous jumpers"; but, so far as can be judged from the racecourse and breeding tests, he has managed to get together a somewhat mixed assortment of transmissible units. Conclusions drawn from very meagre data are at all times useless for scientific purposes, and the fear is that breeders

of bloodstock generally, who are as yet inclined to view Mendelian heredity with suspicion, may attach undue weight to the results of these experiments, which, in the very nature of things, are bound to be more or less empirical, and give varying results.

It was amply demonstrated over 50 years ago by Lord Glasgow that one can breed thoroughbreds of almost any size or weight or conformation he pleases, but his Lordship's annual "shooting days" bear witness to the fact that it is not an easy matter to fix the characters associated with speed and stamina in the same carcass as the show ring characters of mere beef and bone. Lord Glasgow during his long life had unlimited means, and scores and scores of brood mares and many stallions with which to experiment; and one must be sanguine indeed to anticipate that breeding trials repeated on a very minor scale can furnish information which will extend our knowledge.

At the present time there is a sufficient number of thoroughbred horses in the country suitable for siring stock quite good enough for army purposes. The trouble does not lie with the sires, but in the fact that no intelligent agriculturist will undertake to breed horses for army purposes, either from Irish draught, Devon pack, or any other variety of mares, under the present prices paid by the War Office.

Whatever may be the results of the Burbage experiments and Capt. Part's well-intentioned endeavour, this vital point will be left untouched."

REVIEW.

A MANUAL OF VETERINARY PHYSIOLOGY.—By Major-General F. SMITH, B.B., C.M.G., F.R.C.V.S., F.I.C. Fourth Edition. Demy 8vo., Pp. xij. + 808. Two hundred and fifty-nine illustrations, including one coloured plate. Price 18/- net. Baillière, Tindall & Cox, 8 Henrietta Street, Covent Garden, W.C.

It is now nearly twenty years since the first edition of Smith's Veterinary Physiology was published. Each of its successive re-appearances has been marked by an increase in size; and the present fourth edition contains much more than double the amount of literary matter of the first one. We may add that it contains some 90 pages more than the third edition; and, as it is now printed in smaller and closer type than before, its real increase is even greater than the paging would indicate.

The work, and the peculiar underlying scheme of applying the science of physiology to the problems of daily practice that has always been one of its great merits, is now familiar to all of us. In its present form, when its physiological teaching is deeper and more detailed than ever before, its clinical bearing is perhaps not so immediately evident as in earlier editions; but nevertheless the deliberate application of physiology to practice is as essential a feature of the book as before. The aim of the work is unaltered; the only change in it, beyond the necessary bringing up to date, is an enlargement of its scope.

The plan is exactly the same as that followed in the third edition. The book is divided into twenty chapters, varying in length from 6 to 111 pages, and dealing respectively with the blood, the heart, the bloodvessels, respiration, digestion, the liver and pancreas, absorption, ductless glands and internal secretions, the skin, the urine, nutrition, animal heat, the muscular system, the nervous system, the senses, the locomotor system, the foot, generation and development, growth, decay, and death, and the chemical bases of the body. It is characteristic of the author's methods of working that no chapter has escaped a little enlargement, though some have, of course, received much more than others. In

addition to enlargement, the whole text has, of course, been revised; and only a systematic comparison of the present with the last edition, sentence by sentence, will adequately show the scrupulous care with which this has been executed.

The work is such a familiar one that any detailed description of it seems superfluous, except with regard to the additions. There are so many, and include so great a variety of subjects of greater or less importance, that it is impossible to here enumerate them. Two chapters which have received most enlargement are that on the locomotor system—which, by the way, was little altered in the third edition—and that upon the nervous system, which has been extended very greatly. One noteworthy improvement in connection with locomotion is the increased consideration given to "work."

The amount of work to be expected from horses now forms a separate section of ten pages in small type, which is well worth attention. Another new feature is a section on heredity in the chapter upon generation and development, in which the various classic theories are succinctly described, and an excellent though necessarily extremely condensed and elementary account of Mendelism is given. Some of the pathological appendices to various chapters have also been enlarged; and in that upon the heart we note a summary of the revolutionary modern views of human cardiac disease—a subject to which every practitioner would do well to pay attention. Many other similar features could be cited; but the above will serve to exemplify alike the regard paid to modernity, and the progressive expansion which the work continues to undergo with each succeeding edition.

About a hundred fresh illustrations have been added from various sources. All are good—some very good indeed—and we do not see one that is superfluous. Some anatomical ones in connection with locomotion are especially excellent, and useful into the bargain.

The book throughout is a worthy successor to its three well known predecessors. Smith's Physiology has become a classic work to English veterinary readers, and may be trusted to remain so during the author's life time at least. Its first publication in 1892, filled a gap in our literature by meeting the then existent need for an essentially veterinary physiology; and its subsequent reappearances have only strengthened its unique position. No book in the language can compare with it for the use of the professional student; and of no other book on physiology can it be fairly said that it ought to be in the library of every qualified veterinarian. That has been true of preceding editions, and is still more true of this one.

W. R. C.

Vivisection and the Veterinary Profession.

To the Editor of The Referee.

Sir,—I agree entirely with your correspondent, "Pate, J.P.," and congratulate him on his courage in tackling a public evil.

If the Society for the Prevention of Vivisection would take up the question and prosecute in conjunction with the Society for the Prevention of Cruelty to Animals, all unqualified people who use caustic or irritant remedies upon animals, they would certainly relieve more suffering in a day than they ever will under their present policy.

I have had forty years' experience with horses, and hunted a pack of hounds for twelve years, and have rarely known ointment or lotion recommended by a farmer that did not contain an ingredient of a pain-producing character. During the last four years, whilst

developing the Transport Sections of Territorial Field Ambulances, I have constantly had to explain how needlessly cruel remedies in common use with horses are, and invariably have ascertained the prescription has been given by a farmer or groom.—I am, sir, yours, etc.,

P. BROOME GILES.

Bletchley, March 25.

HOW THE VETERINARY PROFESSION IS HANDICAPPED.

Sir,—The letter from "Pate, J.P.," will come as an eye-opener to many persons. It is quite time that we required the owners and users of horses and other draught animals to treat their beasts as something more than pieces of machinery. The whole question is purely one of £ s. d. to the owner, and if he can have his animal "cured" at a cheap rate he "won't spend more money. An animal as it grows older, becomes more liable to disease, while at the same time its pecuniary value decreases, so that while the owner does not wish to kill it yet, still he does not care to expend the money upon it necessary if a veterinary surgeon were to be called in. For the poor man, there may be some excuse; for the richer, there can be none. The "minimum wage" of the animal should include skilled attendance when necessary.

Meanwhile, as "Pate, J.P.," points out, the veterinary profession is handicapped to such an extent that it is threatened almost with extinction.

Neither the veterinary nor the medical profession is protected in any way so far as the *practice* of medicine or surgery is concerned. The only thing which has been done in regard to those professions is to prevent unqualified persons from using certain names or titles. This also applies to dentists and to certain other professional or highly skilled bodies of workers.

The Royal Veterinary College gives a first-rate education to its students, one which becomes every day more highly scientific. Its researches into the causation of disease are doing much for the welfare of the human race. It is not to be thought of for one moment that such an institution is to be allowed to languish because its members do their work in a humane and scientific manner. The blacksmith who spoils your motor, if you are fool enough to allow him to try his hand upon it, is the same man, as ignorant, and as self-sufficient, who "doctors" the local horses and does the painful operations which your correspondent speaks of. The treatment required by the case is obvious, and lies in the hands of the public.—I am, sir, yours, etc.

F. R. HUMPHRIES, M.R.C.S.

Hampstead, March 26.

Donations to R.C.V.S.

ARMY VETERINARY SERVICE.

Extract from *London Gazette*.

WAR OFFICE, WHITEHALL, April 2.

TERRITORIAL FORCE. ARMY VETERINARY CORPS.

A. F. Castle, M.R.C.V.S., to be Lieut. Dated April 3.

Lieut. F. Hogg has been transferred from Aldershot to Dublin.

Lieut. R. C. G. Thwaytes has been transferred from Dublin to Preston.

Capt. H. S. Mosley arrived from India in Transport "Plassy" on April 3, and has been posted to Aldershot for duty.

Personal.

J. A. GILRUTH, M.R.C.V.S.—ADMINISTRATOR.

Prof. Gilruth, Director of Veterinary Instruction at the Melbourne University, has accepted the offer made to him of the post of Administrator of the Northern Territory. The Federal Government has increased the salary, which had originally been fixed at £1500 a year, to £1750, with allowances amounting to £500 a year.

Prof. Gilruth, who is 41 years of age, commenced his veterinary studies at Glasgow College, his final year being taken in London, where his diploma was obtained in 1892. Soon afterwards, he went to New Zealand as Government Pathologist. In addition to doing excellent work in that capacity, he found time to write upon his investigation of animal diseases, and became well known as an authority on the subject in the scientific centres of the world.

In 1909, he was appointed Professor of Veterinary Pathology at the Melbourne University. Last year, in company with Prof. Baldwin Spencer, he paid a visit to the Northern Territory as a member of a scientific expedition.—(From *The British Australasian* of 21st March.

The late ROBERT LANG, Veterinary Surgeon, Bridge of Weir, has left estate valued at £6100 9s. 11d.

OBITUARY.

WYNDHAM BRYER, M.R.C.V.S., St. George's Terrace, Cheltenham. Graduated, Lond: Dec., 1855.

Mr. Bryer died on March 28th, at 87 Parkwood Road, Bournemouth, from exhaustion following apoplexy. Aged 79 years.

J. McDougall, M.R.C.V.S., 56 Grant St., Glasgow. Glas: Dec., 1892.

Death occurred on April 1st, from cardiac failure. Aged 42 years.

EDWARDS.—On the 28th March, at Common Wood, King's Langley, Herts., Georgina Harriett Bowers Edwards, widow of the late Henry Edwards, M.R.C.V.S., of St. Albans, Herts.

CORRESPONDENCE.

ON THE SWALLOWING OF FLUIDS.

Sir,

Under page 616 in this week's *Record* there is a short note with the heading, "A practical method of inducing horses to swallow fluids." The writer states it has been in use a long time. I agree, and thought it was well known in the Profession, having myself adopted it five-and-twenty years ago when first in practice; but, unlike the writer, I fear my patients had to put up with the temporary inconvenience of a small quantity of the draught (whatever it might be) being administered per nostril, as my experience was—one never knew what sort of an animal you had to deal with, until you started on him. Also, a rather important point from my old-fashioned ideas of practice; nine times out of ten the groom or attendant never knew what I had done, and consequently regarded me as one of the best men he had ever seen drench a horse; honestly an unmerited distinction, which nevertheless frequently assisted to fill the ledger.

In respect to the quantity of fluid (clean water) a horse can receive per nostril without harm, I hold quite an open opinion on; but I am satisfied that it is far more than most persons might think. I well recollect a case of a hunter mare on whom I performed a tracheotomy; she was hunted for years after, and I frequently was asked to remove granulations from the inside of the tube; on many occasions I noticed when that mare drank a bucket of water a quantity always found its way into the trachea and trickled out at the tracheotomy opening. Whether this is a condition all bad roasters are subject to, I know not. If so, all I can say is, those who do not have the trachea opened must have a considerable quantity of water enter the lung cavity in the course of a twelvemonth.

I fear there is nothing new in what I have written, but should this short note only stimulate the good young men in our profession to make the best of their powers of observation and also cultivate tact, a valuable trait of character, nowadays, I fear, often neglected, the object of the writer will have been attained.—yours truly,

F.R.C.V.S.

BLACKLEG

(QUARTER-EVIL. SYMPTOMATIC ANTHRAX.)

The New Zealand Official Report on Blackleg shows that the mortality from this disease has been reduced by 75 per cent. since vaccination was made compulsory. The vaccine is supplied in convenient form under the name of

"BLACKLEGGOIDS."

"Blacklegoids" are easily administered by means of the "Blacklegoid" Injector.

Extract from a letter which appeared in *The Veterinary Record*, January 25, 1908: "About five years ago I commenced to inoculate with Parke, Davis & Co.'s 'Blacklegoids,' and since then I have lost only one, and that was this year, out of over 900 inoculated since I commenced. I may mention that I have no interest in Parke, Davis and Co.'s preparations."

Co. Kilkenny, December 28th, 1907.

The Stock Inspector of the Pastures Protection Board, Singleton, Australia, when ordering (May 17, 1907) 200 doses of "Blacklegoids," stated: "This is the third year I have used your 'Blacklegoids,' with a result far better than I or the owners of the cattle ever anticipated. I do not know of an instance where it did not act as an immediate preventive."

Further particulars will be sent on request by

THE 'RECORD' PRECISION SYRINGE.

The FINALITY of
Hypodermic and Serum Syringes.

"The "Record" Precision Syringe is a piece of delicate mechanical workmanship well deserving its name. It meets **all requirements as regards aseptic conditions and accuracy and it is always ready for use.**

It consists of **metal and glass** only. The glass barrel is ground inside perfectly true to cylindric form. The Nickel vacuum piston is "ground in" into the glass barrel by precision machinery so as to fit hermetically, it slides smoothly, yet tightly, **without any lubricant.**

The cover is fixed on the cylinder with a **bayonet-fastening**; for the purpose of **thorough cleaning** it is provided with a segmental incision, by means of which it can be detached from the piston-rod by sliding it off side-ways. When **completely** taken apart the Record Syringe **forms 3 parts only: cover, piston and barrel.**

The **Needles** are provided with the original "Progressive" **flat** mounts. By this arrangement a good hold is afforded to the operator.

The fixing of the needle itself in the mount, by means of a smooth longitudinal guide arranged above the screw threads prevents the needle from breaking off in the mount.

EVERY SYRINGE IS GRADUATED BOTH IN C.C. AND MINIMS.

PRACTICES FOR DISPOSAL

EAST COAST. Agricultural practice returning £600 per ann. Good house containing 2 recept. 4 bed-rooms, bath, kitchens, etc. Stabling for 4 horses, coach-house, kennels, etc. Price required for house and practice £1300, of which £400 can remain on mortgage, or vendor would sell practice for £500 and would let house on lease at £45 per annum.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains : reception and two bed-rooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

PURCHASERS are requested to send full particulars of their requirements as we have a number of practices and partnerships for sale which have not been advertised.

Assistantship

M.R.C.V.S. many years experience, strictly reliable, disengaged 13th inst. Good references. Address, 2043 V.R., 20 Fulham Rd., London, S.W.

For Disposal

M.R.C.V.S., genuine, first-class practice in Glasgow (West-end), established 18 years. Can bear strict investigation. Satisfactory reasons for disposal. One years premium. Address, Mr. David Dickson, Solicitor, 165 St. Vincent Street, Glasgow.

Wanted Immediately

FOR mixed practice, married assistant without family. Must have good references, abstainer preferred. Ride, drive and cycle. State, age, salary, etc. Address, 2044 V.R., 20 Fulham Road, S.W.

For Immediate Disposal

OWING to ill-health, a country practice, capable of considerable extension, suitable for a recently qualified gentleman. Two packs of hounds kept in the neighbourhood. Particulars in strict confidence only to intending purchasers. Address, 2045 V.R., 20 Fulham Road, London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,

LOCUM:

73 Victoria Mansions,
South Lambeth Road, S.W.

HUGH R. SINGLETON, M.R.C.V.S.

LOCUM TENENS.

44, St. Michael's Road.

Bedford.

Locum Tenens

MR. WALTER G. GREEN, M.R.C.V.S.

"Rosenheim,"

Boscombe Park,

Bournemouth.

Assistant Wanted

QUALIFIED, for a busy practice in the North of England, chiefly town and colliery: must be thoroughly steady, capable and trustworthy. A suitable man will be treated liberally. Address, 1048 V.R. 20 Fulham Road, London, S.W.

Wanted

YOUNG man, in good mixed practice, must be practical, good dispenser, capable of visiting when required. Good opportunity for student staying down for a time, indoors. State salary required, and references. Address, 2046 V.R., 20 Fulham Road, London, S.W.

As Locum, Manager or Assistant

M.R.C.V.S. (36), desires position as locum, assistant, or branch manager. Best references. Address, Veterinary Surgeon, 81A Bartholomew Road, Camden Town, London, N.W.

Assistant Wanted

UNQUALIFIED, for horse and cattle practice. State age, experience and salary required. To commence at once. Address, Peter Meikle, M.R.C.V.S., Strathaven, Lanarkshire.

Wanted

ASSISTANTSHIP (or Locum) by M.R.C.V.S., thoroughly practical and reliable, experienced town and country practice. Good references. Address, 5032 V.R. 20 Fulham Road, London, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

Victoria Veterinary Benevolent Fund

President:
W. F. BARRETT, Esq., Fountain Court, Temple, E.C.

FUNDS are urgently needed to enable the Society to extend its relief to distressed Members of the Profession, or to widows and orphans of deceased veterinary surgeons. Annual subscriptions, or donations will be gratefully acknowledged by the Hon. Sec. and Treas.

W. SHIPLEY, Southtown, Great Yarmouth

Partner Wanted.

WANTED a practical qualified partner in a large horse and dog practice in the South. Premium for half-share £300, or by instalment. Every investigation allowed to bona-fide Applicants. Address, 3035 V.R. 20 Fulham Road, London, S.W.

Partner Wanted

VETERINARY Surgeon in a good-class agricultural and residential district, wants a practical, qualified partner. Must be a gentleman with capital at command. For particulars, in strict confidence, apply to 5033 V.R. 20 Fulham Road, London, S.W.

As Assistant or Locum

VETERINARY surgeon desires permanency in good class country practice. Experienced, bloodstock, cattle, reliable, hard worker, used to taking charge, good obstetrician, horseman, single, 35, excellent references. Address, 5038 V.R. 20 Fulham Rd., London, S.W.

Wanted

QUALIFIED assistant, used to country work, must have references. Salary £150, live out, sign usual bond. A. C. Stewart, Veterinary Surgeon, Cardiff.

For Sale

SET P.G.C. also Class C. Pathology Notes, London, typed ready for binding, £1 10s. 0d. Address, 5036, V.R., 20 Fulham Road, London, S.W.

Under Exceptional Circumstances.

A SPORTING and Agricultural Practice, well-established in a favourite County. Returns last twelve years from £350 to £420. All kinds of sport in immediate neighbourhood, and great inducements to those fond of rural life. Price very moderate to quick buyer, Address, 5037 V.R., 20 Fulham Road, London, S.W.

To Vendors.

WANTED Veterinary Practices and Partnerships. Surgeons wishing to sell the whole or a share of their practices are invited to communicate with Messrs. Peacock & Hadley, Veterinary Transfer Agents, 19, Craven Street, Strand, W.C., who will be pleased to introduce likely purchasers. No charge whatever made unless a sale be effected.

Replies to Numbered Advertisements

WHEN replies to several of these advertisements are sent to this office at one despatch, it is not necessary that they should be stamped separately: they may be enclosed in one envelope, but should be marked outside "Replies."

The Journal of The Board of Agriculture

ISSUED on the 15th of each month. Twelve months 4/-, three months 1/-, or single copies 4d., direct from the Board of Agriculture and Fisheries, 4 Whitehall Place, London, S.W., or through any bookseller.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H.J. Pratt, Wholesale Druggist, Cleckheaton.

The Economics of Feeding Horses,

By HAROLD A. WOODRUFF, M.R.C.V.S.

Professor of Veterinary Medicine in the Royal Veterinary College, London.

"An extremely serviceable and well-timed book."

"Should be in the hands of all horse-owners who desire to feed their horses economically."—*Scottish Farmer.*

"MAGNUM" PESSARIES.

(HEWLETT'S)

"Magnum" Pessaries are prepared with a medicated non-oily base which is both effective as a Uterine Antiseptic and of special benefit in Parturition both in Cows and Mares.

A "Magnum" Pessary should be inserted directly after parturition in order to maintain the Uterus in a healthy state. It can be inserted with the greatest ease and will keep the parts in a thoroughly antiseptic condition for a lengthy period.

Alkaline "Magnum" Pessaries have recently been recommended to neutralise excessive acidity of Vaginal secretion.

"Magnum" Pessaries are supplied according to various formulæ as below, and Veterinary Surgeons' own formulæ can be made up as required.

		Doz.		Doz.
"Magnum" Pessaries,	Acid Boric 2 drms.,	4/6	12 doz. @	4/-

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1240.

APRIL 13, 1912.

VOL. XXIV.

THE EXTENSION OF VETERINARY PRACTICE.

Some recent correspondence in the public Press, a few extracts from which we have reprinted, may do good by calling popular attention to the evils of animal doctoring by unqualified men. But its beneficial effect will be very limited. Broadly speaking, the owners of animals responsible for the evil may be divided into two classes—those who do not choose to employ veterinary surgeons and those who cannot afford to. Such correspondence as that published in *The Referee* may do something to educate the former class, but can, unfortunately, have little or no effect upon the latter. This class deserves separate consideration; for there are many owners of animals to whom veterinary fees are practically if not absolutely prohibitive. The result is that very many animals, even horses, never receive qualified veterinary attention throughout their lives. So long as that goes on it cannot be said that the veterinary profession is as useful to the community as it might be.

It is not easy to suggest a remedy. One obvious method—that some veterinary surgeons should deliberately lay themselves out to meet the needs of poor owners—could be practised in populous districts, but is open to grave objection. The sixpenny doctor and the club doctor have been recognised units in the medical profession for a long time. But the positions they hold are not enviable, and their utility is limited. They are hard worked and poorly paid; and one inevitable consequence of their overwork is that they are forced to give their too numerous patients the minimum of attention. On the whole, the attempts to supply medical attendance at the very cheapest rates have done little good to either doctors or patients; and there is no reason to think that they would work any better if introduced into veterinary practice.

How to bring the large amount of veterinary work at present done by unqualified men into the hands of the profession is well worthy of the most serious consideration. In the case of owners who can afford veterinary fees, the problem is simply how best to accelerate their enlightenment; for there is no doubt at all that the public is gradually awakening to the value of the trained veterinarian. The recent establishment of veterinary inspection at Scottish shows was one sign of this; the present correspondence in *The Referee* is another. Absolutely impecunious owners stand upon a different footing; and it is difficult at present to see what can be done for them in the mass. But they form the minority; the great majority of owners can well afford a moderate veterinary fee.

DEMODEX BOVIS.

By S. N. MITTER, G.V.C.BENG., Calcutta.

(From the Raymond Research Laboratory).

In the beginning of last September, an outbreak of a "peculiar kind of fever" among cattle was reported from certain swampy localities in Midnapore on the right bank of the River Rupnarayan, and I was directed to investigate the disease. I found the country to be inundated by the River Rupnarayan, which stopped all agricultural work. I detected within this area several cases of the malady in different stages.

The disease is characterised by the formation of nodules about the size of a large pea, and starts from the hump and neck and spreads all over the body, especially on the shoulders, legs and chest. These local symptoms are generally preceded by fever ranging from 102° F. to 103° F. for 2 or 3 days. While the nodules are forming the skin is inflamed and each spot is surrounded by a hæmorrhagic zone. After a time, which may vary from 3 to 6 days, the nodules become pustules, and a small quantity of thick pus oozes from a small orifice, but most of the matter remains within the abscess, this pus afterwards gives rise to permanent local thickenings. The hair over the pustules generally falls off, leaving a black patch. The disease is carried to the healthy by means of birds, especially crows, and flies. This view is also confirmed by the ryots.

On microscopical examination of material from one of the pustules a large number of demodex was noticed in different phases of development. The length of the mature female varied from 250 μ . to 300 μ . and breadth taken at widest part of cephalothorax from 50 μ . to 60 μ . The length of the male 210 μ . to 230 μ . and breadth from 45 μ . to 50 μ .

Nearly 75 per cent. of the zebu cattle were affected. Calves were more generally attacked than the adults. The disease was not fatal.

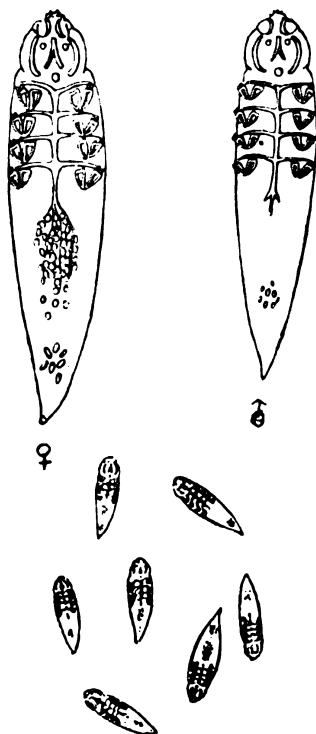

This disease is locally known as "Kat Basanta," or "dry small pox," from the symptoms it presents. "Basanta" is a name which is also given to the skin disease which occurs in Rinderpest. Demodex is reported to occur in the area about the same time every year.

The following extract, from Prof. Neumann's Treatise on Parasites, on the subject may be of interest.

"Demodex of the Ox (*D. Folliculorum* Var *Bovis*). The average length is 200 μ . The rostrum and cephalothorax form about two-fifths of the total length. Eggs ovoid in shape. Causes a pustular affection in the ox."

"The demodex already noted by Gros (1845) in the muzzle of the horse, was found by W. Faxon in 1878 in the hides of cattle prepared for tanning, and sent from Illinois and Minnesota to Boston. More especially in the region of the neck and shoulders these skins showed numerous pustules formed by dilated hair follicles; they were filled with a soft whitish matter which escaped by pressure and was composed of fat globules and a multitude of the Demodex. After being tanned the skins exhibited small cavities, many of them extending through the substance of the hide."

"A case of the disease was observed by Grim in a fifteen-months - old heifer, badly developed and in poor condition, notwithstanding good food. With the exception of the head and limbs, the skin elsewhere—especially at the shoulders—was studded with nodules the size of a pea. The surface of these small tumours was hairless and smooth, and when squeezed yielded a thick viscid pus containing an enormous quantity of the Demodex. The other animals in the herd were quite healthy in every respect."

From a fresh specimen. The lower figures are drawn with a Swift's microscope OcII. obj. 2in. The upper two figures are 4-1/3 times enlarged from the lower ones

THE PHONENDOSCOPE.

The object of this instrument is to render audible all sounds, whether natural or caused by morbid conditions of the animal body. They can be heard with much greater intensity and within much more narrow limits than has been possible with the ordinary stethoscope. At the same time it conveys with great accuracy the nature of the sound.

Next to the clinical thermometer the phonendoscope is the most useful instrument to the general practitioner. With a view to bring it into more general use, I will mention a few conditions where it can be applied with decided advantage to both surgeon and patient.

Beginning at the head, the nasal passages and various sinuses can be examined and obstructions located, such as polypus, thickening of the membranes, and pus. Passing to the throat and larynx,

the moist, faint whispers from any abnormal condition can be heard, and the finger placed on the exact spot. The large blood vessels and semilunar valves can be examined at the front of the chest. In doing this the use of the sound-post gives best results; by its use one is more certain of locating with extreme accuracy the lesions that may be present.

The heart can be examined from the usual position. Consolidated portions and abnormal sounds of the lungs are easily and certainly located. To any one familiar with the positions of the large and small bowels, any sounds from these can be easily placed, and useful knowledge obtained as to which portion of the bowel is active and which dormant.

For ascertaining if an animal is pregnant the instrument can be used on the lower part of the abdomen in front of the mammary gland, or it can be introduced into the rectum or vagina when the rhythm of the foetal heart can be heard. For diagnosing the exact position of deep-seated fractures and locating those of a more superficial nature. Fractures of the pelvic bones may be discovered by unloading the rectum, and introducing the instrument, having an assistant to move the limbs at command. Abnormal sounds in joints may be made out easily, and assist often in diagnosing obscure lameness.

I have *not* had an opportunity of trying it on a case of navicular disease, but have no doubt that it would be of assistance. I think the friction sounds produced by contact of the diseased surfaces would be audible.

The instrument as supplied to the medical profession requires modifying to meet the demands of our work. This I have carried out, so that the instrument can be easily and conveniently used on any of our patients.

R. M. MALLOCH, M.R.C.V.S., Inventor,
Designer, and maker of veterinary instruments.
Kirkby Stephen.

ABSTRACTS.

ON THE OCCURRENCE OF TWO SPECIES OF PARASITES IN EQUINE "PIROPLASMOSIS" OR "BILIARY FEVER."

Nuttall and Strickland have recently published (*Parasitology*, Vol. V., No. 1, 1912) some important researches upon the parasites found in equine "piroplasmosis" or "biliary fever." Hitherto this disease has been regarded as due to a distinctive parasite, the *Piroplasma equi* Laveran. Laveran studied the organism in stained blood films sent to him from South Africa by Theiler, and his description and figures show that his *Piroplasma equi* does not possess the characteristic mode of multiplication and form of a true *Piroplasma*. Franca, in 1909, therefore placed Laveran's parasite in a new genus, which he named *Nuttalia*. Koch had previously pointed out, in 1905, that two types of parasites occur in equine piroplasmosis, and he believed that they might cause distinct diseases.

The present authors clearly show that two distinct species of parasite are found in "biliary fever," and that consequently two distinct diseases are included under the name.

Nuttall and Strickland have studied both parasites, not only in fixed and stained preparations, but also when living in the blood. By so doing, and continuously watching the changes of form which the living parasites undergo (and which have led them to attach comparatively little importance to the variety of forms seen after fixing and staining), they have arrived at the following definite conclusions. The essential difference between the two parasites lies in their methods of multiplication.

Piroplasma equi—or *P. caballi* as the authors call it—though its scarcity in the blood of infected animals renders its examination *in vivo* difficult, can yet be seen to multiply after the same manner as *P. bovis* or *P. canis*. That manner may be briefly described by saying that two buds of protoplasm appear from the single parasite, the chromatin protruding into these buds in a fork-like fashion, and that the buds or incipient daughter-cells continue to augment at the expense of the mother-cell till a stage is reached at which the two daughter-cells have assumed the form of perfect piroplasmata still joined together by their pointed ends. The chromatin masses in the daughter-cells separate, and finally the daughter-cells themselves separate, and escape from the corpuscle. The process, like that in *P. bovis*, is slower than in *P. canis* but otherwise is similar to the latter. Study of the stained parasites shows them to be very closely allied to *P. bovis*, the chromatin structures of the two organisms being identical.

The multiplication of *Nuttallia equi*, with regard to which the authors' conclusions support the previous ones of Franca, is somewhat more complex. It may be briefly summarised by saying that the parasite, at first round (most usually), oval, piriform, or irregular in shape, develops a stellate or "cross" form. This is the multiplication form, and, when complete, consists of usually four, but occasionally five or even six young parasites, oval or piriform in shape, arranged cross-wise, and still attached to one another by their narrower ends. Finally they separate from each other and escape from the corpuscle, in which they may move about very actively before leaving it. The authors did not actually see the young parasites enter fresh corpuscles; but they are convinced that this takes place, as if does in the case of *Piroplasma*.

Nuttallia equi stains similarly to *Piroplasma*; and the division of its cytoplasm is preceded by definite nuclear changes.

As a rule, *N. equi* is not very abundant in the blood, but the number of infected corpuscles varies very greatly. In the authors' three experimental horses the maximum number of infected corpuscles observed was respectively 5.4 per cent., 0.9 per cent., and 13.2 per cent. The parasites appear in the blood at the onset of fever, and their number rises and falls with the body temperature.

Finally, the authors have experimentally proved in one instance that a horse which has been infected by and has recovered from piroplasmosis is still

susceptible to infection from the *N. equi*. It is clear from their researches that the term biliary fever or piroplasmosis really includes two distinct diseases, produced by two equally distinct parasites. They promise a general summary of our present knowledge of these two diseases—Nuttalliosis and piroplasmosis in horses in different parts of the world in a future paper. In the meantime they suggest that trypan-blue, which has already been found of value in treating bovine and canine piroplasmosis, might be of equal service in equine piroplasmosis; and they add the remark that the drug may be found to influence *N. equi* differently to *P. caballi*. A footnote contains the information, received while the article was in the press, that Bielitzer, in Russia, has recently successfully treated equine piroplasmosis by means of trypan-blue.

PIORKOWSKI'S DISTEMPER SERUM.

Jakob reports (*Münch. Tier. Woch.*) his experience with Piorkowski's anti-distemper serum. He attempted to immunise 20 dogs with the serum. Ten of these dogs sickened with typical distemper, two dogs doing so 14 days after the inoculation, two dogs 21 days, one 23 days, three 49 days, one 72 days, and one 83 days. In addition, two other dogs showed catarrhal affections of the laryngeal and intestinal mucous membranes, which could not be regarded as distemper with certainty. Of the ten dogs affected with typical distemper, five died.

Jakob also employed the serum in the treatment of three distemper patients. Two died and one recovered; but Jakob is inclined to attribute the single recovery to the action of medicinal agents which he employed in conjunction with the serum, —(*Berl. Tier. Woch.*)

MULTIPLE ACTINOMYCOSIS.

Prof. Schlegel, of Freiburg, reports (*Zeitschrift für Tiermedizin*) a case of multiple actinomycosis of the reticulum, omentum, liver, diaphragm, and right lung. The subject was a five-year-old ox, and the lesions originated from internal injury by a foreign body.

Reticulum, omentum, liver, and diaphragm showed injuries and cicatrizations. Multiple actinomycotic abscesses of considerable size existed around the injuries. A grey-red growth of granulation tissue the size of the fist, containing grey-yellow foul-smelling pus, was upon the omentum. The middle of the liver was occupied by an actinomycotic abscess the size of a man's fist, with numerous smaller yellowish-red actinomycotata, ranging from chestnut to apple in size, in its vicinity, so that a hard adhesion the thickness of the hand existed between the liver and diaphragm. The diaphragm was adherent to the right lung by means of a hard fibrous deposit the size of a plate, and several centimetres thick; and actinomycotic new tissue was growing deeply into the pulmonary tissue, especially into the intestines.

Numerous actinomycetes, and also pyogenic organisms, could be demonstrated in the masses of new tissue and in the abscesses.—(*Berliner Tier. Woch.*)

W. R. C.

NORTH WALES VETERINARY SOCIETY.

A meeting was held at the British Hotel, Bangor, on March 26th at 3 p.m. The following members were present: Mr. O. Trevor Williams (President); Dr. Evans; Messrs. Owen Thomas, W. Hall Savage, C. W. Cartwright, Richard Jones, Hon. Treas.; L. W. Wynn-Lloyd, Hon. Sec. Visitor: Mr. E. Wallis Hoare.

The minutes of the last meeting were read and confirmed.

The SECRETARY read the circular letter from Mr. A. Gofton, Secretary of the National Affiliation scheme. It was resolved to adhere to the scheme and become affiliated under the new rules.

Apologies for non-attendance were received from Messrs. R. S. Rowlands, J. H. Wynne, and A. W. Noel Pillers.

The HON. SEC. proposed, and the President seconded, a vote of condolence with Mr. J. Mathews on the death of his brother.

The PRESIDENT proposed, and the Hon. Treasurer seconded, a similar vote with the Hon. Sec. on the death of his mother.

Both resolutions were carried unanimously, the members standing.

A discussion ensued as to the disposal of surplus from the entertainment of the National at the Carnarvon meeting last July.

It was proposed by the Hon. Sec., and seconded by the Hon. Treasurer, that half be handed over to the Victoria Benevolent Fund and one-half to the International Veterinary Congress (1914) Fund. Carried.

THE TREATMENT OF WOUNDS.

By E. WALLIS HOARE, F.R.C.V.S.

Mr. President and Gentlemen,—In selecting the "Treatment of Wounds" as a theme for discussion I venture to think that it is one that may prove of interest to every practitioner; certainly there are many points in connection with it, which offer ample room for an interchange of opinions, ideas, and experiences, the result of which is likely to prove useful in our daily work.

I freely confess that one of my reasons in choosing this subject is to ascertain as far as possible to what extent the principles of aseptic surgery can be applied to animals.

I am quite aware that in certain quarters it is held that aseptic surgery *can* be applied to animals, and that failures in this direction are to be attributed to want of care on the part of the practitioner, or to prejudice. But in drawing conclusions on matters of this kind, it is essential to possess a varied experience of surgery under conditions favourable and unfavourable, both in town and country; and one important point that I shall endeavour to demonstrate will be with reference to the effects of environment and certain unalterable conditions that exist in connection with the treatment of wounds in our patients.

I have also another object in view: many medical men and several of the laity hold the erroneous opinion that we do not take the trouble to practise aseptic surgery; we are constantly asked why wounds do not heal by first intention, and why we do not adopt this or that measure which proves so successful in the case of wounds in man. For remember, that owing to the spread of popular medical knowledge the "man in the street" now professes to know something about surgical technique. Horse-owners, through reading various popular works on veterinary science, pretend to know all about antiseptics, and the suggestions that are often made to us when treating wounds are grotesque in the extreme. My

remarks throughout this paper will be specially directed to demonstrate the fact that veterinary surgeons appreciate the importance of aseptic surgery, and endeavour to carry out its principles as far as circumstances will permit them to do so.

Let us first of all take a retrospective view of veterinary surgery as applied to the treatment of wounds. That marked progress has been made is a fact apparent to even the most pronounced pessimist. This advancement must be attributed to the discoveries of Lister, and although the researches of this eminent scientist were directed to the perfecting of human surgery, there is no doubt whatever that the application of his principles to veterinary surgery has been productive of results which, if they cannot be described as brilliant, are at any rate most striking and satisfactory. For although abdominal surgery and the surgery of the joints are, so far as the horse is concerned, in a state of infancy up to the present time, everyone will admit that canine surgery has advanced by leaps and bounds since the principles of Lister have been applied to it. And even in the case of the horse we can justly claim that marked advancement has occurred by attention to Listerian principles. Again, a knowledge of the principles of wound infection has enabled us to prevent the occurrence of those fatal sequelæ of wounds, such as septicæmia, pyæmia, malignant œdema, etc., which were so frequently met with in former days, following accidental and surgical wounds.

Two factors were instrumental in the erroneous treatment of wounds that existed in former days. One was the lack of knowledge concerning wound infection, nothing being known with reference to micro-organisms or their effects.

Another was the prevalent idea that heroic measures were essential to promote healing; hence the employment of "black oils" and similar concoctions, a sublime ignorance existing as to the deleterious effects of irritants on wounds, and as to the existence of natural means of recovery.

The researches of Lister may be said to have extended from 1865 to 1890, and it is recorded that even up to 1880 a number of eminent surgeons were incredulous as to the value of the antiseptic treatment. Hence it is not surprising to find that in Veterinary Surgery up to this period the Listerian principles were not universally adopted.

It may truthfully be said that as that antiseptic treatment progressed from stage to stage in human surgery, its value was recognised by Veterinary Surgeons and its principles gradually came to be adopted. The earlier forms of this treatment would no doubt be considered crude in the present day.

We read in *The Lancet* that in 1865-66, compound fractures were treated by the local application of carbolic acid; the antiseptic was freely applied to the interior of the wounds in order to destroy the air-borne germs which had the property of causing putrefaction, the opening in the integuments was then covered with lint charged with carbolic acid, and protected by an external layer of thin sheet metal. "In opening abscesses, a piece of rag from 4 to 6 inches square was dipped into a solution of one part of crystallised carbolic acid and 4 parts of boiled linseed oil, and then laid upon the skin where the incision was to be made. One edge of this rag being raised, the part was incised with a knife previously dipped in the oil, and the rag was instantly dropped upon the skin as an antiseptic curtain, beneath which the pus flowed out." "For the subsequent dressings a kind of putty was made by mixing common whitening with the carbolic oil, and this, spread into a layer about 6 inches square, was laid over the incision."

From this simple and crude beginning evolved those principles which were ultimately destined to revolu-

tionise surgery, and render the discoverer the greatest benefactor to mankind that ever existed.

In 1867, carbolic shellac plaster was substituted for the putty and found more convenient, and during the same period ligatures of silk or catgut were introduced, the latter however did not assume their final form until 1881. Even with the above primitive antiseptic measures a marked improvement resulted in surgical work, and Lister recorded that Hospital gangrene, Pyæmia and Erysipelas disappeared from his wards.

In 1869 the carbolic spray was introduced by Lister. He still continued his researches, even in the face of opposition, and recorded in 1870 that for 9 months in the Edinburgh Royal Infirmary he had not met with any cases of Pyæmia or Hospital Gangrene in his wards.

In 1875 gauze charged with carbolic resin took the place of the shellac plaster, and various methods of employing carbolic oil and drainage tubes were described in articles written by Lister for *The Lancet*. In these articles were also discussed the sterilisation and use of sponges, and experimental proof was adduced that "the septic ferments were solid particles and not some kind of material in solution." The use of boric acid as an antiseptic was also described.

In 1879 improved methods of protective dressings were introduced, so as to prevent the carbolic acid in the external dressings from reaching the wound, once the latter had been rendered aseptic by the primary application of the antiseptic. This protective dressing was composed of oiled silk coated on both sides with specially thick copal varnish and afterwards covered with a layer of dextrin, so as to ensure its being moistened when dipped into a watery solution of carbolic acid. In cases where patients showed special idiosyncrasies to the employment of carbolic acid, either salicylic jute or gauze charged with a mixture of one part of oil of Eucalyptus and three parts each of gum dammar and paraffin, were employed.

In 1881 Lister delivered two addresses containing what seemed to be his first published reference to pathogenic bacteria as a distinct class of micro-organisms; and in 1883 he demonstrated the success of wiring of the patella, when antiseptic principles were employed.

In 1884 he drew attention to the uses of corrosive sublimate as a surgical dressing, and in 1889 he pointed out that Sal. alembroth was untrustworthy as an antiseptic, and in the same year he introduced the double cyanide of mercury and zinc as a reliable agent to render gauze antiseptic, but pointed out that its germicidal efficacy, or ability to destroy existing bacteria, was inferior to its power of inhibiting bacterial growth, hence it was advised that the dressing should be moistened with a 5 per cent. solution of carbolic acid before being applied.

In 1890 Lister announced that he had abandoned the use of the carbolic spray three years previously, and that he had substituted solution of Corrosive sublimate for carbolic acid, having found the former less irritating and more efficient; he also pointed out that the double cyanide of mercury and zinc could be prepared in a perfectly definite manner, and although the new product contained twice as great a percentage of cyanide of mercury as was present in the substance originally used, it had no tendency to cause irritation.

In 1907 we find what may be regarded as the final utterance of Lister, in a note occurring in Sir Hector Cameron's book "On the evolution of wound treatment during the last forty years." In this note "he advocated the use of the double cyanide of mercury and zinc, he preferred the use of sponges for the absorption of blood or other discharges from an operation wound to any of the substitutes that were proposed, while for the purification and sterilisation of such sponges, with an especial view to the destruction of both the sporeless micrococci and the spore-bearing tubercle bacillus, he preferred

carbolic acid (1 in 20) to any other germicide. For purifying instruments, the hands of the operator and the skin of the patient, he used a similar solution, except in the case of the eyelids, when a solution of corrosive sublimate being less irritating, was preferable."

In circumstances where it was impossible to exclude septic agencies, such as in operations upon the mouth, etc., or in putrid sinuses or in certain compound fractures, Iodoform might be dusted on the cut surface of a wound, "after mopping with a solution of 40 grains of chloride of zinc in one ounce of water." The usefulness of iodoform was, however, rather limited. In the external dressing, gauze impregnated with the double cyanide of mercury and zinc was advised, and before being applied to the wound this gauze must be rendered damp with a solution of carbolic acid. To parts where there was very little space between the wound and some source of septic contamination, the double cyanide powder mixed with sufficient of the 1 in 20 carbolic solution to form a cream, might be applied with a camel's-hair brush. In some circumstances the cyanide powder might possibly be used as a first aid dressing by dusting it over wounds by means of a tin with a perforated top.

As regards the changing of dressings, when there was a free discharge from a wound he preferred, as a rule, to remove the first dressing after a lapse of 24 hours, but a longer interval ought to be allowed after certain amputations.

The above abridged history of the evolution of antiseptic surgery is taken from the biography of the late Lord Lister that appeared in *The Lancet*.

During the course of Lister's career he had to submit to severe and often unjust criticism, but this is the fate of all those who attempt to leave the beaten track. One of his opponents pointed out in 1867 that Lister was not the first surgeon to use Carbolic acid, but this was already admitted. It is also recorded that Sir Wm. Savory (who was President of the Royal College of Surgeons for five years in succession, and full surgeon at St. Bartholomew's Hospital from 1867 to 1891) at the meeting of the British Medical Association held at Cork in 1879, delivered the address in Surgery, and spoke in attack or ridicule of the system of antiseptic surgery. I introduce this matter in order to show that surprise should not be expressed if examples of similar opposition existed amongst veterinary surgeons; that such did exist I have no doubt, but in the present-day there are few practitioners who deny the benefits of Listerian principles.

In order to comprehend the principles of the modern treatment of wounds, and to compare the *Antiseptic* methods with those designated as *Aseptic*, it is necessary to briefly consider the significance of certain terms that are employed in connection with the subject. Unfortunately it happens that the same term is occasionally applied in more senses than one, or has a different meaning attached to it by various authors.

The term "Septic" was formerly applied to wounds of an offensive character, which were frequently associated with Septicæmia, pyæmia, etc. But, as in the present day it is recognised that the conditions may arise from the action of pus-producing organisms, the term septic is generally applied to all suppurating wounds.

Recognising, however, that wounds may be offensive and distinctly unhealthy without any evidences of the presence of pus, it is clear that the term septic can be applied to conditions depending on a variety of micro-organisms. In many cases the septic condition of a wound depends on one pathogenic organism, but in almost every instance ordinary pyogenic organisms are present associated with those characteristic of sepsis.

In practice, we are generally inclined to apply the term *Septic* to a putrid condition of a wound associated or not with the presence of pus. As a very large number of accidental wounds in the horse heal by "granulation," but not under aseptic conditions, suppuration to a varying extent is common; still the pus is not offensive, the wound tends to heal with ordinary care, and we do not apply the term *Septic* to it, although certainly it could not be described as aseptic. A large number of accidental wounds in horses are already infected before the practitioner gets the chance of treating them.

ASEPTIC signifies the absence of sepsis, that is the absence of micro-organisms of any kind, and the term is synonymous with *sterile* or *germ-free*.

ANTISEPTIC is a term that is often loosely applied; literally it signifies anything opposed to sepsis; in a bacteriological sense it indicates an agent that retards or prevents the development of bacteria, irrespective of its power of destroying their vitality. But it is often erroneously applied as synonymous with *germicide*, whereas a large number of agents classed as antiseptics are not capable of destroying pathogenic bacteria.

DISINFECTANT is a term applied to an agent capable of destroying infective micro-organisms, and so far as pathogenic bacteria are concerned it is synonymous with *Germicide*. So that all disinfectants are antiseptics, but all antiseptics are not disinfectants.

DEODORANTS simply indicate substances that are capable of destroying or removing offensive or unpleasant odours, but it does not follow that they possess disinfecting properties. Many disinfectants however, are deodorants.

ASEPTIC AND ANTISEPTIC SURGERY.

To such an extent has the subject been debated that two so-called "schools" have resulted, and even these are not in agreement as to the precise sense in which the term *Aseptic* should be employed. There is in fact a decided antagonism between these "schools" as to the technique which is best calculated to bring about successful results, for be it remembered that both aim at the prevention of infection in wounds, and thus endeavour to promote healing in the shortest time possible. Briefly speaking, the *Aseptic system* aims at preventing the access of pathogenic bacteria to wounds, it embraces all the measures adopted to keep the wound aseptic, or free from the ill-effects of septic organisms, throughout its entire course, Antiseptic agents, except for sterilising the patient's skin, the hands of the surgeon, or in the process of sterilising ligatures, are rigidly excluded, and not permitted to come into contact with operation wounds; while all the materials used, such as ligatures, sutures and dressings contain no antiseptic, but are simply sterilised. The instruments are sterilised by boiling and are not placed in an antiseptic solution. Of course, the Aseptic method can only be applied to operation wounds made through unbroken skin into non-infected tissues.

The disciples of the Aseptic school, term the methods in which antiseptics are employed, either in solutions or dressings, as *antiseptic methods*. Some even go further than this, for we find one surgeon, Mr. Burghard, stating that the term "antiseptic" when applied to the treatment of wounds should be reserved for those measures designed to combat sepsis already present in a wound.

The *Antiseptic School* claim that their methods are also aseptic, although as a means of precaution they employ antiseptics in addition to the means for securing asepsis. Sir Watson Cheyne, who is one of the advocates for this method, states—"Aseptic surgery is the method of treatment directed to the maintenance of an aseptic condition in the tissues of the wound presumably existing at the time of operation. . . . But on the other hand, antiseptic surgery has to deal with tissues which have already been infected, with or without a breach of the surface, and here the surgeon's efforts are

directed to diminishing the effects of already existing sepsis, or, it may be in a few cases, even to eradicating it."

Mr. Lockwood, who steers a middle course, says in his work on Aseptic Surgery, "any method of wound treatment which aims at sterility will be called aseptic."

The bone of contention between these two systems would appear to be the question of the employment of Antiseptics; those of the Aseptic school holding that these agents by causing irritation interfere with the normal powers of resistance of the tissues, and thus retard healing. This weakening of the resisting power of the tissues may even enable micro-organisms to enter and take effect, in cases where surgical cleanliness was neglected although Antiseptics were employed.

Sir Watson Cheyne, however, points out in the "Bradshaw Lecture on the Treatment of Wounds" (1908), that the Listerian principles in wound treatment include two important postulates, (1) "the exclusion of bacteria, especially of pathogenic organisms, as far as possible during and after an operation. (2) Avoidance of irritation of the surface of a wound, so as not to interfere with healing nor with the power of the tissues in preventing the growth of any bacteria which have entered."

This authority clearly explains that, by the Listerian system, every precaution is taken to prevent irritation from the antiseptics employed, and also states that even with adherence to the strict principles of the so-called aseptic system, suppuration has occurred when operations were carried out in regions other than the peritoneum. He believes "that of late many surgeons have gone to extremes in the avoidance of antiseptic solutions," and that the aseptic system, so-called, is "only carrying to an extreme the principle of avoiding irritation of wounds." He also shows that even the application of plain boiled water to the surface of a wound interferes with the integrity of leucocytes and other cells, for under the microscope they are found to rapidly swell up and become completely disintegrated. In summing up his criticism he states that "the pendulum has swung too far in the direction of the avoidance of antiseptics, and that the reasonable use of all the means at our disposal for securing asepticity of wounds will furnish more constant results." He also says "the chief point to which I take exception is the employment of dressings which do not contain an antiseptic in sufficient amount to render the discharges which flow through them unsuitable for the growth of bacteria." (In a dressing not containing an antiseptic, although sterile, when it becomes soaked with discharge, the latter may remain sterile until it comes near the surface of the dressing, then bacteria will grow in it, and rapidly spread through it and reach the wound, unless the blood has in the meantime become so concentrated by drying that it is no longer a suitable cultivating medium).

A second point is the absence of antiseptic solutions during the operation, in which hands, instruments, etc., may be washed from time to time to ensure continued asepsis. . . . "The attempt to treat wounds without any antiseptic is a very unnecessary complication. In the first place it is ever so much more difficult to secure asepticity of a wound under such circumstances than if one takes advantage of antiseptics; and in the second place it requires a man who is especially skilled in bacteriological work to bear in mind the various loopholes which have to be guarded against in order to obtain a constant aseptic result. . . . "I confess that I can see no reason for this great dread of a drop of antiseptic material getting into a wound; I can only say that my own results and those of surgeons who use antiseptics judiciously are in every way as good as those obtained with the more elaborate aseptic precautions, in fact seeing that we are not troubled with sepsis or "stitch abscess" at all, I venture to assert that they are better, because they are more constant and dependable."

Rose and Carless ("Manual of Surgery") in contrast-

ing Aseptic and Antiseptic Surgery, state "It is only natural that we who have had the privilege of working with Lord Lister and have seen the excellent results following the intelligent use of antiseptics, should still cling to that line of practice which certainly can be carried out with more precision under all circumstances, both in private and Hospital, than the other plan, the objects of which may at any moment be defeated by some slight inadvertence or oversight. The theory of Asepsis is no doubt perfect, but its practical application is often difficult owing to the necessity of having sterilisers always at hand, a matter almost impossible in cases of emergency in private practice."

I have deemed it advisable to quote the opinions of these several eminent Surgeons on the subject of Aseptic and Antiseptic Surgery before proceeding to consider how far the principles can be applied in Veterinary Surgery. I shall endeavour to show that, although in the case of the dog it is possible to carry out perfect Aseptic principles under proper surroundings, it is a far different matter when we come to deal with Equine Surgery.

I suppose it will be generally admitted that in the treatment of wounds in horses there are certain important indications to be fulfilled.

(1) Measures should be adopted which are likely to ensure the healing of wounds in as short a time as possible, so that the animal can return to work.

(2) Steps should be taken to prevent serious complications such as Septicæmia, Pyæmia, Malignant (Edema, Erysipelas, Bacillary Necrosis, Tetanus, etc.

(3) Measures for the prevention of permanent blemishes are of importance, and in the case of wounds affecting the limbs, every effort should be made to avoid the occurrence of conditions likely to interfere with the working powers of the animal.

VETERINARY AND HUMAN SURGERY COMPARED.

Here it will be necessary to compare human Surgery and Veterinary Surgery as regards the treatment of wounds, both accidental and as the result of operations. The distinguishing features that stand out pre-eminently are the following: The human surgeon has the advantage of a well-equipped hospital with all modern conveniences, and a staff of trained nurses to carry out his instructions. He is supplied with every detail calculated to ensure surgical cleanliness, and to exert a favourable influence on the course of wounds. Moreover, in operation wounds Aseptic principles are carried out from start to finish by trained hands, and the patients contribute to favourable results by obeying the instructions of the Surgeon. By complete rest the healing of wounds is facilitated, and means can be adopted by which the affected part is rendered as free from movement as possible. In the case of accidental wounds, early treatment is carried out before Sepsis has had time to exert its effects, even though micro-organisms have gained an entrance.

The Veterinary Surgeon, on the other hand, has the most adverse circumstances to contend with in his endeavours to render wounds, whether surgical or accidental, aseptic, and to keep them in this condition. Even in the best equipped Veterinary Infirmary, so far as horses are concerned, it is extremely difficult to carry out Aseptic Surgery. No doubt by the use of iodine it is now possible to sterilise the skin, but there are other points to be considered.

Given an operating table, and a trained staff of assistants, so that the operator is only concerned with the operation, also that the operator or his assistants will carry out the subsequent dressings of the wound, then, indeed, Aseptic Surgery and healing by first intention are possible, provided that the technique is carried out so that the entry of micro-organisms into the wound is prevented.

But in ordinary practice a very different state of affairs exists; the patient is cast on a bed of straw, skilled assistants are not at hand, so that the operator has to attend to the casting, securing, etc., of the animal, by which means his hands become contaminated, and even the best directed attempts at asepsis are likely to be frustrated by the clumsy actions of the assistants. Again, unless the Practitioner is able to carry out the after treatment of the case, his primary endeavours will fail, as contamination of the wound is certain to occur.

With reference to accidental wounds, it is quite apparent that they become infected prior to professional assistance being sought. Contamination occurs at the time the injury is inflicted, and also from the treatment adopted by the owner or the attendant.

Consider also the surroundings in which horses are placed; even with the most scrupulous care and attention, it is impossible to render the best planned stall free from micro-organisms, and every act of the attendant seems calculated to secure infection of the wound. As for the average stable, both in town and country, and the crude methods of treatment adopted by the owners of animals, the wonder is that serious or fatal sequelæ do not occur far more frequently than is the case. For not only is the stall a veritable breeding ground for micro-organisms, but also, everything brought into contact with the wound is teeming with germs. Hands begrimed with dirt, filthy sponges, dirty stable buckets, soiled bandages, etc., are much in evidence, even the water for performing the perfunctory cleansing of the wound is anything but pure. How then do wounds heal under such circumstances? I think you will agree that the explanation is to be found in the natural powers of resistance possessed by the horse. If this vital resistance to the action of micro-organisms did not exist, we should meet with far more cases of Septicæmia, Pyæmia, etc., than we do at present.

No doubt of late years it is not unusual to find disinfectants in the hands of many owners of animals, and these agents are applied in concentrated solutions to wounds, with a total disregard for ordinary cleanliness. The result is that instead of promoting healing they retard it, as they exert a caustic and irritant action on the tissues; besides, the deeper portions of the wounds are not cleansed, and abound in micro-organisms.

A similar error is committed with reference to the disinfection of stable floors, the dirty surface is allowed to remain while disinfectants are scattered thereon.

Then while wounds are being dressed, it is not uncommon to find the dressings laid on the stable floor for convenience, and exposed to contamination from several sources.

MEASURES THAT CAN BE ADOPTED.

In order to fully grasp the importance of attention to surgical cleanliness in the treatment of wounds, it will be necessary to consider the *micro-organisms of wounds*, the *modes of infection*, and the means by which these can be overcome.

Micro-organisms. The most important are the Pyogenic cocci; these include Staphylococci and Streptococci.

Staphylococcus Pyogenes Aureus is found in acute abscesses and is responsible for the majority of suppurative inflammation, it is occasionally present in general pyæmia, and is often associated with other pyogenic organisms in suppurative processes. It is very resistant to many antiseptics, but is readily destroyed by solutions of the more powerful germicides; it is very widely distributed, and is found abundantly in the superficial layers of the skin and frequently beneath the finger nails in man. Experiments have demonstrated its power of producing suppuration, both locally

and internally, and it has been shown that if the vitality of the parts experimented on has been previously lowered, or the tissues damaged by chemical or mechanical means, infection occurred more certainly and readily.

Staphylococcus Pyogenes Albus is far less virulent in its action than *S. Aureus*.

Staphylococcus Pyogenes Citreus is only found in abscesses.

Streptococcus pyogenes is another very important organism. It is the causal agent in spreading Cellular inflammation, and of Pyæmia and Septicæmia in many instances; also of Septic metritis and Ulcerative endocarditis. One of its peculiarities is its tendency to invade the lymphatics and to induce lymphangitis and cellulitis; another is the capability of producing acute suppuration, sloughing of the tissues and inflammatory wound gangrene. Probably there are many varieties of Streptococci whose characters resemble each other so closely that it has not been possible to isolate them. Thus the *S. erysipelatis*, the causal agent of erysipelas resembles so closely both in appearance and cultural characters the *S. Pyogenes* that many authorities regard them as identical. The effects produced, however, are rather distinctive, and the *S. erysipelatis* must be regarded as an organism of serious importance in connection with the treatment of wounds.

The powers of resistance of the Streptococcus must be regarded as feeble when compared with those of the Staphylococci.

The Bacilli which are of importance in connection with wound infection, are, the Tetanus Bacillus, the Bacillus of Necrosis, the Bacillus of Malignant Oedema, and the Bacillus Coli Communis. Occasionally the Bacillus Tuberculosis, and the Bacillus Pyocyaneus, may infect wounds. Amongst other causal agents in wound infection we may mention the Botryomyces and the Actinomyces, also the Streptococcus of strangles.

It is apparent that the most important part of our duties in connection with the treatment of wounds is to prevent the entrance of these microbes as far as is possible, or, failing in this, to destroy their vitality or retard or prevent their development.

Modes of Infection:—By Air: Aerial infection was recognised even in pre-scientific periods. The Listerian principles and the carbolic spray were directed against this mode of infection, and the air was regarded as containing the germs of putrefaction, which were capable of setting up septic processes in wounds and their secretions. This view has been considerably modified in the present day. Experiments have demonstrated that the greater number of bacteria present in the air are non-pathogenic, that germs exist in the atmosphere only in the form of dry dust, that air perfectly freed from dust is harmless to wounds, and, when the air is kept still, wound infection rarely takes place through the atmosphere. But practically, we must admit the possibility of infection by air containing dust when we consider the surroundings of horses, the dust raised from a straw bed and during the process of cleaning the stall. Indeed some observers state that they have found cocci closely related to the pyogenic varieties and some actually belonging to that class, in atmosphere dust, especially where the air is moist.

Infection by water occurs unless this fluid is sterilised by boiling or a germicide added thereto. Ordinary water contains a large number of bacteria.

Other modes of infection include, infection from the skin of the patient, from the hands of the surgeon or those of his assistants, from instruments, sponges or their substitutes, ligatures and sutures, dressing materials, vessels or utensils, syringes, etc,

CIRCUMSTANCES PREDISPOSING TO INFECTION.

We may mention, excessive injury to the tissues during an operation, such as rough manipulation, bruising or tearing of the structures; by such means their vitality is lowered and their resistance is impaired so that the development of micro-organisms which may have gained entrance is thereby favoured. The number and virulence of the infecting organisms, the state of the health of the animal, and the environment, are also important in connection with this subject.

The Repair of wounds. Time will not permit me to enter into this question. As you are well aware, the mode of healing by Primary union or "union by first intention" takes place in simple incised wounds under favourable conditions, i.e., when there is a practical freedom from infection, when hæmorrhage has been arrested, and the surfaces are brought into apposition, and kept at rest. It is the mode of healing we all strive to bring about, but so seldom succeed in attaining—so far as the horse is concerned.

Union by Granulation and Cicatrisation is by far the more common method of healing in horses. Formerly there was an idea that the suppuration accompanying the process originated from the superficial layer of cells on the recent granulations, which were arrested in their development and converted into pus cells, being cast off in the discharge. We know now that the cause of the suppuration is the presence of micro-organisms, and that union by granulation can occur without suppuration, although that is not common in the horse.

Union under a scab. Repair takes place beneath a scab formed by a drying of the discharges. The scab is cast off spontaneously as soon as cicatrisation is completed underneath. It is a common mode of repair in wounds left to heal without any dressing.

OPERATION WOUNDS.

We now arrive at the practical application of the principles, based on a consideration of the points we have considered. Dealing first with operation wounds, in the case of healthy tissues in the normal animal, there are certain details which, if they do not result in bringing about healing by first intention, will at any rate assist in the process of repair, and prevent the occurrence of serious sequelæ.

I suppose everyone will agree that instruments are best sterilised by boiling for five minutes in water containing a teaspoonful of carbonate of soda to each pint. The addition of the soda raises the boiling point of water to 104° C, and besides, it prevents the formation of rust if the instruments are left in the solution for some time; when required for use they are placed in a sterilised tray containing a solution of carbolic acid 1 in 40. The water should be boiling before the instruments are placed therein, and the vessel in which they are boiled should have a closely fitting lid so that the water will boil at a uniform temperature. Some practitioners assert that instruments can be sterilised by placing them in a 5 per cent. solution of carbolic acid. But experiments have shown that instruments, even if left in this solution for hours, are not sterilised with any certainty. As regards sharp instruments, such as knives, scissors, and needles, which become blunt from the effects of boiling, some surgeons advise that the edges be protected with a piece of gauze or lint and state that blunting does not then occur. This is not my experience, and I prefer to immerse such instruments in undiluted carbolic acid for a time, and then place them in a 1 in 20 carbolic solution. This method is advised by Sir Watson Cheyne, and it is also valuable in case an instrument happens to fall on the ground during an operation and is immediately required, as

boiling takes five minutes to sterilise. Indeed this method is also useful in emergency operations, when facilities for boiling are not at hand, or an instrument is required for use at a moment's notice. Corrosive sublimate has a most destructive effect on metallic instruments, hence solutions of this agent are unsuitable for sterilisation purposes.

As regards the preparation of the patient's skin and the hands of the surgeon; it is not feasible to carry out that tedious technique of sterilisation adopted by human surgeons. Fortunately we have in Tincture of iodine an agent which renders the skin of the patient and the hands of the operator aseptic. Of course the operation area should first be shaved before the iodine is applied. Two applications are necessary, viz., one about 15 minutes prior to operation and the other immediately before operation. The employment of Iodine for this purpose is not recent; the agent has been used in various ways in surgery as long ago as 1880. Dr. Antonio Grossich in 1907 published his experiences of iodine in surgery; and since then the agent has been widely employed all over the world. The skin should not be washed before the iodine is applied.

Simple incised wounds are those which are most likely to heal by first intention, provided certain details receive attention.

Deeper wounds generally heal by granulation, but unfortunately in too many instances suppuration occurs in spite of all precaution. But there are degrees of infection depending on the number, character, and virulence of the infecting micro-organisms that gain entrance to the wound; hence the necessity for surgical cleanliness and the judicious employment of antiseptics.

There are two important points in connection with the subject which cannot be ignored. The first is, that in operations of all kinds the tissues should receive as little damage as possible. Neatness and dexterity in operating exert a marked influence on the healing of the resulting wounds. This is well exemplified in the operation of neurectomy, a skilful operator exposes the nerve and excises the desired portion with little or no damage to the surrounding tissues. On the other hand an inexperienced operator, in his efforts to expose the nerve, disorganizes the tissues to a considerable extent. In the former case the wound heals by first intention, in the latter, even with all attempts at asepsis and antiseptics, healing occurs by granulation, often accompanied by suppuration.

Drainage is the next point. Now in all wounds of any extent, an exudation of serum occurs, this is generally referred to as the "secretions of the wound." Such must not be allowed to accumulate in spaces in the wound, and proper drainage is necessary. Accumulations of serum not only cause tension in the wound, but also favour the growth of micro-organisms.

The various details in connection with aseptic wounds need not occupy us further; for the reasons already given it is very difficult to obtain healing by first intention in the case of horses; that it is possible even in the major operations has been demonstrated by operators who have had special opportunities for carrying out the technique. But I have yet to learn that aseptic surgery as conducted by human surgeons, can be carried out in the ordinary operations by the general practitioner. Take even the latest surgical feat—the new operation for "roaring," where aseptic precautions are rigidly carried out before and during the operation, and what is the result? Certainly not healing by first intention in any instance, and more often than otherwise the wound is septic, and frequently fetid. Such a condition would be regarded as anything but creditable in human laryngeal surgery—but then the circumstances are different.

There are some enthusiasts who give details of aseptic methods of castration; needless to remark they do not operate on many colts, and have very little idea of the

conditions and environment of these animals in the country. My experience, in the attempt I made at aseptic castration carried out by means of ligature, was that no suppuration or swelling occurred but the animal died of septicæmia and septic peritonitis: had suppuration and swelling occurred probably the case would not have succumbed. At the same time I believe in all possible attention to surgical cleanliness and to antiseptics during the operation of castration, although I know full well that these measures will be frustrated in their results by the owner or attendant of the animal. How infection occurs in castration wounds is so obvious that I need not refer to the subject. When operation wounds suppurate or become septic they are in the same category as accidental wounds so far as treatment is concerned.

Every accidental wound may be assumed to be infected, to a greater or less extent.

In carrying out treatment, there are certain important procedures necessary, which I shall refer to under the following heads:

(1) *The arrest of Hemorrhage if present*: this constitutes a subject in itself.

(2) *The cleansing and disinfecting of the wound.* This is carried out by careful washing out with an antiseptic solution. As to the agent selected, it is largely a question of choice. The large number of reliable germicides that are now on the market render a selection comparatively easy. Carbolic acid is still largely employed for the purpose, although there is considerable difference of opinion as regards its germicidal power. Whatever agent is used, a thorough cleansing of the wound is essential. Unfortunately we do not often get the chance of first dressing a wound, as the owner or attendant attempts the process on the occurrence of the accident, and far too frequently introduces infection. In the case of a deep punctured wound, in which infection is probably deep-seated and the external opening small in size, it is necessary to carefully enlarge the latter so as to carry out thorough irrigation.

(3) *The removal of foreign bodies.* This is a procedure that requires special attention. Wounds in hunters frequently contain foreign bodies such as thorns, portions of gravel, etc., and a careful search is necessary in order to discover their presence; if they are overlooked serious trouble will occur afterwards.

(4) *Drainage.*—Efficient drainage is of the greatest importance. This is well exemplified in the progress made in punctured wounds extending in an upward direction, and in those extending downwards. Without proper drainage all other means will fail. To carry this out efficiently in the case of extensive wounds is not always an easy matter, but on it depends success or failure. Suitable openings must be made at dependent parts, and the selection of drainage materials will depend on circumstances. If gauze drainage be employed, care should be taken that the gauze does not act as a plug and prevent the escape of discharge. In extensive wounds india-rubber drainage tubes are to be preferred. The old-fashioned Seton must be condemned—it causes irritation and increases suppuration.

(5) *Sutures.*—Careful consideration is necessary in order to decide as to the advisability of employing sutures or otherwise. The frequency with which extensive wounds involving the muscular tissues (such as occur in the region of the hip) suppurate, and the sutures give way, has led some practitioners to leave such wounds open. No doubt in the case of a "squealing" kicking mare, or of an unbroken colt, we all have a tendency at times to avoid the use of sutures, and it is surprising to find how readily such wounds heal. Still there is no doubt that less blemish is left if the edges of such wounds are brought together by sutures, at any rate for a time, provided thorough cleansing is carried out and proper drainage is provided. In extensive wounds of this kind occurring in vicious animals, I always cast

them in order to carry out the procedure properly. The suture material should be soft in texture, but strong; hard material is very likely to cut through the skin. In clean-cut wounds sutures should always be employed. It is hardly necessary to remark that in punctured wounds, or deep wounds of any kind, and in the case of torn or lacerated wounds with much destruction of tissue, or in suppurating or septic wounds, sutures are contraindicated.

Experience has taught me that wounds in the region of the head are best treated without sutures, unless such cases are in an Infirmary under the immediate care of the practitioner, so that the early indications of septic infection may be observed. Under other conditions there is a tendency to the occurrence of Erysipelas or allied complications. I now paint such wounds with tincture of iodine and find the best results therefrom. This may be considered as an irritating agent, but the results justify its employment. There are instances of suppurating wounds in which suturing should be attempted in order to avoid permanent blemish. Some time ago I saw a case in a foal in which a wound extended from the commissure of the lips up the cheek, exposing the first two molar teeth. The accident occurred about 10 days previously, and two attempts at suturing had been made, but they were unsuccessful. The wound was suppurating freely and granulations had formed on each of the edges, but there were no evidences of union. My first attempt was also unsuccessful. I then cast the animal again, removed all granulations with a sharp scissors, freshened the edges of the skin and mucous membrane, removed all debris of food, washed the parts thoroughly with peroxide of hydrogen, inserted a deep layer of sutures so as to bring the edges of the mucous membrane together, the sutures being composed of soft silk, soaked in peroxide of hydrogen, a superficial row of sutures were inserted in the skin, the wound was again cleansed with the antiseptic and then painted over with collodion. The foal was removed from the dam and fed from a pail, and no further dressings ordered except the application of compound tincture of benzoin to the edges of the wound after a few days. A few of the sutures gave way, but healing progressed satisfactorily and perfect union resulted.

(6) *Surgical Dressings.*—As a general rule, wounds should be covered with suitable surgical dressings whenever possible, at any rate in the earlier stages. Whether these dressings should be moist or dry must depend on circumstances. In suppurating wounds I find the best dressing, in cases where expense is no object, is double cyanide gauze soaked in solution of peroxide of hydrogen (1 part of the 10 volume solution to 3 of water), the gauze is then enveloped with a thick layer of cotton wool and a bandage.

As to the frequency of dressing, this will depend on the amount of discharge; when the latter soaks through the dressing it is an indication for renewal. If this be neglected the discharged become putrid and a mixed infection is likely to occur. For country practice a reliable and cheap antiseptic is Huxley's Liquor Cresolis, in 2 per cent. solution. As the discharge lessens the dressing need not be changed sooner than the third day, and later on a dry antiseptic dressing may take the place of the moist one—such as boric acid with zinc oxide.

In punctured wounds, after drainage has been provided for, I find it is a good plan to plug the wound with gauze soaked in peroxide of hydrogen; this is renewed as often as circumstances require.

In country practice it is useless to expect the owner or attendant to apply dressings properly, hence unless there are reasons to the contrary, wounds do best when left open, and simply cleansed with an antiseptic solution and painted with compound tincture of benzoin. This latter agent fell into disuse for some time, but in my

experience it is a most useful wound dressing for country cases, where as little handling as possible of the wound is an important matter. Carbolic oil, which at one time was so popular a dressing, is now known to be *absolutely inert as a germicide*.

In hunters, deep punctured wounds of the front of the hind fetlock, due to sharp stones, are of very frequent occurrence. The bursa of the tendon may or may not be opened, but acute inflammation rapidly develops and marked pain is present. Attempts to heal such wounds quickly do not prove successful, as infection is deeply situated. In my experience the best dressing is one of the modern substitutes for poultices, which are composed of Kaolin, Glycerine, and antiseptic agents, applied hot and changed daily. When acute symptoms have subsided the ordinary dressings may be applied.

Wounds of the sheaths of the flexor tendons are often serious, in consequence of the infection extending upwards and downwards. Free drainage should be provided early, and rigid attention to antiseptics is necessary.

In all wounds in the region of the limbs there is a tendency to the formation of exuberant granulations, and these require early attention in order to avoid permanent blemishes resulting. I find that the judicious application of finely powdered sulphate of copper is the most reliable treatment in these cases—old-fashioned no doubt, but efficient for the purpose required. Wounds of the knee involving the extensor tendons in the vicinity of this joint are not uncommonly followed by Fibrous Ankylosis, accelerated no doubt by keeping the horse from lying down. When such a complication occurs the animal should be cast and chloroformed and the joint forcibly flexed, otherwise the horse will be useless.

Wounds in the feet due to picked-up nails I shall not consider—they would form a separate subject for a paper. But in hunters, wounds are not uncommon in this region as the result of portions of furze (gorse) branches entering the foot in the vicinity of the frog. Sharp portions of flint not uncommonly enter and extend deeply into the sole. The detection of such foreign bodies is not always an easy matter, and requires a careful examination of the foot. I believe the best treatment, after the removal of the foreign body and the proper enlargement of the wound, is to apply pure carbolic acid or Lysol, and a cataplasm composed of Kaolin and Glycerine.

In my experience, the most dangerous class of wounds are those due to punctures from shafts, such as result from collisions. The difficulty in obtaining drainage is very considerable, especially when the wound occurs in the region of the hind quarter. But proper drainage must be secured at all costs, otherwise treatment will fail and septicæmia will result. If necessary the animal should be cast in order to carry out the surgical procedure; after treatment will consist in copious irrigation with antiseptic solutions carried out by means of a Winton's syringe provided with a gum-elastic top. Where expense is not objected to, the wound should be plugged with double cyanide gauze soaked in hydrogen peroxide solution, the irrigation and dressing being carried out daily.

Time will not permit me to deal with the question of open joints—it would require a special paper. But I cannot omit drawing attention to the dangerous character of punctured wounds in the fore-arm, which are not uncommonly followed by purulent arthritis of the elbow joint. The septic inflammation extends along the sheaths of the tendons, and, as you are aware, these tendons support directly the synovial membrane of the elbow joint. Hence wounds of this region should be drained as early as possible by a free dependent opening.

There are many other practical points deserving of notice in connection with the treatment of wounds, but the paper has already exceeded the extent I had intended,

and I fear also that it has over-taxed your patience. The practical outcome of a consideration of the subject appears to be that although we can never hope to practise aseptic surgery in the strict sense of the term, we can at least carry out antiseptic principles as far as is possible under the very unfavourable conditions that surround us.

Improvements in the results obtained are more likely to follow strict attention to surgical cleanliness and proper drainage of wounds than to care in the selection of agents we employ as dressings. Far too frequently there is a tendency to attribute successful results to the use of the special antiseptic employed. But after twenty-five years of "playing the game," and seeing it played by others, I cannot believe that amongst the host of agents that are introduced yearly, one possesses any special virtues over another so far as the healing of wounds is concerned.

In conclusion, I think the practical deduction to be drawn is—that every attempt should be made to exclude infection from wounds whenever this is possible, and, in the case of wounds already infected, to retard the growth and development of micro-organisms, by the judicious employment of antiseptics. Whether in the case of operation or of accidental wounds, it is quite apparent that in ordinary practice, we cannot afford to dispense with antiseptics, and attempts to do so are likely to be followed by disaster.

An interesting discussion ensued, and the meeting terminated with a hearty vote of thanks to the essayist.

L. W. WYNN LLOYD, Hon. Sec.

Where Diseased Meat Comes From.

While the butcher is saddled with all the moral and financial responsibility of unsound or diseased meat, he is not really the producer of it; consequently someone else ought to share the odium with him. Who is that other person? Let the *Farmer and Stockbreeder* tell us. On 26th February last, in its "Replies to Veterinary Queries," we find the following:—

COUGHING HEIFER (S.W.M.)—I should fear it is caused by tubercles in the lungs or on the sides of the chest. Hadn't you better fat her off?

Nothing could be plainer than this. Mr. Field, M.P., having had his attention drawn to this reply, immediately wrote to the Local Government Board and the Board of Agriculture, pointing out that the purchase of tuberculous animals rendered butchers liable to fine and imprisonment. He also asked what these Departments, jointly and severally, had done to prevent the marketing and sale of diseased animals, and, further, what steps, "if any," had been taken to make it known to farmers and members of the veterinary profession that to fatten off tuberculous beasts "was fraudulently criminal." Up to present writing, beyond the usual bald official acknowledgment, Mr. Field has got no answer. Having regard to the attention given to meat inspection at the present moment, it will be interesting to learn the official view as to the production of diseased meat, and the responsibility of the breeders and feeders of same to the public and to the trader.—*The Meat Trades' Journal*.

* As Diseased or Exposed to Infection

PLANT POISONS.

By JOSEPH BURTT-DAVY, F.L.S., F.R.G.S.
Government Botanist (Transvaal).

The losses among stock in South Africa due to poisonous plants have not received that attention which the subject deserves, owing to the fact that hitherto efforts have been largely concentrated upon tick-borne and other diseases due to parasites. Now that these parasitic diseases are in a measure under control, stock farmers are turning their attention to other sources of loss among their flocks and herds such as lack of winter feed and direct loss from eating poisonous plants. The recent ravages of "gal-lamziekte" in Bechuanaland and the adjacent districts of the Transvaal and Orange Free

State, a disease which appears to be caused by some obscure poisonous plant, have brought the subject prominently before the public.

Many farmers have expressed the opinion that gal-lamziekte is caused by some poisonous plant. Others have thought this improbable, or even impossible, because of certain peculiarities connected with the incidence of the disease. A study of plant poisoning in different parts of the world explains some of these peculiarities, which are quite compatible with the known characteristics of poisoning by certain plants, as can be seen from the following notes:—

Season of the Year.—With some poisonous plants trouble is experienced mainly at certain seasons of the year; this is particularly the case with the tulips (species of *Homeria* and *Moraea*) and slangkop (*Urginea Burkei*)

and usually also with Chailletia or Gift-blaar (*Dichapetalum cymosum*). In these cases the reason may be traced to the fact that the plants in question make their new growth of foliage before the rains begin and therefore at a time when green feed is scarce and stock are suffering from a prolonged diet of dry food. They pick up the poisonous foliage in their eagerness for something green, either in ignorance of its poisonous character or accidentally among the short grass just springing. Such plants are usually avoided by animals accustomed to them. But with other poisonous plants the case is sometimes quite different.

In veterinary practice it is commonly recognized that a plant may be harmful at one time and not at another. It is well known that vegetable drugs differ in potency at different seasons of the year, the difference being, perhaps, correlated with the stage of growth of the plant. Some are only official if gathered at a particular season or stage of development. That a similar difference may apply to the toxicity of some plants is shown by Melter (1899), who records that his horse ate 500 lb. of dried hay of *Passiflora incarnata* without any injurious effect; it had been gathered in July when the plant had passed the flowering stage. In the following March, eight months later, the horse ate only 25 lb. of the dried plant, which had been gathered for medicinal purposes when in flower (the condition in which it is most potent); this time the result was fatal.

The Condition and Age of a Plant may affect its Toxic Properties.—The poisonous principle of some plants (e.g. *Conium maculatum*) is volatile, and the dried material may be less dangerous than the fresh. Hay made from the sleepy grass of New Mexico (*Stipa Vaseyi*) does not appear to possess any poisonous qualities, although in the fresh state the plant has a narcotic effect on horses (Scribner, 1898). The young plants of *Lotus arabicus* of northern Africa are highly poisonous to horses, sheep, and goats, according to Dunstan and Henry, but the old, mature plants are freely used as a fodder by the natives. Feeding experiments with *Crotalaria burkeana* produced no effect when the plants were partially dried. This factor renders the investigation of the poisonous principle of some plants more difficult, as they lose a large part of the poison on being gathered or prepared for research.

Some parts of certain plants are more poisonous than others. The fruits of the Hemlock (*Conium maculatum*) and the seeds of Stramonium (*Datura stramonium*), of species of Lathyrus, and of other plants, contain a larger proportion of poison than the foliage.

The relative proportion of poison contained probably differs in individuals of the same species, just as there is a difference in the flavour or sweetness of two fruits from the same tree, in the amount of latex yielded by different rubber-producing trees of the same species, and in the amount and quality of opium produced by the Opium-poppy under varying conditions of soil and climate.

Some kinds of poisonous plants are much more dangerous than others, perhaps because more often eaten, or because the poisonous substance contained is more virulent, or because one kind contains a larger proportion than another. Therefore some species act on the system with great rapidity, while the action of others is relatively slow.

Small doses of some poisons may be taken with beneficial effect, when large doses may be fatal. Some of the most deadly poisons (e.g. Belladonna, Strychnine, Aconite) are valuable drugs when taken in official doses. It is evident, therefore, that a plant is not necessarily harmless because stock are occasionally seen to eat of it without injurious effect.

The toxic properties of plants are not of course due in all cases to the same chemical substance. It is well known that several toxic compounds are present in

various plants, which differ in their effect on the animal system, e.g. the Alkaloids, nicotine, morphine, atropine, hyoscyamine, strychnine, and veratrine; the Glucosides, lotusine, coronilline, and amygdaline; the Gluco-alkaloid solanine; and the Acids aronic and hydrocyanic.

Sometimes the same poison is present in more than one species or genus of plants, e.g. hyoscyamine, which is characteristic of the Henbane (*Hyoscyamus niger*) and atropine, characteristic of the Deadly nightshade (*Atropa Belladonna*), these are both present in the Stramonium (*Datura Stramonium*); solanine occurs alike in the Black nightshade (*Solanum nigrum*), the Jerusalem cherry (*Solanum pseudocapsicum*), the tomato (*Lycopersicum esculentum*), and in the white sprouts and unripe tubers of the potato (*Solanum tuberosum*) when grown near the light.

Similar toxic properties sometimes occur in many plants of the same family.—The presence of poisonous alkaloids, narcotics, acids or acid compounds is often common to and characteristic of many species of a genus and even of a family; thus Hyoscyamine, Atropa, Datura, and Lycopersicum, referred to above, all belong to one plant-family, the Solanaceae. On this account we are able to treat some plant families as more dangerous than others; thus the Ranunculaceae are often acrid and poisonous; the Papaveraceae, the tribe Cichoriaceae of the Compositae, and the Solanaceae are apt to be narcotic; the family Loganiaceae produces some of the most dangerous vegetable drugs known to us. On the other hand, some large families of plants contain no species known to be poisonous, e.g. the Cruciferae, etc.

Not all kinds of animals equally affected.—Some kinds of animals are poisoned by plants which are harmless to other kinds, e.g. Darnel seed is said to be poisonous to man, dogs, horses, and sheep, but to be wholly innocuous to cows, pigs, and ducks (Wood, Remington, and Sadtler). The well-known Poison ivy, *Rhus toxicodendron*, of the Atlantic coast of North America, and the Poison-oak, *Rhus diversiloba*, of the Pacific coast, are very poisonous to man, but are greedily eaten in quantity by horses with no ill-effect. Morris (1896) states that *Leucaena glauca* is greedily eaten by cattle, sheep, and goats without ill effect, though very injurious to horses, mules, donkeys, and pigs. Dr. Watkins Pitchford suggests that probably all plants which are poisonous to animals are also poisonous to man.

Not all individuals equally susceptible—Nor are all individuals of the same animal species equally susceptible to certain poisons. In California some people are immune against poisoning by *Rhus diversiloba*; most persons are only slightly inconvenienced, some are made seriously ill, and a few have been killed by it. Chesnut (1898) reports that *Rhus toxicodendron*, of the eastern United States, acts in the same way, and he further states that this variability is not confined to poisons acting externally.

Susceptibility may be increased by ill-health or poverty of condition.—The condition, age, or state of health of the animal sometimes has an influence on its susceptibility to certain poisons, or to the quantity which may be consumed without serious effect. Wilcox (1901) reports that sapotoxin, a poisonous substance found in many plants, is far more injurious when the alimentary tract is ulcerated than when it is healthy.

Acquired craving.—In the case of some poisonous plants animals which taste them develop a morbid craving which, when once acquired, can scarcely be overcome. This is true of *Astragalus Hornii* and other "Loco-weeds" of the Western United States. Maiden (1901) reports a similar result from eating the Australian "Indigo Plant" *Swainsona galegifolia*. Chesnut (1898) finds that in the Southern United States stock usually avoid *Helenium autumnale*, but sometimes develop a taste for the plant and are killed quickly by eating it in

large quantity. The seeds of the common Boer pumpkin of South Africa, if eaten freely by poultry or ostriches, are said to make the birds "crazy" and to produce temporary paralysis; it is also said that "once they acquire the bad habit of eating the pips it is difficult to break them of it." This craving may be developed to such an extent that animals ignore their proper food and, instead of grazing quietly, spend their time hunting over the camps in search of individuals of the particular plant they have learned to like, even digging up the roots to satisfy their craving, with the result that they become emaciated from lack of sufficient food. This taste is an acquired one, and does not necessarily affect all the animals in a herd or flock. Certain animals on one side of the fence may acquire it, while those on the other side may not. It is well known that animals have their particular friendships and that some of them generally graze together, especially if they belong to the same family. If one member of such a grazing group acquires the taste for a certain poisonous plant it is likely that the other members will learn to eat it also.

These facts might explain the "spread" of a disease caused by poisoning, to farms which were hitherto supposed to be clean. Farmers who have a herd affected with a disease which is not contagious sometimes move to supposed clean farms, either hiring the grazing or selling the herds outright. If some of these animals have acquired the taste for the particular plant they will hunt for it, and if they find it in sufficient quantity will eat of it and become affected; in this way the disease may "spread."

This abnormal craving may be acquired through scarcity of feed in winter or early spring, which causes the animals to eat anything green. If they are moved to a farm where the feed has not been eaten down closely they are likely to find enough of their normal food to make it unnecessary to resort to the dangerous species, and so the losses may be checked for a certain time, only to recommence, however, when the veld is eaten down. In such cases an obvious method of treatment is the provision of an adequate supply of palatable winter feed such as Teff hay. This would act as a preventive, but not as a remedy for cases where the poison has already been taken into the system.

A distaste may also be acquired.—It is commonly stated by men who are much with stock in South Africa that animals learn to know and to avoid poisonous plants. Certain it is that stock brought up on a farm where Tulp abounds will feed among it constantly and with impunity, often without the loss of a single head, while strange animals, from places where it does not grow, will eat of it and die if not carefully watched and treated. Experiments carried out by our Veterinary Division tend to confirm this view; G. V. S. Dunphy (1906) notes that sheep and goats which had once been poisoned with *Dichapetalum* and had recovered from the effects seemed to show a great dislike for the leaves. In a test with Yellow Tulp (*Homeria pallida*) Doctor Theiler was unable to induce a hungry ox which had been starved for thirty-six hours to eat Tulp even when chopped and well mixed with hay.

Small amounts of poison may sometimes be taken with impunity. It does not necessarily follow that a plant is harmless because stock are occasionally seen to eat of it without injurious effect, for large doses may be fatal. Some deadly poisons (e.g. Strychnine, Belladonna, and Aconite) are valuable drugs when taken in official doses.

Many stock farmers of the Transvaal are firmly convinced that the converse is also true, and are prone to give decoctions of Tulp or Gift-blaar to render their cattle and horses immune.

Classification.—Vegetable poisons may be grouped as follows, if we adopt Kobert's classification of poisonous substances:—

1. Irritants which cause gross anatomical changes of the organs, e.g. croton oil and savin.
2. Blood poisons—
 - (a) which interfere with the circulation in a purely physical manner, e.g. ricin and abrin;
 - (b) which dissolve the red corpuscles, e.g. the saponins;
 - (c) which, with or without primary solution of the red blood corpuscles, produce in the blood met-haemoglobin, e.g. picric acid;
 - (d) which have a peculiar action on the colouring matter of the blood or on its decomposition products, e.g. hydric cyanid.
3. Poisons which kill without the production of gross anatomical change—
 - (a) which affect the cerebro-spinal system, e.g. strychnine, morphine, coniin, curarine, atropine, strophine, aconitine, etc.;
 - (b) which affect the heart, e.g. digitalin, helleborin, muscarine.

Parasitic Mange—Farmer Fined.

At Eddisbury Petty Sessions on Monday, before Captain Wynne Griffith and other magistrates, Thomas Henry Barnard, of the Rectory Farm, Delamere (Northwich, Cheshire), was summoned under the Diseases of Animals Act, 1894, for failing to notify a case of parasitic mange on his premises, as required by the Parasitic Mange Order, 1911, Mr. J. Holland, solicitor, Brinsford, defended.

Constable Barber stated that on February 25th he was on duty in Chester Road, Delamere, when he noticed an aged brown mare in the defendant's orchard. He could see that patches of hair were missing from the neck and back, and the animal appeared to be uneasy. He interviewed the defendant, who admitted that the animal belonged to him. Asked how long the horse had been in that condition, he said a fortnight. He also stated that the mare was lousey, and had a little itch, and the hair had come off with her rubbing against the trees. Witness accompanied him to the orchard, and, on examining the mare, he found the mare in a shocking condition. It was a mass of scab, and he noticed several patches on the back and neck which were bleeding. There was scarcely any hair on the back and neck. He told the defendant that in his opinion the mare was suffering from parasitic mange, and he replied, "I see by the papers that they have got it very bad around Manchester, but she has not got it. It is lice and old age that is the matter with her." He told the defendant that he had seen many cases of parasitic mange, and he was strongly of opinion that that was a very bad case. However, witness told him to keep the animal isolated, and he would report it to his sergeant. On March 1st witness again visited the premises in company with Sergeant Turner. The latter asked defendant why he had not destroyed the mare as promised, and he replied that he did not intend to, because Mr. Bibbey, veterinary surgeon, of Winsford, had told him that the animal had not got the mange, but that it was affected with lice and old age. Acting under Mr. Bibbey's instructions he gave the mare a dressing of Australian sheep dip. On examination he found the animal had had a very severe dressing, and on the point of the near shoulder he saw five or six marks where the hair had been cut, apparently by scissors. In his opinion that was the part of the animal which was least affected by the mange. Defendant was asked who had cut the hair, and he replied that Mr. Bibbey had done it for the purpose of making an examination.

Mr. Holland: Do you think it is easy to detect mange?—I have seen several cases.

Sergeant Turner stated that on February 25th he called on Mr. Price, the local veterinary inspector, and accompanied him on the following day to the Rectory Farm. Mr. Price examined the mare, which was in a shocking condition, but he did not put his hand on the animal, because defendant said, "Don't you touch her, keep away or she will kick you." He asked the defendant if the mare had been off the premises and defendant replied that she had been to the Northwich Market on the previous Friday. He then told defendant that it was the worst case of mange he had seen. He corroborated the evidence of Constable Barber as to the visits to the farm on March 1st and 2nd, and added that on the 16th he went there again with the chief veterinary inspector, Mr. Laithwood.

Robert Price, veterinary surgeon, Tarvin, stated that he had been in practice 32 years, and for 27 years had been inspector under the county. On Monday, Feb. 26th, he examined the mare in question, and found she was badly affected with mange on the head, withers and back; it was a pronounced case. On March 2nd he took some of the scab for the purpose of microscopic examination, and found dead parasites.

Cross-examined: He condemned the mare before he found the parasites; he had quite sufficient evidence without. The disease was a very contagious one, and it was possible for an animal to have mange and lice together.

Jas. Laithwood, chief veterinary inspector for the county, stated that he examined the defendant's brown mare on March 6th, and he found it to have all the symptoms of mange. Accordingly he took scurf from various parts of the animal's body, and under the microscope he discovered no live parasites, but shrivelled-up dead ones; also what he concluded were eggs. He put a quantity in an incubator to hatch out, and on the fourth day he discovered young lice as well as mange parasites had been hatched out.

The magistrates with the aid of a microscope inspected the hatched-out lice and parasites.

In cross-examination, Mr. Laithwood said he would have been surprised to find any parasites where the hair was cut off by Mr. Bibbey. He admitted that if the animal was attacked with lice she might rub herself raw. It was safer not to come to a conclusion about parasitic mange before making a microscopic examination.

DEFENCE.

For the defence, Mr. Holland urged that the mange order was of recent date, and therefore the defendant might be excused if he was not fully cognisant with it. One could also understand the police being a bit keen on it. In the Act it was stated "where the owner or person charged with an offence against the Act, he shall be presumed to have known of the existence of the disease." The contention was that the animal was affected with lice, owing to the fact that the defendant could not curry-comb her, with the result that she became dirty. He would point out that Mr. Bibbey was the only veterinary surgeon who saw the mare before the dressing was carried out.

Thomas Henry Barnard gave evidence to the effect that the mare was 30 years of age. When the constable came he told him the animal was affected with lice, but the officer said it was the mange, and ordered him to isolate her. If he had suspected mange he would certainly not have put her with the grey mare. The latter was perfectly clean. It was in consequence of Mr. Bibbey's advice that he did not have the animal destroyed.

Herbert Bibbey, veterinary surgeon, Winsford, stated that he examined the mare with his fingers first, and found an even surface, but she was swarming with lice. In his opinion the presence of the lice had caused the mare to get in the condition in which she was. Some-

times lice and mange parasites were found together, but not as a rule. He examined the grey mare and found no trace of disease or lice. He took scrapings from various parts of the brown mare, and subjected them to microscopical examination, but found nothing except the eggs of lice. In his opinion if the mare had been suffering from mange, and had been worked with another animal for two or three weeks that other animal would have become affected. The absence of mange in the grey mare confirmed his opinion that the brown mare was not affected. Five days after she had been dressed the mare improved, new hair appeared on the bare patches, and the irritation had subsided. A week later the condition of the mare was still further improved.—In reply to the Magistrates' Clerk, witness said he could not speak as to the eggs, because he did not incubate them.

Albert H. Darwell, veterinary surgeon, Northwich, stated that he had had 30 years' experience as inspector under the Diseases of Animals Act. He spoke to examining the defendant's brown mare on March 2, and she was suffering from a skin disease of a non-contagious character. He admitted that the mange was highly contagious. The grey mare had two or three lice upon her, but there was no sign of any skin disease.

The magistrates retired to consider their verdict, and after an absence of upwards of half-an-hour, the Chairman said the magistrates considered the mare was suffering from parasitic mange. They also were of the opinion that the defendant thought the animal was infected with lice; at the same time the Bench were of the opinion that the defendant showed gross negligence in not treating the mare himself or seeking advice. Under these circumstances he would be fined 20s. including costs.—*The Chronicle*.

Parasitic Mange, or Surfeit?

At Steyning, on Monday, April 1, Charles Huggett of Laybrook Farm, Thakeham, was charged with not having notified the police of two cases of parasitic mange from which it was alleged two of his horses were suffering, as required by the Parasitic Mange Act of 1911. According to the prosecution, when a police constable saw the horses on March 21 he was told by the defendant that they had had the complaint for about a fortnight and that he had done the best he could for it. "Try not to make it any harder than you can help for me," he was alleged to have said to the constable, but before the Bench he denied making use of any such remark. Questioned by Huggett, the constable admitted that he did not remember him using the word "parasitic," but he was quite sure he said he had been treating them for mange.

When Supt. W. Fowler called at the farm, he found a preparation in the stable for treating horses with mange, and the stable itself had been partly disinfected.

Mr. J. Bolton, a Steyning veterinary surgeon, who was with him, had no doubt that the horses—which it was said were in a very bad condition, very poor, and very old—were suffering from parasitic mange. He showed some parasitic hair under a microscope, which led Mr. Powell Breach, one of the Magistrates, to ask whether it was possible to know that a horse had parasitic mange without making a microscopic examination. "In this case the animals were bad enough for any one to see they had the mange," replied the witness.

While admitting that he was unaware parasitic mange had to be notified, defendant said he believed the horses were suffering from surfeit—a very common disorder at this time of the year.

Mr. J. Castledine, a Partridge Green veterinary surgeon, who had been called in, told the Bench he formed the opinion it was a very severe case of surfeit. He

admitted, however, that the microscope revealed a parasite.

The Bench, while remarking that the police could not do otherwise than bring the case forward, thought perhaps the public did not know the Act so well as they did, and so they wished to deal as lightly as possible with the defendant. No conviction would be registered, but he would have to pay 10s. costs.—*West Sussex Gazette*.

The Van Horse Parade.

The ninth annual Parade of the London Van Horse Parade Society took place in Regent's Park on Easter Monday, in weather which, though cold and windy, was almost uninterruptedly fine. Judging began at 10 a.m. and went on till nearly lunch time; after lunch the long "march past," with the customary attendant presentation of prizes, took place.

There was a good concourse of spectators; and, for the first time in its history, the Parade was honoured by the presence of the Lord Mayor of London, who presided at the Parade Luncheon and remained to witness the march past afterwards. He was accompanied by the Lady Mayoress, who distributed the prizes.

The presence of the Mayor and Mayoress was an indication of the growing recognition of the Parade; the number and quality of the animals shown testified to the constant increase of its popularity amongst owners and carmen. The entry was a record one for the Society; 613 drivers of singles or pairs entered and 746 horses were exhibited. The first Parade in 1904 had only 132 entries; and, it may be added, every successive year since then has shown an increase of entry over the preceding one.

It was generally agreed also that the present Parade showed a marked improvement in the standard of the horses. A few were of lighter class than the typical vanner, but the general quality and condition was very high indeed. So evidently thought the judges, for a very large proportion of the competitors obtained first-class awards. One striking feature was the special prizes, 66 in number, given to drivers for the length of their unbroken service with one firm. Two veteran drivers each exceeded 50 years' unbroken service; seven others had records of between 40 and 50 years; sixteen of between 30 and 40, and forty of between 20 and 30.

The four pairs of judges were Sir Gilbert Greenall, with Col. the Hon. Charles Byng, Sir Henry Hoare, Bt., with the Hon. A. E. Parker, Mr. Richard Budgett with Mr. R. N. Stollery, and Mr. A. C. Church with Mr. H. Horton. The four veterinary inspectors were Messrs. J. W. Edwards, F. W. Stanley, H. Lomas, and E. Alfred West. These officers, with the support of a strong Committee and a dozen energetic stewards, succeeded in making the Society's ninth Parade the most attractive one in its history.

Army Horses.

A memorandum of the Secretary of State for War relating to the Army Estimates for 1912-13, which was issued on the 27th February as a Parliamentary Paper [Cd. 6064] contains the following:—

"Recent cavalry manœuvres have brought prominently to notice the large proportion of the horses in the ranks of the cavalry regiments at home which would not be fit, on the outbreak of war, for the very hard work which would at once be demanded of them. A thorough investigation was made during 1911 into the system of horsing the cavalry, as regards peace establishments, mode of supply of remounts and methods of training. As a result it has been found necessary to make a further increase in the number of horses maintained in the

regiments in peace, and it is in contemplation to introduce a system of collecting remounts and sending each regiment its annual supply in one batch, to be then subjected to a course of systematic and progressive training, instead of sending horses in small numbers throughout the year. Under the new system, when fully established, no horse will be subjected to the strain of manœuvres or put into the ranks on mobilization for war until he has been thoroughly hardened in this way and has reached the age of six years. It is confidently expected that the cost of the new scheme will be to a large extent covered by the saving made on wastage, and the longer average service obtained from the horses.

In pursuance of this scheme 20 horses are added to the peace establishment of each line regiment at home.

I mentioned in my memorandum on the Estimates of the current year that County Associations had encountered various difficulties in the task of organising the supply of horses to the Regular and Territorial Forces on and after mobilisation. After full investigation, I found the best solution to lie in transferring the responsibility for completing the work to General Officers Commanding-in-Chief, providing them with a small staff of remount officers for the purpose, and placing at their disposal the services of adjutants of the Territorial Force, to inspect and classify a sufficient proportion of horses in each county to provide the required quotas after allowing for casualties and rejections.

This month was the time assigned for the completion of the first classified lists and hereafter the lists will be continuously revised so as to keep touch with the changes in the horse population of the country.

The expansion of mechanical transport in the Army will reduce the number of horses required for the Expeditionary Force to a considerable extent, but unfortunately the corresponding expansion in the civilian world threatens to lead to the disappearance of the 'bus horse, on which we have hitherto mainly relied for artillery purposes."

Vivisection and the Veterinary Profession.

"No Choice of Doctor."

To the Editor of The Referee.

Sir,—Many, I feel sure, must have welcomed, as I did, the letter which appeared under the above heading in last Sunday's *Referee*.

I, for one, sincerely hope "Pate's" letter may bear fruit, and that we shall see the matter taken up, particularly by the societies which exist expressly for the purpose of protecting dumb animals. The members of these societies must surely be ignorant of the extent to which unnecessary suffering is inflicted upon animals by unqualified vets., or we should have heard of this matter long ago.

When a man consults a quack doctor and suffers in consequence, he has only himself to blame. Not so the horse! For him there is no "choice of doctor." His master chooses, while he, too often, suffers.—I enclose my card, and am, sir, yours, etc.

F.R.C.S.

Harley Street, W., March 27.

THE EFFECT OF GLYCERINE UPON THE CHROMOGENICITY OF BACTERIA.

C. Gazetti states (*Zentralbl. f. Bacteriologie, U.S.W.*) that the addition of glycerine to culture media in which chromogenic bacteria are being grown generally exercises an unfavourable effect upon the chromogenicity of the organisms.—(*Berliner Tier. Woch.*)

* As Diseased or Exposed to Infection

The late Mr. Wyndham Bryer.

I much regret to see in your obituary list of the death of one of my old friends, Wyndham Bryer, late of Cheltenham, also that nothing is said about his many good qualities. Members of the profession who were in practice 20 or 30 years ago, will remember him as doing probably the largest practice in the examination of hunters as to soundness that has ever been done, or ever will be done, in this country, and at the same time making very few mistakes, his opinion being taken without question by the well-known horse-owners of that time. He was a man who had great force of character, and a determined but pleasant manner. He did not attend veterinary meetings to spout brotherly love and affection and the elevation of the profession, then go home and do a nasty trick to his professional neighbours, but I think I can safely say he never did a brother vet. any harm if he could possibly help it. In short a *man*, in the true sense of the word, has passed away. For some years he has been living at Boscombe, Bournemouth, having quite retired from the profession.

JAMES BLAKEWAY.

Mr. JOHN M'DOUGALL, M.R.C.V.S., second son of the late Mr. John M'Dougall, M.R.C.V.S., Helenburgh, and one of the most competent of the younger generation of veterinary practitioners, died with startling suddenness at his residence, 56 Grant Street, Glasgow, on 1st inst. We make this announcement with deep regret. Mr. M'Dougall was a young man of conspicuous promise in his profession, and leaves a young wife and family to mourn his loss. To his bereaved wife and family we tender our deep sympathy.—*The Scottish Farmer*.

CORRESPONDENCE.

UNQUALIFIED ASSISTANTS.

Sir,

I beg to draw your attention to certain advertisements in *The Record* for or by unqualified assistants. This seems to me to be extremely unfair to the young qualified man, who has usually very little capital and is not allowed to work for an unqualified man, and if he does so is considered to be acting unprofessionally, and is liable to be struck off the Register.

Meanwhile the richer practitioner is allowed to employ unqualified men, and so lessen the market value of the qualified assistant. At the same time he is acting, or supposed to be acting, professionally, and is not liable to be struck off the Register. I should like to know if the Council consider this justice?

It seems to me to be a case of one law for the rich and another for the poor. The fact is, that the qualified assistants are two small and weak a body to demand justice at the hands of the profession.—Yours faithfully,

M.R.C.V.S.

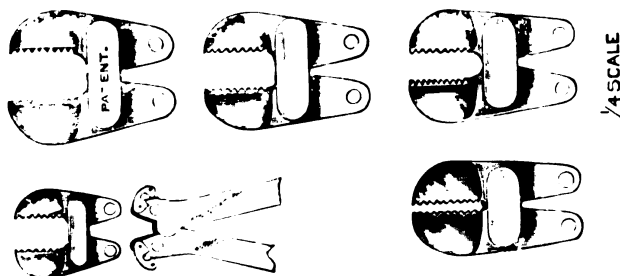

[We agree with our correspondent that practitioners should not employ unqualified assistants. But they do, and our Council makes no attempt to prevent them. We may modestly assume to help in guiding the profession in the right way, but we cannot be expected to usurp the powers of the Council.—Ed]

Original articles and reports should be written on one side of the paper only and authenticated by the names and addresses of the writers, not necessarily for publication.

PRACTICES FOR DISPOSAL

EAST COAST. Agricultural practice returning £600 per ann. Good house containing 2 recept. 4 bedrooms, bath, kitchens, etc. Stabling for 4 horses, coach-house, kennels, etc. Price required for house and practice £1300, of which £400 can remain on mortgage, or vendor would sell practice for £500 and would let house on lease at £45 per annum.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises. Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains: reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended.

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

PURCHASERS are requested to send full particulars of their requirements as we have a number of practices and partnerships for sale which have not been advertised.

VOL. XXIV.

THE COUNCIL MEETING.

At last week's Council meeting not much was said regarding finance, and, indeed, the financial position speaks plainly for itself. The liabilities for the quarter exceeded the Treasurer's balance by over £30, and so, for the second time in the College year, £1000 worth of Consols are to be sold perforce. This is not quite so bad as it looks; for the greater part of the first sale of Consols went to repay a heavy bankers' overdraft, and the deficit now to be met is only a small one. But the thought that the present sale will keep us going longer than the last one did is cold comfort. The fact remains that we have been forced to take another step towards a bankruptcy from which nothing can save us, except the passage of our long-delayed Bill.

Two items connected with the Registration Committee's report call for notice. The first is that the Council has had an opportunity of expressing an opinion upon the proposed advertisement of veterinary surgeons by *The Private Horse Mart*, to which we called attention a fortnight ago. That opinion, expressed to the paper itself, is a definite one; and we may hope that no more will be heard of the scheme. The second is that the Council has at last decided to take action against the employment of unqualified assistants by veterinary surgeons. This is perhaps the most important decision arrived at during the meeting; and we shall refer to it at greater length in future. It is easy to foresee that individual cases will present some practical difficulties in their adjudication; but we are glad that the Council is making a move against a custom which is altogether harmful to the profession.

The President has been deputed to give evidence upon the question of patent medicines before a Home Office Select Committee, and has been fortified by a resolution which we only wish we could think likely to soon pass into law. Dr. Bradley has given notice of a proposed alteration of bye-law, the effect of which, if it is carried, will be to bring the dates of the Scotch Summer examinations into line with the English and Irish ones, as is the case with the Christmas examinations; and certainly the change seems commendable. The now well-known resolutions of the Association of Veterinary Officers of Health relating to tuberculosis have wisely been referred to a Committee for full consideration and report; so we shall hear more of them.

The Annual General Meeting in Dublin is to be marked by a revival of the official dinner. Apparently this is to be done without cost to the R.C.V.S.—and our impression is that the Irish practitioners will make meeting and dinner alike a success.

AN EXCEPTIONAL CASE OF LACERATION OF THE MUCOUS MEMBRANE OF THE TRACHEA IN A HORSE.

The subject was a five-year-old Black van gelding which was bought in the country on Oct. 26th, 1911, and sent to London the same day. The next day it was tried for its wind and found to be sound. On 30th and 31st October it was worked for two short trials and was reported to be a good worker, nothing being noticed amiss.

On November 1st it was found to be sick and was admitted to the Infirmary for treatment.

Symptoms.—On the first three days feverish symptoms were shown. On the fourth day the temperature rose to 107, pulse 90, a suppressed cough was observable, and a slight noise was heard which appeared to be Laryngeal or from upper part of Trachea. Auscultation of thorax revealed sounds of Broncho-pneumonia.

For the following three days the horse showed some improvement with lowering of temperature, 104, pulse 65, and was feeding better.

On November 9th it became worse, temperature rose to 105, pulse 72, and the respirations were very quick, with dyspnoea. A peculiar vibrating, sonorous, thumping sound could now be heard in the Trachea. The dyspnoea grew gradually worse, and on the evening of the 9th day the noise in the Trachea could be heard 30 yards away, and as there was danger of suffocation, I performed Tracheotomy on the 10th day to see if it would give relief. On inserting the finger through the tube-opening made in the trachea a membrane could be felt which was being firmly pressed downwards, almost blocking the lumen of the wind-pipe. The Tracheotomy tube was inserted, but had to be withdrawn immediately as it only made the breathing worse.

On 13th November the breathing became easier and it now commenced to breathe through the opening made in the wind-pipe. Diuresis set in and a slight discharge from both nostrils was noticeable, first of a catarrhal kind, after which it became muco-purulent. The horse was now in a very weak and exhausted condition, with quick, weak, irregular pulse; became worn out and died the 14th day from the commencement of the illness.

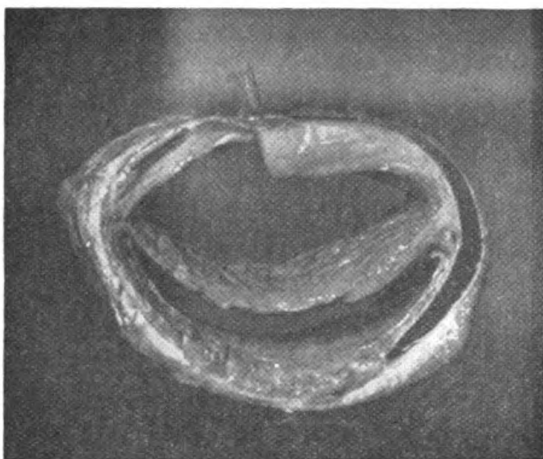

Treatment.—In early stages, febrifuges; later, carbonate of Ammonia, Camphor and Nux Vomica was given in bolus. Hot cloths to sides and oxygen inhalations gave temporary relief.

Post Mortem.—The trachea was found divided throughout its entire length from larynx almost to the branching of the right and left bronchi, by a transverse septum formed by the mucous membrane

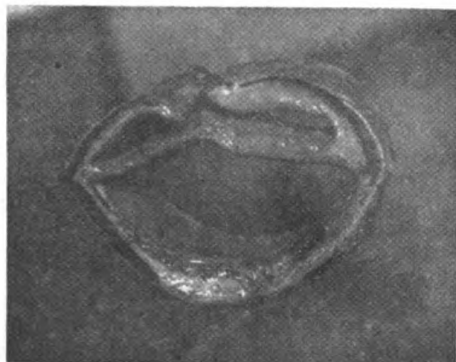

on the posterior or upper part of the tube being torn from the fibro-elastic membrane and forced downwards. The septum in the lower part of the trachea was still complete, in the upper part it had ruptured longitudinally in the middle line to just below the seat of the tracheotomy operation.

The mucous lining of the trachea and bronchial tubes was intensely red and inflamed, and that part forming the septum much thickened.

Three-fourths of the right lung and one-third of the left was pneumonic and very much consolidated. The anterior portions of the lungs were only affected, and septic changes had commenced to take place in the lung tissue.

Section of trachea showing septum as found at post-mortem.

Section of trachea showing septum fixed back in position.

Remarks.—Although inquiries failed to discover that the horse had met with an accident, and there were no external marks of injury on the neck, I am of opinion that it must have met with an injury through coming in contact violently with something, causing injury to the mucous membrane in the upper part of the Trachea. Laceration of the membrane and tearing of it from the fibro-elastic membrane led to the formation of a pocket or cul-de-sac into which the air rushed, which with inflammatory changes and spasm of the tube led to

the gradual tearing up of the membrane and its being forced downwards, blocking the lumen of the tube and leading to distressed breathing. The relief in the breathing on the 13th day was, I think, due to the rupture of the septum longitudinally from larynx to just below the seat of the tracheotomy operation when breathing commenced through the opening made in the wind-pipe.

The septic condition of the lungs was no doubt due to infection from trachea.

The accompanying photographs will show the septum complete.

R. EAGLESHAM, M.R.C.V.S.

Paddington, London.

ABSTRACTS

THE ISOLATION AND CULTIVATION OF JOHNE'S BACILLUS, AND EXPERIMENTS UPON THE PREPARATION OF A DIAGNOSTIC VACCINE FOR JOHNE'S DISEASE.

Messrs. F. W. Twort, M.R.C.S., L.R.C.P., and G. L. Y. Ingram, M.R.C.V.S., have recently reported (*Proceedings of the Royal Society*, B. Vol. 84. 1912) some important experimental work upon the bacillus of Johne's disease. The report covers a great deal of very valuable work; and the following is a brief summary of its main results.

The authors confirm the view of previous workers that Johne's bacillus fails to grow on any of the artificial media at present used by bacteriologists. They also find that the bacillus shows no definite growth on fresh bovine tissue or fresh extracts of bovine tissue, removed aseptically and placed in sterile flasks. In addition, they performed some experiments to test the possibility of Johne's bacillus working in symbiosis with an ultra microscopic virus, and in every case obtained negative results. They have therefore no evidence of such symbiosis in the case of Johne's disease.

Further, the authors, working upon the same reasoning as that which previously led one of them (Mr. Twort) to the successful cultivation of the lepra bacillus (see *V.R.*, February 4, 1911, page 494), have devised a method of cultivating the bacillus of Johne's disease. They find that Johne's bacillus will grow on media containing the dried and powdered growth of certain acid-fast bacilli which have been previously killed, and this is so even when the dead bacilli have been kept for a period of eight years, and subjected to a temperature of 115°C in the autoclave for one hour. The bacilli are easily sub-cultured on to fresh tubes of the same medium, but not on to the ordinary laboratory media.

The most suitable bacillus to incorporate in the medium is the timothy grass bacillus, and to a somewhat less degree the smegma bacillus of Möller and the naseuschleim bacillus of Karlinski. The human type of tubercle bacillus is also good, but on media containing the avian type Johne's bacillus grows very slightly, if at all. The authors tested a few strains of bovine bacilli in media, but were unable to get any definite evidence of growth of Johne's bacillus. Tubercle bacilli isolated from cats also gave negative results.

The substance or substances in the various acid-fast bacilli (timothy, etc.) which render the medium suitable for the growth of Johne's bacillus can be extracted from them by means of hot ethyl alcohol. The extract thus obtained, when added to media in lieu of the dead bacilli, permits the growth of Johne's bacillus.

The authors have isolated Johne's bacillus (using ericocolin to aid in the isolation in the case of contaminated specimens) from five consecutive cases of Johne's disease, and have proved the morphological and biological characters of the bacilli isolated to be identical in every respect. The isolated bacilli produce no lesions when administered orally, intraperitoneally, sub-cutaneously, or intra-venously to mice, rats, guinea-pigs, rabbits, pigeons, or hens. When given orally or intra-venously to bovines, however, the isolated bacillus reproduces Johne's disease, which cannot be distinguished from the original disease either clinically during life or *post-mortem*. The bacillus can be recovered from the lesions in the intestine of the inoculated animal, and shows characters in every way identical with the bacilli isolated from the original cases.

Having succeeded in cultivating the bacillus, the authors proceeded to work with the object of obtaining a diagnostic vaccine. They find that animals suffering from Johne's disease, either normally contracted or experimentally produced by the inoculation of pure cultures of Johne's bacillus, gives no definite reaction with diagnostic vaccines prepared from cultures of the timothy grass bacillus or from the avian tubercle bacillus. They further find, however, that vaccines similar to those prepared from other acid-fast bacilli can be prepared from cultures of Johne's bacillus. Diagnostic vaccines prepared from cultures of Johne's bacillus grown on "tubercle bacillus medium" gave positive reactions with *tubercular* animals, which proved the medium used to be unsuitable for the preparation of a specific diagnostic vaccine for Johne's disease. Vaccines prepared from cultures of Johne's bacillus on a "timothy grass bacillus medium" gave negative reactions with normal and with tubercular animals, and also with cattle suffering from Johne's disease. The authors attribute this to the fact that they have hitherto obtained only a small amount of growth in their fluid media, and partly also to most of the growths having been obtained from solid media, and therefore not made in the same manner as diagnostic tuberculin. They also believe that a highly concentrated vaccine will be required to give a positive reaction; and, as one of their strains of Johne's bacillus has now commenced to grow upon the surface of fluid media, they anticipate that other strains will yield a similar growth in time, and that it will then be possible to prepare a diagnostic vaccine of sufficient strength.

At present, the authors are financially handicapped; for, though they are now preparing a number of vaccines for further diagnostic experiments, they require more cattle upon which to test their efficacy. They express the hope that a reliable diagnostic vaccine will soon be obtained, by other investigators if not by themselves; and with that end in view they have sent sub-cultures of Johne's bacillus grown by them to various workers in the British

Isles, France, and Denmark. Johne's disease, from its nature, is one in which an efficient diagnostic vaccine would be of especial value; and the authors, by devising a method of cultivating the bacillus, have brought such a vaccine into the realms of possibility.

AN OUTBREAK OF BOVINE DIPHTHERIA.

Hendrickx, professor at the Belgian Veterinary School, and Kempeneers, a veterinary practitioner at Landen, describe an outbreak of bovine diphtheria which they observed upon a very large farm. Upon this farm was a nearly constant average number of 120 fattening cattle, the fattening period lasting from two to three months. The hygienic conditions were as perfect as possible; and, just before the outbreak, the animals appeared in perfect health.

Clinically, the authors divide the disease into three stages. The first stage lasts little more than forty-eight hours, and its special manifestation is fever, the temperature rising in the first place to 105.8° F. The cattle prefer to lie rather than stand; the respiration is slightly accelerated; but neither catarrh, nor cough, nor fetidity of the breath, are yet observed. The appetite is still partially preserved, but rumination is absent.

During the second stage a very marked predominance of the respiratory symptoms is observed. The respiration becomes very frequent and difficult. Dyspnea is so great that the animals hold the mouth open, showing the buccal mucous membrane cyanosed. Soon the respiratory difficulty becomes such as to threaten asphyxia; the respirations now amount to from 100 to 120 per minute. Coughing has now appeared, and becomes frequent and spasmodic. This latter symptom is explained by the fact that the alterations, at first localised in the nasal cavities, extend to the larynx and soon invade the trachea and the large bronchi.

Decubitus has now become almost constant. The appetite is lost, the fæces are scanty and dry, and the urine is scanty.

Percussion of the chest reveals nothing abnormal. Auscultation reveals abundant mucous râles and an augmentation of the vesicular murmur at the base of the lung.

Towards the end of this second period it is noticed that the breath in some patients is very fetid, and that its odour may be recognised at some distance. Examination of the nasal mucous membrane shows that it is very injected and turgid; its surface presents greyish deposits, some adherent, others partially detached or totally separated from the mucous membrane, and undergoing elimination in the discharge.

In the third period the dyspnea becomes yet more accentuated. The air passages, up to and including the small bronchi, are invaded by the products of secretion, which obstruct them and render the respiration, which is very difficult for the anterior passages, soon impossible for the posterior ones. Standing becomes more and more difficult; the animals lie upon their sides and soon die asphyxiated.

During this period the fetidity of the breath augments more and more. An abundant mucopurulent discharge, containing *débris* of gangrenous mucous membrane mixed with croupous exudate, flows from both nostrils. Examination of the thorax reveals evident symptoms of broncho-pneumonia, especially in the anterior lobes.

Lesions.—In benign cases, or in animals slaughtered during the first period, the lesions extend little beyond the nasal cavities. Superficially, the engorged mucous membrane shows a pale greyish tint, due to the superficial exudate. If this is stripped off the mucous derma is seen to be exposed by desquamation and destruction of the epithelial layer.

The exudate mixed with epithelium appears in the form of patches of varying size, and still adherent to the derma.

If the animal succumbs later, the same lesions are found upon the whole extent of the respiratory mucous membrane, from the wings of the nostril to the fine bronchial ramifications. From one end to the other the mucous membrane is corroded, and the diphtheritic lesions extend to such a depth that at some points the mucous membrane is totally destroyed. Even the septum nasi may be affected. The destructive lesions attack the laryngeal mucous membrane, and the authors have even seen the vocal cords become detached by fragments. A creamy, yellowish-white mass, more or less adherent and giving out a repulsive odour, is found upon the whole extent of the tracheal mucous membrane. When this mass is removed by light traction or by scraping the epithelium beneath it is found to be totally destroyed.

The lungs collapse very incompletely. In places they show gas-containing sacs resulting from the rupture of pulmonary vesicles. The emphysema is the consequence of the animal's violent respiratory efforts; which, in some cases, are so pronounced that the authors have seen the visceral pleura separated from the lung and forming emphysematous sacs the size of a hen's egg.

The anterior lobes of the lung show lesions of broncho-pneumonia. When they are cut into the bronchi are seen to be obstructed by fibrinous plugs.

The subglossal and bronchial lymphatic glands are almost unaffected. They may be slightly engorged, but their sectioned surfaces show no abnormality of texture. The mucous membrane of the sinuses is unaffected, as are also all other organs.

The flesh, even from a severely affected animal, has a good aspect; and its consumption has caused no ill effects.

Diagnosis.—The disease may perhaps be confused with verminous bronchitis; but the absence of nasal lesions in the latter, the character of the catarrh, the results of auscultation of the chest, and the special *timbre* of the cough, are sufficient to avoid an error in diagnosis. Moreover, verminous bronchitis rarely sets in so suddenly, and its initial symptoms are not so alarming as in the case of diphtheria.

Prognosis.—Spontaneous recovery is possible when the disease is mild and has not advanced beyond the first stage. In more serious cases an active treatment may save the patient, but the mortality is high. Hutyra and Marek give Danish statistics, showing a mortality of 44 per cent. The authors, in the outbreak under notice, saw eight cases die or be destroyed out of twenty-one affected animals; the mortality was therefore 38 per cent. As there were 120 cattle upon the farm where these twenty-one cases were seen, the proportion of affected animals was about 18 per cent.

Treatment.—Prophylactic measures to avoid the extension of the disease to healthy animals are very important. These consist in the ordinary ones— isolation of the patients and vigorous disinfection of all objects which have been in contact with them. For the latter purpose the authors use a 4 per cent. solution of sulphuric acid. As *curative* treatment, they recommend nasal insufflations with a 10 per cent. solution of tannic acid; by which, even in serious cases, they have obtained complete recovery at the end of eight or ten days.

Finally, they suggest that an appropriate serotherapy may be found practicable in the future.—(*Annales de Méd. Vét.*) W. R. C.

INFLUENZA OF THE HORSE IS DUE TO A FILTRABLE VIRUS.

As was foreseen from the results of the researches into many other contagious diseases, equine influenza has been shown by Basset to be due to an invisible organism and an inoculable disease, as was long ago pointed out by Dieckerhoff. Nearly every other authority has failed to transmit influenza by inoculation.

Basset obtained some blood from a horse suffering from influenza; this was defibrinated and 100 c.c. of the resulting liquid was injected into the vein of a susceptible horse. Five days later the temperature rose to 105° F. and then all the characteristic symptoms of the natural malady declared themselves. On the eleventh day the animal being unable to rise and having some extremely violent tetaniform attacks it was destroyed.

Inoculation of 20 c.c. of defibrinated blood diluted with 200 c.c. of water and filtered through a Berkefeld V. bougie, determined in a horse, after an incubation of three days, symptoms of influenza which lasted eight days and then terminated in recovery.

Inoculation under similar conditions as mentioned above did not give any result in a very aged mare without a previous history. Therefore this animal was immune at the time of the experiment, but it is quite possible this immunity was due to a previous attack of the malady. It is without doubt that by the haphazard choice of experimental subjects, or rather by the absence of any choice, the explanation of the repeated unsuccessful attempts to transmit by inoculation influenza is due.

Inseminations of blood of subjects having natural influenza and of those experimentally infected always remained sterile.—(*Recueil de Méd. Vét.*, September, 1911, ex *Revue Vétérinaire*, April 1st).

SERO-THERAPIC TREATMENT OF WOUNDS.

Léclainche and Vallée have applied the specific sero-therapeutic treatment to infected wounds. The serum should cover the surface of the wounds, aseptic or infected, to favour the vitality of the cells and to bring antibodies to the phagocytes, so as to stimulate their phagogenous action.

A polyvalent serum is obtained by submitting the horse to an immunising treatment by the aid of various varieties of staphylococci and streptococci and multiple strains of colon and pyocyanic bacilli.

The microbial bodies employed are derived from cultures on agar or on the Maurice Nicolle medium (agar and potato). The mixture of the microbial varieties cultivated are used in equal parts. The microbial bodies are killed by alcohol-ether, then dried and preserved in a dry state in vacuo and kept in a refrigerator.

The dried germs are weighed, rubbed up in an agate mortar, and then emulsified in normal saline solution. Of the dried microbial bodies 5 to 50 milligrammes, corresponding in weight to ten times more than that of the fresh organisms, are injected. The injections are made every eight days with progressively increasing doses. After several months treatment the animal can support an injection of 50 centigrammes of fresh microbes.

The authors have used this serum in the treatment of old or atonic wounds and suppurating cavities. After washing the wound with boiled water the dried or liquid serum is applied by a spray or an insufflator.

In every case the duration of cicatrisation has notably been shortened and the serum generally acts with surprising rapidity. (*Académie des Sciences, Séance du 4 Mars, 1912, ex Revue Vétérinaire, 1er Avril.*)

H. G.

ANOMALY OF THE SEXUAL ORGANS IN A HORSE.

By S. S. SOKOLOV, Veterinary Surgeon, Russia.

This horse has a very interesting disposition of the sexual organs. The penis commences at the anus and descends straight down; the prepuce and penis are normally developed. The horse is capable of erection when near a mare: urination takes place through the penis.

The scrotum is wanting, but in its stead are two normal teats and a small udder somewhat higher: in the inguinal canal two small testicles may be felt with difficulty; these are carefully withdrawn into the abdominal cavity.

Externally the horse is well shaped, markedly masculine, with a strong and well formed body.

F. E. P.

Royal College of Veterinary Surgeons.

QUARTERLY MEETING OF COUNCIL.

A Quarterly meeting of Council was held at the College, 10 Red Lion Square, London, W.C., on Friday, April 12th, Prof. A. E. Mettam, President, in the chair.

The following members were present: Major-General Thomson, C.B.; Professors Bradley, Sir J. McFadyean, and Shave; Messrs. Abson, Banham, Carter, Garnett, Lawson, Lloyd, Mason, McL. McCall, McKinna, Mulvey, Roberts, Shipley, Slocock, Stockman, Sumner, Trigger, and Villar; Mr. G. Thateher, Solicitor, and Mr. F. Bullock, Secretary.

MINUTES.

On the motion of Mr. Roberts, seconded by Major-General Thomson, the minutes of the previous meeting of Council were taken as read and confirmed.

OBITUARY.

The SECRETARY read the Obituary List.

ADMISSIONS TO MEMBERSHIP.

The SECRETARY announced that since the date of the previous quarterly meeting the following admission to membership had been made:

London College.—Mr. Charles Holland.

CORRESPONDENCE.

The SECRETARY announced the receipt of apologies for absence from Messrs. W. F. Barrett, Dewar, Dunstan, Rutherford, and Wharum.

The SECRETARY read the following letter: "The President and the Committee of Organisation have the honour to invite the Royal College of Veterinary Surgeons to participate in the Fifteenth International Congress on Hygiene and Demography to be held under the auspices of the Government of the United States, at Washington from the twenty-third to the twenty-eighth of September, nineteen hundred and twelve."

The PRESIDENT: You have heard the invitation read. What is your wish? Shall the College be represented or not?

Mr. MULVEY: Certainly. As far as I am concerned I shall be pleased for the Royal College to be represented, so long as they do not ask for any money. (Laughter).

Mr. LAWSON: Will somebody volunteer?

The PRESIDENT: Have we anyone in the States who could represent us? I find on looking at the Register that we have a member of the College who occupies an eminent position at Washington in the Bureau of Animal Industry, Mr. Albert Hassall, who is acting chief in the Zoological Division. Perhaps he might represent the College. I think it is as well that we should keep in touch with all these congresses, and if we can do it at a minimum cost all the better. I propose that Mr. Hassall be asked to represent the Royal College of Veterinary Surgeons at the Congress of Hygiene and Demography to be held in the States in September next.

Mr. TRIGGER: As an honorary representative.

The PRESIDENT: As the representative of the College.

Mr. LAWSON: I will second that.

The PRESIDENT: Is it your wish that Mr. Hassall be asked to represent the College?

Mr. STOCKMAN: Is he a member of the Royal College?

The PRESIDENT: Yes, he is a member of the College and is in the Bureau of Animal Industry at Washington.

Mr. STOCKMAN: Are we going to pay his expenses? I think the people there are allowed £3 a day, which is pretty heavy.

The PRESIDENT: If the United States pay for it, it does not matter.

Mr. STOCKMAN: What I want to know is, are we going to pay him?

Mr. TRIGGER: I think I should let the matter lie as it is, myself, as he lives at Washington.

The PRESIDENT: We could put in a private note that we could not afford to pay any expenses.

Mr. TRIGGER: If you do that I agree. I should not leave it open.

The PRESIDENT: You must remember that he is at Washington.

Mr. STOCKMAN: And under those circumstances his expenses will be nothing.

The PRESIDENT: I think he will take it as an honour to represent the College.

Mr. TRIGGER: I suggest that we ask him to be our honorary representative.

The PRESIDENT: We can communicate with Mr. Hassall in the meantime, and if it is going to cost us anything we will know what to do. Is that your wish? (Agreed to).

The SECRETARY: I have received the following letter from Prof. Mettam, the President, in reply to one of mine in regard to the annual general meeting of the College:

"Dear Mr. Bullock, yours to hand, and before replying I communicated with the Royal Dublin Society, who have granted the use of their Theatre for the meeting on June 5th. So that the place of meeting will be 'the Theatre of the Royal Dublin Society, Kildare Street, Dublin (by permission of the Council of the R.D.S.)' I enclose the correspondence with the Royal Dublin Society and the regulations under which the use of the Theatre is granted."

The following is the letter that was enclosed:

"Royal Dublin Society. Dear Sir,—In reply to yours of 18th inst., I beg to say that the Council have much pleasure in granting the use of the Lecture Theatre to the Royal College of Veterinary Surgeons for a meeting on June 5th, 1912, on the usual conditions."

Mr. SUMNER: Should we send them our thanks now?

The PRESIDENT: I wrote and thanked them for the permission. I think a Resolution of Thanks had better come afterwards.

The SECRETARY: The only other item of correspondence is a letter from Mr. A. M. Trotter, M.R.C.V.S., Hon. Secretary of the Association of Veterinary Officers of Health, enclosing the following Resolution passed at the Annual Meeting of the Association held in Edinburgh on the 13th October, 1911: "The Delegates and Members assembled at the Annual Meeting of the Association of Veterinary Officers of Health, held at Edinburgh on 13th October, 1911, recognising the danger to the public owing to the prevalence of tuberculosis amongst animals, and particularly by the consumption of the meat and milk of such animals, respectfully and urgently call upon the Government to take immediate steps to control the disease by (1) Scheduling tuberculosis as a contagious disease under the Diseases of Animals Act, with partial compensation for all tuberculous animals and carcasses notified and condemned, payable out of State funds for a limited period; (2) Offering financial assistance to all owners and breeders of stock who are willing to take the necessary action to breed tubercle-free herds; (3) Compelling owners of property to provide sanitary buildings in which to house healthy animals, by means of State loans if necessary—the occupants of such buildings to keep them in a cleanly condition; (4) Taking such further action as may be considered necessary in the future to completely eradicate tuberculosis from the

midst of farm animals; and (5) Placing under adequate control sea-borne supplies of meat and milk."

Mr. MULVEY: I move that this communication be sent to the General Purposes Committee for consideration and report.

Mr. STOCKMAN: May we ask what the meaning of it is? It seems to me to be a set of Resolutions framed for the Government. How do we come in? Is it sent to us asking us to support the Association or to support the Resolutions, or what is the position of the thing?

Mr. LLOYD: I might say in regard to this Resolution that it has been sent to each Member of Parliament; to each Local Authority in England, Scotland, and Wales; to each Member of the Association of Veterinary Officers; to the Chambers of Agriculture; to the Royal, and Highland and Agricultural Societies; and to other similar bodies.

The PRESIDENT: Before you go on, in order to put matters in order, will someone kindly second Mr. Mulvey's motion that the letter be referred to the General Purposes Committee?

Mr. TRIGGER: Will that be in time? A meeting of the General Purposes Committee will not be held before July.

The PRESIDENT: There is no rush; there is no hurry about it. This is a very big question.

Mr. TRIGGER: Then I will second with pleasure.

Mr. LLOYD: I propose the following Amendment: "That this Council expresses its general approval of the principles of the Resolution relating to tuberculosis passed by the members of the Association of Veterinary Officers of Health at Edinburgh on October 13th, 1911."

In support of that Amendment I would claim your indulgence for a time to make a few observations. I do not think that anyone will minimise or want to deny the prevalence of tuberculosis amongst animals. Neither will they want to deny that there is a danger to the public through such prevalence. The danger which I have in mind more particularly is in regard to tuberculous milk, and, secondly, tuberculous meat from animals so affected. As we all know, tuberculosis of the udder, particularly in cows, is a very insidious disease and requires considerable attempts to deal with it. At present it is not being dealt with in anything like a satisfactory manner; the attempts that are being made are simply of a piecemeal character. In regard to tuberculous meat, there is not perhaps so much to say, but if you look at it from another point of view, namely, the loss to the community, we shall see at once that it is considerable. The disease causes loss to farmers through wasters; it causes loss to dairymen through cows affected with tuberculosis of the udder being condemned and having to be killed; it causes loss to butchers through well-nourished but extensively diseased carcasses being either surrendered or seized and condemned. Taking into account that general statement, I think the time has certainly arrived when some measures ought to be taken to eradicate the disease. The methods of control at present are shortly: The Dairies and Cowsheds and Milkshops Orders, and Regulations made thereunder. Those are voluntary or permissive, and in other ways not as effective as they might be. The Tuberculous Milk Orders in connection with certain towns go a considerable distance towards protecting the inhabitants of those towns from the consumption of tuberculous milk if they are thoroughly and efficiently carried out. The recommendations of the Royal Commission on Tuberculosis are practically the only means that have ever been brought forward for dealing with tuberculous meat; and those I might say at once are to some extent unpractical. In my opinion all these Regulations which are now in force or can be put in force are both inefficient and insufficient. They are inefficient due to the want of compulsion, co-ordination and uniformity. They are insufficient inasmuch as they are only running after

the disease and doing nothing at all to prevent it. The future Regulations which might be taken into consideration are the Tuberculosis Order and the Milk Bill. The Tuberculosis Order deals with notification, condemnation and slaughter of wasters and cows affected with tuberculosis of the udder, with compensation from local funds. I might say that that Order was welcomed by nearly everyone, but as a matter of fact it was opposed by almost everyone, and for two divergent reasons. The ratepayers in the country objected to pay compensation out of local rates, because they said they were doing so to protect the inhabitants of the towns. The inhabitants of the towns, on the other hand, objected to pay out of local rates because they said nothing was being done under the Tuberculosis Order to eradicate the disease. The Milk Bill instead of being run by the Board of Agriculture was proposed to be run by the Local Government Board, and from that point I think was to be deplored. It was establishing or ratifying the dual control which is at present in force. Neither of them, in my opinion, go far enough to deal with the disease. The required methods for controlling and eradicating the disease are, in my opinion, something on the lines of Ostertag and Bang. The methods recommended by Ostertag are those recommended under the Tuberculosis Order.

The PRESIDENT: I am afraid you are going a little too far in the discussion of the question. You must speak to the motion.

Mr. LLOYD: I think I am; I am only speaking to it, but I will be called to order with great pleasure. I am dealing with the resolution. I think this covers the resolution submitted by the Association of Veterinary Officers of Health.

The PRESIDENT: I would like to draw your attention to the fact that what you are saying only emphasises the necessity of having a real dress debate on this subject. It cannot be settled to-day. I would like you to stick rather to the fact that we should refer the matter to a Committee.

Mr. LLOYD: There are the general principles to be considered.

The PRESIDENT: We cannot discuss it now; it is so big a subject.

Mr. LLOYD: I do not think there would be any advantage gained in leaving it over although it is such a big subject.

Mr. STOCKMAN: It is in order, is not it?

Mr. SUMNER: We all agree about these measures.

The PRESIDENT: But the thing cannot be settled to-day.

Mr. LLOYD: In order to put it shortly I will speak without any notes at all. My reason for moving the amendment is this, that as at present suggested we shall have the Tuberculosis Order being brought forward by the Board of Agriculture and the Milk Order being brought forward by the Local Government Board, which as I have just said will ensure dual control; whereas I think if the whole matter was left in the hands of the Board of Agriculture, which is what these Regulations really amount to, it would be to the advantage of the public and certainly to the advantage of the veterinary profession. If the matter is dealt with by the Local Government Board it means that a lot of the control of the diseases of animals, particularly tuberculosis, will be left in the hands of the medical men, whereas I think if it were taken and scheduled as a contagious disease and put in the hands of the Board of Agriculture it would be dealt with by veterinary surgeons. As I have said before, veterinary inspection of cows with tuberculous udders, of wasters, of cow sheds, and of dairies is very necessary to secure a pure milk supply, and the same staff would both educate the public in trying to eradicate the disease and help them by testing the cattle and soon. With these remarks I will move the amendment.

The PRESIDENT: Is there any seconder to Mr. Lloyd's amendment, namely, "That this Council expresses its general approval of the principles of the resolution relating to tuberculosis passed by the members of the Association of Veterinary Officers of Health at Edinburgh on October 13th, 1911."

There being no seconder to the amendment, I will put the original motion moved by Mr. Mulvey, and seconded by Mr. Trigger, that this resolution be referred for consideration to the General Purposes Committee for report to this Council.

The resolution was put and carried.

PRESENTATIONS TO THE LIBRARY.

The SECRETARY announced that the following presentations had been made to the Library since the last meeting of Council:—

Veterinary Physiology, 3rd edition, by Maj.-Gen. F. Smith, C.B., C.M.G.; Veterinary Physiology, 4th edition, by Maj.-Gen. F. Smith, C.B., C.M.G.; The Economics of Feeding Horses, by Prof. H. A. Woodruff, M.R.C.V.S.; Calendar of the Pharmaceutical Society of Great Britain, 1912; Calendar of the Pharmaceutical Society of Ireland, 1912; The Registers of Pharmaceutical Chemists and Chemists and Druggists, 1912; Calendar of the University of Liverpool, 1912; Report of the Bureau of Animal Industry, 1910, U.S. Department of Agriculture; Report of the Director of Veterinary Research, 1911, Department of Agriculture, South Africa; Report of Director of Abattoirs and Live Stock Markets, and Municipal Veterinary Surgeon, 1910 to 1911, Johannesburg; By-Laws, Municipal Live Stock Market, Abattoirs, etc., 1912, Johannesburg. Pamphlets of U.S. Bureau of Animal Industry: Directions for Constructing a Vat and Dipping Cattle to Destroy Ticks; The Spontaneous Oxidation of Arsenical Dipping Fluids; Tuberculosis; Practical Methods of Disinfecting Stables; Trypanosoma Americanum, a Common Blood Parasite of American Cattle; *The Rhodesian Agricultural Journal*, December, 1911, and February, 1912; *Revue de Pathologie Comparée*, December, 1911, January and February, 1912; Bulletins of the Sleeping Sickness Bureau, January, February, March, and April, 1912; Bulletin of the Yellow Fever Bureau, January, 1912; *The Journal of the Board of Agriculture*, January, February, and March, 1912; Leaflets of the Board of Agriculture and Fisheries; *The Journal of Tropical Veterinary Science*, Vol. VII., No. 1; *The Veterinary Journal*, *Veterinary News*, and *Veterinary Record* for the quarter; *The Journal of Comparative Pathology and Therapeutics*, March, 1912; *La Tuberculose*, November-December, 1911, and January, 1912. Replica of Medal presented to Prof. Degive by the Fédération Médical Veterinaire de Belgique on the occasion of his promotion to the rank of Commander of the Order of Leopold.

On the motion of Mr. MULVEY, seconded by Mr. BANHAM, a hearty vote of thanks was accorded to the respective donors.

The PRESIDENT: Before we go to the next business I would like to draw the attention of the Council to the very beautiful replica of the Medal which was presented to Prof. Degive, and which was sent to me in my official capacity as President of the Royal College of Veterinary Surgeons. I acknowledged the receipt of the replica, and told the donors that I would have the pleasure of personally presenting it for them to the Council of the R.C.V.S. I therefore now have pleasure in passing round to the various members of the Council the medal containing the portrait of Prof. Degive, which is a most admirable one, and if the Council will permit me I would like myself to pay for the mounting of the medal so that it may be preserved in the College Library. (Cheers).

FINANCE COMMITTEE.

Mr. MASON read the following report of a meeting of the Finance Committee held on Friday, April 12th, 1912:—

Donations. The Secretary reported the receipt of donations from members for the year 1912, amounting to eight guineas. It was resolved that the donations be accepted with thanks.

Financial Statement. The Treasurer submitted his Financial statement for the quarter, which showed a balance in hand of £84 7s. 11d, and liabilities amounting to £116 12 3d., leaving a deficit of £32 4s. 4d.

It was resolved—

(a) That the Financial Statement be approved, and that the Treasurer be authorised to pay the liabilities shown, together with cheques for monthly salaries, petty cash, insurance, examiners' fees and examination expenses, Scotland, Fellowship fees, gas, electric light and window cleaning.

(b) That the Treasurer be authorised to sell out a further £1000 of Consols if necessary.

Mr. MASON: I beg to move that the report be received and adopted.

Mr. TRIGGER: I do not think there was any "if necessary" in the sanction that we gave to the Treasurer to sell out a further £1000 worth of Consols. I think the unfortunate resolution was—and it had better go straight to the profession—that we had to sell another £1000 of Consols. I appeal to the Treasurer that there was no "if necessary" about it. I suggest that that is wrong.

Mr. LAWSON: It was my proposition, and there was certainly no "if necessary" in the resolution.

Mr. TRIGGER: Subject to "if necessary" being struck out, I move the adoption of the minutes.

Mr. LAWSON: I second that.

The resolution for the adoption of the minutes, with the deletion of the words "if necessary," was then put and carried unanimously.

REGISTRATION COMMITTEE.

The SECRETARY read the report of a meeting of the Registration Committee held on Thursday, April 11th, 1912, which stated that a letter (April 4th) was received from the "Private Horse Mart" with reference to the publication of a list of veterinary surgeons, and it was resolved that the Secretary be instructed to reply that any member whose name was published in such a list of veterinary surgeons would be contravening the bye-laws, and would be liable to have his name removed from the Register.

A card bearing the name "———, Operator and Castrator, Assistant to Mr. ———, M.R.C.V.S.," was submitted, and the Secretary was instructed to communicate with the member warning him of the breach of the bye-laws, and asking for an explanation to be submitted to the next meeting of the Committee.

A copy of Kelly's Directory of Paddington was submitted, containing advertisements by six members of the R.C.V.S., and it was resolved that the Secretary be instructed to call upon these members to appear before the next meeting of the Committee to show cause why their names should not be removed from the Register.

A letter (Feb. 22nd) was received calling attention to an advertisement by a member, and the Secretary was instructed to write requesting that the sign be removed forthwith, failing which the Member be called upon to appear at the next meeting of Committee to show cause why his name should not be removed from the Register.

Other letters were received and the Secretary was instructed as to the replies to be sent.

Thirteen cases were considered by the Committee, and instructions were given with regard to the action to be taken in each of them.

A letter was received from Mr. Peter S. Cowan submitting his resignation as a member of the Royal College of Veterinary Surgeons, and it was resolved to recommend to the Council that the resignation be accepted.

Unqualified Assistants. The question of the employment of unqualified assistants was considered, and the following recommendation was passed:—

"It having been brought to the notice of the Registration Committee that a considerable number of veterinary surgeons are employing unqualified assistants in ways calculated to lead the public to believe that these assistants are qualified to practise veterinary medicine and surgery, the Committee are of opinion that the time has arrived for taking definite action to put an end to this objectionable practice of covering."

Restorations. Applications for restoration to the Register were received from Mr. George Francis Brown and Mr. Albert Spruce, whose names had been removed under the operation of Section 5, Sub-section (4) of the Veterinary Surgeons Act, and it was resolved to recommend that the names of Messrs. George Francis Brown and Albert Spruce be restored to the Register of Veterinary Surgeons.

Mr. MULVEY: I move that the report be adopted.

Maj.-Gen. THOMSON: I second that.

The PRESIDENT: Are there any remarks upon the report?

Mr. CARTER: I would like to ask a question with regard to the recommendations on the subject of unqualified assistants. It does not clearly define their duties. Do we understand that any gentleman having an unqualified assistant who is assisting in his practice is committing a breach of the bye-laws, or does the recommendation simply refer to men who have got assistants managing branch practices?

The PRESIDENT: It refers to the employment by veterinary surgeons of unqualified assistants in the prosecution of their profession.

Mr. CARTER: I am only asking for information.

Mr. TRIGGER: I was not present, but I do not think I read it in that way. If I remember rightly the recommendation distinctly states: "leading the public to believe that they are qualified." It does not prevent men employing unqualified assistants as long as they make it known that they are unqualified.

The PRESIDENT: The recommendation is as follows. "It having been brought to the notice of the Registration Committee that a considerable number of veterinary surgeons are employing unqualified assistants in ways calculated to lead the public to believe that these assistants are qualified to practise veterinary medicine and surgery, the Committee are of opinion that the time has arrived for taking definite action to put an end to this objectionable practice of covering."

Mr. TRIGGER: That is my point; that is exactly what I said.

Sir JOHN M'FADYEAN: I think that this is a question upon which it is very desirable that there should be no misunderstanding. I think what should go out to the profession is this, that provided this passes the Council we are prepared to take action against any member of the profession who employs an unqualified assistant to do the work which is generally done by a qualified assistant. I take it that a person employing an unqualified assistant in that way would not have a good defence if he merely said that he had done nothing to lead the public to believe that his assistant was qualified. My own point of view is that anybody who employs an unqualified person to do veterinary work implies that he is qualified; and I venture to remind this Council that there is, or was at any rate, a pretty widely expressed feeling that this Council did less than its duty in not putting into the Bill which is now before Parliament a clause to the effect that practice by unqualified persons

should be prevented; that is to say it was suggested that we ought actually to seek powers.

Mr. THATCHER (Solicitor): It is not in the Bill; it was in the original draft.

Sir JOHN M'FADYEAN: that we ought actually to seek powers to proceed against unqualified persons when they were practising on their own account. Is there anybody here who has the courage to say that if it be an offence for an unqualified person to practise on his own account the offence is any less when he does it under cover of a Member of this College? In my opinion it is high time that the practice of employing unqualified assistants was stopped.

Mr. MULVEY: I have nothing to say on the merits of the case, but I must point out that this clause was originally in the Bill as presented to Parliament.

Mr. THATCHER: As presented to the Privy Council.

Mr. MULVEY: And that the Privy Council ordered that particular clause to be eliminated. I am also of opinion that, if you enforce a clause of this kind, on an appeal to the Privy Council you would lose the case.

Sir JOHN M'FADYEAN: Might I have the permission of the Council to make an explanation that appears to be necessary? Nothing similar to this has been struck out of the Bill. What we are desiring to strike at now is not the practice of veterinary medicine and surgery by unqualified persons, but the action of qualified members of the profession leading the public to believe that unqualified persons are qualified.

Mr. TRIGGER: I think the recommendation is quite right as it is now. As it is now it is quite sufficient.

Mr. MULVEY: I think you will have very great difficulty in proving that certain members who are employing these gentlemen do lead the public to think that.

Sir JOHN M'FADYEAN: Then they will be immune from attack; they cannot be proceeded against.

Maj.-Gen. THOMSON: I think perhaps a remark or two might elucidate this point at the present moment. I do not think I shall be out of order if I mention that in the discussion on this particular subject yesterday in the Registration Committee, the unqualified assistants who were aimed at more particularly were those who were employed in managing branch practices (Cries of "No, No.")—branches.

Sir JOHN M'FADYEAN: That was struck out.

Maj.-Gen. THOMSON: I do not say it was carried; I only say it was mentioned.

The PRESIDENT: It was mentioned in the course of the discussion.

Maj.-Gen. THOMSON: I was not going to support that in any way at all; I was only mentioning that that occurred in the discussion at the time as an illustration of the point at issue.

Mr. ROBERTS: I think it is altogether a case of covering, and that is a penal offence under our law. I also think that a great number of these men are covered by veterinary surgeons, and the public do not know it. They have no means of telling whether or not they are qualified men. Several of them exist round my district, and I am quite sure the owners of animals very often employ them for the treatment of their animals believing them to be qualified veterinary surgeons.

Mr. MASON: There is only one remark I should like to make. We know that many men are employing unqualified assistants. Is there to be any time limit allowed for some very old and valuable servants that some veterinary surgeons have in their employment at the present moment? Some of them are most respectable and good men, and educated, too. Is there to be any time limit given to the profession, or is this to become operative at once? It might come up perhaps in three months time or at our next meeting. Are gentlemen who have been in the habit of employing un-

qualified assistants to have any time limit? or is this to commence from the moment it is carried?

Sir JOHN M'FADYEAN: The time limit is in the Act in the original Act.

Mr. TRIGGER: I think as the resolution stands now it is all that is necessary. It is a warning.

Mr. LAWSON: The question to me is, What is an unqualified assistant? I take it that he is a gentleman who represents the principal, and if so he is doing wrong, especially if he manages branch practices under another name. Of course the man, the assistant, whom you have on your premises who is sent out to wash dogs and give ordinary colic medicine and that sort of thing is not an assistant. He is simply a temporary assistant—a servant.

Mr. STOCKMAN: There is no proposal to prosecute such a man.

The resolution for the adoption of the report of the Registration Committee was then put and carried; and on the motion of Mr. Mulvey, seconded by Maj.-Gen. Thomson, authority was given for the seal of the College to be affixed to the various orders for prosecution mentioned in the Report.

EXAMINATION SYLLABUS COMMITTEE.

The PRESIDENT: A meeting was held yesterday of the Sub-Committee appointed to consider the syllabus. A certain advance was made in the examination of the syllabus, but the Sub-Committee deferred any report until they are able to complete the examination of the syllabus.

EXAMINATION COMMITTEE.

Mr. VILLAR read the following report of the meeting of the Examination Committee held on Thursday, 11th April:—

Correspondence.—Letters (Jan. 15, 1912, and March 16, 1912), were received from Mr. W. J. Easton, of Natal, asking for an exemption to be made from the First Professional Examination in favour of a candidate who had passed the First Science Examination of the University of the Cape of Good Hope.

It was resolved that the Secretary be instructed to reply that such an exemption is not possible under the Bye-laws of the College.

Resolution of Association of F.O.H. The following resolution was considered:—

"That the members of the Association of Veterinary Officers of Health beg to request the Council of the Royal College of Veterinary Surgeons, and the Governing Bodies of the various Veterinary Colleges to consider the advisability of treating those branches of the profession relating to public health—meat and milk hygiene—as a special subject."

It was resolved (a) That the matter be deferred until the special Sub-Committee on Examination Syllabuses now sitting considers these matters.

(b) That the Secretary be instructed to inform the Association that any views which they would put in writing on the matter would be considered by the Sub-Committee.

Educational Certificates.—Educational Certificates numbered 1,250 to 1,267 were considered and approved.

Jubilee Memorial and Bursary Examination.—It was resolved that the date of the Jubilee Memorial and Bursary Examination be fixed for Thursday and Friday, August 1st and 2nd next.

Preliminary Educational Examinations.—The Secretary reported:—

(i) A resolution passed by the General Medical Council to the effect that after 1913 the following Preliminary Educational Examinations would no longer be recognised as qualifying for registration as a medical student: The Junior Local Examination of the Uni-

versity of Oxford; The Junior Local Examination of the University of Cambridge; The College of Preceptors Preliminary Examination for Medical Students; The Educational Institute of Scotland Preliminary Examination; The Royal College of Physicians and Surgeons in Ireland Preliminary Examination; The Intermediate Education Board of Ireland Middle Grade Examination.

(ii) That he had received an application from the Educational Institute of Scotland requesting to know the views of the Council with regard to the continued recognition of their Preliminary Examination for Veterinary students.

After discussion it was resolved that the consideration of the matter be deferred until the next meeting of this Committee.

On the Motion of Mr. VILLAR, seconded by Mr. McKINNA, the Report was received and adopted.

PARLIAMENTARY COMMITTEE.

Mr. GARNETT read the following Report of the Meeting of the Parliamentary Committee held on Thursday, April 11th, 1912:—

Swansea Corporation Bill.—The Secretary reported the receipt of letters from the Swansea Corporation, stating that the Corporation could not see their way to assent to the suggested alteration in Clause 107 of the Bill.

Sales for Agricultural Purposes Bill.—A letter was received from Mr. L. C. Tipper, calling attention to this Bill, but it was resolved that no action be taken in the matter.

Coal Mines Act Regulations.—The Solicitor read a letter received from the Home Office, stating that it was not in contemplation to prepare any further regulations at present, but that the College would be consulted and their suggestions received if, and when, such regulations were drawn up.

Patent Medicines.—The Solicitor read a letter received from the Home Office, stating that a Select Committee would shortly be appointed to consider the question of Patent Medicines, and that if the College wished to submit evidence, communications should be addressed to the Clerk of the Committee.

It was resolved that the President, Prof. A. E. Mettam, be requested to prepare evidence, and to undertake the duty of appearing before the Select Committee to express the views of the Council upon the matter.

Public Bills.—The following Public Bills were considered: Dogs (Protection) Bill; Protection of Animals (Scotland) Bill; and Interpretation Bill.

It was resolved that with regard to the Interpretation Bill the Solicitor be instructed to call the attention of the promoters to the two additional Supplementary Charters of 1883 and 1892, and the Act of 1901 of the Royal College of Veterinary Surgeons for insertion in Clause 87.

Mr. GARNETT: In moving the adoption of the Report, it will spare time if I point out at once with regard to the Swansea Corporation Bill that the Solicitor, as instructed yesterday by the Committee, has found out the position in which this Bill now is, and he reports that it has passed its second reading. If there is a feeling that this should be proceeded with it is for you gentlemen to say. With regard to patent medicines, if these Minutes are confirmed I propose, after they have been adopted, to move a resolution embodying the opinions of the Council with regard to the sale of patent medicines.

Mr. McKINNA: With regard to the Swansea Corporation Bill, has it yet gone before the Committee of the House of Commons?

Mr. THATCHER: It has not been referred as yet to any special Committee. It will go before the Committee

of Selection, as it is called, and then it will go to the Committee in rotation. I might venture to suggest, in reference to this, that all Bills of this class are submitted to the Parliamentary Agent of the Local Government Board, and on a previous occasion he suggested to me that if this Council at any time had any objection to any Bill it would be well to consult him and to let him know about it first.

Mr. McKINNA: I hope instructions will be given by the College to do that—that our Solicitor be instructed with reference to this particular Bill, because I think it is very important that we should give our opposition, if I may use such a word, and express that feeling with reference to the word that we all of us objected to yesterday.

The resolution for the adoption of the Report was then carried unanimously.

Mr. GARNETT: I beg leave to propose: "That this Council is of opinion that all patent medicines should have a full description on each package showing the quantities of every constituent contained in the preparation." I merely move that as a formal resolution to strengthen your hands, sir, when giving evidence before the Select Committee.

Mr. ROBERTS: I have pleasure in seconding that motion.

The resolution was then put and carried unanimously.

ANNUAL FEE COMMITTEE.

Sir JOHN M'FADYEAN read the following report of a meeting of the Annual Fee Committee held on Thursday, April 11th, 1912.

Veterinary Surgeons Act Amendment Bill.—The Solicitor reported that the Veterinary Surgeons Act Amendment Bill had been read a first time on February 19th.

Sir JOHN M'FADYEAN: I beg to move that the Report be received and adopted.

Major-Gen. THOMSON: I second that.

Mr. McKINNA: Is there any chance of the Bill coming on? (Laughter.)

The PRESIDENT: You should know, Mr. McKinna.

Mr. SUMNER: Home Rule!

The resolution was put and carried unanimously.

MELBOURNE UNIVERSITY DEGREE COMMITTEE.

The SECRETARY read the following report of a meeting of the Melbourne University Degree Committee held on Thursday, April 11th, 1912:

Western Australia Act.—The Secretary submitted a communication from the Colonial Office containing a copy of an Act to regulate the practice of veterinary surgery, and for other relative purposes, passed by the Legislative Assembly of Western Australia on the 31st December, 1911.

And it was resolved that the Secretary be instructed to acknowledge the receipt of the communication with thanks.

On the motion of Mr. Mason, seconded by Mr. Mulvey, the Report was received and adopted.

APPOINTMENT OF EXAMINERS IN FRENCH AND GERMAN FOR THE JUBILEE MEMORIAL EXAMINATION.

The PRESIDENT: As the Council know, the candidates for the Jubilee Memorial Prize must pass an examination in a foreign language, French or German. At the previous examination this Council appointed M. Barlé to conduct the examination in French. I am not aware whether this gentleman is able or willing to examine in both French and German.

Sir JOHN M'FADYEAN: If my memory does not mislead me, the gentleman whose name you have mentioned was not employed by us directly, but through the Royal College of Preceptors. I would suggest we follow the same procedure on this occasion, and that we ask the

Royal College of Preceptors to be good enough to set the questions and examine the papers in French and German; and I move accordingly.

Major-Genl. THOMSON seconded the motion, which was carried unanimously.

APPOINTMENT OF SCRUTINEERS.

The PRESIDENT: At this meeting it is usual to appoint the Scrutineers for the ensuing election. The counting of the votes will be done at the College, but the declaration of the poll will be made at the annual meeting wherever it happens to be held. Mr. Bullock has given me a list of names of gentlemen, some of whom have officiated before and some of whom have not. The names are: Messrs. T. C. Minett, E. A. Prudames, B. Gorton, W. L. Harrison, F. T. Trewin, E. P. A. Offord, W. A. Pool, J. T. Edwards, H. A. MacCormack, V. S. M. Cope, H. A. Lake, J. de Meza, H. B. Nixon, C. W. Perrin, A. H. Towne, and J. Willett. There are sixteen names. We must have at least a dozen, and it is as well to have a certain number over and above the minimum number that we require.

Mr. McKINNA: I propose that those gentlemen be elected.

Mr. MULVEY: Are they the names of members who have officiated before?

The PRESIDENT: Five of them have officiated before.

Mr. ROBERTS: I second the motion for their election. The resolution was then put and carried unanimously.

NOTICE OF ALTERATION IN BYE-LAWS.

Dr. BRADLEY: I wish to give notice of an alteration of Bye-law 59, so that it shall read in these terms:—"The Examinations for the Diploma of Membership shall be held in each city in which there is situate an affiliated Veterinary School twice during each year, namely, in July and December. At the quarterly meeting of Council held in July in each year, the Council shall fix the dates of the Membership Examinations to be held during the following December and July."

The PRESIDENT: Prof. Bradley has suspended his notice of motion, and it will come up for discussion in October because sufficient time has not elapsed between this meeting and the next meeting of Council.

OTHER BUSINESS. ANNUAL DINNER.

The PRESIDENT: Is there any other business.

Mr. MULVEY: I regret to say that during the last few years the R.C.V.S. has not thought it advisable to hold an annual dinner, but as this year the annual meeting is to be held in Ireland I think that the opportunity arises for reviving that festival. I therefore propose that the annual dinner of the R.C.V.S. be held in Dublin.

Mr. TRIGGER: Are you going to give a grant?

Mr. MULVEY: Do not ask questions.

The PRESIDENT: We have not asked for one.

Mr. STOCKMAN: I beg to second the motion.

The PRESIDENT: The motion is that the annual dinner be held in Dublin on the evening of June 5th next.

The resolution was put and carried unanimously.

This concluded the business of the quarterly meeting of Council.

SPECIAL MEETING.

Immediately following the quarterly meeting, a special meeting of Council was held. The President (Professor A. E. Mettam) occupied the chair, and the same members were present as at the quarterly meeting.

MINUTES.

The minutes of the last special meeting were, on the motion of Mr. Abson, seconded by Mr. Sumner, taken as read and confirmed.

ALTERATIONS TO BYE-LAWS 56-84.

Mr. VILLAR moved the following alterations to Bye-laws 56 to 84, of which due notice had been given:—

56. A Session shall be a period of not less than thirty weeks, exclusive of the recognised holidays of the Institution at which the student shall have studied.

57. The Examination for the Diploma of Membership shall be held in each city in which there is situate an affiliated Veterinary School twice during each year as follows: In England and Ireland in July and December, and in Scotland in May and December. At the quarterly meeting of Council held in July in each year the Council shall fix the dates of the Membership Examinations to be held during the following December, May, and July.

58. An Examination fee of five pounds shall be paid for each Examination, and successful candidates for the Diploma shall pay a further fee of one pound for registration.

59. Should a student fail in any examination he shall pay a further fee of three guineas for each re-examination.

60. No candidate shall be eligible for any examination unless the examination fee be paid at least seven days prior to such examination.

61. Any candidate who through mis-statement, error, or false certificate shall seek, or be led, to apply for any examination, shall be prohibited from undergoing that examination, or if he has undergone it, shall not be permitted to enjoy the advantages to be derived therefrom, and shall be declared disqualified for such examination for such a period as the Council shall see fit.

62. Should a candidate conduct himself disrespectfully or otherwise improperly at any examination, the chairman of the class or the delegate or officer of the Council is empowered to stay the examination of such candidate, and report the transaction to the Council, who shall deal with the offender.

63. No rejected student shall be eligible for re-examination unless he produces satisfactory evidence that he has attended a full term of ten weeks at a Veterinary College between the dates of rejection and re-examination.

64. If a candidate who has been rejected at a Final Examination fails to present himself for re-examination within one year (except in case of illness or other cause satisfactorily certified), he shall be precluded from further re-examination.

65. Candidates shall be tested in each subject by a Written Examination where not otherwise specified, and an oral examination on the living or other specimens. Written papers to consist of six questions, but only four to be attempted, except in Class D, when eight questions shall be set, and six attempted.

66. The Written Examination shall commence at 10 a.m. on the days to be fixed by the Council. Each examiner shall set three questions (except in Class D, when each examiner shall set four questions), the answers to which he shall read, mark, and return to the Secretary as soon as possible. The time allowed each subject is specified in scheme set out in Bye-law No. 67. Answers shall be written on one side of the paper only, and each question answered on a separate sheet. Each candidate shall be given an examination number and each paper shall be signed with such number only, and not with the name of the candidate. Passage of papers, references to books or documents, talking, or copying shall render the candidate liable to immediate dismissal from the examination room, at the discretion of the representative or representatives of the Council, present.

67. The subjects for each examination, and the time to be devoted to each subject, shall be as follows:

Examination A.

1. Anatomy of Domesticated Animals:—Bones, Ligaments, Joints, (written, 2 hours; oral, 15 minutes).
2. Chemistry and Elementary Physics (written, 2 hours; oral, 15 minutes).
3. Biology:—Elementary Zoology and Botany (written, 2 hours; oral, 15 minutes).

Examination B.

1. Anatomy of Domesticated Animals (written, 2 hours; oral, 20 minutes).
2. Histology and Physiology (written, 2 hours; oral, 20 minutes).
3. Stable Management and Manipulation of Domesticated Animals and Principles of shoeing (oral only, 30 minutes).

Examination C.

1. Morbid Anatomy, Pathology, and Bacteriology (written, 2 hours; oral, 15 minutes).
2. Materia Medica, Practical Pharmacy, Therapeutics and Toxicology (written, 2 hours; oral, 30 minutes)*
3. Veterinary Hygiene and Dietetics (written, 2 hours; oral 15 minutes).

Examination D.

1. Principles and Practice of Veterinary Medicine; Meat Inspection (written, 3 hours; oral, 1 hour).
2. Principles and Practice of Veterinary Surgery and Obstetrics (written, 3 hours; oral, 1 hour).

* At the Oral Examination two students shall present themselves at the same time, and shall be examined for fifteen minutes by each Examiner.

Examiners.

68. The Council shall appoint a sufficient number of persons to constitute the Court of Examiners, and shall from time to time fill any vacancies which may occur.

69. There shall not be less than two examiners to each subject.

70. An examiner in any one class, shall not examine in any other, in the same set of examinations.

71. Each candidate for the office of examiner shall, at least fourteen days before the date of election, intimate in writing to the Secretary (either by himself, or with his consent, by a member of the Royal College of Veterinary Surgeons), his desire to be appointed, and submit with his application a statement of his qualifications, and a copy of any testimonials he may possess as to his especial fitness for the position he seeks. The name and qualifications of each candidate shall be suspended on the notice board at the College, as and when received, and appear on the circular convening the meeting at which the examiners are to be appointed. Each examiner shall be elected for such period not exceeding three years as the Council may think fit. Each examiner shall be eligible for re-election. Any examiner may be removed by the vote of two thirds of the members present at any meeting of the Council, to be confirmed by a special meeting called for the purpose.

72. Every member of the Court of Examiners shall be entitled to such fees as shall from time to time be fixed by the Council.

73. Each Class of the Court of Examiners shall elect a chairman from amongst its members. In the event of an examiner being unable to attend at any centre, the President, or, in his absence, the Chairman of the Examination Committee or failing these the Chairman of the Class in which the vacancy occurs, shall have power to

select a substitute to act in his stead at each centre at which the examination is to be held.

74. Local Secretaries to the Court of Examiners shall be appointed by the Council, and shall not be eligible to act as examiners. Such secretaries, acting on the instructions of the Secretary R.C.V.S., shall be responsible for the arrangements of, and provision of specimens for, the Examinations at each centre in England, Scotland, and Ireland respectively.

75. The marks to be used by the examiners in the record of examinations shall be indicated by numbers. One hundred marks shall be the maximum in each subject. The written and oral sections of the examination shall be taken conjointly for the purpose of estimating the result of each examination. An aggregate in the written and oral portions of forty-five per cent. in each subject shall qualify for a pass. Sixty per cent. in each subject shall qualify for Second Class Honours, and seventy-five per cent. in each subject shall qualify for First Class Honours.

76. Each student shall be examined in each subject of his Class, and at the conclusion of the examination the examiners shall confer, and the sense of the whole shall be taken as to the qualifications of the student.

77. Should the result of the examination of any candidate appear doubtful to the examiners, they may re-examine him. The award of marks made by the examiners shall be final.

78. The Local Secretaries to the Court of Examiners shall immediately on the conclusion of the examination notify in writing to the Council the names of students who have passed the examination and specify those who have gained honours.

79. A report of each examination shall be drawn up and signed by the Chairman of each Class and shall be transmitted to the Council, stating the number of successful candidates, and the general standard attained in each subject, and referring to any other matters which it is desirable should be notified to the Council.

80. Copies of examination record sheets shall be supplied to the Principals of each school.

81. One or more Members of Council shall be delegated to attend each professional examination. The travelling expenses of the delegates together with an allowance of one guinea per night spent away from home on the business of the examinations shall be defrayed out of the College funds.

82. Subject to the preceding Bye-laws as above, the chairman of each class of the examiners may refuse admission, during examination, to any person whose presence may be deemed objectionable.

83. The President, or in his absence the senior Vice-President, may direct a Special Court of Examiners to be holden on any emergency.

Admission to Membership.

84. No student shall be entitled to receive the Diploma, or have his name entered on the Register of the Royal College, until he has completed his twenty-first year, but he may present himself for his Final Examination, provided he would complete his twenty first year before the date of the next Examination to be held at the centre where his course of studies has been pursued.

Mr. VILLAR said: In my capacity as Chairman of the Examination Committee I beg to move the alterations of certain Bye-Laws connected with the examination of students. The suggested alterations have all been exposed in the Council Room for six months, with one exception, in regard to which it was found necessary to make a further alteration, and for that reason my motion was suspended for a further three months. The second alteration which it was considered desirable to make was in Bye-Law 62, which now reads:

"Should a candidate conduct himself disrespectfully or otherwise improperly at any examination, the chair-

man of the class or the delegate or officer of the Council is empowered to stay the examination of such candidate, and report the matter to the Council who shall deal with the offender."

In submitting to you this motion for the alteration of Bye-Laws I would point out that although there are no very great alterations made, the matter has been thoroughly considered in Committee, and it is as a result of such Committee's deliberations that they have been suspended and that I ask you to permit these alterations of Bye-Laws to be made. The view was that as they are now placed there is a certain sequence of ideas in the Bye-Laws as they follow one another; they are not put, if I may say so, higgledy-piggledy as they were and as they are in our present Register; and it is chiefly to remove this somewhat chaotic condition that these alterations have been made. I beg to move the alterations.

Mr. McKINNA: I beg to second that.

Mr. MULVEY: The question I wish to ask, Sir, is as to the interpretation of the words at the end of Bye-Law 73: "At each centre at which the examination is to be held." Does that mean that in the event of the temporary indisposition of the examiner, say, who has examined in London, who is temporarily indisposed and who does not feel that he will be able to examine, say, in Liverpool or any other centre on the following day, that he is to be precluded from going on with the examinations at the other centres? That is what I wish to know.

Mr. McKINNA: He has power to get a substitute.

Mr. MULVEY: It does not say so. It is not clear enough. Does it mean at only one centre, or does it mean that he is to be precluded from conducting the examinations at the whole of the examination centres; because if so it is my intention to move that those words "At each centre at which the examination is to be held" be eliminated.

Sir JOHN M'FADYEAN: May I ask the President whether it is not a fact that the Council passed a Resolution recently which has practically the same effect as the altered Bye-Law would have, namely, that if the examiner were not able to complete the circuit a substitute to do the whole round of the examinations was to be appointed? I merely ask the question.

The PRESIDENT: Yes.

Sir JOHN M'FADYEAN: So that Mr. Mulvey is mistaken in supposing that this is new.

Mr. MULVEY: Then, Sir, I will proceed to move as an Amendment that those words at the termination of Bye-Law 73 be eliminated: "At each centre at which the examination is to be held." I do so because I consider it would be most unfair to the examiners or to an examiner who through temporary indisposition might be precluded from attending at any one centre, that he, although he has made his arrangements for conducting the examination, is to be precluded from going the round or from following up the examination at the other centres. Personally I can see no reason why an examiner should not be selected on the spot, wherever the examination is held. For instance, at Liverpool there are plenty of men who can temporarily do the work, or at Dublin or any other centre, without having to appoint them to go the whole round. I know this, that certain of the examiners feel this matter very acutely; and without going further into the matter I simply move that those words at the end of Bye-Law 73 be eliminated.

Mr. GARNETT: I beg to second Mr. Mulvey's motion. I do so for this reason—that this Bye-Law practically prohibits the class, where the full body of examiners have held their examination at one centre from being completed. Take for instance London; the whole body of examiners take their class and examine their students. One of them falls sick, and therefore he stops the whole of the examinations in that class through all the other

centres. You are tying your hands in such a way that it would make it illegal to appoint a man in his place even if he was taken sick. Now let me give you another instance, to show you how impracticable this Bye-Law would be if it were carried to-day. Once when I was a delegate at Edinburgh we received a telegram from one of the examiners who had been present at one of the other centres saying that it was impossible for him to be in Edinburgh, and we had to find on the spur of the moment another examiner to make that examination legal. Although that gentleman very kindly came, at great inconvenience to himself, and sat at the table and examined the students, it was impossible for that man to go to the other centres; and it would make this Bye-Law, if it is carried into effect and made a hard and fast one such as it is now proposed to be, to my mind very absurd indeed. We must have some elasticity. You must give some power to the Chairman of the Examiners, from local Secretaries and your delegates to substitute examiners in cases of emergency, otherwise you are going to invalidate the whole of that examination in that centre.

Sir JOHN M'FADYEAN: Sir, I have no very strong feeling on this matter, but I think it is right that both sides of the question should be put before the Council. As you, sir, have told us, there is in existence a resolution recently passed which has practically the same effect as this Bye-law will have if we alter it in the manner suggested. I believe that the reason for passing the resolution to which I refer was that in practice serious inconvenience was sometimes caused by the fact that examiners from other causes than illness occasionally declared that it was impossible for them to attend at one particular centre to examine the students. They were quite prepared to attend at all the other schools, but they had an engagement which they wished to fulfil on that particular day. Now I do not think it is good that that should occur frequently. We all admit the desirability of having our examinations as uniform as possible in the different centres; and if we make it easy for an examiner to absent himself to fulfil some other engagement—to absent himself from the examination at one particular school—it means that on the spur of the moment one school has to have a special examiner in that particular subject. It does not seem to me that there is any very great hardship in this. I admit that it would be a hardship if an examiner, through illness that incapacitated him only for a few hours or a day, should be prevented from participating at all in any examinations at that time, but I believe that is not a thing that has very frequently happened; and I am not able to agree with Mr. Mulvey when he asks the Council to believe that it is always an easy matter to find in any one of the cities in which our examinations have to be conducted an examiner able to step in and take the place of any one of the regular examiners who may be absent through illness or not. That was not my experience when, as President of the Council, it was once or twice my duty to have to find a substitute. It must be remembered that to act as an examiner in some of the centres actually involves a loss to the examiner. I remember on one occasion I endeavoured to secure the services of one or two eminent men to act as examiners on the occasion of a vacancy, and when I had to tell them that it was only for one day and at one centre, they said, "No, thank you; it is not worth my while." And really I must ask the Council to take that into consideration—that it is not reasonable to expect a first class man to throw up engagements which he may have and come to do our work, and find that when he has done it he is actually out of pocket. It would be very good news if it were a fact that in Liverpool, or Edinburgh, or Dublin, or London, one can at a few hours notice find an efficient substitute for any one of the appointed examiners. I was wondering about my own

particular subject. Supposing the examiner in veterinary pathology happened to be taken ill, and it was Mr. Mulvey's duty to appoint somebody in Liverpool to conduct the examinations—I do not mean anything invidious when I say Liverpool, I will substitute Glasgow if you like, or Edinburgh, either—because he has got to keep outside the schools. I do not really see that there is any difficulty about carrying out this bye-law. I was not quite able to follow either Mr. Mulvey or Mr. Garnett when they represented that the thing was impracticable. It seems to me to be perfectly practicable. You have got to contemplate the case of an examiner being ill, or being unable to attend from any cause whatever. Well, at least you have got to appoint an examiner for one particular day, and my point is that it is easier to get an examiner to go the whole of the remainder of the round than it is to get an efficient examiner to act for one day.

Mr. SHIPLEY: This seems to be rather a difficult question. I have been looking through this new Bye-law and it says: "In the event of any examiner being unable to attend at any centre." I understand this provision has to be made in case a man is taken ill.

Mr. MCKINNA: Or for any other reason.

Mr. SHIPLEY: Suppose he is taken ill at the end of the journey, at the last place of examination, it goes on to say then "The Chairman of the class in which the vacancy occurs shall have power to select a substitute to act in his stead at each centre at which the examination is to be held," but the examination has then been held.

Sir JOHN M'FADYEAN: It is not "to be held" if it has been held. It is the place at which "the examination is to be held." If it has been held it does not apply.

Mr. GARNETT: My contention simply is that if a man is substituted under any circumstances and this Bye-law is in force the whole of that class of the examination is invalidated. The same man must examine all round or not at all.

The PRESIDENT: Is there any further discussion?

Mr. MULVEY: If there is no further discussion, I think I have the right as the proposer to say a few words in reply. I simply want to point out that to my mind if these words are left in it will render this Bye-law absolutely unworkable. I must say that it would be far more easy to appoint an examiner at any one centre than to ask an examiner without preparation or without prior knowledge to go the whole round. I think if those words are left out the Bye-law will be workable, otherwise if they are left in you are going to spoil the whole thing.

Sir JOHN M'FADYEAN: Might I point out the exact phraseology of the thing? Mr. Mulvey seems to have assumed that the President, or whoever is empowered to fill up the vacancy, must act in this way. But that is not so. It says he shall have the power to do it.

Mr. MULVEY: If he does not have power the whole thing is nugatory.

The PRESIDENT: Mr. Villar, do you want to reply?

Mr. VILLAR: Yes, Sir. I have the greatest respect for Mr. Mulvey's opinion, especially on examination matters, because you know that he was Chairman of the Examination Committee for very many years. But it seems to me that this Bye-law is specially framed so as to render it permissive; it is not compulsory. As Sir John has pointed out, it simply gives the Chairman of the Examination Committee or the Chairman of the class the power to select. It does not say he shall exercise that power. I cannot help feeling that Mr. Mulvey, and for that matter Mr. Garnett, are reading difficulties into this Bye-law which do not exist.

Mr. MULVEY: I asked the question—what was the intention of those who moved it?

Sir JOHN M'FADYEAN: Although I adopt the same interpretation of the matter as Mr. Villar does, I beg to move that Mr. Villar should sanction the omission of the

words "At each centre at which the examination is to be held." That will leave matters exactly where they are; that is to say the effect will be the same as it is now under the resolution as we passed it. Under the resolution as it stands at present if an examiner is unable to act for the whole round a substitute for the whole round has to be found.

The PRESIDENT: Do you, Mr. Villar, move the adoption of the alteration of these Bye-laws with the deletion of the last line of Bye-law 73?

Mr. VILLAR: Yes, Sir, I am prepared to do that. I move their adoption, subject to the deletion which Mr. Mulvey has proposed.

Mr. MCKINNA: I second that.

Mr. TRIGGER: Have we power to do that until it has been suspended for three months?

The PRESIDENT: Yes; I have already taken advice on the matter.

The resolution was then put and carried.

Dr. BRADLEY: It occurred to me, Sir, that if I am in order I might move the alteration of Bye-law 59 of which I gave notice at the Quarterly Meeting. It is a pure technicality and of course I shall have to abide by your ruling, but it may save time on a merely non-controversial point if I move as an amendment to Bye-law 57 the amendment of which I have given notice. The old Bye-law is No. 59.

The PRESIDENT: It is merely that instead of being an amendment to Bye-law 59 the notice of motion which Prof. Bradley has given is an amendment of Bye-law 57 in order to give it its proper number.

Sir JOHN M'FADYEAN: It is illegal at present.

The SOLICITOR: This is consequent upon the resolution you have just passed. It is a mere alteration of description only.

Mr. STOCKMAN: It will have to be suspended?

The SOLICITOR: Dr. Bradley only wants to alter 59 to 57.

Sir JOHN M'FADYEAN: I am not objecting to it. I approve of it.

Mr. VILLAR: It now becomes my duty to suggest a date for the Confirmatory Meeting for passing the alterations of Bye-laws. I believe it is provided by our Act that such meetings shall take place somewhere between the 7th and 14th day after the meeting. I have consulted some of the gentlemen round me, and I find that Tuesday, the 23rd inst., would probably be a convenient day on which we should get a quorum. I therefore beg to move "that the Confirmatory Meeting be held on Tuesday, the 23rd inst., in this room."

The resolution was seconded and carried unanimously.

On the motion of Dr. McI. McCall, seconded by Mr. Abson, a hearty vote of thanks was accorded to the President for his conduct in the Chair, and the meeting terminated.

VICTORIA VETERINARY BENEVOLENT FUND.

The Quarterly meeting of Council of the Fund was held at 10 Red Lion Square, Holborn, on Thursday, April 11th, 1912. There were present: Messrs. H. Sumner, S. H. Slocock, F. Garnett, H. MacCormack, S. Stockman, F. Hobday, S. Villar, W. J. Mulvey, W. Burt, jun., and W. Shipley, Hon. Sec.

Apologies for absence were received from the President, Mr. Freeman Barrett, and Messrs. J. Dunstan, and Jos. Abson.

Mr. S. H. Slocock, Vice-president, was voted to the chair.

The minutes of the previous meeting were read and confirmed.

A letter was received from Mr. R. Jones, Towyn, enclosing on behalf of the North Wales Veterinary Medical Society a donation of £32 to the Fund. The Council

passed a cordial vote of thanks to the Society for its welcome assistance.

Three fresh applications for relief were considered. In the first case a lady in Ireland, widow of a veterinary surgeon, it was decided to make an immediate grant of £10 to meet pressing requirements and a weekly grant of 7/-.

In the other cases it was felt there was no immediate need for assistance, there being more pressing cases for relief. The limited amount of funds with which the Council had to deal also deterred them from making further grants.

The Secretary was requested to make further enquiries in two other cases which are to stand over till next Council meeting.

It was resolved that if arrangements can be made by the President and Secretary, the annual general meeting of the subscribers to the Fund should be held in Dublin immediately after the annual meeting of the Royal College of Veterinary Surgeon.

A draft of the annual report was considered and adopted.

The receipt of the bequest from the late E. Coleman was reported, and the trustees were desired to invest same in accordance with the instructions of the deceased.

The SECRETARY submitted the list of new subscribers January 1st to March 31st, 1912.

It was noted the Fund was making slow progress, and that every effort should be made to obtain new subscribers.

Hugh Lacey, Roland Robert Callingham, eldest son of the late Robert Callingham, 22 Sussex Place, Regent's Park, and of Mrs. Callingham, 132 Fellows Road, N.W., to Loris, only daughter of the late Major F. F. Crawford, A.V.C.

Mr. EDWARD LAWRENCE, M.R.C.V.S., of Swindon, who died last December, left estate of the value of £29,271.

ARMY VETERINARY SERVICE.

Extract from *London Gazette*.

WAR OFFICE, WHITEHALL, April 16.

REGULAR FORCES. ARMY VETERINARY CORPS.

Maj. H. A. Sullivan retires on retired pay. Dated April 17.

VIVISECTION AND THE VETERINARY PROFESSION.

Sir,

I am the individual who wrote the letter that opened up the discussion in *The Referee* about unqualified veterinary surgeons, and I should like to express my opinion on some of the remarks in the article entitled "The extension of veterinary practice" and also on some other points.

You state that the sixpenny medical man and the club doctor are hard worked and poorly paid; as a matter of fact, gentlemen in this particular branch of the profession make, as a rule, far more money than the ordinary practitioner, and I fail to see why this club practice could not be adopted by qualified men in the veterinary profession. Surely it would pay a vet. to take, say, ten shillings a year from his poorer clients to look after their stock: anyhow, it might be worthy of consideration.

You state that many owners of animals never call in a veterinary surgeon because they cannot afford it, in my opinion that is all bosh. It is simply because any layman can do absolutely what he likes in the administration of drugs or operations to animals and the law cannot stop him.

The Veterinary Council itself condones such proceedings by allowing qualified men to employ unqualified assistants and permitting them to advertise for such persons in the public press.

I may state that not the slightest interest was taken by the veterinary profession concerning the discussion that was opened up in *The Referee*, and so the matter was dropped.

Possibly you will ask what business it is of mine, and I reply that as a member of the public I have a right to express my opinion with regard to the brutality which daily occurs on dumb animals through the reasons I gave in my first letter.

I am no soppy sentimentalist. I have ridden, hunted, and shot all my life, and my brother was master of hounds, and I at present command a transport section in the Territorial Army, so I should know something of what I am writing about.—Faithfully yours,

PATE, J.P.

County of London Magistrates Club.

UNQUALIFIED ASSISTANTS.

Sir,

Your correspondent in the *Veterinary Record* of 13th inst. asserts that a practitioner is not liable to be struck off the Register for employing an unqualified assistant. As that was a very misleading statement I am surprised that it was allowed to pass uncontradicted.

Everything depends on how an unqualified assistant is employed, there being no objection to one dispensing, dressing, giving medicine, rendering first aid in emergencies, and so on, provided always that he does not "act" or "pass himself off" as a V.S. (see Bye-law 110).

You, Sir, state that the Council make no attempt to prevent abuse of the unqualified assistant. I do not know

why that is so, but as they made the bye-law at one time their views must have differed. I have my own reasons for believing that the Council are not actively enforcing Bye-law 110 to such an extent as Bye-law 109, but I do not see how we are to force them to act, other than by bringing some case forward and, if the Council do not act, applying to the High Court for an order for the Council "to show cause, etc." I do not understand legal procedure myself, but no doubt if some members like to take some little trouble the employment of unqualified assistants improperly could be stopped, as it is a matter affecting the public as well as ourselves.—Yours faithfully,

Ealing, W.

F. O. PARSONS, M.R.C.V.S.

SECRET REMEDIES.

Sir,

It would be both useful and instructive to the farmer who experiments upon his unfortunate Live Stock if he got an analysis made of some of the much-advertised Horse and Cattle medicines which he dabbles in! He would find that he was buying Turpentine at £7 per gallon and Epsom salts at £11 per cwt.

The farmer would be very much in pocket if he would study the action of well-known drugs for himself. It would be also much better for the Veterinary Surgeon who is afterwards called in could he be told what the animal had been given, instead of working in the dark as it were.

Let us take a case of obstruction of the bowels, requiring a purgative, which the farmer has treated with no appreciable effect by giving so many of "Somebody's Drinks." He sends for a Veterinary Surgeon who asks what has been given? Has a purgative been given? The farmer does not know whether "Somebody's Drinks" contain a purgative or not. Now if a purgative were given and the V.S. then gives more he probably gives too much; and if no purgative were given the animal might die for want of one.

Then, again, it is often stated that "If they do no good they do no harm." But we would point out that the farmer is given a false sense of security, losing time in getting proper advice and the complaint gaining ground until a qualified man, if called on the scene, is too late to do any good. But these things frequently actually do harm. Repeated doses of Turpentine (disguised and coloured) bring on inflammation of the kidneys. Frequent doses of Salts have caused the death of many an animal, and thousands of animals of all kinds have been destroyed not by disease but by inappropriate medicines. We had an illustration of this recently. A small holder in one of the Southern Counties found his in-foal mare after some hard work suffering from, as he thought, Colic. He rushed into his house and got a Colic drink, of which he had bought a dozen bottles in the local market. He gave the unfortunate mare the contents of one of these bottles, and as she appeared no better, he gave her a second drink and then a third. The mare died as he was giving (or shortly after he gave) the third bottle, and a post mortem examination showed that the mare had not suffered from Colic—she was aborting!

The cuteness of the proprietors of these medicines is wonderful. A short time ago a noted quack had his own wonderful cure for corns. A warning was printed on the label stating that the mixture would burn the hand or skin, and that when applied to the corn it must be done with a stick. This "cure" was nothing less than one ounce of Linseed oil coloured with Judson's Dye. It was sold by the quack at the price of 10s. per bottle, and was considered as "wonderful stuff" by the ignoramuses of the neighbourhood.

A shrewd man must see that it is greatly to his advantage to call in an experienced Veterinary Surgeon as early as possible as the amount of loss caused by the death of one animal would pay the V.S.'s bills for a considerable period.

It is a pity that a law is not made making it a felony for anyone not properly qualified to sell, buy, make, or advertise medicines. It seems rather harsh to suggest such a course, but hard and harsh measures are usually better than mild ones, and the Veterinary Profession, as well as the medical, might then come into its own.—Yours faithfully,

J. F. D. TERRY

55 Southgate Street, Winchester, Hants

BLACKLEG

(QUARTER-EVIL. SYMPTOMATIC ANTHRAX.)

The New Zealand Official Report on Blackleg shows that the mortality from this disease has been reduced by 75 per cent. since vaccination was made compulsory. The vaccine is supplied in convenient form under the name of

"BLACKLEGGOIDS."

"Blacklegoids" are easily administered by means of the "Blacklegoid" Injector.

Extract from a letter which appeared in *The Veterinary Record*, January 25, 1904: "About five years ago I commenced to inoculate with Parke, Davis & Co.'s 'Blacklegoids,' and since then I have lost only one, and that was this year, out of over 900 inoculated since I commenced. I may mention that I have no interest in Parke, Davis and Co.'s preparations."

Co. Kilkenny, December 28th, 1907.

The Stock Inspector of the Pastures Protection Board, Singleton, Australia, when ordering (May 17, 1907) 200 doses of "Blacklegoids," stated: "This is the third year I have used your 'Blacklegoids,' with a result far better than I or the owners of the cattle ever anticipated. I do not know of an instance where it did not act as an immediate preventive."

Further particulars will be sent on request by

THE 'RECORD' PRECISION SYRINGE.

The FINALITY of Hypodermic and Serum Syringes.

"The "Record" Precision Syringe is a piece of delicate mechanical workmanship well deserving its name. It meets **all requirements as regards aseptic conditions and accuracy and it is always ready for use.**

It consists of **metal and glass** only. The glass barrel is ground inside perfectly true to cylindric form. The Nickel vacuum piston is "ground in" into the glass barrel by precision machinery so as to fit hermetically, it slides smoothly, yet tightly, **without any lubricant.**

The cover is fixed on the cylinder with a **bayonet-fastening**; for the purpose of **thorough cleaning** it is provided with a segmental incision, by means of which it can be detached from the piston-rod by sliding it off side-ways. When **completely** taken apart the Record Syringe **forms 3 parts only: cover, piston and barrel.**

The **Needles** are provided with the original "Progressive" flat mounts. By this arrangement a good hold is afforded to the operator.

The fixing of the needle itself in the mount, by means of a smooth longitudinal guide arranged above the screw threads prevents the needle from breaking off in the mount.

EVERY SYRINGE IS GRADUATED BOTH IN C.C. AND MINIMS.

Price with 2 Steel Needles in Metal Case—20c.c. 21/- 10c.c. 17/6. 5c.c. 15/- 2c.c. 10/- 1c.c. 9/-

PRACTICES FOR DISPOSAL

EAST COAST. Agricultural practice returning £600 per ann. Good house containing 2 recept. 4 bedrooms, bath, kitchens, etc. Stabling for 4 horses, coach-house, kennels, etc. Price required for house and practice £1300, of which £400 can remain on mortgage, or vendor would sell practice for £500 and would let house on lease at £45 per annum.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains: reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended.

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

PURCHASERS are requested to send full particulars of their requirements as we have a number of practices and partnerships for sale which have not been advertised.

As Locum

EXPERIENCED M.R.C.V.S., would like to take locum work in town or country, on reasonable terms. Address, 4041 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

CANINE nurse or dispenser, widow of M.R.C.V.S. wishes post as above. Experienced town and country. Address, 4042 V.R., 20 Fulham Road, London, S.W.

Wanted

TEMPORARILY, a good qualified assistant, first-class credentials, good dispenser and willing to make himself generally useful. Apply E. H. Leach, Newmarket, stating experience, and salary required. Live out.

Wanted

ASSISTANTSHIP by M.R.C.V.S., in town and country practice, with view to early succession. Capital at command. Address, 4044 V.R., 20 Fulham Road, London, S.W.

Locum

WANTED on May 4th for a week, country practice. State terms and references. Address, 4043 V.R., 20 Fulham Road, London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

Bedford.

Locum Tenens

MR. WALTER G. GREEN, M.R.C.V.S.

"Rosenheim,"
Boscombe Park,
Bournemouth.

As Assistant or Locum

STUDENT, reliable, practical man, free last week in May, desires situation as above in good-class practice. Excellent references. Apply, "Scalpel," Royal "Dick," Vet. Col., Edinburgh.

For Disposal

TRANSVAAL. Practice in good mining town, returns £900 per annum, including contracts, with full complement of instruments, drugs, and latest veterinary books: good horse, trap, saddle, bicycle, etc. Substantial cash payment, and balance at 12 months. Address, 3041 V.R., 20 Fulham Road, London, S.W.

Locum Tenens

WANTED, from 8th to 25th May next, qualified, competent and steady, for country practice, well up in obstetrics. Reply with references to 3047 V.R., 20 Fulham Road, London, S.W.

As Locum Tenens

WANTED, young qualified man to act as locum tenens for about three weeks from May 21st. Apply, giving references and stating salary required, to 3048 V.R., 20 Fulham Road, London, S.W.

As Assistant

RECENTLY qualified man, son of V.S., requires berth in busy canine practice, can furnish good references. Address, 3043 V.R., 20 Fulham Road, London, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

South Africa

APPPLICATIONS are invited for the appointment of Veterinary Surgeon in the Department of Agriculture, South Africa, at a commencing salary of £350 per annum rising by annual increments of £15 to £500.

Further particulars may be obtained from the High Commissioner for the Union of South Africa, 32 Victoria Street, Westminster, S.W.

For Absolute Disposal

OWING to increasing infirmities I am compelled to sell my lucrative city and country practice in a fashionable and wealthy locality, two packs of popular hounds meet near. Introduction and assistance given until established. Address, 4046 V.R., 20 Fulham Rd., London, S.W.

To Veterinary Surgeons

SECOND year student offers services to veterinary surgeon for summer, from June 1st, in return for board and opportunity of seeing practice. Address, Z.N. Royal Dick College, Clyde Street, Edinburgh.

Assistantship Wanted

BY thoroughly practical M.R.C.V.S., in a high-class busy practice. Excellent references, terms moderate. Strict abstainer. Free April 10th. Address, 8304 V.R., 20 Fulham Road, London, S.W.

As Assistant

CLASS D student desires situation. Good experience, references, terms moderate; cycle and drive. Free at beginning of May. Address, 3042 V.R., 20 Fulham Road, London, S.W.

Assistant Wanted

QUALIFIED, for a busy practice in the North of England, chiefly town and colliery: must be thoroughly steady, capable and trustworthy. A suitable man will be treated liberally. Address, 1048 V.R., 20 Fulham Road, London, S.W.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885 at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

For Immediate Disposal

OWING to ill-health, a country practice, capable of considerable extension, suitable for a recently qualified gentleman. Two packs of hounds kept in the neighbourhood. Particulars in strict confidence only to intending purchasers. Address, 2045 V.R., 20 Fulham Road, London, S.W.

To Vendors.

WANTED Veterinary Practices and Partnerships. Surgeons wishing to sell the whole or a share of their practices are invited to communicate with Messrs. Peacock & Hadley, Veterinary Transfer Agents, 19, Craven Street, Strand, W.C., who will be pleased to introduce likely purchasers. No charge whatever made unless a sale be effected.

The Journal of The Board of Agriculture

ISSUED on the 15th of each month. Twelve months 4/-, three months 1/-, or single copies 4d., direct from the Board of Agriculture and Fisheries, 4 Whitehall Place, London, S.W., or through any bookseller.

For Immediate Disposal

A SPORTING and Agricultural Practice, well-established in a favourite County. Returns last twelve years from £350 to £420. All kinds of sport in immediate neighbourhood, and great inducements to those fond of rural life. Price very moderate to quick buyer. Address, 5037 V.R., 20 Fulham Road, London, S.W.

As Assistant or Locum

VETERINARY surgeon desires permanency in good class country practice. Experienced, bloodstock, cattle, reliable, hard worker, used to taking charge, good obstetrician, horseman, single, 35, excellent references. Address, 5038 V.R., 20 Fulham Rd., London, S.W.

News Cuttings.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1242.

APRIL 27, 1912.

VOL. XXIV.

THE TREATMENT OF CANKER.

Mr. Noël Pillers' paper upon this subject, which we print to-day, has the interest always possessed by independent work upon a difficult question, and perhaps something more. Every veterinary surgeon knows how troublesome and unsatisfactory the treatment of canker is; and though the paper contains no revolutionary innovation, it does introduce a modification of technique which may prove of real value. The drugs used, and the general line of treatment adopted—including the principle of applying the dressings with pressure—are all well known. The exact mechanical device used to obtain pressure—the hard rolls of tow of varying thicknesses—is new, so far as we know; and it certainly seems to permit a more firm and even pressure than would be gained by more haphazard methods of packing the foot. Certainly, also, the treatment has been exceptionally successful in the hands of the few who have yet tried it. Whether it will be equally successful, when practised by a larger number, is open to question.

It is at least possible that a great deal of the success which has hitherto attended the treatment has been due to the care and thoroughness with which all its details were carried out. The paper itself contains ample indirect evidence of this. Mr. Pillers requires "absolute foot restraint, preferably by means of stocks," and he emphasises the necessity for "plenty of uninterrupted time and a strong liking for thoroughness." Lack of these desiderata has accounted for much failure in the past, and will probably cause much more in the future. Many cases are treated—often unavoidably—with inadequate means of restraint and with but scant allowance of time. It remains to be seen whether these cases will derive much benefit from Mr. Pillers' methods applied with less than Mr. Pillers' thoroughness.

Still, the paper is a distinctly valuable one; and should set many men working afresh upon the treatment of canker. It is suggestive in various directions: for Mr. Pillers' remarks upon the use of strong caustics are worth noting, and some of his observations upon the incidence of canker are interesting.

It is curious, for instance, that canker should be held to be increasing in the North M dlands, while it is generally regarded as decreasing in London. In every respect the paper well deserves study, and will ensure its author a future welcome at the Central Society.

A VETERINARY HISTORY.

A Veterinary History of the late War in South Africa will shortly be published by this Journal. The intention is to issue it as a supplement fortnightly, or as opportunity occurs. It will be consecutively paged, and detached for the purpose of binding. The history will be divided into parts, and arrangements for the production of Part I. are now completed.

THE CLAIM OF THE ROYAL VETERINARY COLLEGE TO GOVERNMENT AID.

It is well known that the Governors of the Royal Veterinary College are endeavouring to obtain a grant from Government sufficient to place the oldest of our schools upon a firm financial basis. One might suppose that all veterinary surgeons, and especially all old Camden Town students, would wish the attempt success. Unhappily that is not quite the case. It has occurred to one successful practitioner that the present crucial period in the history of the Royal Veterinary College is the best of all moments for an endeavour to mend his old school according to his own liking—or end it. So much, at least, is clear from the otherwise somewhat incoherent address of which Mr. Henry Gray unexpectedly delivered himself before the Central Veterinary Society at its last meeting, and which appears in another column of this issue.

It is true that the address commences with a profession of agreement that "the Royal Veterinary College should receive liberal financial aid from the State," but this tribute to convention might very well have been omitted. Its insincerity becomes patent when we read what follows; for the substance of the address amounts to a proposal that the College shall be crippled as far as may be, and starved out of existence if possible—unless the Governors can and will remodel it on lines suggested and apparently considered practicable by Mr. Henry Gray. We are asked, "Are we going to meekly allow the College to obtain this grant from the Government and then to continue this competition, unfair now, because we when students supported the College to exist?"—and it is difficult to interpret this not particularly scholarly sentence otherwise than as a trumpet-call to arms. The next sentence contains the modest proposal that

the Central Society should send a deputation to the Board of Agriculture—presumably to oppose “this grant,” of which Mr. Gray has previously professed approval. And finally we are dogmatically told that “The Royal Veterinary College is no longer a necessary institution to the country, as there are several other self-supporting ones that do not enter into competition with the practitioners.” It might fairly be asked how many of our schools do not compete with practitioners, and whether any one can justly be called self-supporting at all. But these and various other statements in the address will be subject matter for criticism at the Central Society’s next meeting. The sentences above are quoted now simply to show their author’s attitude towards the Royal Veterinary College.

Discussion upon this precious “address” stands adjourned to Thursday next, when there will be ample opportunity for testing the accuracy of its assertions, the consistence of its arguments, and the nature of the motive underlying the whole. In the meantime, it is well that all should know how preponderant a part the Camden Town College—the very existence of which we are asked to regard as immaterial to the profession and the nation, unless it can be conducted to meet the approval of a few veterinary surgeons who choose to practise in its vicinity—still plays in veterinary education. Fortunately such demonstration is easy. One of the recent additions to the Register of the R.C.V.S. is a list of the members who have graduated during the preceding twelve months, and in this list the School from which each member graduated is indicated. The list first appeared in the Register of 1908, and has been continued since. The following table, compiled from the Registers shows the number of graduates which each school has turned out, in each separate year and during the whole period:—

	1907.	1908.	1909.	1910.	1911.	Total
London	35	22	42	35	19	153
Dublin	11	13	20	20	24	88
Edinburgh	22	12	17	21	15	87
Liverpool	8	2	7	9	9	35
Glasgow	3	6	7	8	5	29
	79	55	93	93	72	392

Thus, during the last five years, the London College has given us *more than three-eighths* of the new members of the profession. The individual figures fluctuate considerably from year to year; and in two of the years of the period, viz., 1907 and 1909, London supplied more graduates than *any two* of the other Colleges. Again, in either of these two years, if we exclude the School which is second to London for that year (Edinburgh in 1907 and Dublin in 1909) we shall find that London supplied more graduates than *the other three put together*. Still, if we take the full five years’ totals, we do not find that London surpasses *any two* other Colleges together; for Dublin and Edinburgh, with a combined total of 175, somewhat exceed the London one of 153.

But Dublin, Liverpool, and Glasgow combined only total 152 for the five years; and Edinburgh, Liverpool, and Glasgow combined only 151, while London alone totals 153. Thus London, in the last five years, has turned out more men than the three other Colleges in Great Britain put together. Founded 120 years ago, it remains by far the most potent factor in British veterinary education to-day; and whoever affirms it to be “no longer a necessary institution to the country” can only be congratulated upon his hardihood.

DIFFICULT CASE OF PARTURITION IN A CLYDESDALE MARE.

On Thursday morning the 18th inst. we—my son and myself—were called to Mr. Saul Miller’s, of Aspatria Hall, to assist an aged Clydesdale mare to foal. On examination both hock joints and the tail were found presented at the brim of the pelvis of the mare, with the foal lying on its off side transversely, in fact the position was exactly similar to that in the photo. After a good deal of work a strong cord was passed round the lower or off hock joint and gradually manipulated down the shank to the pastern joint, the upper or near leg was treated in the same way, and then by pressing the hock of the off or under leg below the body of the foal and forward—a jolly hard bit of work, the foot was got over the brim of the pelvis bones into the vaginal passage; the other leg was handled in a similar manner, and both hind feet pulled out to the hocks. At this stage the foetus stuck and would not move; further examination proved that there was plenty of room, and no obstruction could be felt as far as could be reached, but from previous similar cases I concluded that the head was turned back over the shoulder, and this proved to be the case on delivery (see photo). A good strong rope was fixed above both hock joints and the other end of the rope tied to a post, and as the mare was lying down on her near side and refused to stand on her feet a moment, the lower end of the post was fixed firmly on the ground, and the upper end pulled carefully and steadily back and down, when the foetus moved gradually into the passage. The bent head pressing against the brim of the pelvis of the mother proved to be the obstruction: by steady leverage the head and neck were straightened out, and delivery accomplished, but immediately after delivery the head fell back into its original position (see photo). It will be seen that the face of the foal is concave on the lower or near side to correspond with the bend of the ribs, in which position it had been developed, whilst the off or upper side of the face is convex. The time occupied in delivery was one hour forty minutes and the mare rallied wonderfully, but 24 hours after she began to sicken, and succumbed about fifty hours after the operation. She was seventeen days overdue of her usual time, was twenty years old, and had always been a successful breeder.

As the foal seemed to me to be a monster for size I had it weighed and measured and photographed, and here are the particulars:—

Length from poll to head of tail	ins. 50
Round the girth	33½
Length of head from poll to nose	18
From withers to foot	44
From hip to foot	40
Round stifle joint	22½
Round hind shank	6
Round fore shank	5½

Weight 156 lb.

My reason for recording the case is that I think the weight and measurements will about constitute a record. According to Fleming's Obstetrics the weight of a foal runs from 31 to 55 kilogrammes, or about 68 lb. to 121 lb., whilst the only measurements named for the foal is length 3½ feet.

The foal was photographed lying on the top of a sheep rack. Note the beautiful pastern joints, it was by a well-bred horse.

HENRY THOMPSON, M.R.C.V.S.

Aspatria, April 22nd.

AN IMPROVED METHOD IN THE TREATMENT OF CANKER OF THE HORSE'S FOOT.

By A. W. NOEL PILLERS, F.R.C.V.S.

I must first thank you for the honour you have done me by consenting to listen to the following short paper. The treatment which I am about to describe was first related to me by Mr. J. B. Chadwick, M.R.C.V.S., of Messrs. J. and A. Lawsons, of Manchester, last year when I was stationed at Sheffield. In addition to giving me particulars of the treatment, the above gentleman

kindly came over to Sheffield and dressed a case which was placed at our disposal by a colleague who does not desire publicity. From that time the treatment was applied by other practitioners in the town with excellent results. Although it is extremely unwise to make any statements with regard to the discovery of a method of treatment without a very careful and systematic survey of the literature of the subject, I am going to be bold enough to place it on record that we are indebted to Mr. Chadwick for this treatment until it is proved that the credit belongs to someone else. The general opinion prevailing in the North Midlands some five or six years ago was that canker of the horse's foot was greatly on the increase and that it was practically incurable. I shared that opinion, after extensive reading, and practising the various recognised methods of treatment. The application of German, French, Swiss and Dutch methods did not give at all satisfactory results. Considering the seriousness of the disease it occurred to me that a committee composed of specialists in histology, bacteriology, pathology and clinical surgery supported financially by owners of commercial horses was a thing to be desired. I regret very much that I have been unable to go carefully into the literature of the subject, but the lack of a complete library is my excuse. I have, however, appended a list of the works which I have been able to consult. A consideration of the evolution of ideas concerning canker treatment during the last fifty years would form an interesting article in itself. There are many very good accounts of the disease in the various text books and periodicals, and many authors have affirmed specific medicaments and methods of dressing. The objection to most of these specifics is that other experimenters have not had the same results, and that in those cases where cures have been effected the time taken and cost of treatment have greatly reduced their real value. I trust the number of cases, treated by different clinicians, mentioned later on, will save the method about to be described from a similar fate. I wish to leave out of consideration altogether the important subjects of etiology and symptomatology and consider only the therapeutics of the disease. I hope to gather a

great deal from the discussion, and I would only ask those who feel inclined to offer adverse criticism to be certain that they have given every detail of the treatment a fair trial.

APPARATUS REQUIRED.

This consists of (1) a plain flat shoe not too wide in the web and rather long at the heels, with a slightly seated foot surface to allow the insertion of iron cross pieces after the shoe has been nailed on; (2) cross pieces of soft iron, two or three in number, shaped somewhat like a letter U with the arms bent outwards. The width should be about one inch, the metal must be soft so that it will bend under the hammer and remain in the desired position; (3) a strong linen bandage to envelope the foot; (4) a small ointment pot containing pure carbolic acid; (5) a box of wound powder containing as its active principle iodoform; (6) smiths tools, foot knives, dressing forceps, probes and spatula; (7) absolute foot restraint, preferably by means of stocks; (8) a large number of hard rolls of tow ranging in cross section from that of a wheat straw up to that of a man's thumb, these are best made by rolling tow tightly on a board or table top. More important than these articles are plenty of uninterrupted time, and a strong liking for thoroughness. The two feet before you show most of the features of the treatment.

METHOD.

Mr. Caulton Reeks, in an article on this subject in his book on the diseases of the horse's foot, says that the principles of treatment to be observed are as follows:—

- (I) The removal of all the horn overlying infected portions of the keratogenous membrane.
- (II) The application of an antiseptic not too powerfully caustic in its action.
- (III) Frequent changes of the dressing in order to insure a maintenance of antiseptis.
- (IV) The application of an adequate pressure to the exposed soft structures.

He then goes on to describe Mr. Malcolm's method of treatment as the most satisfactory, although it fails to satisfy the second and fourth of these important postulates. The hot iron is a most powerful caustic, and the method of dressing does not secure adequate pressure. As far as I can see at present the best method of ful-

filling the desired principles is that devised by Mr. Chadwick. After removal of the shoe the foot is subjected to some softening process. Bran poultices or the foot bath answer the purpose well. The bearing surface of the wall is then reduced as far as possible, and the healthy horn of the sole and frog carefully thinned well beyond the points at which separations are likely to be found. Starting at the lowest point when the solar surface of the foot is in a vertical plane all the under-run horn is removed until blood just appears at the union of diseased and healthy structures. It is important to pay especial attention to the junctions of frog and sole, sole and wall, and cleft of frog. Should the diseased process extend up the wall then the inner aspect of it must be removed so as to allow the hard rolls of tow to be packed firmly in. After removing all the separated horn with as little hæmorrhage as possible, the diseased parts are cleansed with pledgets of tow, and the whole smeared with pure carbolic acid. If there are no lesions up the wall or above the bearing surface of the shoe, this can now be nailed on. The diseased area is then covered with the wound powder and the hard rolls of tow are firmly packed in, starting with those of small diameter and gradually increasing the size employed. Extra long rolls will have to be used in the lateral and median lacunæ, so that the pressure may not be lacking behind the influence of the shoe. Rolls of tow are heaped up until they stand well out from the plane of the sole. The two or three cross irons are then applied and hammered down until firm and even pressure is obtained. Animals often go slightly lame after this process. After two or three dressings, animals are generally too restive for a shoeing smith to hold. A couple of rolls of tow across the posterior aspect, covered by a tight bandage finishes the dressing. Care must be taken to see that there is not a lack of pressure in the region of the wall, as this predisposes to laminal infection.

At the second dressing the above process has to be repeated. The chief point to be observed is the removal of all cheesy material and horn which may appear normal but yet is under-run. Failure to respond to treatment of any area always indicates some error in obtaining pressure or in removing a sufficiency of horn. A case confined to the frog, its junction with the sole and the region of the bars will require dressing every other day for a fortnight, after which it should be treated every third day. The future progress of the case will be indicative of its requirements.

RECORD OF CASES TREATED BY MESSRS. ARBON, CHADWICK AND LAYCOCK.

Consecutive No.	Subject.	Affected limb.	Treatment commenced.	Treatment terminated.	Duration weeks.	Remarks.
1.	B.H.	off hind	—	—	6—7	1st case treated by this method
2.	No. 3324 C.H.	near hind	Jan. 25, '10	Feb. 8, '10	2	
3.	No. 8073 B.H.	"	Feb. 24,	Mar. 30,	5	
4.	No. 8164 Br.H.	"	Mar. 15,	Mar. 29,	2	
5.	No. 4316 B.H.	"	Aug. 26,	Sep. 24,	—	Injured in stocks and sold.
6.	No. 1644 B.M.	"	Aug. 30,	Sep. 25,	—	Sold, aged and severe case.
7.	No. 2641 B.H.	"	Jan. 16, '11	May 3, '11	15½	
8.	Br.M.	both hind	—	—	8	
9.	B.H.	"	—	—	8	
10.	No. 6793 Gr.H.	near hind	April 12,	April 26,	2	
11.	No. 7586 B.H.	near fore	July 7,	July 30,	3	Has broken out 3 times, and treated for 3 weeks each time
12.	No. 2886 B.H.	near hind	Nov. 3,	Dec. 25,	7½	
13.	No. 9847 B.H.	"	Nov. 3,	Dec. 4,	4½	
14.	B.H.	off hind	—	—	8	
15.	No. 8741 B.H.	near hind	Jan. 20, '12	Feb. 24, '12	5	No relapse to date.

Although I do not wish to make a point of it in this paper it is easy to recognise different clinical pictures of canker. There is (1) thrush leading to canker; (2) cheesy canker commonly seen after injuries to the foot; (3) canker with excessive proliferation, and (4) a form of canker seen only in mares in Holland and in those animals with soft callosities the prognosis is bad.

RECORDS OF CASES.

The following records of cases have been kindly furnished by Messrs J. Abson, F.R.C.V.S.; J. B. Chadwick, M.R.C.V.S., and R. H. Laycock, M.R.C.V.S., and I am indebted to them for permission to publish their results.

Mr. J. B. CHADWICK, Manchester. The data concerning Mr. Chadwick's cases is most meagre, no notes having been taken at the time because it was not anticipated that they would be of any value.

It is interesting to note that out of 15 cases in the above list 13 animals were geldings and 13 were affected on the hind limbs, and of these 10 on the near hind, 2 on both hind and 2 on the off hind, so that the near hind limb was involved in 12 cases out of 15, and the near fore only once. Of 15 consecutive cases 12 were completely and permanently cured in periods ranging from 2 to 15½ weeks with an average duration of just over six weeks. One case had relapses, and 2 were treated for about a month and then sold.

Mr. J. ABSON, Sheffield. The notes concerning six consecutive cases occurring in the above gentleman's practice have been furnished by Mr. R. H. Laycock, M.R.C.V.S. They are somewhat fuller than the last series and will perhaps be more interesting if quoted in full.

Case I. Subject.—A seven-year old chestnut Shire gelding.

History.—Had been at work on a farm seven miles from town. The frogs had been noticed to be affected for about twelve months. The diseased horn had periodically been removed and the cankered areas dressed with creosote. The disease was, however, slowly extending. The feet were seen and dressed by Mr. Pillers and treatment was then seriously undertaken.

Lesions.—Both hind feet affected. The near was attacked on the whole frog and bars and one-third of sole; wall at outside heel just diseased. The off foot had only the frog diseased.

Treatment.—As above described commenced on 22/9/11 and terminated 2/12/11 a period of 10 weeks with a total of 27 dressings. These were applied 3 times a week up to 25/10/11 when the whole of the soles and frogs were normal. The feet have been examined weekly but there has been no relapse.

Remarks.—The animal was dressed in stocks, lameness after dressing (due to pressure) was marked for the first three weeks but after this the animal resumed work.

Case II. Subject.—A five years old bay shire gelding.

History.—The animal went lame and the horsekeeper noticed a discharge from the clefts of the frogs which he thought was thrush and treated it with astringent lotion.

Lesions.—On paring down the frogs all four were found to be completely affected.

Treatment.—Was commenced on 5/12/11 and terminated on 24/1/12 a period of 7 weeks with a total of 16 dressings.

Remarks.—This animal was dressed without the aid of stocks and was at work during treatment.

Case III. Subject.—A ten years old bay cart mare.

History.—The animal was sent to the yard on account of lameness when the extent of the disease was discovered.

Lesions.—The frog, bars, and about two-thirds of the sole of the off hind limb were badly affected.

Treatment.—Was commenced on 7/12/11 and lasted until 16/2/12 a period of about 10 weeks. The number of dressings given was 24.

Remarks.—This animal was dressed in stocks and went to work about a month after the commencement of treatment.

Case IV. Subject.—A fourteen years old bay shire gelding.

History.—None.

Lesions.—The near hind foot was affected at the frog, bars, sole, up to the wall to the coronet at the inside quarter.

Treatment.—Was commenced on 11/1/12 merely to satisfy the owner and after 9 dressings the animal was destroyed.

Remarks.—It was so difficult to get the desired pressure that it is quite possible that an unsatisfactory termination would have been experienced even had one determined to continue treatment.

Case V. Subject.—An eight years old shire gelding.

History.—The animal had been fired and blistered and turned out to grass for three months when he was noticed to be lame and was presented for treatment.

Lesions.—Both near feet affected, the fore on the frog and the hind on the frog, bars, and about one-third of the sole.

Treatment.—Was commenced on 23/1/12. The near frog has healed completely and the hind limb is doing very satisfactorily.

Remarks.—The case is still under treatment (29/2/12) which is carried out in stocks. Judging from previous cases a cure can be safely prognosticated.

Case VI. Subject.—A twelve years old black cart horse.

History.—Purchased by owner who knew it was affected.

Lesions.—Near fore and hind frogs completely affected

Treatment.—Was commenced on 1/2/12 and although still (29/2/12) being treated, in stocks he is sure to make a good recovery, as it is making such rapid progress.

Remarks.—The animal has remained at work throughout treatment.

Mr. Abson's cases reported by Mr. Laycock do not allow as yet (3/3/12) of any very definite conclusions. Out of six consecutive cases 5 were geldings. It would seem safe to regard 5 of the cases as cured in an average period of 8 to 10 weeks. (Mr. Laycock has informed me later that cases V. and VI. were cured). To these records there could be added five cases occurring in another practice and three which I successfully treated myself.

CONCLUSIONS.

The first point which strikes one on reading a report on canker cures is that possibly the writer has been dealing with bad cases of thrush or some other more or less simple condition. It can be confidentially stated however that the cases mentioned in this paper were beyond doubt typical examples of the disease.

1. Of 21 consecutive cases where treatment was undertaken 17 were cured, 1 had relapses, and 3 were not cured. The period of treatment was comparatively short (6 to 10 weeks) and after 2 to 3 weeks many of the animals resumed work, only losing the time during which their feet were being dressed, throughout the remainder of treatment.

2. Of 21 recorded cases 18 were geldings and 18 animals were attacked on the hind limbs (some on the front ones as well); 11 cases were confined to the near hind foot alone. Although the number of cases is small these points may be of some service in considering the cause of the disease. If it is admitted that canker is more prevalent than formerly, and that peat moss on uneven floors retains decomposing urine, which may have injurious effects upon horn, then the apparent increase in prevalence of the disease and the comparative susceptibility of the hind limbs, especially the near one of geldings can be explained on grounds of anatomy and stable habits.

3. It is possible and indeed likely that future experience may show that dressings not so concentrated, and other than pure liquid carbolic acid can be used with good results. Comparing a series of cases treated by the above method with one where the hot iron and medicants have been used, the former is found to be the superior in many ways, the chief of which are (1) ease of application, (2) reliability, and (3) the short time that an animal is off work. It would further appear that the continued use of strong cauterising agents such as chloride of antimony and the mineral acids were contra-indicated.

4. Pressure has long been recognised as a very important principle in canker treatment, and it is possible that cases treated successfully by other methods have been really cured by unconsciously obtaining the requisite pressure. The success of strong antiseptics and pressure would seem to indicate that possibly the direct cause may be some form of microbic infection of already abnormal tissue, so secreted on account of the absence of a certain degree of pressure from the keratogenous cells. This may explain the negative results in inoculation experiments. Pressure plays an important rôle in the production of physiological secretions, and some pathological conditions are cured by its application, e.g. milk fever.

5. I think it may be safely said that canker of the frog and sole is curable in 4 to 8 weeks with about half this amount of total rest.

ABSTRACTS FROM FOREIGN JOURNALS

PERITONEAL ACTINOMYCOSIS IN THE OX.

Emmanelli, of Fano, records (*La Clin. Vet.*) a case of this nature. The subject, a cow, was very emaciated. No fever was present; but the pulse was small and frequent, and the cow showed diffi-

culty in breathing. Post-mortem, a large number of grey soft nodules, from the size of a hazel-nut to that of a potato, of roundish, flattened, or partially cauliflower-like shape, were found upon the serous covering of the rumen, liver, and spleen. They showed numerous purulent centres, in which the microscope revealed actinomyces.

The remaining organs, the pleura, and especially the tongue and jaw, were intact. The author considers that infection must have resulted from some foreign body, perhaps a beard of corn, penetrating the gastric wall and so carrying the fungus to the peritoneum. Rasmussen and Jensen say that this form of actinomycosis is not rare in Denmark. —(*Berliner Tier. Woch.*).

THROMBOSIS OF THE POSTERIOR AORTA IN A BITCH.

Although thromboses of the posterior aorta are fairly common in the horse and ox, there are few records of them in the dog.

Ball now records (*Journal de Méd. Vét. et de Zoot.*) the case of a nine-year-old bitch which, a month before being shown to him, had manifested disturbances of locomotion which appeared to be situated in the hind-quarters. From that moment, progression became more and more difficult. At last the bitch sank upon her hind-quarters, rested in that position for a few moments, and was then able to resume progression, but soon sank again. The symptoms are analogous to those seen in thromboses of the posterior aorta in the horse and ox. Finally, locomotion became almost impossible; and the dog, practically paraplegic, was brought into the infirmary of the Lyons School, where she died five days later.

Post-mortem, the posterior aorta was found to be thrombosed. The thrombus, partially occluding the lumen of the aorta, was from 6 to 7 centimetres (2 2-5ths to 2 4-th inches) long and 1 centimetre (4-10th inch) in diameter, and terminated at its posterior extremity by a rather fine point.

The abdominal aorta and the terminal portion of the thoracic aorta were completely obliterated by another thrombus, red-brown in colour, firm in consistence, and with a fairly regular surface.

Short branches projected from the thrombus into the principal arteries issuing from the aorta.

Ball made a most minute histological examination, but discovered no true atheromatous lesion. The only lesions existing were arterio-sclerotic ones of chronic aortitis. —(*Annales de Méd. Vét.*)

A FLESH DIET IN EXPERIMENTAL NEPHRITIS.

Theohari reports (*Presse Médicale*) some important researches upon this question. His observations have been made upon dogs in which experimental nephritis had been induced, the disease being manifested by albuminuria and cylindrical casts in the urine. These animals, affected with grave renal lesions, succumbed rapidly if they were fed upon meat, but were able to survive for a long time if they were placed upon a vegetable diet. This is the main result of the author's researches.

At the commencement, the nephritic dogs showed a large amount (0.5 to 2 grammes to the litre) of

albumen in the urine. Under the influence of a vegetable diet, this quantity of albumen diminished greatly; hydruria became established: and the sediment now only contained a few cylindrical casts. In becoming chronic, therefore, these cases of nephritis evolved towards the type of atrophic nephritis of man. Anatomically, alterations of the same nature as those of human atrophic nephritis were seen, viz., atrophic glomerulitis, enlargement of the calibre of the tubules with reduction in the thickness of their epithelium and interstitial proliferation of connective tissue. If, however, in these dogs which tolerated their nephritis, a fleshy diet was substituted for a vegetable one, symptoms of uremia rapidly supervened and the animals succumbed in a very few days (from 1 to 3 days in 8 cases out of 9 experiments). This toxicity of flesh food is equally marked in the case of either roasted or boiled flesh.

The evolution of the nephritic process is quite different if the dogs are kept upon a flesh diet at the commencement. In these cases the quantity of albumen becomes enormous (up to 15 grammes to the litre); the sediment, by its abundance and its composition, shows degeneration and intense desquamation of the renal tubes; uremic symptoms appear rapidly, and the animals succumb in a few days. Histologically, glomerular hyperæmia with tumefaction of the endothelium is found. The majority of the convoluted tubes are affected with necrosis of their epithelium; in other points, the epithelial elements are less massively affected, and present every variety of cellular alteration.

All this shows the highly toxic character of a flesh diet in the course of nephritis in a normally carnivorous animal, such as the dog. From this point of view there is no sensible difference between raw and cooked meat. It is possible that a flesh diet in nephritis also produces alterations in other organs; but the renal lesions which were demonstrated were alone sufficient to cause the death of the animals.—(*Annales de Méd. Vét.*)

W. R. C.

Royal College of Veterinary Surgeons.

A Special Meeting of Council was held at 10 Red Lion Square, W.C., on Tuesday, April 23rd, and the following members were present: Messrs. Banham, Barrett, Col. Sir F. Duck, Sir John M'Fadyean, Mulvey, Prof. Shave, Slocock, and Villar.

Mr. W. Freeman Barrett being a Vice-President, was elected to the chair.

The minutes of the previous special meeting were read and confirmed.

Mr. VILLAR then proposed that the alterations made in Bye-laws 56 to 87, passed at the previous special meeting, be now confirmed.

Sir JOHN M'FADYEAN seconded the motion, and, on being put to the meeting, it was carried unanimously.

This concluded the business.

LANCASHIRE

VETERINARY MEDICAL ASSOCIATION.

The quarterly meeting was held at the Grand Hotel, Manchester, on March 21st, the President, J. W. Brittlebank, Esq., Manchester, in the chair. The attendance included Messrs. McKinna, Faulkner, Woods, Wolstenholme, Taylor, Norbury, Munro, jun., Carter, Turner, Hopkin, Holroyd, A. Lawson, Stent, Garnett, Sumner, Pillers, Ellis, Mattinson, Wilson, Whitehead, Locke, Michaelis, and Spreull.

Apologies for absence were received from Messrs. Packman, Edwards, and Clarkson.

The minutes of the last meeting were taken as read on the proposal of Mr. Lawson, seconded by Mr. Taylor.

Mr. T. O. RICHARDSON, F.R.C.V.S., Tarporley, and Mr. J. P. HEYES, F.R.C.V.S., Wigan, were duly elected members of the Association.

Mr. HAYHURST, M.R.C.V.S., D.V.S.M., Blackburn, and Mr. RICHMOND, junr., M.R.C.V.S., Oldham, were nominated for membership by the President and Mr. Stent respectively.

REPRESENTATIVES TO THE COUNCIL N.V.A.

This matter had previously been discussed and referred to the Council of the Association for consideration and report. The Secretary submitted their recommendation, to the effect that Messrs. Brittlebank, Stent, J. H. Carter, Packman, and Locke (*ex-officio*) be elected as representatives from the Lancashire V.M.A.

Mr. TAYLOR moved that this recommendation be adopted. Mr. Garnett seconded, and it was carried.

Members in Arrear. The Council recommended that the names of three members whose subscriptions are in arrear be struck off the roll. Mr. Locke proposed that this be done, Mr. Carter seconded, and it was carried.

International Congress, 1914. The Council advise that an annual subscription of five guineas for the years 1912, 1913, and 1914 be sent. Mr. Lawson moved that this be done.

Mr. GARNETT, as Treasurer to the Congress, thanked the Association for making this recommendation. The profession had probably the greatest undertaking it ever had since it had been organised. The International Congress of 1914 will require energy from every Society in the land as well as every member of the profession. Sir John M'Fadyean has been successful in obtaining substantial financial support from nine other members of the profession to the extent of £100 each, and he (Mr. Garnett) was pleased to say that Lancashire and their Association was not unrepresented in the ten. This should be an example as to what the rank and file should be prepared to do. Sacrifices would be required from all if the undertaking is to be carried through as all Britishers will expect it to be. Those who had attended the Congresses held abroad could testify to the princely way in which they were entertained. He realised that this year was a great one for the Lancashire V.M.A. in its Jubilee year, but felt that the members would not forget also the International Congress. He had pleasure in seconding the proposal. This was carried.

MECHANICAL LAMENESS.

Mr. TAYLOR opened a discussion on this subject. He referred to a report in *The Veterinary Record* of Dec. 23rd, 1911, of the proceeding of a meeting of the Southern Counties Veterinary Society which included a paper by Col. L. J. Blenkinsop on "The possibility of preventing the present conflict of veterinary evidence in police court cases." In the discussion which followed, Mr. Burt, Brighton, is reported to have said, "if an animal with short tendons was to go lame it must be suffering

pain." Mr. Taylor said the question is whether such conditions as were understood by the term lameness could exist in a horse without the animal suffering pain. Apparently Mr. Burt thought that all lame horses should not be worked. He (Mr. Taylor) had looked up one or two cases in which the R.S.P.C.A. were prosecutors and where the defence was that of mechanical lameness with absolute freedom from pain. He was afraid that when giving evidence in police courts and other courts veterinary surgeons were apt to be rather too dogmatic. Instances arise where one says such a condition of things exist and another says they do not, with the result that the magistrates are in a quandary, and sometimes have to act as arbitrators between the two. Conclusions should not be too hastily drawn. He could name cases where he could not say the animals were fit for work, but when turned out in the morning were absolutely sound. In one such case where lameness had developed suddenly the opposing veterinary surgeon had stated the cause of lameness to be ringbone, but it turned out to be a pricked foot, from shoeing. The shoe had never been removed. In all cases where a veterinary surgeon gives evidence in court he should use every means at his disposal to ascertain the exact cause of the lameness. It is possible to think too much about symptoms and too little of the causes of disease.

However, the question before them was, Can there be such a condition as mechanical lameness with freedom from pain? He had seen cases of absolute shortening without thickening of the flexor tendons in which there was freedom from pain, where the animal, unshod, goes upon its toe and is unable to put the heel on the ground. If suitably shod it should be able to perform certain work without pain.

Again, in cases of complete ankylosis of a joint resulting from inflammatory diseases, are there not some of these cases which are fit for certain kinds of work? He recommended all to read the paper of Col. Blenkinsop. It was good to discuss such matters and exchange opinions, so that there need not be great variance when appearing in Court. He could not help feeling that undue prominence was given by the press to conflicting evidence by veterinary surgeons, for there was quite as much of it given by the legal and medical professions.

Mr. WOLSTENHOLME said that to his mind the whole question resolved itself into a juggling of terms. If a man makes a statement that there can be no lameness without pain, and the word lameness is synonymous with pain, then of course there cannot be lameness without pain. If the word lameness be construed into an altered method of movement, into an altered action—shortened, exaggerated, unequal or unusual, then there can be no doubt that, if that is the definition of lameness, there can be lameness without pain.

It is perhaps well in looking at this subject to observe an animal that is found lame with pain and occasionally lame without pain. The higher animal, man, often gives these conditions, viz., an altered gait in some way or other with or without pain. Who has not noticed affections in children from want or stunted development in the brain resulting in inability to move one or other leg, or if moved then brought along in a curious, exaggerated, jerky fashion? They had noticed cases of lesions in the brain of the human subject caused by hæmorrhage or injury, the result being a peculiar movement of an arm or leg. A man may get a fractured limb resulting in a shortening of the limb. Is it suggested that the movement of that shortened limb is accompanied by pain? How many men have broken the flexor tendons of their fingers with results as marked or more marked than found in the lower animal? Is a Potts' fracture, for instance, accompanied by pain? To his mind the idea is ridiculous, and contrary to well-known fact.

There are many ways of judging whether a horse is in pain or not. You see a horse which has contractions such as described, the flexor tendons and fore limbs rigid, without any signs of heat or pain on pressure, and that horse must go with interference of action, yet there are indications that the animal does not suffer pain.

Mr. LAWSON said he had seen many cases of lameness in which he thought the horses did not suffer pain. Such cases could only be judged by symptoms. In acute cases where, possibly, the cause could not be seen externally, further examination should be made before action is taken. His experience was that conclusions were drawn too quickly, and to some extent their profession was to blame for this. He thought it would be well if some proposal could be made by the Association so that the public might be informed as to their conclusions.

Mr. GARNETT thought that the best way of dealing with the cases which came before the magistrates would be to have a Veterinary Assessor, in the same manner as the Medical Assessor is appointed for cases of injury. The Society might take the initiative by bringing the matter before the Home Secretary in the form of a resolution as follows: "That in the opinion of this Society and in the interests of justice it would be advisable to have a Veterinary Assessor attached to all Courts of Justice who might be called in to give an unbiased opinion in disputed cases of lameness."

Mr. MCKINNA makes it a rule that before deciding on the question of lameness the horse shall stand at least an hour for observation as to whether there is the pain ascribed to it. Ringbone had been mentioned, and personally he would like to see that term expunged from the list. He agreed with the suggestion of appointing a Veterinary Assessor.

Mr. CARTER endorsed the remarks of previous speakers. He thought they could have ringbone without interference of articulation.

Mr. SUMNER said the first thing to consider was what was lameness. He had no particular definition, but thought it meant interference with harmony of either flexion or extension of a limb. He thought they must admit that there could be lameness without pain; but as to mechanical interference and lameness, probably with a view to getting an acquittal, the term of mechanical lameness was used. They could have manifest ankylosis of the lower phalanges without any serious defect of action. On this question of mechanical lameness it would be desirable in the interests of the profession to consult the Royal Society on the subject, acting in sympathy with them and not in antagonism. Where there is fixity of the lower phalanx without evidence of actual pain on progression, he had no hesitation in saying that it is mechanical lameness unattended by pain.

Mr. HOPKIN pointed out that magistrates were at liberty to adjourn doubtful cases and get expert opinion on them.

Mr. FILLERS advised caution and careful consideration in framing resolutions, as there were so many factors to be taken account of.

Mr. WOLSTENHOLME said the point was—is there such a thing as interference in the symmetry of progression without pain. He thought it was indisputable that such a thing could exist. It exists in the animal that can speak, and he believed also in the animal that could not speak.

Mr. MATTINSON, referring to the remarks of Mr. Sumner, wished to point out with respect to his definition of lameness that they could have an animal dead-lame without either flexion, extension or progression.

Mr. WHITEHEAD referred to the practice of the R.S.P.C.A. in Salford, more particularly in regard to their selection of veterinary surgeons for Court cases.

Mr. STENT was of opinion that each case must be

taken on its merits in examining as to its suitability for work and freedom from pain. He thought that frequently veterinary surgeons in carrying out such examinations hardly subjected their patients to tests sufficiently drastic. It was perfectly obvious that as a business proposition the only way of testing a horse was to apply to him as far as possible a test similar to that which he would undergo in his ordinary work. That is to say, in the case of a horse which had to perform heavy draught work he should be put in harness and tested for that particular work, and not merely trotted or walked free from gears.

The PRESIDENT thanked Mr. Taylor for the admirable manner in which he had opened the discussion, and he desired to say that it was the outcome of a policy that he hoped their Council might be able to adopt, namely to look upon the quarterly meetings as meetings of serious purpose. He was hopeful that the Council would select in the future a subject for discussion at each meeting, and they might even go so far as to call upon an individual member of the Society to take the responsibility of either reading a paper or opening a discussion on the subject selected. He certainly hoped—and did not think he would be disappointed, that this scheme would meet with the approval of all, and that if called upon they would readily respond. At the last meeting this had been done, and he thought the result was an unqualified success. With regard to that day's discussion everybody would agree that it had been extremely instructive, and matters of much public interest had been brought forward by most of the speakers in an able and practical manner.

The question of mechanical lameness was one affecting the politics of the profession very considerably, and he was certain that the dignity of the profession would be furthered considerably if the occasional unfortunate clashing of professional evidence were less evident. He had been in police courts and heard on questions of absolute fact, and where he had seen the animal under consideration, one man denying what was evident to any layman. He could understand differences of opinion on matters of technical import. The moral standing of the profession is at stake, and some different line of action should be arrived at. If an assessor or assessors could be appointed to every Court where these cases are heard the interests of justice would be furthered, and also the interests of the profession. If resolutions were to be framed it would be better to frame them on that question.

Mr. WHITEHEAD proposed that the matter be referred to the Council to draft resolutions and submit them to the next meeting. Mr. McKinna seconded.

The PRESIDENT asked for some expression of opinion as to what kind of resolutions they wished to have framed. In the first place they might consider the recommendation as to the appointment of Veterinary Assessors. Secondly, with regard to mechanical lameness.

It was agreed to refer these two points to the Council.

Mr. LAWSON referred to his connection with the N.S.P.C.A., and more especially to the Local Committee of Management on which he acts. He said he had drawn attention to the fact that in the majority of examinations a certain veterinary surgeon was always called in, and he had suggested that the nearest surgeon to the accident should be summoned. To some extent this had been adopted.

Mr. WOLSTENHOLME pointed out that there were objections to this, as in his own case he did not desire to be summoned to such cases, and no doubt there were others like minded. It would be far better to have a salaried official or officials appointed as municipal officers who would act quite independently and would not be affected by the number of cases arising.

A vote of thanks to the President, proposed by Mr. McKinna, seconded by Mr. Faulkner, was adopted.

CENTRAL VETERINARY SOCIETY.

A general meeting was held at 10 Red Lion Square, on Thursday, April 4th, Mr. R. J. Foreman, President, in the chair. The following Fellows signed the attendance book:—Messrs. J. W. McIntosh, D. Stewart, H. G. Simpson, Prof. J. Macqueen, J. Willett, Profs G. H. Wooldridge, W. Hunting, Prof. H. A. Woodruff, C. Herbert Sheather, W. S. Mulvey, H. D. Jones, Ralph Bennett, N. Almond, A. L. Butters, F. O. Parsons, G. Gordon, R. Brydon, W. Willis, F. W. Willett, W. Perryman, Charles Sheather, J. A. Gosling, C. A. W. Cunningham, Henry Gray, W. Roger Clarke, and Hugh A. MacCormack, Hon. Sec.

Visitors: Messrs. W. Taylor, S. C. Rowbotham, A. W. Noel Pillers, and W. H. Brown.

On the motion of Mr. Butters, seconded by Mr. Almond, the minutes of the last general meeting were taken as read and confirmed.

MORBID SPECIMEN.

Prof. WOOLDRIDGE exhibited an enlarged prostate weighing 1½ lb. which he had removed from a fourteen-year-old fox-terrier about 20 lb. in weight. The prostate which was cedematous, was the largest he had seen.

ELECTION OF FELLOWS.

The following gentlemen were unanimously elected Fellows of the Society:—Messrs. A. E. Sangster, M.R.C.V.S., 141 Finchley Road, N.; H. KEELING ROBERTS, M.R.C.V.S., Lanherne, Bexley Heath; H. ANDREWS, M.R.C.V.S., Montague Street, Stones End, Borough, S.E.

THE PRESIDENT'S REPORT *ex POLICE*.

Gentlemen,—A deputation consisting of Messrs. Hunting, Willett, McIntosh, and myself, Mr. Stewart being unavoidably absent, waited upon Sir Ed. Henry by appointment on March 13th, 1912. He having been called out of town, deputed Major Woodhouse to interview us. I made some opening remarks as follows:—

March 13, 1912.

Sir Edward Richard Henry.

Sir,—As President of the Central Veterinary Society I beg to thank you for receiving this deputation of London Veterinary Practitioners. Our object is to point out some conditions which we think are unfair to owners charged with working an animal in an unfit state.

Before entering upon details I should like to assure you that our profession is second to none in its admiration of the police, and that we recognise the absolute necessity of enforcing the law for prevention of cruelty to animals. Our whole lives are devoted to allaying pain, and checking disease in domestic animals.

But, sir, we see both sides of the question, and think it our duty to bring to your notice some methods of procedure which cause increased suffering to horses, and not a little hardship to horse owners.

It may be thought that our interests as general practitioners bias our opinions in favour of the defence, as the horse-owners are our clients. As a matter of fact no respectable veterinary surgeon desires to enter a court to defend cruelty; I may go further, and say that very few of us care to join in the defence, even when we are convinced that no cruelty exists. Such a position seems to place us at once "on suspicion" and we enter a witness box with a feeling that our evidence is not received with the same impartiality as is meted out to the veterinary expert appearing for the police.

Our calling, like all other others, has some bad men in it, and it is certain that in some cases a defence has been attempted when none honestly existed. The Council of the Royal College of Veterinary Surgeons, however, possesses disciplinary powers over men who

disgrace their profession ; and would only be too willing to act if a specific case could be brought forward with the assistance of the police.

Assuring you, sir, of our earnest desire to give every help in the suppression of cruelty, I now ask you to hear Mr. Hunting state some of the methods which we consider open to objection.

Mr. Hunting took up the subject and with due deliberation stated our case in a very lucid manner.

Messrs. Willett and McIntosh also contributed valuable notes.

The Major was very sympathetic, asking many questions on different matters, pointing out that some of them were in the magistrates' jurisdiction.

He promised that the complaints regarding the "greenyard," "exposure of animals," and difficulty of owner's veterinary surgeon obtaining an inspection of, or in urgent cases treatment of, an animal in a "greenyard," would be looked into and altered ; the other points to have due consideration.

We formed the opinion that this was no idle or formal promise, but would be actually carried out, as the Major seemed to thoroughly understand the matter, being a horseman himself, and, I believe has this part under his supervision. He impressed upon us the desirability of placing before them specific cases, saying that it was no use bringing up old ones as they could not be dealt with.

I would suggest that we try to get owners to lodge complaints where there is a genuine grievance, and that we should also complain, if we have grounds for it, on any important matter touching ourselves. The Major gave us to understand that there is not, or ought not to be, any special veterinary surgeon attached to a Court, but that the police ought to call the nearest available veterinary surgeon on their list, as in case of street accidents. This point, however, was not made too clear.

On the whole we were satisfied with the interview, and hope there will be some favourable results to justify our action.

Mr. HENRY GRAY read the following proposition :—
THE ROYAL VETERINARY COLLEGE AND ITS WORK.

As I consider the matter I am about to bring before your notice to-night is of prime importance to practitioners in London and the Suburbs, and in fact to the profession at large, I offer no apology in asking you to bear with me for a short time while I put before you a few facts relating to it.

No doubt you have recently read in the daily and professional papers that a deputation of Governors of the Royal Veterinary College waited upon the Minister of Agriculture, with the object of obtaining from the Government a sum of several thousand pounds to enable the College to build and equip certain necessary laboratories, and also to supplement the salaries of its teaching staff.

I certainly think, as no doubt all of you do, that the Royal Veterinary College should receive liberal financial aid from the State, so that it could be so equipped as to bring the teaching and the means of investigation up to the level of modern requirements ; or at least up to the level of the best veterinary institutions on the Continent. Agriculture is the greatest asset this country has, yet I believe there is no civilised country in Europe where veterinary education and research is so starved as it is in England.

So far I am in agreement with the action of the Governors, but when I come to consider the manner in which the Governors conduct the College practice, and the bye-laws and regulations formulated by them in the interests of subscribers by whom they are appointed, I feel there is room for drastic reform.

The sole object of the Royal Veterinary College when

founded was for veterinary education. But as time went on and the original subscribers dropped out, a new type of subscribers replaced them whose motive generally for becoming a subscriber was a commercial one, i.e., they subscribed purely for the purpose of obtaining veterinary advice and medicine at a special low rate, considerably lower than that of local veterinary practitioners, indeed in some instances at one-half, or even one-third their fees. I am informed that in certain cases medicines have been supplied under cost price. Again, anyone would know that it was impossible to keep a large dog, such as the Great Dane, for 5s. a week (without any allowance being made for treatment).

It may be said that this cutting down practice is for the purpose of obtaining material for the education of the students ; but those of us with experience in London know that very low fees are not always an advertisement, and that those who are in a position to become subscribers are not likely to be influenced so vitally on a question of paying a reasonable fee.

As an alternative, and I think a better one, I suggest the method of taking in animals only belonging to the poor and getting subscriptions from the sentimental public.

The proof of the neglect of this branch by the Royal Veterinary College is the establishment of "Our Dumb Friends' League" Hospital and "The Animals' Institute" Kinnerton Street. These institutions are supported by voluntary contributions, but the subscribers derive no personal benefit whatever. These institutions take in poor people's animals for treatment. This point tells with the public. I am informed on very good authority that the Brown Institution had last year nearly, if not quite, as many patients as the Royal Veterinary College. Veterinary students, under the will of the late Mr. Brown, have the right of attending the Institution and obtaining experience. So much for the material for the teaching of students.

The London Hospitals for people are run by voluntary contributions and the subscribers have the privilege of giving letters of admission to the needy ; and any people they may receive as paying patients are charged strictly according to their means.

This brings me to the main point which I wish to bring before you : that is, the grave competition between the College and London practitioners ; and it is not solely the fact that a certain number of patients are lost annually to practitioners ; but the example set both to the public and to the young veterinary surgeon, starting out into the world.

The public naturally thinking that the skill of the College Professors is of a higher standard than that of an ordinary practitioner. It is only fair to point out that all former students of the Royal Veterinary College have all the privileges of subscribers excepting a vote in the election of Governors ; and that Bye-law 11, states that "The Professors are not to examine horses as to soundness out of the College, nor visit sick animals (otherwise than in the course of investigating any such outbreak as aforesaid), except by special permission of the Principal or Professor in charge, and then only for the purpose of consultation with a veterinary surgeon, or with the object of removal of such horses or other animals to the Infirmary for treatment if this be found convenient and safe."

The Governors should consider the facts that the College has been supported mainly by our fees, i.e., those of us who were students there ; that when the Dublin and the Liverpool Veterinary Schools were founded the local practitioners were considered and the Colleges undertook not to enter into competition with them. I believe the R.C.V.S. took a very great interest in these institutions at the time of their foundation !

The London and suburban practitioners are more numerous than those in the Army, Board of Agriculture,

in Ireland, Scotland or the Liverpool district, and yet not one practitioner is represented directly or indirectly on the Board of Governors, although the latter include representatives of the Army and Board of Agriculture veterinary services.

Since the days of Coleman the Royal Veterinary College has always been suspicious of veterinary practitioners, one of the College bye-laws being that the number of veterinary surgeons on the Board of Governors should not exceed five.

Now the question arises: should not a Society like this exert its influence in the interests of its members in order to get *direct* representation on the Board of Governors? The Governors have "full power and authority to alter, vary, break, and renew" the bye-laws "at their discretion," (section 10 of the Charter of Incorporation).

Are we going to meekly allow the College to obtain this grant from the Government and then to continue this competition, unfair now, because we when students supported the College to exist?

I sincerely hope this Society will consider this matter and, if necessary, decide to form a committee to approach the Royal College of Veterinary Surgeons as the custodian of the interests of the profession, or the Governors of the Royal Veterinary College, or deal otherwise with the matter as they may think fit, even to the extent of sending a deputation to the President of the Board of Agriculture.

The Royal Veterinary College is no longer a necessary institution to the country, as there are several other self supporting ones that do not enter into competition with the practitioners.

Mr. HUNTING moved as an amendment that the communication be printed with the Minutes and put on the agenda of the next meeting for discussion.

Mr. STEWART seconded the amendment, which was carried.

The amendment was then put as a substantive motion, which was also carried.

AN IMPROVED METHOD IN THE TREATMENT OF CANKER OF THE HORSE'S FOOT.—By A. W. NOËL PILLERS, F.R.C.V.S. [See p. 676].

THE PRESIDENT, in opening the discussion, said that in the case of a private practitioner canker was a difficult disease to treat, as he rarely had the use of stocks, and, as Mr Pillers had said, it was impossible for a farrier to hold the horse. He (the President) but very occasionally attempted to treat such cases: he generally tried to get them passed on. When he was on the staff of the Great Eastern Railway Infirmary the practice then was to use crude carbolic acid and sulphates of zinc and copper with a padding of tow. Rolls of tow, as exhibited by Mr. Pillers were not used, but the pressure was obtained in a very similar manner by means of hoop iron. He found the great difficulty was in getting all the cauliflower growth away, and in fact he had had but very little success in cases of canker. He should be very much inclined to try Mr. Pillers' new method, especially if one could tell an owner that the treatment was only going to take a month. In that case he thought owners would be very willing to allow their animals to be treated.

Mr. SHEATHER, SENR., said he had been at some trouble to discover the actual novelty in the method of treatment other than the rolls of tow which gave the particular pressure. He himself had pursued the method of treatment indicated by the essayist with considerable success. He thought the secret of the whole thing was the unlimited amount of time given to the case, the regularity of dressing, with the application of pressure, and the absolute control of the animal. He had treated some cases of canker very successfully and other cases very unsuccessfully. In those cases where he had been unsuccessful, the want of success was simply owing to

the fact that some amount of time was involved in treating the animals, a fact which did not appeal to the owners, who became impatient and refused to let the treatment be regularly applied. Consequently the matter was continually being put off, the result being a state of chaos, one not being able to give that amount of regularity of treatment which was necessary. With regard to dressings, all sorts of dressings were used. Sometimes one dressing was not so good for a particular case as another. As he had said, although he had very much appreciated the essay, he failed to see where any novelty came in other than the rolls to get a particular pressure. He did not say that was a bad method; he thought it was a good one, but at the same time he should hesitate to say that it was the only way to get pressure on the foot.

Mr. ALMOND said the paper introduced one novelty, and so far as he knew only one—that was the pressure by means of rolls of tow. The other features of treatment he had himself employed at different times. He had used carbolic acid as well as other caustics with greater or less advantage; and he noted that in the only case mentioned by the essayist in which the disease had extended to the laminae to any great extent the animal was destroyed. Any other case of canker he thought might be treated fairly successfully by the ordinary modes of treatment; that was to say, varying forms of caustic and pressure. He had successfully treated a good many cases where the frog and perhaps a little of the sole or bars had been affected, without putting the horse out of work at all; in fact by the ordinary methods of treatment unless a horse was capable of continuing his work it was not usually worth treating—certainly not in country districts. To obtain pressure he had usually employed an iron plate of the same shape as the sole, with the transverse bars supporting it underneath the seated out "webb" of the shoe, and when treating an animal by the ordinary method of removing as much of the diseased horn as possible, he had always used as far as he could a hot iron for searing it before removal. His cases had generally taken a considerable time to cure, but except where the disease had extended to the laminae he had generally been successful after an indefinite length of time. Having got a comparatively dry surface by means of a hot iron, he generally painted the diseased portion of the foot with chloride of antimony, which caused an exudate from the soft horn, and the surface could be again dried by the application of the hot iron. That, with the introduction of powerful astringents such as dried sulphate of zinc or sulphate of copper, packed tightly with a covering of tow and tar, had generally been the methods he had adopted. Further, after the plate had been fixed in the way he had indicated to obtain pressure, he filled up any cavity that existed by means of further plugging from the back of the heel underneath the iron plate, which, extending as it did some distance posteriorly to the frog, enabled him to fill it up with some blunt instrument like a piece of wood or iron. A small quantity of oil of tar was poured into the heel between frog and plug daily. He had seen many cases recover in which the frog only was affected. He was referring to those cases which were sometimes described as neglected thrush, but which, if neglected, experience told would go on to exhibit the ordinary symptoms of canker. He had had such cases recover by simply removing and redressing about once a fortnight.

Whether there was any special virtue in the rolls of tow time and experience would show, but one might suppose that there would be a certain advantage in the use of them, inasmuch as they would admit of the passing out of any moist exudate from the diseased surface, which would to some extent be prevented in a case where a plain iron plate was used under the surface of the foot; and also there would be a certain amount of

motion between the rolls of tow which might have a beneficial influence.

With regard to the greater frequency of canker he confessed it was not his experience of recent years that canker was on the increase. Whether that was due to the fact of there being fewer horses he did not know.

Mr. BUTTERS thanked Mr. Pillers for bringing this method of treatment before the Society, because although perhaps to some practitioners there was nothing very novel in it, yet it tended to arouse interest in the subject. He had seen a good many cases of canker, and years ago he used to treat them in the old-fashioned way with the hot irons, chromic acid, solution of perchloride of mercury and other strong caustics. He occasionally put an iron plate on in order to get pressure on the sole and also to enable the animal to work. This treatment, however, was not very successful. His colleague who used to assist him was an enthusiast upon the subject of canker, and some years ago had shown him a method of treatment which was somewhat similar to the one recommended that night by Mr. Pillers. The foot was thoroughly pared, all the loose and diseased portions removed by the knife and the parts well cleaned. The exposed parts were then dressed with a strong liniment of iodine, and boracic acid was dusted over the top. The foot was then packed tight with tow, strips of irons being used to keep it in place. The time occupied in curing each case varying according to the part affected. When the disease extended up the wall, especially at the heel, his colleague had a long shoe put on, pressure being applied by means of a bandage. That treatment seemed to answer very well. The length of time a horse was laid up was always a very important item in the treatment of canker. It was seldom less than two or three months when the disease extended to any degree over the sole and frog, and with the exception of those cases where the wall was much involved, all recovered. There was no doubt that the antiseptic treatment and the use of mild dressings was the most successful way to treat canker. Another very important item in the treatment was the frequency of the dressing. His colleague dressed the horses' feet every day at the beginning of the treatment and for perhaps three or four weeks. Tow was used very plentifully about the frog, but there was no special rolling. One point had struck him with regard to canker, namely, how very seldom it was seen in the better bred horses. He only recollected seeing one horse of that description suffering from canker, and that was a half-bred. The disease was nearly always confined to the heavier breeds of horses. A loose box was a very useful item in the treatment of a cankered foot, as was also the bedding used. One had to keep the bedding dry, and he thought sawdust or peat changed pretty frequently was about the best material for the purpose.

Mr. R. BENNETT said he himself had tried treatment on somewhat the same lines as those which were indicated in the paper on three or four cases. He was inclined to attribute the success of Mr. Pillers' method to the use of iodoform combined with the good method of pressure. He (Mr. Bennett) did not think strong caustics were advisable. The method of treatment he adopted was to thin the horn down as much as possible, wash with formaldehyde 40 per cent. solution, and then dress with equal parts of iodoform and tannic acid. The result in two cases, in the fore feet, was complete success in about a month. He had another bad case in the hind foot, nearly recovering but breaking out afresh, and in which, also, the fore feet were subsequently affected. That animal was sold. The cases were very few to form any opinion upon at present, but they rather bore out what Mr. Pillers had found, and they also showed that these cases in which the fore feet were affected were more hopeful of treatment than those in which the hind feet were affected. He should like to know a little more about how Mr. Pillers rolled the tow to get the pressure

he did. It seemed to him that getting a pressure all over the sole was very difficult, and in the specimen of the foot which had been passed round the table he noticed that the pressure was not very good just at the base of the frog. He would also like to inquire if any member of the Society had ever used pure metallic mercury in the treatment of canker. He knew a blacksmith who had a very great reputation for treating canker, and certainly to his own knowledge the man had had a great many successes. He had been told that the man's method was to thin the horn down and treat with pure mercury.

Prof. WOODRUFF desired to thank Mr. Pillers for the careful clinical observations and records of the cases he had treated. There was a good deal too much loose thinking, loose speaking, and loose writing at veterinary meetings with regard to results which had been obtained. Mr. Pillers had made careful observations, and he had given the members the benefit of those exact observations on all his cases. Practitioners wanted information on all cases and wanted to know all about them, and that is what they had had that night. Consequently he thought Mr. Pillers' results justified him in saying there was perhaps some novelty in his particular treatment. He questioned whether many members in the room, if they were honest and brought all their cases of canker to the criticism of a meeting, could produce 21 or 22 consecutive cases with anything like the good results which the essayist had put before them. Whether it was the rolls of tow, or the carbolic, or the iodoform, he (Prof. Woodruff) did not know; he rather thought it was a combination of those three things, combined with absolute perseverance in dressing. The novelty of the treatment was in the result, and that surely was the best novelty one could get for any treatment. He desired to point out that Mr. Pillers did not dress too frequently. He (Prof. Woodruff) was quite satisfied there was such a thing as over zeal in treatment. Taking a skin disease in a dog for example, if one treated with something fairly caustic and corrosive very often, a chronic disease which would take a good deal of getting rid of would be obtained, but if one applied something mild, like lime water and glycerine, the malady would be cured in half the time. The same might be true of canker; one could overdo the caustic and also the frequency of the dressing. With regard to the particular stocks which had been used in Mr. Abson's cases, Mr. Abson had showed him the stocks two or three years ago, and he was bound to say that they struck him at that time as being the best stocks he had ever seen, and an important item was that they were comparatively cheap. Mr. Abson had assured him that after considerable experience he had had no accidents, and that the stocks were quite safe. He would like to know from Mr. Pillers if he advised the removal of the shoe at every dressing. He took it from the make of the shoe that he did not, but he would like some information on that point. Mr. Bennett had raised an interesting point about pure mercury. He (Prof. Woodruff) should have thought that the blacksmith—another name for mercury being quicksilver—would have had a difficulty in getting it on the spot, but apart from that the man might easily have rubbed it down with chalk and obtained the ordinary grey powder of the Pharmacopœia. He thought probably that that was what the man did. This rather seemed to lend support to Jowett's theory, that canker was due to a spirochete, for syphilis in man, due to a spirochete, was acted upon most efficiently by mercury. That seemed to him an interesting point with regard to the use of mercury in canker.

Mr. W. HUNTING said he did not rise to discuss the paper but merely to thank Mr. Pillers for bringing it forward. He had done so in such a lucid manner that he (Mr. Hunting) could not but think that probably the same lucidity and exactness was applied by the people

who had been treating the cases so successfully. His own experience of canker had been that, after different periods of treatment extending up to ten months, all the cases had ended in the same way—miserable failures. He noticed that in Mr. Pillers' cases it was an assistant in each instance who had treated the animals. If one treated the cases oneself every three days, one was never free from the odour, and it was just the sort of job an assistant ought to take on. He did not think anybody else but an assistant would take it on if he could get out of it. One thing about the treatment was very clear, namely, whether the packing or the dressing had much to do with the cure, the very greatest exactitude had been followed. In the paring of the sole, in taking care that there was nothing left under-run, in the treating of the whole surface, and in the packing, everything seemed to point to great exactness; and exactness in detail was the secret of nearly all good surgery. He did not know, however, even with the rather enticing method of treatment which Mr. Pillers had brought forward that evening, with its equally enticing results, he would ever tackle a case of canker again.

PROF. MACQUEEN said Mr. Pillers had asked the members to discuss his treatment and to criticize it, otherwise he would not have felt inclined to have intervened in the discussion. To begin with he found fault with the paper because it did not give sufficient information as to the nature of the cases treated. That was a very important point in connection with the treatment of canker. The impression which had been conveyed to him by the paper was that Mr. Pillers had had only one genuine case of canker. Those cases which had been quoted with a cheesy discharge on the sole and frog were commonly called cases of canker, but they were not the kind of cases which required exceptional treatment. And, strange to say, the case of canker which had extended beneath the wall was the only case of the number which had been unsuccessful and which had to be slaughtered. He doubted if Mr. Pillers' cases of canker were typical, because they were restricted to the sole and frog, with one exception, and the cankered tissue, or whatever Mr. Pillers liked to call it, was removed by scraping. He (Prof. Macqueen) said that if one was dealing with genuine canker one could not properly scrape off the cankered tissue because it was too fleshy and vascular. But apart altogether from the features of the disease Mr. Pillers had been treating, he failed to find any novelty in the method. The title of the paper was to the effect that it was an improved method. He agreed with Mr. Hunting and with all those who had spoken in the same tone that the improved method was the improvement in the personal energy of the individual, and he gave Mr. Pillers and Mr. Chadwick all the credit they deserved in that respect. The man who succeeded in treating canker successfully was the man who devoted himself to his case. Mr. Pillers mentioned the shoe, the straps, the bandage and so on, and a great deal had been made of rolls of tow. What else had there been in years gone by but tow with which to dress cankered feet? How were cankered feet treated years ago? They were treated by rolls of tow, tow rolled up as tightly as possible and placed against the surface, pieces of hoop iron being put across a partially seated shoe. In veterinary surgery it was extremely difficult for anyone to alight upon a new method of treatment least of all in canker. No disease of the horse's foot had been more frequently experimented with, and he maintained that there was nothing novel in the method of treatment, with the exception that Mr. Pillers rolled his tow in a most artistic manner and was entitled to all the credit for the way in which he managed those rolls. With regard to carbolic acid, ever since its introduction that acid had been one of the acknowledged remedies for canker, but like a great many other remedies it was not a specific, and he supposed Mr. Pillers would find that it was not a specific;

in fact he had been inclined to do so, because in the concluding remarks of his paper he had placed more faith in the powder which was applied to the foot than in carbolic acid. Mr. Pillers deserved the Society's thanks for the trouble he had taken in the preparation of his paper, in the collation of cases, and for the very excellent way in which he had submitted the whole of the facts. He (Prof. Macqueen) regretted he could not say that he found any novelty in the treatment. His experience of canker was that irrespective of the agent employed, if one desired to succeed in curing canker one had to give the case one's personal attention.

MR. GRAY thought one point had been overlooked, namely, that Mr. Pillers had resuscitated an old treatment. As time went on, when newer generations of veterinary surgeons came along they overlooked or were ignorant of the old treatment and went in for something new. He thought that was a very strong point in favour of Mr. Pillers' paper, that it resuscitated the old treatment which was much superior to many of the more modern methods. He quite agreed with the remarks of Mr. Sheather and Prof. Macqueen. When he (Mr. Gray) was at the Royal Veterinary twenty-eight years ago it was the emphatic teaching of Sir George Brown that the principal factor in the treatment of canker was pressure. He had known canker to be cured with quick lime, and also with formalin, but in those cases pressure was also adopted. The last case of canker he had ever treated was with formalin. He put pure formalin on the sole and packed it up with tow and then forgot all about it for four or five days. When he next saw the case the whole of the sole was dried up, so much so that the horse had to be killed.

Prof. WOOLDRIDGE desired to add his meed of thanks to Mr. Pillers for the very lucid manner in which he had brought the subject before the Society. He knew one gentleman in the Midlands who had told him just recently that he was actually pleased when he saw a case of canker coming into his yard because he could guarantee a cure in nineteen cases out of twenty. The line of treatment which he practised was Malcolm's, and personal application. He (Professor Wooldridge) had been particularly interested in hearing that gentleman say so, because in previous years the father of that practitioner had always consigned cases of canker to the knacker. There had been therefore a complete change of front, due simply and solely to the personal application of Malcolm's line of treatment.

In the milder cases of canker which he (Prof. Wooldridge) had lately come across—he was glad to say there had not been very many—the line of treatment he had adopted, after removing under-run horn and applying the actual cautery, had been a first dressing of subchloride of mercury with as much pressure as he could possibly get with tow and hoop iron applied somewhat in the same way as Mr. Pillers' method, except that he was not able to get his numerous rolls of tow so tightly packed. Following the sub-chloride of mercury, salicylic acid and oxide of zinc, 1 in 4, applied every second day, preceded by the very cautious use of the actual cautery where discharge appeared, had been his routine treatment, and he had met with more success than he had dared hoped for at the commencement of the treatment.

MR. SHEATHER said in confirmation of Mr. Gray's remarks about reviving an old treatment, he saw Mr. George South of Bond Street, over forty years ago, use Malcolm's treatment in canker.

MR. J. WILLETT said that no doubt some older practitioners knew something of the treatment under discussion, but younger practitioners had often tried without success to treat cases of canker. He agreed that there was nothing new in the dressing, but the whole secret of the treatment which Mr. Pillers had brought forward was the graduated rolls of tow from the size of

a straw to the size shown on the outside. When the rolls were pressed in they dovetailed in so that a uniform pressure over the whole surface of the foot is gained, and which gives with the foot when its weight is pressed on it. He thought that was the whole secret of the success of the treatment.

Mr. PILLERS, in reply, said that the President's method of treatment with carbolic acid, sulphate of zinc and padding was one which had been greatly adopted by the practitioners in his, Mr. Pillers', district before the method dealt with in the essay had been discovered. The President had remarked that the padding was not put in rolls, but was used simply as a pad. He intended to refer to that point later on in his reply, and would therefore pass on.

Mr. Sheather's remarks were chiefly directed to an attempt to show that the method of treatment mentioned in the essay was not a new one. He (Mr. Pillers) found that directly he mentioned the treatment to veterinary surgeons they always said it was as old as the hills, but he would very much like them to show him some literature wherein it had been definitely stated that the rolls of tow were rolled up as hard as a pen-holder and that they had been used in the way which Mr. Chadwick had advised. The ordinary conception that a veterinary surgeon had of using tow in rolls was just to put them up loosely and push them in. In Mr. Chadwick's case the tow was rolled as hard as a penholder, and that, he (Mr. Pillers) maintained, was the novelty. He did not maintain that treatment by carbolic acid was a new thing: nor was the pressure new, but just the way of getting it. Mr. Sheather also seemed to think that enough mention had not been made of the great necessity for time, restraint and regularity, but he would point out that he had said in the paper: "More important than these articles are plenty of uninterrupted time and a strong liking for thoroughness," and that the seventh thing which was required was "absolute foot restraint, preferably by means of stocks."

Mr. Almond differed a little from Mr. Sheather by saying that there was one novelty in the treatment and one only, namely, the rolls of tow. The various methods which Mr. Almond had used with success had been used by others with success at times, and without success at other times. The iron plate was a common method of treatment, as was also the hot iron, but if they were compared—assuming of course that a mistake had not been made in the diagnosis—side by side with the treatment he had mentioned in his paper, one would be absolutely convinced that the latter was far and away the best method. Mr. Almond had mentioned that he had been successful "after an indefinite length of time." If one used the method which he (the Author) had outlined one could be a little more definite than that, and say that the cases would recover in from six to eight weeks. Mr. Almond also mentioned the drugs he had used, starting with the ordinary caustics and ending with chloride of antimony, sulphate of zinc, sulphate of copper, tar, chloride of zinc and so on—quite a number of agents of the Pharmacopœa. He would point out that in the treatment under discussion only three agents were necessary. With regard to Mr. Almond's theory that the rolls allowed the exudate to escape, it would be found that after they had been applied they did stop the exudate from escaping, but they stopped it from escaping from the cells. It did not escape from the cells and then pass through the rolls of tow. The pressure which could be put on by means of the rolls stopped the exudate from coming out of the diseased tissue, and that is where he thought the question of pressure was, and always had been such an important one.

With regard to Mr. Butters' remarks, he would ask him for the names of the places where he had seen the treatment used. Mr. Butters had said that there was nothing novel in it, and Mr. MacCormack had also

privately said to him that there was nothing novel about the treatment, and he had asked that gentleman to give him a reference. Mr. MacCormack had given him one, but unfortunately he was not able to find references to rolls of tow in Prof. Axe's work. It turned out that the practitioner mentioned by Mr. Butters treated the cases with iodine and boracic acid, and the treatment had lasted in some cases for two or three months. By applying the treatment he (Mr. Pillers) had brought forward that evening the case got better in a very much quicker time and that was where the treatment became economical. With regard to Mr. Butters' remarks about canker being confined to the heavy breeds of horses, he was unable to offer any explanation on that, but the point was a little bit wide of the subject.

Mr. Bennett had said that he had seen a somewhat similar treatment as the one mentioned in the paper and that he thought pressure and iodoform played very important parts. It was a very peculiar thing that if one looked up the records of canker one would see every now and then iodoform being put forward as a very important drug, and possibly there might be something in it. He noted Mr. Bennett's remarks about metallic mercury.

With regard to stocks, Mr. Abson's stocks were excellent. He had seen many horses in them and he had nothing but praise for them. Prof. Woodruff had asked if the shoe was removed. He thought in all Mr. Abson's cases it was removed, and he (Mr. Pillers) always removed it because of the difficulty of manipulating knives. He thanked Mr. Hunting for his kind remarks, and with regard to the smell which hung about one, he trusted that Mr. Hunting had not noticed that he had been dressing a case of canker that very morning.

He thanked Prof. Macqueen for his valuable criticism. It reminded him very much of what Prof. Macqueen used to say at College: "If when you go into the examination and they ask you certain questions, answer as the examiners desire, and when you come out have a different opinion if you think they are really wrong." When he (Mr. Pillers) was at College he always took what Prof. Macqueen said as being gospel truth, but now he felt inclined to ask the Professor why he did not expound at College the treatment which had been mentioned in the paper, if it was so old. With regard to Mr. Chadwick's cases not being cases of genuine canker, it was of course quite possible to produce six or seven veterinary surgeons who had seen the cases and who would say that they were canker, and then to produce one who had not seen them to say they were not, but as he (Mr. Pillers) had pointed out in the last part of his paper, he had provided for that contingency, and had moreover not mentioned any symptoms. These were cases that, had they not been mentioned in this paper, he thought Prof. Macqueen would have agreed that they were cases of canker. Possibly Prof. Macqueen thought they were not cases of canker because they were not up the wall. He (Mr. Pillers) took it that canker must start somewhere, and surely it could exist before it had gone to the wall. Prof. Macqueen had said the only case that looked like a true case of canker was the one which had gone up the wall and which had been killed. He had not described that one's symptoms any more fully than the other cases.

Prof. MACQUEEN, interposing, said it depended on the lesions, and that was what he objected to—the lesion was not described.

Mr. PILLERS, continuing, said. With regard to Prof. Macqueen's remarks about the rolls of tow not being new, he had seen cankered cases dressed under Prof. Macqueen's instructions, but never in one had the hard rolls similar to those on the foot which he had passed round that evening been used by the Professor. Then Prof. Macqueen mentioned something which he called postulates. He would like to remind him that the postulates were mentioned in the paper under quite

a different heading, and that the term "postulate" was extracted from Mr. Caulton Reeks' book. The things which Prof. Macqueen had called postulates were what he had mentioned under "Apparatus required." That Mr. Chadwick had derived the treatment from traditions handed down, he (Mr. Pillers) was unable to say, but he could aver that canker had been common in Sheffield and Manchester, and that very little could be done for it except by a prolonged treatment extending over six or seven months, with hot irons, and that then Mr. Chadwick gradually came upon his mode of treatment with very successful results, so that he (Mr. Pillers) thought although possibly it might have been handed down from tradition, it was certainly new to Mr. Chadwick. He was fairly satisfied that nobody had shown conclusively that the hard rolls of tow had ever been used before. He thanked Prof. Macqueen for his remarks about the rolls being artistic, but he must differ from him there, because he thought that they were very straight and plain. Further he must say that he did not fasten his faith at all on the powder. What he did think important was pressure.

He thanked Mr. Gray for his remarks. Perhaps Mr. Gray would send him the reference where he could see that the tow had been rolled up as hard as pieces of pencil.

Mr. GRAY said he had never said that.

Mr. PILLERS, in conclusion, thanked the members for the very hearty discussion which they had given to his paper.

On the motion of Mr. Mulvey, seconded by Mr. McIntosh, a hearty vote of thanks was accorded to Mr. Pillers for his essay, and the meeting terminated.

HUGH A. MACCORMACK, Hon. Sec.

A Judge on Doctors.

At Clerkenwell County Court on Wednesday, 17th inst., at the close of the evidence in a case under the Workmen's Compensation Act, Judge Cluer said the matter would have to go to one of the medical referees appointed by the Home Secretary.

"I have heard the evidence of the doctors," said his Honour. "One has told me that the workman's condition is owing to the old injury of last year. The doctor on the other side has said the opposite, so I must refer it to somebody else."

Continuing, his Honour remarked, "We have to put much confidence in doctors; but the fact that they come into a court to give evidence on either side is not creditable to the members of the profession. They cannot be giving their evidence honestly. They will come and say anything because they think we are fools."—*Daily Telegraph*.

The importation of dead larks to market by the hundredweight is an indictment for which there is no answer, either in their plenty or our needs. The Member for Peterborough put the question on no sentimental grounds, and we think the Board of Agriculture might take it up on the score of material value, for the bird is worth his weight in gold as an insect killer. All the Board replied was that the matter rests with chief constables and county councils, and this, to our mind, is not enough. We cannot wait for the official or semi-official mind to be percolated with facts which the Department of Agriculture has at its finger ends. What we want is to use knowledge at headquarters for the preservation of a bird which is, first of all, a boon to farmers, and then the other things shall be added unto us—the grace of a creature which other nations envy us, and the everlasting rapture of this small seraph of the fields.—*Pall Mall Gazette*.

Scoring Pigs.

Alfred Gosmore, pig dealer, Tarvin Bridge, near Chester, was summoned at Mold for cruelty to pigs. An inspector of the R.S.P.C.A. said he saw the defendant at a Mold auction with five pigs which were cut and bleeding. There was a wound right across the loin of each pig, varying in size from three to five inches in length. Gosmore admitted he had cut the pigs with the sharp end of a pair of scissors, and added that he was aware it was an offence to "score" pigs in that way. Defendant, in a letter to the court, said the practice of "scoring" pigs was extensively carried on, especially in Ireland. The Inspector said the Board of Agriculture had made known several other methods of marking, and there was no necessity for the cruel practice. The defendant was fined 2s. for each pig and the costs.—*Farm and Home*.

Trespassing Animals.

In a case at Shoreditch County Court in which a Dalston tailoress claimed 10s. against a neighbour, the value of a vase broken by a cat, Judge Cluer found for the defendant. He observed that the law was odd with reference to animals. Owners of wild animals were liable, and the owner of a horse or ox that trespassed and damaged a neighbour's field was also liable. But the owner of a cat or dog could not be mulcted in damages for trespass, though the owner of a dog which bit a sheep could.

LONDON CART HORSE PARADE.—Arrangements are completed for holding the 27th Annual Parade of London Cart Horses in Regents Park on Whit-Monday, May 27th. All drivers competing in the Parade will receive a prize. Entry forms and full particulars can be obtained from the Secretary at the Society's offices, 12, Hanover Square, London, W.

Dr. ROBERT KERR, in his recent book, *Morocco after twenty-five years*, states that the Jews rarely suffer from phthisis; tuberculous animals are common, and are sold to the Moslems when the Jewish slaughterer has pronounced them unfit food for the chosen race.

OBITUARY.

VET.-MAJ. D. M. GLADSTONE, late A.V.C.

Graduated, Edin: April, 1874.

Major Gladstone died on April 11th, at Goolds Hill, Mallon, Co. Cork, from heart failure. His age was 62 years.

ARMY VETERINARY SERVICE.

Extract from *London Gazette*.

WAR OFFICE, WHITEHALL, April 22.

REGULAR FORCES. ARMY VETERINARY CORPS.

Lieut. (on probation) B. R. Body is confirmed in his rank.

Capt. F. W. F. Thomas arrived from India in transport "Rohilla" on 17th inst. and has been posted to Woolwich for duty.

Lieut. (on probation) R. F. Stirling has been transferred from Aldershot to Bulford for duty at that station.

Capt. B. L. Lake arrived from South Africa in S.S. "Balmoral-Castle" on 20th inst., having been granted six months leave of absence to the United Kingdom.

Prof. J. A. GILRUTH who has been recently sent north to Port Darwin to reign over Australia's tropics as, what one critic of the man has called "the Scotch Czar," has already reached the Northern Territory with his wife and family.

"The territory has been damned by everybody, and never been given a show," he said just before he left Sydney to take up his post. "It is five times the size of New Zealand, and yet the whole population numbers only 1264. There is not one bullock to the square mile, and but one European to every 450 square miles. The emptiness of the country is astounding and inexplicable."

VIVISECTION AND THE VETERINARY PROFESSION.

Sir,

The letter of Pate, J.P., opens up a subject that might well occupy more of the attention of amateur and professional preventers of cruelty. The tolerably frequent use of irritating substances to irritable and sensitive spots is well-known to most veterinary surgeons who have practised even for a short time. The two chief factors in the perpetrating of mal-treatment are ignorance and parsimony. Perhaps more human beings consider themselves capable of treating animal ailments than human diseases, but even in the latter case the faith-healer and the dabbler often try their hand on a serious job. To alter the state of things ignorance must give way to enlightenment, but how can you expect scientific knowledge in a numskull whose environment is utterly commonplace and his every-day work based on a bad rule of thumb procedure. Besides, many men keep and work a horse who cannot keep themselves. Until horseownership is fixed on an income basis there will always be a tendency to look on an animal as an inanimate machine that only wants oiling or lubricating occasionally with some cheap muck,

To overcome the parsimonious trait it is necessary to spread the knowledge that remedies are sold by the veterinary surgeon often at a less price than by the proprietary medicine vendor, and that a call at the surgery may enable helpful advice to be given in addition. Advertising that all veterinary surgeons supply medicine would be a counterblast to the unblushing advertisements of the patent medicine vendor, and the wheedling ways of the itinerant quack-remedy traveller, and the shop displays of bottles and packets at shows. At present for the professional man to fight against these is like beating the wind.

If knowledge of the veterinary surgeon's field were more widely spread we should not hear so much about irritating applications being made to inflamed structures, evil-smell-potent drugs being given to canine patients, whitening and vinegar being used to cover open sores (on the principle that hiding an evil cures it, especially if it is cloaked in white), pepper and onions to make mares urinate, and elementary applications for mange that kill the skin as well as the parasite.

Amateur treatment without a guiding head is often followed by a police court prosecution, and vinegar and whitening at a cost of twopence may eventually work out at 15/- an ounce.

The remedy is the spreading of knowledge that veterinary surgeons are reasonable men who wish to help those who consult them—that they are not all "on the make" to the uttermost farthing, and that a timely call on them may often hinder much future trouble and expense.

The difficulties in the matter are apparent, and to none more so than to the veterinary surgeon himself, the remedies are not hard to indicate, but their adoption can only result largely by altering temporary fundamental conditions and by spreading the light: and epistles to the public press like those of Pate, J.P., do good and help to clear the way.

—Yours faithfully,

G. MAYALL, M.R.C.V.S.

PRACTICES FOR DISPOSAL

EAST COAST. Agricultural practice returning £800 per ann. Good house containing 2 recept. 4 bedrooms, bath, kitchens, etc. Stabling for 4 horses, coach-house, kennels, etc. Price required for house and practice £1300, of which £400 can remain on mortgage, or vendor would sell practice for £500 and would let house on lease at £45 per annum.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises. Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains: reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended.

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

GOOD CLASS practice in the West of London, returning £800 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

PURCHASERS are requested to send full particulars of their requirements as we have a number of practices and partnerships for sale which have not been advertised.

Average—seven words in a line.

These Advertisements will not be inserted unless prepaid, and if replies are to be received at this office an extra sixpence must be included.

Southern Counties Veterinary Society

THE Annual Meeting (postponed), will be held at Brighton on Tuesday, 14th May inst.

J. ALEX. TODD, Hon. Sec.

Worthing.

South Eastern V.M.A.

THE first General Meeting will be held at the County Hotel, Canterbury, on Wednesday, 8th May. Mr. James Crowhurst, F.R.C.V.S., President, will take the chair at 2-30 p.m. and give a presidential address. Business, adoption of rules and regulations commended by committee: A report of committee and suggested amendments to scale of fees allowed to veterinary inspectors, and other matters. All V.S. under the K.C.C. are particularly requested to be present, and V.S. from adjoining counties are cordially invited to attend.

T. C. TOOPER, Hon. Sec. & Treas.

City of Sheffield.

APPLICATIONS are invited from qualified Veterinary Surgeons for the position of Junior Assistant Veterinary Inspector to the Health Committee of the Sheffield Corporation. Experience in cattle practice and certificate of a post-graduate bacteriological course will be considered recommendations. The person appointed must reside within the City and devote his whole time to the duties. Salary £150 per annum.

Applications stating age, qualifications, together with copies of three recent testimonials to be sent to the undersigned, endorsed "Assistant Veterinary Inspector" on or before May 15th, 1912. The successful candidate must be prepared to commence duties at once.

JOHN S. LLOYD,

Town Hall, Sheffield.

Chief Veterinary Inspector.

South Africa

APPLICATIONS are invited for the appointment of Veterinary Surgeon in the Department of Agriculture, South Africa, at a commencing salary of £350 per annum rising by annual increments of £15 to £500.

Further particulars may be obtained from the High Commissioner for the Union of South Africa, 32 Victoria Street, Westminster, S.W.

Genuine Country Practice

IN Western county for immediate disposal through ill-health, suit young energetic man. Price very moderate to quick buyer. Particulars in confidence to intending purchaser. Address, 1052 V.R., 20 Fulham Road, London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,

Locum:

73 Victoria Mansions,

South Lambeth Road, S.W.

HUGH R. SINGLETON, M.R.C.V.S.

Locum Tenens.

44, St. Michael's Road.

Bedford.

Locum Tenens

MR. WALTER G. GREEN, M.R.C.V.S.

"Rosenheim,"

Boscombe Park,

Bournemouth.

Class D Student

SEEKS situation in mixed practice during the summer months. Free early in May. Address, "Student," Royal (Dick) Vet. College, Clyde Street, Edinburgh.

As Locum or Assistant

FINAL year student, up this month, desires situation as above. Free at end of May. Done locum before in mixed practice. Good references. Address, "Lugol," Vet. College, Edinburgh.

Locum

WANTED locum from May 18th to about June 1st. Must have experience and good credentials. Apply, F. G. Edwards, F.R.C.V.S., Newgate Street, Chester.

As Assistant

CLASS C student desires situation as above, can take charge, seen town and country practice, references. Free end of May. Address, 1051 V.R., 20 Fulham Rd., London, S.W.

Assistant Wanted

IN South London horse and dog practice. Apply, H. H. Whitlamsmith, 1 Shardeloes Road, New Cross, S.E.

Manager Wanted

COUNTRY branch: M.R.C.V.S.: married, experienced standing castrator, good references. State age, salary required: house free. Address, 1053 V.R., 20 Fulham Road, London, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

To Students

VETERINARY Surgeon with extensive country practice has vacancy for student during vacation; one who has seen practice preferred. Reply with references. Address, 1055 V.R., 20 Fulham Road, London, S.W.

For Disposal

EXCELLENT old established horse and dog practice and horseshoeing business for sale in leading Scotch town. Address for particulars, 1054 V.R., 20 Fulham Road, London, S.W.

As Manager or Locum

MR.C.V.S., is open for engagement as manager or locum. Disengaged. Abstainer and reliable. Town or country. Address, 1059 V.R., 20 Fulham Road, London, S.W.

Wanted Immediately

RELIABLE qualified assistant for mixed practice. Temperate habits. State terms, experience, etc. Address, 1056 V.R., 20 Fulham Road, London, S.W.

Manager

VETERINARY Surgeon required to manage London practice with forge. Live in, unmarried. Must be used to dog practice. State salary required and references. Address, 1057 V.R., 20 Fulham Road, London, S.W.

Practice Wanted

WANTED, genuine town and country practice, returning £700 or over. West of England, (Somerset, Devon or Cornwall preferred). Address, 1058 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

CANINE nurse or dispenser, widow of M.R.C.V.S. wishes post as above. Experienced town and country. Address, 4042 V.R., 20 Fulham Road, London, S.W.

As Locum Tenens

WANTED, young qualified man to act as locum tenens for about three weeks from May 21st. Apply, giving references and stating salary required, to 3048 V.R., 20 Fulham Road, London, S.W.

As Assistant

RECENTLY qualified man, son of V.S., requires berth in busy canine practice, can furnish good references. Address, 3043 V.R., 20 Fulham Road, London, S.W.

For Disposal

TRANSVAAL. Practice in good mining town, returns £900 per annum, including contracts, with full complement of instruments, drugs, and latest veterinary books: good horse, trap, saddle, bicycle, etc. Substantial cash payment, and balance at 12 months. Address, 3041 V.R., 20 Fulham Road, London, S.W.

To Purchasers

PRACTICES & PARTNERSHIPS for Sale. Messrs Peacock and Hadley, Veterinary Transfer Agents, 19 Craven Street, Strand, W.C., will be pleased to forward to intending purchasers, who register their requirements, full particulars of anything suitable on their books. No charge to purchasers or for inquiries.

The Journal of The Board of Agriculture

ISSUED on the 15th of each month. Twelve months 4/-, three months 1/-, or single copies 4d., direct from the Board of Agriculture and Fisheries, 4 Whitehall Place, London, S.W., or through any bookseller.

Assistantship Wanted

BY thoroughly practical M.R.C.V.S., in a high-class, busy practice. Excellent references, terms moderate. Strict abstainer. Free April 10th. Address, 8304 V.R., 20 Fulham Road, London, S.W.

As Assistant or Locum

VETERINARY surgeon desires permanency in good class country practice. Experienced, bloodstock, cattle, reliable, hard worker, used to taking charge, good obstetrician, horseman, single, 35, excellent references. Address, 5038 V.R. 20 Fulham Rd., London, S.W.

Assistant Wanted

QUALIFIED, for a busy practice in the North of England, chiefly town and colliery: must be thoroughly steady, capable and trustworthy. A suitable man will be treated liberally. Address, 1048 V.R. 20 Fulham Road, London, S.W.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

The Economics of Feeding Horses,

By **HAROLD A. WOODRUFF, M.R.C.V.S.**

Professor of Veterinary Medicine in the Royal Veterinary College, London.

"An extremely serviceable and well-timed book."

"Should be in the hands of all horse-owners who desire to feed their horses economically."—*Scottish Farmer.*

Price 3s. 6d.

London: **BALLIERE, TINDALL & COX,**
8 Henrietta Street, Covent Garden.

THE FARRIERS' JOURNAL.

A Monthly Magazine for Horse Shoers.
The only paper devoted to the interest of the Shoeing Smith.

Price 2d., by post 2½d.

Published by **G. WILD, 62 Mount Street,**
Ashton-under-Lyne.

**Non-Poisonous,
Non-Corrosive,
Soluble in Cold Water.**

CHINOSOL

**Active Antiseptic,
Strong Deodorant,
Powerful Germicide.**

Practical experience for years past proves that Chinosol in solution or ointment readily penetrates diseased tissue, thoroughly cleanses and keeps healthy all kinds of wounds, favours granulation and speedy healing, mostly without a scar, and promotes the growth of hair. Chinosol is supplied in

POWDER.

CHINOSOL PURE POWDER for therapeutical preparations used *INTERNALLY*.

CHINOSOL VETERINARY POWDER for lotions, ointments, etc., for *EXTERNAL* use.

CHINOSOL CRUDE
GRANULAR FORM } for prompt production of disinfecting fluids for odourless disinfection.
CHINOSOL CRUDE
POWDER F }

CHINOSOL SPRINKLING POWDERS for disinfecting and deodorizing stables, sheds, styes, kennels, fowl-houses, etc.

Also **ANTISEPTIC DRESSINGS, OINTMENTS, SOAPS, PESSARIES, CHINOSOL BORACIC DUSTING POWDER VETERINARY EQUIPMENT**, etc.

Write for full Price List, also for **POCKET CIRCULAR** for *VETERINARY PRACTICE* giving full particulars of treatment of **MILK FEVER, ABORTION, INFECTIOUS VAGINAL CATARRH** in *COWS*, and a great number of approved formulae.

NOTE.—Buyers of our preparations should in their own interest insist in receiving *ORIGINAL PACKAGES* bearing our trade mark with name and address of the Company and full directions inside, they should reject all packages not answering above description *AS NOT GENUINE* and inform us when such are offered.

Sold by Messrs. **Hewlett & Son, Ltd., London;**
Wyleys, Ltd., Coventry.

Willows, Francis & Co., London;
Woolley & Co. Ltd., Manchester.

And all **WHOLESALE CHEMISTS** dealing in *VETERINARY MEDICINES*.

VOL. XXIV.

THE SOUTH EASTERN V.M.A.

The Veterinary Society recently formed in Kent under the name of the South Eastern V.M.A. holds the first general meeting since its inception at 2.30 p.m. on Wednesday next, at the County Hotel, Canterbury. Business of real importance is on the agenda. It will be remembered that at the meeting at which the Society was first formed, reported in our issue of January 13th last, the question of veterinary inspectors' fees was raised, and it was resolved "That the whole of the veterinary inspectors be invited to attend the next general meeting to confer in formulating a revised scale of fees more commensurate to the services rendered." That has been done, and more; for the visiting inspectors are to be provided with a starting point for discussion. We gather from the advertisement of the meeting that the Committee of the Society will bring forward suggestions for a revised scale of fees, and all veterinary inspectors under the Kent County Council are invited to be present and discuss these.

From last January's report, it is easy to see that there are good grounds for hoping for an improvement in the conditions of Kentish veterinary inspection—if only the inspectors can be induced to act collectively. Representations by one or two would not be very likely to be effectual; a joint representation by all would be a very different thing. Every veterinary inspector in Kent, therefore, should attend the meeting if possible. If that is quite impossible, he should at least enter into communication with the Society's Secretary, Mr. Toope, of Dover, with a view to supporting concerted action. If that is done, it is more than possible that the Society may commence its career by securing a substantial improvement in the remuneration of the most responsible veterinary work in the county.

THE INTERNATIONAL CONGRESS FUND.

Recently it has been announced that Sir John McFadyean has succeeded in inducing nine other members to join him in subscribing £100 each to this Fund. Our few affluent members, therefore, are doing their duty by the Congress, and so are the Veterinary societies. What are we to expect from the average members—from the rank and file? We have little more than two years in which to raise the money—but with such a start it should be raised. If ten men can give £100 each, surely a hundred more can give £10, and a thousand more the modest sum of £1—and that, with the Societies' subscriptions, would almost if not quite suffice.

THE TREATMENT OF CANKER IN THE HORSE'S FOOT.

It has been stated by a whimsical critic that literature would come to a dead halt were the musty records of the British Museum and the wisdom of the secondhand bookstalls tabooed. After reading Mr. Noel Pillers' interesting paper on "An improved method in the treatment of canker of the horse's foot," I was impressed with the acumen of the above remark. Not that I wish to infer that Mr. Pillers' has recently paid a visit to the library of the British Museum, or gained inspiration from the shelves of secondhand bookstalls. Indeed otherwise, for the bibliography attached to his paper contains no reference to any of the earlier veterinary authors. As the following quotation from the fifth edition (1841) of Delabere Blaine's "Outlines of the Veterinary Art" is very much to the point, I make no apology for giving it at some length.

"TREATMENT OF CANKER. The principal indications appear to be, first to reduce the inordinate increase of parts to a level with the surrounding surface; and next to restore the healthy secretions Proceed carefully and accurately to examine what extent of sensible sole is separated from the horny; or, as farriers would say, how much is "under-run." Exactly to this extent must the sole of the hoof be removed with a drawing knife Not only must this be done in the first instance, but at every future dressing the same attention should be paid to examine if any further separation has occurred, that it may be removed also. Having thus fulfilled the first indication, by reducing the diseased fungus, and having lessened the irritation that occasioned it, by removing the detached horn, the next process is to promote a more healthy action in the diseased surface: two plans tend to this end—the first by *stimulants* applied to the surface of the vessels particularly; the second, by *pressure*, which strengthens them generally. After the exposure of the whole cankered surface, therefore, and of its treatment, as before directed, let it be sprinkled with either of the following powders:

No. 1.—Red oxyde of mercury	½oz.
Acetate of copper	"
Calamine	"

Mix.

No. 2.—Sulphate of copper	1oz.
Alum	"
Carbonate of lead	"

Mix.

The cankered surface being lightly covered with either of these, or any other escharotic stimulant judged proper, let it be dressed as dry as possible, first by a layer of lint, over which place pledgets of tow thickly over the bottom of the foot, which should be done very judiciously, so to fulfil the remainder of the indication, that is, to keep up a firm and equal pressure; and, to ensure a uniform continuance of it, place over the tow a piece of canvas to keep all smooth, and then introduce over the whole thin strips of iron or steel slid under the shoe, and crossing each other, which will retain the dressing and keep up a continual pressure, on which so much depends. This being done, wrap up the whole in thick sacking, or hose, so as to keep the foot perfectly dry, which is of the utmost importance, as nothing so tends to increase of the fungus as moisture; nor does anything so strongly prevent its future increase, and restore the healthy action, as dry applications united with firm and regular pressure over the sprouting surface. A very great fault is often committed by dressing cankered feet too seldom. I would, however, except the first dressing where it has been severe; here it is usual to let it remain on two or three days, until sloughing may be supposed to have commenced, and matter to be formed; but afterwards, no bad case ought to be dressed less frequently than every day. From a wish to avoid trouble this is often neglected, and a cure that might be quickly performed is needlessly protracted Nor must it be lost sight of that it is imperative at each dressing that the luxuriant and diseased slough or fungus must be first removed, not only to produce a level surface, but also to procure a complete view of the parts underneath."

Except for the fact that Mr. Pillers advocates the use of carbolic acid and iodoform (which were unknown when Blaine wrote) his treatment differs in no respect from that advocated by the author quoted. Blaine had a fair command of the English language, and when he used the term "pledget of tow" it may be taken that he meant a tight roll of tow. Whether these rolls were arranged in the geometrical manner advocated by Mr. Pillers it is impossible to say; but at least it is reasonable to assume that a veterinarian who had the ingenuity to devise a scheme of regular and constant pressure for the treatment of canker would manipulate his pledgets of tow and other appliances to the best advantage.

Without doubt veterinary science has made some advance since Blaine wrote. Theories of toxins, anti-toxins, opsonins, and the chemico-physiological side-chain hypothesis, formed no part of his education. But the forward movement can hardly have extended in the direction of making pledgets of tow. In this branch of the veterinary art Blaine's predecessors "ferriers and horse leeches," would also appear to have had nothing to learn. In these circumstances I suggest Mr. Pillers should alter the title of his paper to "The revival of an old method in the treatment of canker of the horse's foot."

PARACELSUS.

CASTOR OIL BEAN POISONING.

One morning, during the autumn of last year, a telephone message was received to the effect that an alarming outbreak of disease had occurred amongst swine on a farm within the city boundaries. On visiting the premises it was found that the illness had commenced within the previous 12 hours. There was a total of 52 swine on the premises. Of these three sows and three store pigs were ill whilst one boar, one sow and three small store pigs were found dead.

Symptoms.—Off food, lying down, disinclined to move, crouching under the bedding, somewhat tucked up in the abdomen, signs of abdominal pain, ears drawn backward, and the body surface almost cold.

Post mortem.—A young pig, about 4 months old, which had just died, and was still warm, was opened. There was hæmorrhagic gastro-enteritis with large blood clots—in some parts completely filling the lumen—in the small intestines. The mesenteric lymphatic glands were highly congested. The remaining glands and organs appeared normal.

An examination of the food was made, and a bag of meal being suspected it was decided to set this apart under lock and key.

The owner, after dosing the live swine, including those not affected, with raw linseed oil, used up the remaining food stuffs in the usual way. After 2 or 3 days the swine made an uninterrupted recovery. The illness commenced at the first or second feeding with the suspected meal.

The owner, after marking one of the small unaffected swine for identification, made several attempts to feed it with the suspected meal, but the animal absolutely refused to oblige.

Samples of the meal were then forwarded by the owner to a public analyst. The following extract explains the latter's finding:—

"Dear Sir,—We have examined the sample of pig's meal received from you on the . . . and find that it contains a considerable quantity of crushed castor oil beans. From the circumstances you have described to us we are of opinion that the illness and death of the pigs have been caused by eating this meal"

Negotiations followed between the owner of the swine and the tradesman who supplied the meal, and, I am led to believe, terminated in a manner satisfactory to both.

THOMAS PARKER, F.R.C.V.S., Veterinary Officer.
Newcastle-upon-Tyne.

ABSTRACTS FROM FOREIGN JOURNALS.

DIAPHRAGMATIC HERNIA IN THE DOG.

Steinberg, of Gelsenkirchen, records the case of a mongrel male terrier, about two years old, which was run over by an automobile on January 2nd, 1910. Steinberg examined him soon afterwards, and found him quite conscious. The pulse was small, irregular, and beating about 150 times per minute. The respiration was very dyspneic, the

auxiliary respiratory muscles being in energetic action. The expression was anxious, and the animal avoided all movement, on account of the difficulty in respiration. Raising the dog from the ground so as to elevate the fore part of the body lessened the dyspnea; raising him so as to elevate the hinder part, on the other hand, increased it.

The diagnosis was diaphragmatic hernia with prolapse of the intestines. The treatment adopted, in the first place, was to lift the dog by the fore limbs and shake him to and fro, the object being to induce reposition of the prolapsed organs. A firmly applied bandage was then placed corset-wise round the thorax; and finally the dog's bed was arranged so as to elevate the fore part of the body. The next day the breathing was markedly less laboured, and the appetite had returned.

On the 20th February, the dog was again shown to Steinberg. The report was that he had seemed to recover from the accident, and for a time had been completely healthy, the breathing and appetite being normal. Three weeks before, however, he had been seized and held by the tail, and, while energetically struggling to free himself, had suddenly cried out. Since that time he had again shown temporary dyspnea, which bodily exertion could augment till the animal became unable to stand. The appetite had also been very irregular.

Steinberg found the dog ill-nourished. He came barking to meet Steinberg, and even this movement induced violent dyspnea to the extent that the dog stopped and stood swaying to and fro. Steinberg diagnosed a defect of the diaphragm and advised destruction, which was immediately carried out.

Post-mortem examination showed that the right and major portion of the liver and a great deal of small intestine had passed into the thorax through a rupture in the diaphragm, the edges of the rupture being smooth, bright white, and scarcely thickened. The liver was united to the under part of the pericardium and the diaphragmatic surface of the right lung by yellowish-white and easily detachable adhesions. Some serous fluid with caseous flakes was present in the thoracic cavity. A furrow was visible upon both sides of the liver; and the prolapsed portion was rather darker in colour than the remainder.

The first hernia had healed without leaving behind any organic derangement. The fresh scar, however, had not withstood the violent strain put upon it at the time when the dog was seized and held as stated above; and a new rupture had arisen, through which organs had become prolapsed into the thorax.

The author adds that, in the course of meat inspection, he has seen diaphragmatic hernia in swine in the most different stages and degrees, from an opening in the diaphragm the size of a ten pfennig piece with a fungus shaped distortion of the liver, to the condition in which the liver was completely and firmly adherent to the costal pleura and the diaphragm by connective tissue, and the displaced portion of liver presented the appearances of chronic interstitial inflammation.—(*Berliner Tier. Woch.*)

EPILEPSY IN THE HORSE.

Zschokke records (*Schweizer Archiv.*) the following peculiar case in a horse. The animal had been affected with a lobar pneumonia, which ran a typical course through all its phases. Zschokke examined him, and found that all the morbid symptoms had disappeared.

Wishing to examine the mucous membranes, Zschokke attempted to raise the internal wing of the nostril, but the animal resisted against this. Suddenly the horse's head began to tremble, and the flexor muscles of the neck were violently contracted.

When the inferior extremity of the head had almost reached the carpal region, the trembling of the muscles became extended over the whole body; the limbs were flexed, and the horse fell upon the left side. The neck was bent until the head arrived between the forearms; and the limbs were slowly stretched out, as is often seen in the death agony. The ears were erect, and the eyes were retracted into the orbits, causing the membrana nictitans to become apparent, as in tetanus. The nostrils were widely dilated and immobile, and respiration was arrested. The abdominal muscles were violently contracted. The pulse was imperceptible. The horse remained in this position for a minute and a half. Sensibility was greatly impaired, the animal responding neither to the owner's voice nor to pricks from a pin.

Soon a deep inspiration took place; the contracted muscles relaxed, and the head was raised. The eyes were staring and the pupils dilated. The respiration became regular; and, two minutes later, the horse got up without the least help. Progression was uncertain at first, but soon became normal.

The horse had had three similar attacks at the time of the pneumonia, and since then had shown nothing abnormal. Zschokke asks the question—to what cause can these seizures be attributed.—(*Annales de Méd. Vét.*) W. R. C.

NOTES ON TWISTS OF THE INTESTINES.*

By Mr. J. WILLETT, M.R.C.V.S., Marylebone, London, W.

Mr. President and Gentlemen,—To my mind the investigation of the causes of Torsion of the Intestines, both predisposing and actual, ought to open up a large field of inquiry to our pathologists, which has too long been neglected, for, when we consider the great mortality amongst horses, due to these diseases in our larger towns—a proportion at least of 40 per cent. greater than any other disease—and how little we can do in the majority of cases in effecting a recovery, the reflection is not pleasant.

TWIST OF THE SMALL INTESTINE.

Causes.—The causes of Twists of the Small Intestines I am inclined to think are mainly dietary. This is no doubt a very debatable point, but it is interesting to note that you will get a series of cases from a particular stud of horses; and it is my experience that the large

* Read at the meeting of the Royal Counties V.M.A. at Alperton, April 16th.

stud furnishes a bigger percentage than does the small owner. When inquiry is made as to the mode of feeding the routine is as follows: In the large stud the night man usually feeds the animals early, in many cases giving no water previously. On the arrival of the day men a second feed is given, before the horses start their day's work; then, when brought out of the stable, they make for the trough and fill themselves with water. Result—after working some hours, indigestion, followed in some cases by Colic. Or given a wet slippery day, accompanied with a heavy load—result, either "Rupture of the Stomach" or "Rupture of the Mesentery."

The latter state I am convinced may occur several days before a loop of the bowel becomes imprisoned. Again, I have made many "post mortems" where I have failed to find any rupture of the mesentery where Twist has been present, even after a prolonged search.

It is a peculiarity to be noted, that rarely has pain been shown early in the morning, but generally towards the afternoon or evening, and the duration from the first symptoms to death is on an average about 12 hours.

A second cause no doubt is prolonged exertion without food and the increased spasmodic contraction of the bowels during that state.

The question arises: How long has the displacement of the bowel occurred before pain is evinced? I think it may be some hours, for you very often hear the statement made, that the animal had nearly or had quite finished his mid-day meal, and on resuming work was taken with pain. Another point to consider: Is the Colic more often antecedent to the "displacement," or is the "Twist" the cause of the Colic.

Many practitioners are of the opinion that "Twist" may be caused by the animal rolling in the paroxysm of pain, and they will not, under any circumstances, allow the animal to roll; but for my part I have no objection, providing there is a good loose box, as I hold that very few, if any cases occur in this way, and I have known several cases when in my opinion the animal has been suffering with this complaint to spontaneously recover after rolling.

Twist of the Small Intestine is, I believe, 60 per cent. more frequent in London than twist of the large bowel; yet very little information is given of its various symptoms by the authors of our various text-books.

Symptoms.—In the early stages the symptoms may apply to several of the other bowel troubles, and in many cases are misleading, for they vary according to the temperament of the animal. In one case you may have only a moderate amount of pain shown throughout, and only by the persistence of the symptoms—unrelieved by the sedatives administered, the patchy perspiration, and later, the haggard expression, the deeper injection of the conjunctival membranes, the running down pulse, and the sobbing breathing shows the gravity of the case. Yet the next patient may be violent from the first, with profuse perspiration, followed by delirium, with a quieter interval before the end. These cases run a rapid course and there is not much difficulty in suspecting the cause.

The next constant symptoms present, which aid the diagnosis are the hard and bounding pulse, the increased violence of the symptoms, the peculiar crouching action—as though the animal was going to lie down, yet the prolonged reluctance shown before he eventually does go down.

There is one symptom which I have rightly or wrongly considered diagnostic in Torsion of the small bowel, and that is, the tinkling, bell-like sound heard on auscultation. You may have to listen some time before this is apparent, but in every case in which I have heard this sound I have found on post mortem the small bowel involved. The examination per rectum is often, in the early stages, misleading, you generally find

it empty, neither unduly constricted or dilated, but later you get the tenesmus on introducing the hand, and the dilated coils of the small bowel may be felt close to the rectum. The tympany also varies in different cases.

TWIST OF THE LARGE INTESTINE.

Torsion of the Large Bowel is mostly confined to the heavy Dray Horse, and is in my opinion more often due to direct accident than to dietetic errors, viz. by slipping or stumbling when drawing a load up an incline. My own experience has been, whilst assistant in a City Cart Horse practice—that the animal had been drawing heavy loads from the London Docks, where there is a steady incline of about two miles to pull up to the City, or the steep draw up from Tooley Street, or over one of the many bridges—and mostly on a wet day. Therefore the causes are not so easily avoidable. Professor Walley states in his book that the displacement usually occurs many hours before any symptoms may appear, and my own experience confirms this.

Some observers are of opinion that the "twist" is more often at the pelvic flexure than at any other part of the bowel, but I must confess that I have not taken that notice, although I think it possible that the great length of bowel filled with food, and its great freedom of movement may explain this.

Symptoms. In the early stages the symptoms are not characteristic, for on first examination you may conclude that you have only a simple case of "impaction" to deal with, but when the colic, at first slight, continues with increased pain, and the pulse becomes smaller and more frequent, a rectal examination generally reveals the true nature of the disease.

Mr. Caulton Reeks, in an able paper published in the December number of *The Journal of Comparative Pathology*, enumerates the symptoms of "torsion of the pelvic flexure of the colon," and in case any of the members present have not read it, I cannot do better than quote him. He calls attention to the comparative weakness of the pulse from the first, the constancy of the pain, the peculiar crouching movement, the sitting position with the fore limbs extended, rising partly up, then subsiding time after time, the patchy sweats gradually increasing and becoming colder, the haggard expression, the studied walk which later becomes a stumbling gait, the sobbing breath and running down pulse, the inability to feel the pelvic flexure on rectal exploration, owing to its being drawn back out of reach, the clasping of the arm by the rectum, and the excessive straining caused by its introduction.

Treatment. In most cases the treatment is disappointing, and if a recovery results it is very much a matter of luck. In the early stages the usual remedies for colic and obstruction, viz., a purgative accompanied by one or two sedative draughts, and if these do not relieve but rather increase the pain, a serious case may generally be anticipated. We may discover on examination per rectum that we have torsion of the bowel to deal with; I say *may*, because even then you may not be able to feel the displacement of the bowel. Personally, in all bowel troubles, I always start with a dose of barium chloride per ore, followed by stimulants, in fact I have totally abandoned aloes in cases of obstruction. If there is any tympany I do not hesitate to puncture, for I am quite convinced that I have had cases recover after puncture. When the distended small bowel could be felt I have punctured it through the rectum with success in two cases. I invariably follow on with an injection of Arecolin to increase the muscular contraction for I am of the opinion that sometimes a cure may be effected in this way, and even if not, it hastens the end of a fatal case.

Jelkman, in "Möller and Dollar's Surgery," claims to have effected a recovery of "torsion of the colon" in

quite a number of cases by retroversion, and I think you will agree with me that he is to be congratulated on his success. I have tried in several cases to emulate him, but have unfortunately failed, the clasp of the rectum round the arm, accompanied with the straining of the animal has rendered the task, at any rate in my case, beyond my skill.

THE NORTHERN TERRITORY.

By J. A. GILRUTH,

Professor of Veterinary Pathology, Melbourne University

For a copy of this Report, published as a Special number of *The Australasian Traveller*, we are indebted to an old and valued contributor to our pages. A tolerably full abstract is here given, as showing the breadth of the subject, and, incidentally, that given the man, the present day veterinary curriculum qualifies for wide views as well as for accurate knowledge and observation.

The Northern Territory, familiarly known to its inhabitants as the "N.T.," possesses at the present juncture great interest for every individual in the Australian Commonwealth, if for no other reason than that in the beginning of this year it passed from the control of the State Government of South Australia into that of the general Federal Government. Naturally it becomes desirable, therefore, that every Australian should at least have some knowledge of the problems and the possibilities of that country which is a State, yet not a sovereign State, within the Commonwealth.

Heretofore we have been in the habit of considering the southern shore of the continent the front door, for the chief reason that there has always existed the only entrance and the only exit. If looked upon as a possible door at all, the northern coast has at most been deemed a very poor back-door, and truly the entrances there have been few and the exits in goods or people none. Will this always remain so? While the future alone can decide, it is worth remembering that rarely is the entrance-hall of a dwelling facing the empty yard, while the back-door faces the busy street. We rather forget, when we consider our territorial dwelling, which is the empty yard and which is the busy thoroughfare of the world; for, this fair land being an island, we are perhaps too apt to view it as an orb in space without near neighbours. A glance, however, at the map (of which there are but few copies), showing the tropics of Asia and of Australia with the intervening islands, promptly convinces us that we have many neighbours. Lying very close to our northern littoral are the islands of the Dutch Indies, with a total population of nearly fifty million people, whereas a century ago there were but five. The nearest point is well under two days' steam from the northern capital. In this same zone, besides the Philippines and Borneo, as yet partly civilised, we see the tongues of Asia dipping downwards almost to the Equator. And when we consider that Hong Kong is in point of journey-time nearer to Port Darwin than is Sydney, the close connection between our continent and the "teeming East" begins to be realised.

Personally, I confess that until recently, when I was fortunate enough to be able to visit portions of the Northern Territory with my colleagues on a Federal Scientific mission, my ignorance was no less than that of the average tax-payer, who has to find his share of that £1,100 per day which the Territory is said to cost.

The total area is over 530,000 square miles, or five times the size of New Zealand, yet to-day we find the whole population, excluding Aborigines—but including Asiatics—a little over 3,000, of which the whites by last

statistics number 1,274. In 1908 the total number of Europeans was but 1,091, while in 1889 the number was 970. Even the native aboriginal population is sparse, though the exact number is unknown. The number of stock is exceedingly small when the area is considered, there being, according to last available statistics, under 400,000 cattle, and about 12,000 horses. Of sheep there are none, unless in the extreme south. A few goats are kept by station-owners and others for milking and as a substitute for mutton, while here and there a few pigs are kept. In other words, the country does not carry one domesticated animal to the square mile, and but one European per 450 square miles.

A study of the map shows that at all events the northern portion, particularly the great peninsula which forms the western border of the Gulf of Carpentaria, and is bounded on the west by the Timor Sea, and on the north by the Arafura Sea, is very well watered by rivers, such as the Victoria, the Daly, the Adelaide, the West and the South Alligator, the Liverpool, the Goyder, and the Roper, a number of which are navigable for many miles up from the mouth by sea-going vessels. Indeed, few parts of the continent, if any, are so well provided with permanent running waters.

It would be but reasonable to expect that along the banks of such rivers there must be large extents of flat or undulating country that should be available for the pursuit of agriculture in some of its many phases; that this is so our personal observation confirms.

For one who has been able to spend but two short months travelling through only a small portion of such a vast area to dogmatise on its possibilities for agricultural or any other development would be as presumptuous as absurd, the more especially as the season when I visited the Territory was the most favourable period of the year for general impressions. Yet one who has visited various parts of the world, and who for the whole of his life has taken a keen interest in all that pertains to agriculture, as I have, can hardly fail to form some general opinions, tentative it may be, on the possibilities as a whole.

Rightly or wrongly Australia has adopted almost unanimously a White Australian policy.

It is true that no white race has ever succeeded in permanently establishing itself within the tropics. But has it ever thoroughly attempted to do so in such a country as this? No, for the chief reason that all other habitable portions of the tropics were already supporting large numbers of coloured people long ere the white races were aware of their existence. Yet here is an enormous area within our borders, tropical no doubt, but practically empty of human beings! The European is distinct from other races chiefly in that he has the infinitely greater power of altering his immediate and general environment, in the narrow as well as in the widest sense, to suit his requirements. And is tropical Australia to prove that the limit of these powers has been reached? I trow not.

First of all, it must be frankly admitted that the Northern Territory is tropical. But that in itself does not argue the impossibility of agriculture. On the contrary, the tropics are, as a whole, more fecund than the other zones. In the parts where we travelled, droughts as experienced in the south are unknown. From the coast at Port Darwin to the Roper Bar, the rainfall gradually diminishes from 60 to 20–25 inches. Over this area the rain falls solely during the rainy or summer season (November–December to the end of March). The rainy season is perennial, and apparently as sure as the dawn of each day. For the remainder of the year there is the dry season, when no rain falls, and each day is fair and cloudless; and then it is winter, the coolest or least hot season of the year. Even the heat of the long dry season is not so detrimental to plant life as might be assumed, for at least till the end of August, or even

later, heavy dews are of nightly occurrence. So heavy were these dews on our overland journey to the Gulf during July that it was always necessary at night to place our garments under the mosquito tent: those left out were generally soaked by morning. At daybreak the first touch of the tent's roof meant an unwelcome shower bath, and on those tents with roof of double thickness frequently a pool of water could be seen. Such heavy dews naturally are of much benefit to the herbage, and prevent to a great extent the too early parching of the country. Chiefly to these dews, though partly to the comparative mildness of the daily temperature, combined with the absence of scorching winds, is attributable the fact that enormous areas of beautiful green grass could be seen in many parts during the trip, although no rain had fallen for over 100 days.

During the "wet" or summer season (there are only two seasons—the "wet" and the "dry") the climate by all accounts, and as to be expected, is trying to everybody—to the coloured people as well as to the white—and this is especially so near the coast, where the rainfall, and, consequently, the humidity, is greater. In the "dry," however, the climate is not unpleasant. Indeed, during our short stay in Darwin at the end of June, most people there complained of the undue severity of the cold, though to us southerners this appeared a decided exaggeration. Inland the weather was perfect. Rarely during the day did the dry-bulb thermometer register 80 degs., while the wet-bulb, the true indicator of the temperature as we feel it, was from 10-15 degrees lower. At night the temperature fell rapidly, generally reaching below 50 degs., at times below 40 degs., on one occasion 29.5 degs. being registered, when we were certainly not over 200 feet above sea level. Such conditions are decidedly not what one is led to expect at any time, at such a low altitude, within fourteen degrees of the Equator, and on some early mornings formed a not too agreeable surprise. Indeed, one of the party who has lived for a number of years in the tropics, and prefers to live in such latitudes, was once heard to exclaim ruefully, as he ran shivering from his blankets to the glowing camp fire, "This is no white man's country—it's too cold!"

What of the soil? That this varies greatly in quality is to be expected. As already stated, in the vicinity of Darwin the soil is, on the whole, poor and inhospitable. It is of a hard, gravelly, ironstone formation. From there to Pine Creek the railway line runs for 140 miles, mostly through mining country that is of little or no value for pastoral, let alone agricultural, purposes. Yet that there are patches of good land even amongst this, abundant testimony is borne by various Chinamen's gardens, where luscious pineapples, bananas, and other tropical fruits grow, not to mention the Botanical Gardens in Darwin itself, where so much good work has been done by Messrs. Holtze, senior and junior.

To the east of Darwin, near "Rum Jungle," there is a beautiful looking plain of black soil, doubtless wet and swampy in summer, but which, with drainage that should not be difficult, bids fair to grow anything from sugar-cane downwards. Still further east, running along towards and beyond the Adelaide River to the Mary and the Alligator Rivers, is an enormous plain composed for the most part of black soil, on which at present but a few station cattle run, besides large numbers of swamp buffalo, the descendants of those introduced many years ago by the early British settlements further north.

These plains, hundreds of miles long, seem to be, judging by what I saw, of rich alluvial black soil. At present they are water-logged, and so cultivation, which has been attempted by the indefatigable owner of the largest station (Mr. W. Laurie, a virile settler of thirty years' experience in the Territory), has been unsuccessful under present conditions. This to me was not surprising when I found stagnant water two feet

from the surface. But to-day, as everyone knows, some of the most fertile parts of the earth would still be much more useless bogs than the worst of these had man's ingenuity not transferred the water elsewhere by means of drainage systems. In my visit to these plains I crossed the Beatrice Hills—a range of quartzite a few miles long, whereon, many years ago, coffee was grown successfully by an early pioneering Company. Near this I touched the part of the Adelaide River, sixty miles from the mouth, whence some years ago numbers of cattle were embarked on board an ocean-going steamer and exported to Singapore, direct from the station whereon they were reared.

From Darwin, Prof. Spencer and I visited Melville Island, the home *par excellence* of the buffalo, where he has undisputed sway, there having hitherto been no attempts to breed cattle thereon. The ancestors of these buffalo were introduced by Sir Gordon Raffles in 1826, and they have multiplied so greatly that to-day the owner (Mr. E. O. Robinson) through his able superintendent (Mr. R. J. Cooper), exports annually about 1500 buffalo hides. This Island, consisting of about a million and a-half acres, should be admirably suited for cattle-raising purposes, so far as I was able to judge. It is excellently watered, and covered with open bush, amongst which is good herbage. The timber is mixed, there being a fair sprinkling of "blood-wood"—a white ant resisting timber—and other trees of less value. Perhaps in the years to come this island may become a dairying centre, but, meanwhile, it could be made a very fair cattle station by the expenditure of capital and energy. There is every evidence that at present it is free of ticks, the buffalo not being a natural host of these parasites, and this position should at all costs be maintained.

In our journey from Pine Creek, *via* the Katherine, to the headwaters of the Roper River and down the banks of that noble stream, we passed through country of varying character. Although, perhaps, the greater portion is of quartzite or sandstone formation, there are large areas of limestone country, and many hundreds of square miles of rich black soil covering a basalt formation were seen. Generally speaking, the country is more or less bush-covered; but the bush is open, and grasses of various kinds grow profusely. Often beautiful plains, where the rank grass was half the height of the horse, were crossed. Down the whole length of the Roper these plains are intersected at irregular intervals by quartzite ridges from 50 to 200 feet in height, the general trend being north and south, while here and there flat-topped knolls are common, indicating that formerly the country was covered by this quartzite or sandstone formation. The Roper itself commences at Bitter Springs, about 250 miles roughly from the sea, and pursues an easterly direction to the mouth. At the very source, which we visited, it is a considerable stream of water, issuing as a series of warm springs direct from the limestone. Here the water is slightly saline to the taste; hence the term "Bitter Springs." Within comparatively a few miles it broadens out into a magnificent stream, many yards broad, and many feet deep, with high banks. Two hundred miles from the mouth there is a reach thirty or more miles long, thirty to fifty yards broad, and twenty feet deep. Then for ten or twelve miles the river loses itself in the Red Lily Swamp—an enormous lagoon, from which it emerges after pursuing a tortuous course not yet explored, once more as a magnificent broad stream. The river, though broad and deep throughout almost the whole of its length, has no great current, by reason of several bars which divide it into reaches from twenty to fifty miles long. It appeared to us that were locks built at each of these bars, after a proper survey of the channel, this noble river would become navigable almost to its source, and so prove a valuable asset and a highway of the

country. Even now a coastal steamer visits, twice a year, Leichhardt's Bar, about ninety miles from the mouth, and I believe it would be possible to take an oil launch almost to the source, for the bars, which are not even difficult rapids, could be negotiated with a little persistence and ingenuity. Such is the Roper and its valley:—a magnificent stream bounded by broad plains which are intersected transversely by low ridges, all of which are grassed to the very tops. But the emptiness of this vast area is absolutely inconceivable. Some vague idea may be grasped from the statement that between the Katherine and Leichhardt's Bar, where there was a solitary mounted constable, we passed but one habitation, and that occupied by but one white man. Day after day, for three weeks, our party wended its way eastward without encountering a single wayfarer.

Now, how can this great emptiness be developed? To-day it is as empty as it was forty years ago, when viewed by the first white man. Will one ever from the ridges be able to see the homesteads of the settlers scattered over the plains? Surely it cannot—nay, it will not—be allowed to remain for long thus undeveloped, thus unoccupied even by the beasts of the field. Many thousands of square miles are not even selected on paper for cattle runs, and on these there is not a hoof print. Yet that it can grow cattle I have had ocular demonstration. Horses do well also; there is a "brumby" or wild herd on the Roper and Elsey Rivers, all in excellent fettle, and the lessees of the run are catching what they can and shooting what they can't catch. Pigs and goats do very well, but of sheep there are none, while dairy cows are unknown; indeed, all the cow's milk we partook of in the Territory reached us *via* the "tin."

It may be accepted that with irrigation the soil, even some of the poorest in the Territory, will produce almost anything. On three stations we partook of delicious melons, beautiful tomatoes, and vegetables of various descriptions, which seemed to grow with little attention, provided they were sufficiently supplied with water. At the Roper Mission Station banana plants were growing well, and several rubber trees, which, though planted but two and a-half years ago, are now ten to twelve feet high, testify that they will do very well with attention and a proper water supply. The cultivation of neither of these is looked upon as suitable for white men to engage in. But is this justified as an attitude? It is true that rubber at present is grown solely where cheap black labour is plentiful, and in climates where the white man could not possibly labour. The reason though is not the latitude so much as the excessive humidity of the atmosphere, for rubber, I believe, only succeeds where the annual rainfall exceeds 80 inches. Such a rainfall means a humid atmosphere and a rapid development of undergrowth, which must be kept down. Irrigation can, however, supply the moisture without the excessive humidity, and horse-drawn cultivators can do away with the necessity for much of the hand-labour. The mere tapping of the trees in a climate such as that of the winter season of the Northern Territory, and the further necessary labour in the preparation of the crude rubber, should not prove too onerous for white people.

Cocoon trees grow well, as can be seen in a small plantation of a few acres established near Darwin twenty years ago. The trees are tall, straight, and strong, and seem to bear well, although no attention is paid to them by their present owner, the area planted being too small to work commercially. Yet it serves to prove what might be done in this direction.

Upland rice will probably be found a very suitable cereal for cultivation in many parts of the Territory, and without irrigation. Experiments conducted by the Curator of the Experimental Gardens at Darwin are extremely encouraging. The swamp rice, commonly grown in the East, is, of course, impossible with white

labour; but the upland rice will grow in much drier situations, and possibly the land can be cultivated by machinery much as wheat land is cultivated.

In this connection it is of great interest to note that the American rice-grower is rapidly finding, according to official publications, that the employment of machinery "is revolutionising the methods of cultivation and greatly reducing the cost. The American rice-grower, employing higher-priced labour than any rice-grower in the world, will ultimately be able to market his crop at the least cost and the greatest profit."

Sisal hemp culture is being tested on a large scale, at the Experimental Gardens, with most encouraging results. Over fifty acres have been planted with this fibre-producing plant, and it is growing as well as it could in any part of the world. Many thousands of bulbils, or young plants, have been distributed to settlers who are anxious to experiment on their own lands, which shows that keen local interest has been aroused in this industry. Everything seems to augur well. The question, however, as to the suitability of sisal hemp culture with white labour, is not yet settled.

Good cigar-leaf tobacco is also grown in small plots in different parts. I am informed on good authority that samples submitted have been highly praised by experts, and, so far as the soil and climate are concerned, there is no doubt that everything essential for this crop exists in the Territory. Only experiment can demonstrate what possibilities are in store for tobacco cultivation as an industry, or a branch of agriculture, with white labour.

Cotton, both native and imported, grows well almost anywhere. If the cotton-picking machine of which one hears proves a success, and does not damage the flowers and unripe seeds, then there is no doubt that the cotton-growing industry will prove of the utmost value in many parts of tropical Australia. Without some such machinery, however, it is unlikely to ever become established without coloured labour to do the picking.

Most of the plants, whose cultivation I have referred to, do not, I am aware, appeal in any way to the Australian as part of the agriculturist's work, and, unless it can be demonstrated that other kinds of agricultural produce to which he is accustomed may be grown, neither he nor his British brother will care to seek his fortune in the North, at least in any great numbers. But are other products impossible in such a country? To assume so would be rash indeed, especially in Australia, many parts of which, formerly considered little better than desert, are to-day prosperous agricultural settlements. When considering the North we are apt to forget, if we know, that India has something like 23,000,000 acres annually under wheat. It is true that the wheat grown in India is of the coarse bearded variety; but it is also true that experimenters there are beginning to find that some Australian varieties promise better results than any hitherto cultivated. Of course, it is likely to be argued that India has cheap native labour and intense cultivation with irrigation. As regards the labour, cheap land enables a higher price to be paid, and anyway the Australian methods of wheat-growing do not concern themselves with the spade. As for irrigation, in many parts of India the soil is not irrigated for wheat. In Pusa and Muzaffarpore districts, for instance, where the rainfall is about 40 inches, irrigation is not resorted to for wheat-growing. The rainfall there occurs during only three to four months of the year, all of which is comparable to certain parts of the Northern Territory. Even in the vast tract from the Katherine to the Roper River, where the rainfall gradually diminishes from 35 to 40 inches to 20 to 25, it seems not unreasonable to suppose that, with proper methods of "dry-farming," such as are now so well known in Australia, and with rapidly-maturing wheat, this cereal could be grown successfully if sown just before the end of the wet season, or at all events imme-

diately after it, just so soon as the land becomes workable. If successful, the question of the settlement of this Territory by whites, so far as large areas are concerned, would be immediately set at rest, and for all time.

The same necessity for experiment-demonstration farms seems to me to exist for wool production. Sheep have been brought to the Territory in the past by one or two settlers, notably by Mr. A. Giles; but their breeding was ultimately given up. Although I made numerous inquiries as to the reasons for abandoning sheep-breeding, the information I received did not satisfy me that there was any real justification for the conclusion that sheep are unfitted for much of this country—that is, under proper conditions. In a country absolutely in a state of Nature, without dray-roads, without any fences, with water-holes in the dry season often over ten miles apart, with even no herding, and with spear grass and such vegetable annoyances to the wool-grower not kept down by grazing, it is not surprising that sheep were troublesome to look after, and that cattle were preferred on such enormous holdings, many thousand square miles in extent.

That the Territory has its drawbacks goes without saying. The absence of roads, and the practical absence of railway facilities, are potent, but may be remedied. Freezing-works are also wanting, but whenever the number of stock suffices, their establishment will be prompt.

The white-ant and the ant-hills are in many places serious, but science, if its services were properly enlisted, might show a way to eliminate, or at least diminish, them greatly. On the other hand, the stock,

especially the cattle, are healthy, the climate during half the year is very pleasant, the soil in many parts is good, there is much timber suitable for fencing, etc., the country is well watered by rivers, and above all, the rainfall, though limited to one season of the year, is certain. Such a country cannot much longer lie empty; it will surely be filled—by whom?

"Vivisection and the Veterinary Profession."

To the Editor of The Referee.

Sir,—I read with great interest "Pate, J.P.'s" letter on Vivisection and the Veterinary Profession, and I simply ask this question: "Is it true that unqualified men can perform any operations they like on animals and administer whatever drugs they choose and the law cannot intervene?" Surely if it were not true "Pate's" statements would have been contradicted.

I did wonder why there were no letters from the veterinary profession in this interesting correspondence that has been going on in your columns, because I note in a leading veterinary journal that there is an article which excuses people from calling in a qualified vet. because they cannot afford it, and there is at least one advertisement where a fully qualified man advertises for an unqualified assistant. Comment is useless when the profession itself stoops to such dealings, but for the sake of common humanity "Pate's" statements should receive official support.—I am, sir, yours, etc.,

ROBERT SMYTH.

Upper Tooting, April 15.

The Veterinary Profession.—Why there are so many Unqualified Assistants.

To the Editor of *The Referee*.

Sir,—I can tell "Pate, J.P.," whose letter in *The Referee* I read with great interest and the contents of which I wholly approve of, why there are so many unqualified assistants in the veterinary profession. It is because a young fellow who has just obtained his degree knows so little of the first rudiments applying to all sorts of animals. He knows little or nothing of castration, of the keeping and handling of stock, because he has never had any practical experience at college. I will quote a case in point, not in the slightest way exaggerated. A friend of mine, a Government veterinary inspector, engaged a duly qualified young vet. fresh from college and sent him to castrate some colts, some of which had been operated upon. The young professional, full of zeal, proceeded to try and operate on one of the animals which had been castrated. Small wonder was it that the owner, a very rich and profitable client, closed his acquaintance with that Government inspector.

Now, the unqualified operator has had his knowledge handed to him by those he has served under. He is greatly skilled in that branch of his calling; he understands the handling of stock and their requirements. He has a rough-and-ready way of personally dealing with animals which pleases the farmer. It is not the fault of the fresh qualified man that he fails in these matters, it is the fault of his training; and I venture to think that if the curriculum were again reduced to three years, and portions of the examinations were eliminated which are absolutely of no good to a man in his practice, and much more attention was given to practical surgery and the life management of all kinds of animals, that the young vet. would be far better fitted to be of use in his profession at once, and that very soon the unqualified man would drop out of that place which he occupies now from a matter of necessity.—I am, sir, yours, etc.,

C. J. RICHARDSON.

West Hampstead, April 23.

Cruelty Prosecution at Wolverhampton. Dismissed, with Costs.

At Wolverhampton County Police Court, before Mr. Loftus B. Moreton, Mr. Samuel Bayliss, and His Honour Judge Smith, Frederick James Reavy, 34, mineral water manufacturer, Hen and Chickens Yard, Dudley Street, Wolverhampton, was summoned at the instance of Inspector F. Slattery, of the R.S.P.C.A., for cruelty to a mare. Mr. A. Turton defended.

Inspector Slattery said that on the 19th ult., he visited a field at Compton and saw a mare, belonging to the defendant, grazing. The animal was lame in the fore-legs, due to acute inflammation of the feet.

Cross-examined: The animal was suffering from what was known as "fever in the feet" and it was cruelty to turn it into a field in that condition.

Mr. J. E. Cartwright, veterinary surgeon, said he saw the mare and found that the case was an exceptionally bad one. The mare was hobbling about in a good deal of pain, it was causing her pain to move and it was cruelty to let her walk about to graze.

Mr. Turton said the case was one in which there was going to be a dispute between professional gentlemen. The defendant, as a layman, acted on the advice of his veterinary surgeon Mr. J. H. Bates, and a man was obliged to act on the advice of his veterinary surgeon, the same as he was with his doctor or, in a greater degree, his lawyer. There could be no intentional

cruelty where a man acted on professional advice given him.

Defendant gave evidence that he was managing partner of Messrs. Smith and Co., who kept several horses. Witness called in Mr. Bates to this mare, and it was on the advice of Mr. Bates that the animal was taken from the stable to the field at Compton. The mare was also visited in the field by Mr. Bates and by witness. Witness's knowledge of horses was sparse and he relied on his veterinary surgeon.

Mr. Bates, called as a witness, said he had had 25 years' experience as a qualified professional man. He was called to this mare and advised her removal to the field. She was walked there and was "perfectly fit to go." The best treatment for a horse in such a condition at a certain stage was slow exercise. He should give the same advice to-morrow as he had done in this case.

Mr. Turton intimated he had also another veterinary surgeon—Mr. Johnston, of the firm of Messrs. Cartwright and Kidd, but he would leave the case where it was.

Mr. Loftus Moreton: The case will be dismissed.

Mr. Turton then applied for costs to be granted against the society, and said the inspector knew that his client was being professionally advised. The defendant had also been put to a great deal of expense to build up the defence.

The magistrates granted Mr. Turton's application.—*The Midland Evening News*.

Experiments in Maize Feeding.

A series of experiments covering four years by the College of Agriculture of the University of Wisconsin has shown that cows fed only on maize produce large vigorous calves and were in good condition throughout the experiment. Those fed on wheat produced undersized calves either dead at birth or dying shortly thereafter. Those fed on oats were better than those fed on wheat, but not so good as those fed on corn. The experiments, says *Hoard's Dairymen*, have demonstrated that the value of feeds for cattle cannot be determined absolutely by the amounts of digestible feed which they contain, and that certain physiological effects of different feeds, which hitherto were considered of practically no importance, have a vital effect upon the health of cattle. In view of the commonly accepted theory as to the insufficiency of maize alone as a food, the results of the experiment are interesting.

Export of Horses.

During last year 9342 horses were examined at Custom House Quay and Fresh Wharf before shipment to Rotterdam. Of these 280 were rejected by the veterinary inspector of the Board of Agriculture, and 43, which suffered either from glanders or parasitic mange, by the City inspector. Compared with the previous year, this showed a decrease of 473 in the number examined and an increase of 112 in the number rejected.

In Wiltshire a causeway built and endowed by a market woman in 1474 still serves its purpose of bringing the neighbouring villagers dryshod into the ancient market town of Chippenham. It runs from Chippenham Cliff to the top of Wick Hill, in Bremhill parish, a four-and-a-half mile road, traversing the heavy clay of the low-lying lands on either side of the Avon. The raised stone footway is placed high above the horse road, and is kept in good repair to-day, as it has been for some 450 years. The good Maud Heath not only saved enough to build the road, but pursued her trade so wisely that she was able to leave property in trust for the maintenance of her road.

REVIEW.

HANDBUCH DER SERUMTHERAPIE UND SERUMDIAGNOSTIK IN DER VETERINÄR. MEDIZIN. Unter Mitwirkung von Dr. Oluf Bang, Copenhagen; Prof. Dr. Oskar Bail, Prague; Prof. R. Grassberger, Vienna; Dr. G. Grosso, Budapest; Dr. F. Hutyrá, Budapest; Prof. Dr. C. O. Jensen, Copenhagen; Dr. R. Klett, Stuttgart; Prof. Dr. M. Klimmer, Dresden; Dr. F. Löffler, Greifswald; Prof. Dr. H. Miessner, Bromberg; Dr. Noack, Dresden; Prof. Dr. Paul H. Römer, Marburg; Prof. A. Schattenfroh, Vienna; Dr. Josef. Schnürer, Vienna; Dr. Schmidt, Dresden; Dr. Seitz, Berlin; Dr. Sieber, German South-West Africa; Dr. Theiler, Pretoria; Dr. Georg Wolfsohn, Berlin; Dr. A. Wolf-Eisner, Berlin. Herausgegeben von Dr. M. Klimmer und Dr. A. Wolf-Eisner. Band II vom Handbuch der Serumtherapie. (Pp. 495. Four Plates. Price—stitched, 18 marks—bound, 20 marks. Published by Dr. Werner Klinkhardt. Verlagsbuchhandlung, Liebigstrasse 2. Leipzig.)

Only the fact that comparatively few British veterinary surgeons are familiar with the German language prevents us making a very extensive review of this valuable book. It is the second section of a two-volume publication, the first section having been issued some time ago. The first section, which deals with serum therapy in human medicine, has had a wide circulation, and has already been translated into Spanish and Russian. The present second volume, dealing with the same subject from a veterinary point of view, will be no less valuable than the first. The first volume was published under the editorship of Dr. Wolf-Eisner, with numerous collaborators. For the second, Dr. Wolf-Eisner has obtained the aid of Prof. Klimmer as co-editor, with, as is indicated in the subtitle, a powerful list of collaborators.

This extensive collaboration is one of the most valuable features of the work. Broadly speaking, the book may be best described as a series of long distinct articles, each consisting of a methodical and detailed exposition of the present knowledge of a particular department of the subject, and each written by a specialist. Dr. Theiler, for instance, writes upon rinderpest serum and active immunisation against rinderpest; Dr. C. O. Jensen deals with inoculation against diseases of calves, specific prophylaxis and therapy against streptococcal diseases, inoculation against bradspot, and protective and curative inoculation against canine distemper; while the numerous remaining subjects are entrusted to equally capable hands.

The theoretical part of the subject receives ample consideration; but the aim of the work is nevertheless essentially practical. Full information is given of the methods of preparing and employing the various sera and vaccines, their value is estimated—generally by means of statistics—and their advantages and drawbacks indicated. An appendix at the conclusion of the volume gives the prices of the different products, with the names and addresses of firms supplying them.

In addition to protective and curative inoculation, the whole subject of sero-diagnosis (including agglutination, precipitation, and complement-fixation) are very fully dealt with; and here again special attention is given to the technique of the various procedures. Finally, the work includes sections upon the bacterial destruction of mice, and the campaign against rats.

The names of the numerous authors speak for themselves; and the work is of the quality that might fairly be expected from such men. We know of no single book which conveys anything like the same amount of information upon these particular subjects to the veterinarian. It may be unreservedly commended to every veterinary surgeon who can master the language in

which it is written, whatever his line of work may be. Much of its matter concerns methods which are, or soon may be, current in daily in daily practice; and therefore it will be very valuable to the clinician. It will perhaps be even more valuable to the pathologist.

LANG'S BREEDERS' DIRECTORY, 1912. (R. T. Lang, Ltd., Tudor House, Tudor Street, E.C.)

This work is a directory of the breeders of various species of livestock—horses, cattle, pigs, sheep, goats, dogs, rabbits, poultry, pigeons, and bees. As the only breeds of horses included are the Shire, Clydesdale, Suffolk, and thoroughbred, the equine section cannot be called satisfactory; and it is rendered still less so by some curious reduplication of the pages dealing with the two first named breeds. Other sections are, however, less imperfect; and on the whole it may be fairly said that, despite some manifest flaws, the book will be of some use to breeders in the present initial form. The present being the first edition, we may hope to see considerable extension in subsequent tissues.

W. R. C.

CORRESPONDENCE.

THE ANNUAL DINNER OF THE ROYAL COLLEGE OF VETERINARY SURGEONS.

Sir,

I am sure that the profession will be pleased to learn that His Excellency the Lord Lieutenant has promised to be present at the Annual Dinner of the College to be holden in Dublin on June 5th, 1912. A considerable number of members of the profession have already intimated their intention to be present, many accompanied by guests, and I should be glad to have the names of any members from Great Britain who intend being present, that the necessary arrangements may be made without delay. A representative committee, to have charge of the dinner arrangements, has already been formed.—Yours faithfully,

G. E. HAINES.

Registrar of the Royal Vet. Coll. of Ireland.

CANKER OF THE HORSE'S FOOT.

Sir,

After reading Mr. Pillers' interesting article on "The improved method in the treatment of canker of the horse's foot" [in your last issue, I am induced to send you the treatment that the late Prof. Simonds recommended to his class in the early fifties. It was as follows:

After the foot has been well prepared, mop the cankered parts with pure nitric acid, then sprinkle them freely with sulphate of copper, and cover the whole with Stockholm tar, and repeat this dressing every third day.

The directions for preparing and dressing the foot are so well and so fully described in Mr. Pillers' article, that it is unnecessary for me to repeat them, but I may add that if a plate of sheet iron is screwed on to the shoe, more rolls of tow can be packed in, and this will ensure greater pressure and keep the foot dry. This we were told was indispensable. Moss litter or sawdust is preferable to straw for bedding.

I have never applied Nitrate of copper direct, as Professor Simonds used to say that it was not so effectual as when formed on the seat of disease.

I may mention that I practised in Salisbury the greater part of my life. The disease is not so prevalent in agricultural districts, but I have had some excellent results from the above treatment, and I do not remember having had any relapses. I have also found this treatment an excellent remedy for foot rot in sheep.

I must quote Mr. Pillers' wise remark, "Plenty of uninterrupted time and a strong liking for thoroughness are invaluable in treating those cases.—Yours faithfully,

T. AUBREY.

Sir,

On reading the discussion on the above in your last week's issue, especially on the point which Mr. Pillers pins his contention that the "novelty" and originality is in the application of the tow in firm rolls, I am tempted to ask, "Is there anything new under the Sun?" If it will interest Mr. Pillers to know that forty years ago, when but a child or little more, driving about the country with my father, I witnessed him on several cases of canker, how he used to roll the tow up in pledgets as hard as ever he could and pack them in over the sole, held in sometimes by iron straps crossways, and sometimes the iron plate, frequently stating that the pressure cannot be too great, as it was the all-important thing, and the free use of the drawknife, but always careful to avoid bleeding, and he seemed annoyed when such did at times happen.

As to the drugs he used, Carbolic Acid, Zinc Sulph. Copper Sulph. Antimony, the hot iron, varied accordingly. Other agents he may have used, but the above I know.

Personally I have used the above, and have also tried Perchloride of Mercury in spirit; Formalin in varying strengths; and as a dusting powder, Boracic and Zinc Sulph. mixed. One case which I had in a big sized Farm Horse in both hind feet, extending over the whole surface of the sole and frog. My first examination and advice was to have it destroyed, but I was told that such would not do. I must treat, not kill. In this case money was no object, as the prompt and ungrudging payment of bills indicated. I treated it for two years, several times breaking out afresh, but eventually dried up and became absolutely cured. That was twelve years ago, and I saw the horse last year at work and still correct. Doubtless one could not afford the time nor the patience as the above often.

I was frequently disgusted and sick of it.—Yours, etc.,
Ochilview, Dunning. A. W. LAWSON.

UNQUALIFIED ASSISTANTS.

Sir,

Seeing the subject, employment by veterinary surgeons of unqualified assistants, has again aroused the attention of our Council, I venture to offer a few remarks which I assure the Council and the veterinary profession generally are made without any prejudice, and with a firm resolution not to enter into correspondence on the matter.

I will ask newly qualified men seeking situations as assistants not to think I am making any suggestions against them; I assure them I am not. No man likes young men more than I, or would do more for them. One reason I regret to be getting old is, that I cannot have more of them about me.

I think there can be but one opinion regarding the question, and that is—All freshly engaged veterinary assistants should be members of the Royal College of Veterinary Surgeons.

I am surprised to see members of the profession advertising for unqualified men. The same view I now hold I expressed some few years since when a discussion on the subject took place in the Council Room, during the time I had the honour of belonging to the Council. I am a Veterinary Surgeon who have living with me an assistant who is not an M.R.C.V.S.; who never professes to be. My employers know he is not, and are as pleased to see him to do the work he does as they would be to see me. He has been with me many years. He attended the Royal Veterinary College, Camden Town, as a student one Session—1874-5 I think it was—having previously served a pupillage. After the vacation, through no fault of his, he was unable to return to College.

He is not kept from any menial object, nor is he ever asked to do anything derogatory, or that I could not, nor would not do myself.

During the years this assistant has been with me I have had some few veterinary assistants—some newly qualified, others who have passed some little time. I have had gentlemen from each of our present schools, and from the one that was. I make no comparison, and have nothing to say against any. A few have been really good men, as proved by positions they are now holding.

Not one of these men when he first came to me could have filled the place of my unqualified assistant in a hard-working country practice, in which all branches of veterinary work are included; as my valued friend and fellow-student, Wm. Hunting, once remarked, any amount of Colic, Castration, and Cow Calving, and of course other rough work.

My point and reason for writing is—undoubtedly, there are other men in the same position as the one to whom I refer. Can it be expected that such men are to be thrown out of the only means they possess of obtaining a living? A man 60 years of age knows no other business, and if he did, is too old to start at a new game. I don't think this subject has been clearly understood, as one of the leading members of Council, in a speech on April 12th, said: "I venture to remind this Council that there is, or was, at any rate, a pretty widely expressed feeling that this Council did less than its duty in not putting into the Bill which is now before Parliament a clause to the effect that practice by unqualified persons should be prevented;" that is to say, it was suggested that we ought actually to seek powers. Surely some stipulation would be made for men who could be certified by members of the Royal College of Veterinary Surgeons to have served as unqualified assistants for a given number of years.—Yours truly,

WM. BOWER.

East Rudham, King's Lynn, May 1st.

VIVISECTION AND THE VETERINARY PROFESSION.

Sir,

I read with much attention "Pate, J.P.'s" opening letter on vivisection and the Veterinary profession, but I fear legislation cannot bring about the required reforms. It rests with the Veterinary profession to put its own house in order.

The cause of the whole question is explained in Mr. C. J. Richardson's letter, which appeared in the *Referee* of April 28th, entitled, "Why there are so many Unqualified Assistants?"

To my mind a copy of this letter should be sent to every qualified veterinary surgeon in England, and they should be requested to say if they agree with the suggestions, that the curriculum be reduced to three years, certain items be eliminated from the exams, and special attention be given to practical surgery, such as castration, etc.

I would go further, and suggest that every student before he could go up for his final should produce a certificate signed by a qualified man with whom he had been during his vacations, to the effect that he had a practical knowledge concerning the castration of all kinds of animals. That he could cast and handle in a practical way, and understood the whole management of all kind of stock. And if the majority of the qualified men were in favour of such alterations, then the matter should be placed in the hands of the governing authority of the R.C.V.S.

I believe that if this were done the Veterinary profession would soon regain its old standing, and the unqualified man become a thing of the past.—Faithfully yours,

C. E. PETLEY.

BLACKLEG

(QUARTER-EVIL. SYMPTOMATIC ANTHRAX.)

The New Zealand Official Report on Blackleg shows that the mortality from this disease has been reduced by 75 per cent. since vaccination was made compulsory. The vaccine is supplied in convenient form under the name of

"BLACKLEGOIDS."

"Blacklegoids" are easily administered by means of the "Blacklegoid" Injector.

Extract from a letter which appeared in *The Veterinary Record*, January 25, 1908: "About five years ago I commenced to inoculate with Parke, Davis & Co.'s 'Blacklegoids,' and since then I have lost only one, and that was this year, out of over 900 inoculated since I commenced. I may mention that I have no interest in Parke, Davis and Co.'s preparations."

Co. Kilkenny, December 28th, 1907.

The Stock Inspector of the Pastures Protection Board, Singleton, Australia, when ordering (May 17, 1907) 200 doses of "Blacklegoids," stated: "This is the third year I have used your 'Blacklegoids,' with a result far better than I or the owners of the cattle ever anticipated. I do not know of an instance where it did not act as an immediate preventive."

Further particulars will be sent on request by

PARKE, DAVIS & Co., 50 Beak St., Regent St., London, W.

THE 'RECORD' PRECISION SYRINGE.

The FINALITY of Hypodermic and Serum Syringes.

"The "Record" Precision Syringe is a piece of delicate mechanical workmanship well deserving its name. It meets **all requirements as regards aseptic conditions and accuracy and it is always ready for use.**

It consists of **metal and glass** only. The glass barrel is ground inside perfectly true to cylindric form. The Nickel vacuum piston is "ground in" into the glass barrel by precision machinery so as to fit hermetically, it slides smoothly, yet tightly, **without any lubricant.**

The cover is fixed on the cylinder with a **bayonet-fastening**; for the purpose of **thorough cleaning** it is provided with a segmental incision, by means of which it can be detached from the piston-rod by sliding it off side-ways. When **completely** taken apart the Record Syringe **forms 3 parts only: cover, piston and barrel.**

The Needles are provided with the original "Progressive" flat mounts. By this arrangement a good hold is afforded to the operator.

The fixing of the needle itself in the mount, by means of a smooth longitudinal guide arranged above the screw threads prevents the needle from breaking off in the mount.

EVERY SYRINGE IS GRADUATED BOTH IN C.C. AND MINIMS.

PRACTICES FOR DISPOSAL

EAST COAST. Agricultural practice returning £600 per ann. Good house containing 2 recept. 4 bedrooms, bath, kitchens, etc. Stabling for 4 horses, coach-house, kennels, etc. Price required for house and practice £1300, of which £400 can remain on mortgage, or vendor would sell practice for £500 and would let house on lease at £45 per annum.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains: reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended.

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

PURCHASERS are requested to send full particulars of their requirements as we have a number of practices and partnerships for sale which have not been advertised.

Professional Advertisements.

These will be received up to Thursday morning.
Five lines or under 2/6 (exclusive of heading): for two insertions 4/-; for three 5/-; after three 1/- each.
Each line above five—first insertion 6d; after first 3d.
Average—seven words in a line.

These Advertisements will not be inserted unless prepaid, and if replies are to be received at this office an extra sixpence must be included.

ANNUAL DINNER OF THE ROYAL COLLEGE OF VETERINARY SURGEONS, June 5th, 1912.

THE Annual Dinner will be held on Wednesday evening June 5th, 1912, and Members of the Royal College wishing Tickets (One Guinea each), for themselves and friends, are requested to communicate at once with the undersigned: the Secretary of the Dinner Committee, GEO. E. HAINES, Registrar, Royal Veterinary College of Ireland, Ballsbridge, Dublin.

Southern Counties Veterinary Society

THE 31st Annual General Meeting will be held at The Royal York Hotel, Brighton, on Tuesday next, 14th inst. Business: Routine. Election of officers, etc. Paper on John's Disease. The president, Mr. William Hunting, will take the chair at 2.30 p.m.
J. ALEX. TODD, Hon. Sec.

Midland Counties V.M.A.

A MEETING will be held at The Swan Hotel, Stafford, on Tuesday, May 14th, at two p.m. The President, W. H. Brooke, Esq., in the chair. Agenda: Routine business. Inaugural Address by the President. Brennan Devine, Esq., F.R.C.V.S., Birmingham, will read a paper on "John's Disease." Tea at 5 o'clock.
Camden House, H. J. DAWES, Hon. Sec.
West Bromwich.

City of Sheffield.

APPLICATIONS are invited from qualified Veterinary Surgeons for the position of Junior Assistant Veterinary Inspector to the Health Committee of the Sheffield Corporation. Experience in cattle practice and certificate of a post-graduate bacteriological course will be considered recommendations. The person appointed must reside within the City and devote his whole time to the duties. Salary £150 per annum.

Applications stating age, qualifications, together with copies of three recent testimonials to be sent to the undersigned, endorsed "Assistant Veterinary Inspector" on or before May 15th, 1912. The successful candidate must be prepared to commence duties at once.

JOHN S. LLOYD,
Town Hall, Sheffield. Chief Veterinary Inspector.

To Veterinary Surgeons

ADVERTISER, 38, unqualified, been to college, fine horseman, good operator: assistantship or buy share in practice: well up in hunting work, thoroughly knows the game. Address, 2058 V.R., 20 Fulham Road, London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,
Locum:

73 Victoria Mansions,
South Lambeth Road, S.W.

HUGH R. SINGLETON, M.R.C.V.S.
Locum Tenens.

44, St. Michael's Road.
Bedford.

Locum Tenens

MR. WALTER G. GREEN, M.R.C.V.S.

"Rosenheim,"
Boscombe Park,
Bournemouth.

Locum Wanted

FOR about a week from May 27th, Southern Counties; state terms, and addresses of two gentlemen for whom you have previously acted. Town and country practice. Address, 2057 V.R., 20 Fulham Road, London, S.W.

Canine Practice for Sale

RETURN £900 last year, situated wealthy suburb practically unopposed, good fees, easily worked with cycle. No night or Sunday work. Scope for increase, particularly if horse work encouraged. Owner retiring. Premises costing £1500, including modern dog infirmary, to be sold. Strictest references given and required. For further particulars, apply Messrs. Hammond, Clarke and Co., 11 Great St. Helens, E.C.

To Veterinary Surgeons

FINAL year student up for exam. this month, seeks situation in mixed practice for the summer. Address 2059 V.R., 20 Fulham Road, London, S.W.

Student Wanted

IN an extensive country practice, Norfolk, must be good horseman and dispenser. State age, terms and experience: one able to start immediately preferred. Give name of practitioner for reference. Address, 2051 V.R., 20 Fulham Road, S.W.

Locum Tenens

BY Class "D" student, son of V.S. Thorough knowledge of every branch of profession. Good credentials. Apply "Lysol," Vet. College, Edinburgh.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

Partner Wanted.

PRACTICAL qualified partner in a large horse and dog practice on the South Coast. Premium for half-share £300. Easy payments might be arranged. References given and required. Open to full investigation. Address, 2052 V.R., 20 Fulham Road, London, S.W.

Assistant Wanted

MR.C.V.S. practical, steady for colliery and mixed practice in Lancashire. Must be experienced in parturition. Salary £160 to commence. Live out. Address, 2053 V.R., 20 Fulham Road, London, S.W.

For Disposal

SUSSEX. For immediate disposal through ill-health, genuine country practice established 20 years; returns about £400. Suit young energetic man. Price very moderate to quick buyer. Address, C. F. F., 42 Canonbury Square, Highbury, N.

Practice for Sale

GOOD, sound, large scope for increase, about £200. Agricultural, hunting district, Midlands. Expenses low. House, stable, low rent. Possession now or June. Drugs, etc., low premium. Address, 2054 V.R., 20 Fulham Road, London, S.W.

Locum Wanted

TO take charge of country practice from May 29th until June 17th. Must be steady. A practical unqualified man will do. State terms indoors. Address, Rawlins, Chesterfield.

Caponing Instruments

WANTED, Caponing instruments. State price, etc. Address, Stinson, Marden, Kent.

To Veterinary Surgeons

CANINE nurse or dispenser, widow of M.R.C.V.S. wishes post as above. Experienced town and country. Address, 4042 V.R., 20 Fulham Road, London, S.W.

As Locum Tenens

WANTED, young qualified man to act as locum tenens for about three weeks from May 21st. Apply, giving references and stating salary required, to 3048 V.R., 20 Fulham Road, London, S.W.

To Vendors.

WANTED Veterinary Practices and Partnerships. Surgeons wishing to sell the whole or a share of their practices are invited to communicate with Messrs. Peacock & Hadley, Veterinary Transfer Agents, 19, Craven Street, Strand, W.C., who will be pleased to introduce likely purchasers. No charge whatever made unless a sale be effected.

Missing Numbers

OWING to claims for missing numbers reaching us often many weeks after date of issue, we have to notify that claims for non-delivery will not be accepted if the date of origin is later than four weeks from date of due delivery in the case of foreign subscribers, or more than fourteen days after printed date in the case of inland subscribers.

H. & W. BROWN.

Manager Wanted

COUNTRY branch: M.R.C.V.S.; married, experienced standing castrator, good references. State age, salary required: house free. Address, 1053 V.R., 20 Fulham Road, London, S.W.

Genuine Country Practice

IN Western county for immediate disposal through ill-health, suit young energetic man. Price very moderate to quick buyer. Particulars in confidence to intending purchaser. Address, 1052 V.R., 20 Fulham Road, London, S.W.

As Assistant or Locum

VETERINARY surgeon desires permanency in good class country practice. Experienced, bloodstock, cattle, reliable, hard worker, used to taking charge, good obstetrician, horseman, single, 35, excellent references. Address, 5038 V.R. 20 Fulham Rd., London, S.W.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H. J. Pratt, Wholesale Druggist, Cleckheaton.

"MAGNUM" PESSARIES.

(HEWLETT'S)

"Magnum" Pessaries are prepared with a medicated non-oily base which is both effective as a Uterine Antiseptic and of special benefit in Parturition both in Cows and Mares.

A "Magnum" Pessary should be inserted directly after parturition in order to maintain the Uterus in a healthy state. It can be inserted with the greatest ease and will keep the parts in a thoroughly antiseptic condition for a lengthy period.

Alkaline "Magnum" Pessaries have recently been recommended to neutralise excessive acidity of Vaginal secretion.

"Magnum" Pessaries are supplied according to various formulæ as below, and Veterinary Surgeons' own formulæ can be made up as required.

		Doz.	12 doz. @	Doz.

Vol. XXIV.

UNQUALIFIED ASSISTANTS.

Two questions, which though quite distinct from one another are yet closely allied, are just now engaging the attention of our correspondents. One is the old problem of how best to increase the practical knowledge of our young graduates. The other is the recent resolution of the Council against the employment of unqualified assistants. The former question may be dealt with at length later; at present, we are concerned solely with the latter.

We are in full accord with the repression of the practice of employing unqualified assistants. Doubtless some of them are deserving men individually—and so, it may be added, are some unqualified men who practise independently. But unqualified assistants as a class are probably nearly, if not quite as detrimental to the best interests of the profession as are independent unqualified practitioners, though the harm they do is less obvious. The general employment of unqualified assistants to do strictly veterinary work certainly does not raise our profession in popular estimation. Again, unqualified assistants, occupying positions which should rightly be held by qualified men, render it difficult for the young graduate to either earn a living or gain professional experience. Finally, we all know that unqualified assistants, if the opportunity arises, are very apt to commence practice independently; and not a few of the independent unqualified practitioners, who are still too abundant, have gained their knowledge in the service of veterinary surgeons. In giving up unqualified assistants, we shall be cutting off a fruitful source of the supply of unqualified practitioners. For these and other reasons, we are glad that the Council has at last decided to take action.

The Council, of course, will act not against the unqualified assistant directly, but against the veterinary surgeon who employs him. It is not quite clear, however, how far the Council are prepared to push such action at first. The actual resolution passed condemned the practice of "employing unqualified assistants in ways calculated to lead the public to believe that these assistants are qualified to practise veterinary medicine and surgery." This sounds rather vague; but one of the most influential members of Council subsequently defined it as meaning that "we are prepared to take action against any member of the profession who employs an unqualified assistant to do the work which is generally done by a qualified assistant."

Undoubtedly this stops the employment of the unqualified assistant in the form in which he is most useful from one point of view and most objectionable from another—the man who regularly visits cases, performs operations, and, in a word, does everything connected with veterinary practice except the very few things which can only legally be done by a graduate. It is possible, of course, that some allowance may be made in individual cases for the next few years—that a few unqualified assistants of very old standing may receive special consideration. But any such lenience, if shown at all, will probably be reserved for exceptional cases. Practitioners cannot too clearly remember that the keeping of unqualified assistants has now practically been declared illegal. The veterinary surgeon who continues to employ an unqualified assistant—whether in his main practice or to manage a branch—is risking trouble. The veterinary surgeon who deliberately engages a new unqualified assistant is simply challenging prosecution.

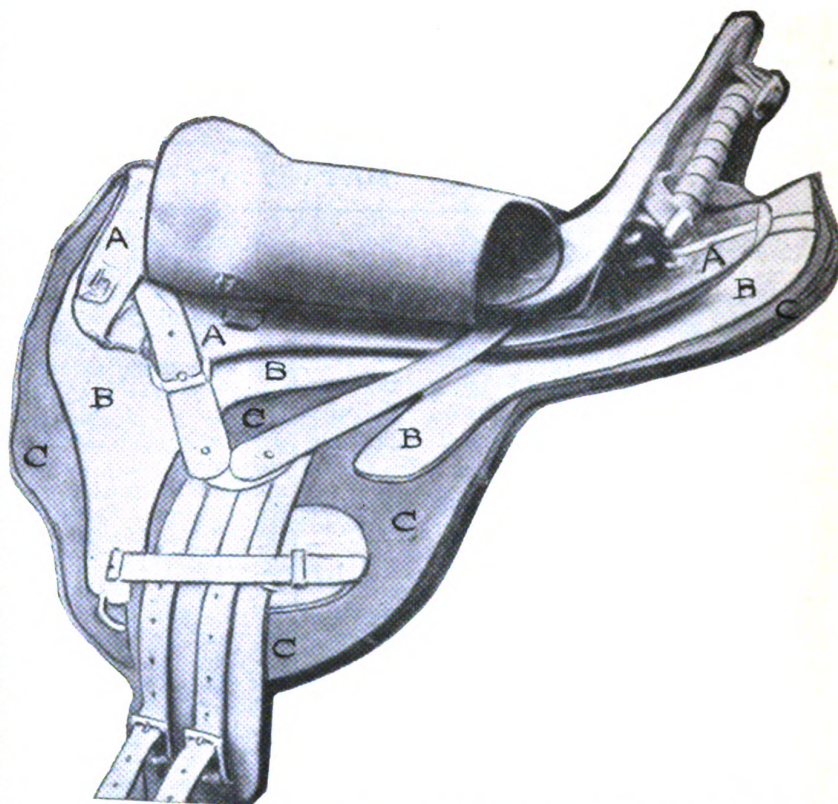

There is another type of unqualified assistant to be found in most large practices—the mere skilled attendant upon animals, who is employed to wash dogs, give medicines, and generally perform the same sort of services which are allotted to the trained nurse of human beings. Of course there is no proposal to interfere with these men, who are far removed from the really objectionable unqualified assistants. So long as their independent work is confined to first aid in emergencies, they are valuable in all practices and indispensable in some. But it should be remembered that these skilled attendants have often developed into unqualified assistants and unqualified practitioners in the past—some of the men registered under the Act of 1881 came from this source—and practitioners employing such aid should therefore be careful in the use they make of it. A busy practitioner, having such a man upon his staff, is constantly tempted to use him for work that should be done by a qualified man; and so many a flourishing quack has been first made. A commendable rule would be—let no unqualified assistant visit a case, unless to give medicine or take other measures prescribed by a qualified man after first seeing it.

PREVENTION OF SADDLE INJURIES.

It is well known to our readers that the subject of saddles and saddle galls is one of the deepest interest to the Army Veterinary Corps and to the Army at large. So far no saddle is known which will not gall; pneumatic pannels give some hope in that direction, but there are structural difficulties in the way.

It is, therefore, with peculiar pleasure that we place before our readers the latest in gall-preventing saddles, devised by Major Eassie, D.S.O., A.V.C., and which is said to protect the back so effectively, that horses suffering from injuries may continue at work without retarding the healing of the part. Major Eassie has provided the horse with a metal skin, which is placed on top of the felt saddle cloth used on all Army horses (known as a numnah). The saddle rests directly on the metal surface, while between it and the skin lies the numnah. In the illustration, **A** is the saddle tree, resting on **B** a thin metal plate which takes the shape of the back, and of suitable width and curve at its various parts; **C** is the felt numnah to which the armour plate is secured. The friction between the saddle and the back is expended on the metal surface.

Trials made of this contrivance in India have yielded most satisfactory results, and so far no disadvantages have been disclosed. We wish it every success; the idea is in accordance with physiological necessity and is most ingenious.

IRRIGATION OF JOINT CAVITY.

In his address to the Eastern Counties V.M.A. on "Some Joint Diseases of the Horse." Mr. William Hunting is reported as saying, "I regret to say that I have not tried washing the joint out with antiseptics, a course that seems to offer useful possibilities."

Seeing no allusion to this point in the discussion I am sending you the following history of a case which occurred in my experience in case it may prove of interest.

Subject.—Chestnut gelding, one of nine remounts bought at Mooi River horse fair on 11th Nov., 1909, and left loose with the others in a kraal for the night. Forage was well distributed and the horses fed from the ground.

Nov. 13th, 1909. Brought to Sick lines at Headquarters with contused skin wounds over orbital arch and wing of atlas. Antiseptic lotion and dry dressing applied.

14th. Synovial discharge from wound over

orbital arch. Oil of cloves and Zinc oxide applied and sloppy diet ordered.

15th. Discharge increased, coagulum adherent and synovia running freely. Treatment as on 14th.

16th. Large coagulum, and synovia running freely. Treatment as before.

17th. Coagulum gone. On moving jaws synovia discharges freely, and on slight pressure below wound a quantity of coagulated synovia is squeezed out. Treatment changed to cold cotton wool swabs soaked in a 1:1000 Hyd. Perchlor. solution and bandaged in position; changed twice daily.

19th. Trace of blood-stained pus in coagulum squeezed out. Treatment as before.

20th. Blood-stained pus in synovia much increased and pocket forming below wound. Probe passed into wound to bottom of pocket and point cut down upon. Joint cavity thoroughly irrigated by gravitation with a 1 in 20 solution of Tinct. Iodine in distilled water. All aseptic precautions taken, and wound then covered with aseptic dressing bandaged in position. Irrigation twice daily.

22nd. I left on inspection duty and left instructions for joint to be irrigated from lower (operation wound) once daily, and original wound allowed to close.

28th. Much improved. Original wound almost healed, and very slight discharge of clear synovia from operation wound during mastication. Irrigation as before. Bandages causing irritation, and horse inclined to rub his head, so discontinued bandages merely using small flake of cotton wool.

29th. Clear synovial discharge just perceptible during mastication. Discontinued irrigation. Painted wound with Clove oil, and dusted with Iodoform and Zinc oxide.

Nov. 30th to Dec. 6th. Progress satisfactory. Wounds gradually healed. Ordinary ration given, and horse regaining condition, but unable to open mouth more than four inches.

Dec. 15th. Discharged from sick lines. Unable to open mouth as wide as normal, and showing slight bony enlargement over tempero-maxillary joint.

31st. Re-admitted on account of poverty and weakness.

Jan. 1st to 10th, 1910. Horse continually eating, but eating very slowly. Condition improving, but possible movements of jaws decreasing and no lateral movements of lower jaw possible towards injured side.

Feb. 19th. No improvement. Horse sent to graze, and ran at grass until 20th May, when he was brought in and returned to duty. Movements of jaws much more free, and horse fat.

April 12th, 1912. Horse is now being used as an officer's charger, and nothing abnormal can be seen.

I have since twice used irrigation with Tinet. iodine solution, once successfully, in a case of purulent infection of a tendon sheath in front of the knee, and once unsuccessfully in the case of open hock joint in a mule.

In view of the above cases, I shall certainly not hesitate to resort to irrigation of joint cavities upon the first sign of suppuration. I looked upon the case of open tempero-maxillary joint as a practically hopeless case from the first, owing to the impossibility of keeping it still, and only resorted to irrigation as nothing else I could think of appeared to offer any hope of success.

PARTURITION CASES IN MARES—EARLY USE OF THE KNIFE.

The following may probably be of some interest, as illustrating the advantages accruing from the early use of the knife in difficult cases of foaling.

As is well known, the mare cannot stand nearly so much "pulling about" as the cow, and the longer neck and limbs of the foal, combined with the stronger pains of the mare as compared with the cow, make altering the presentation of the fœtus a much more difficult and arduous task. In some cases it is quite impossible, or only accomplished after several hours work, by which time the foal is generally dead and the mare in a state of collapse.

Now, I take it that in foaling cases the aim of every Veterinary surgeon is primarily to have a live mare and foal, failing which, a live mare; and that end is I think best attained by using the knife

when, after a reasonable trial of other means, it is found impossible to accomplish delivery.

The question arises, "How long should those other means be exploited before resorting to the knife?"

I think most surgeons accustomed to these cases know directly, almost instinctively, whether or not the knife will be required. Personally, I employ it without any hesitation if after ten or fifteen minutes work the fœtus cannot be got into proper position. Perhaps I may be condemned for being too precipitate, but in my opinion results justify the means.

The use of block and pulleys I am afraid is still practised, even by some who ought to know better. That, and the still more barbarous method of which I have heard, viz. yoking a horse to the foal, are, to my mind, gross cruelty, and neither more nor less than murder of the unfortunate mother.

Parturition is a natural process, and in using force, efforts should be directed towards assisting Nature, full advantage being taken of the straining of the mare. With men on your ropes you can regulate the amount of traction applied (or know the reason why), but a lengthened continuous application of force is most unnatural and most detrimental, and should never be employed.

I record the following cases of dystokia to try and show that after removal of a limb or limbs, parturition may become comparatively easy, and, what is more important, the mare is not subjected to any great strain.

Case I. The foal's head was doubled back on its off side, but could not be reached, the fore legs protruding from the vulva as far as the knees. Failing to get head forward, I removed the off fore limb, skinning it over the scapula and severing the muscles in the usual manner. With a hook I was then able to reach the head and pass a rope through the mouth and over the poll, and so bring it forward.

Case II. The foal lay on its back with the head downwards below the brim of the pelvis; and the fore legs protruding as in Case I. The off fore leg was removed at the shoulder, and the head brought up by means of a clasp hook through the lower jaw behind the symphysis.

Case III. This was a breech presentation, the foal lying on its near side. I was quite unable to push the foal far enough back to get at the hind limbs, which were firmly wedged at the hocks. The off leg was removed at the hip joint and the near one at the stifle. To add to the difficulties in this case, the only way we could keep the mare on her feet was by walking her slowly round the yard—not a very enviable job on a wet day.

Case IV. This was practically the same as Case I, but occurred in a 16-year-old Shire mare, and the foal's legs had been protruding for ten hours when I first saw her. It was necessary to remove both fore legs. The foal was then taken away by means of clasp hooks in the upper and lower jaws.

Case V. Here again the fore legs protruded, with the head down between them and out of reach.

As in Case IV., both legs were removed at the shoulder. By means of traction on a hook fixed in the neck I was able to reach the mouth, and the rest was easy.

Case VI. In this case the foal lay on its off side with all four legs firmly wedged in the pelvis, so that I could reach a little way above the hocks, and with difficulty touch the elbows. The head I never did feel. In order to make room I cut off both hind legs at the hock, and after a good deal of work severed both fore limbs at the shoulder. Then, while I pushed the sternum back with a repeller, assistants pulled on ropes fixed to the lower ends of the tibiae. On delivery the face of the foal was found to be almost semi-circular, due to the cramped position the head had occupied pressed against the off side.

The average time taken to effect delivery in these cases was about one-and-a-half hours.

In each case the clotted blood collected in the womb (this constitutes a great danger) was carefully removed, and the mare's genitals thoroughly disinfected. The mares themselves were treated with laxatives, febrifuges, and internal antiseptics, and fed on mash, and green food where available. The shoes were removed, owing to the risk of laminitis.

Recovery in every case was uninterrupted and uneventful, except Case I. which had a mild attack of laminitis. However she soon recovered, and is due to foal again early in May.

I by no means advocate haphazard employment of the knife, but the death of a mare at foaling (from whatever cause) does not tend to enhance the Veterinary surgeon's reputation, and I do think that a good many mares die annually which might be saved by its timely and judicious use.

ALEC MCTURK, M.R.C.V.S.

Swaffham, Norfolk.

THE ANCIENT AND MODERN TREATMENT OF CANKER.

It is for mediocrity to talk, but genius to observe. Genius has been defined as the capacity for taking infinite care and pains. How very wise we now all appear since Mr. Pillers has called our attention to the success he has obtained by his method of treatment of canker? Even though the principles and practice of the method may be old, none the less Mr. Pillers is just as entitled to credit as if it were unknown to his contemporaries.

Vaccination was used for time immemorial before Jenner's day, but Jenner still retains the credit due to him for popularising and defining preventive inoculation. Perchloride of mercury was used in the treatment of wounds from obscure times, yet as its proper use was not defined before Koch's time, Koch still deserves the credit rightly accorded him. Mr. Pillers has shown us what perseverance and thoroughness may accomplish in a particular line of treatment.

Solleysel (*Parfait Mareschal, 1733*) recommended the actual cautery in the treatment of canker; he

condemned *violent* caustics as "harmful and tending to make the complaint worse." Prévost, of Geneva, confirmed the efficacy of this method (*Recueil Vétérinaire, 1828*). Since that date numerous practitioners have advised it. More recently Malcolm, of Birmingham, has brought it forward again.

Every British authority, even including Percival, has overlooked the teachings of Richard Hayward Budd, veterinary surgeon, of 72 Curtain Road, E.C., who wrote a little book, which was published on Feb. 14th, 1816, entitled:—

"A Practical Treatise on the diseases of the foot of the horse containing a correct description of their nature, causes, and methods of prevention: with suggestions of improved plans of treatment, founded on physiological principles, etc., etc."

He tells us "Those authors who have hitherto noticed this affection seem to have had some idea that pressure was useful in the application to the part; and having ourselves observed the same circumstances, we were led to consider its mode of action more particularly. It appeared to us that the vessels of the part, debilitated and relaxed as they generally are, might have derived benefit from the support which pressure gave to their sides; with this idea, we determined to give it a fair trial, and we have not been disappointed in our expectations."

"As affording means of the application of pressure, as we have before observed, a bar shoe is necessary; and if the sensitive parts have assumed a fungous appearance, the application of a small quantity of the sulphate of zinc powdered will be of service. After the shoe has been applied, therefore, we proceed to lay pledgets of tow of an equal thickness, one upon another, on the diseased part, till we have brought it up to a level with the shoe, or something above it; a thin plate of iron, of about an inch and a half in breadth, is then to be introduced transversely under the shoe, which can generally be done with ease; another of the same kind of a proportionately greater length is to be introduced in the opposite direction upon it, the pressure will be thus nearly equally applied; but if the disease extends only over part of the sole, and a greater degree of pressure is necessary to that part, the pledgets of tow may be proportionately of greater thickness."

Speaking of Thrush he says:

"Pressure, by the support it gives to the vessels secreting the horn, greatly favours the production of that horn; and pressure, applied to the seat of this disease, gives the assistance to nature which she requires; that assistance, which we have no hesitation in saying, will be always adequate to its cure."

Evidently this was not rare practice in the East of London in the early part of the 19th century. This author looked upon caustics and astringents with general disfavour, but would not say "that such applications are never necessary."

Whether Budd got his idea from his preceptor, Bracy Clark, who practised in Giltspur Street, West Smithfield, is not known. It is quite possible Clark instilled the idea into his pupil's mind.

Six years later (1822) this masterly and scholarly veterinary surgeon and distinguished naturalist published his *Essay on Canker*, which has not been mentioned so far by the writer of this critique is aware, by any British author.

Bracy Clark condemned powerful irritants, but lauded the plentiful use of tar combined with firm, regular and uniform compression. He had a better conception of the pathology of canker than the majority of the present day practitioners when he said this disease was not specific like human cancer as some thought. It was, according to him, a simple ulceration of the sub-corneal tissue, accompanied by a more or less weakness of those parts connected with the formation of horn, and generally by irritation of the cells in the vicinity of the ulcer. It did not need specific agents but *much care and attention* to destroy the causes of irritation and to favour the natural formation of horn on the tissues which were deprived of it. Youatt condemned powerful caustics, but advocated pressure. Chas. Steel, in *Blaine's Outlines of the Veterinary Art* (1865) was very strong on this point.

A similar method of procedure as outlined by Budd in 1816 and by Bracy Clark in 1822, was in vogue at least 30 years ago in some of the East End of London veterinary establishments, and was no doubt handed down from one generation of practitioners and farriers to another as mere tradition. As a rule those who have had a long experience in this direction are very reticent on a practice with which they are too familiar. Still, it was the traditional teaching, at least by Sir George Brown at the Royal Veterinary College, quite 30 years ago, Brown having been a pupil of Prof. William Sewell, who was a contemporary of Clark and Budd. Iodoform and carbolic acid were in use in the treatment of canker at least 30 years ago, even at the Royal Veterinary College.

Prof. Woodruff is somewhat inclined to believe in Jowett's theory as to a spirochaete being the cause of canker. This theory has been disproved. He brings forward the action of mercury in syphilis in man as tending to support—by the action of grey powder in canker—the similarity of cause between the two spirochaetes. It is quite true that at least two spirochaetes are found in the healthy genital organs of man; but they are not the cause of syphilis, which is due to a treponeme—*Treponema pallidum*—an organism closely resembling the spirochaete. Syphilis in man is a generalised disease; canker in the horse is a local disease, confined to the external surface of the body. Syphilis requires systemic treatment, canker simple local treatment—pressure and antiseptics.

Spirochaetes may exist in healthy animals, as they do in unhealthy secretions; in transudations and exudations; in putrid water or dead organic matter. They have been found in the normal as well as in the diseased horse, ox, sheep, pig, goat, dog, cat, fowl, etc. Their mere presence is not by any means to be taken as an indication that they are the cause of disease.

Canker by its response to simple external treatment, carefully and thoroughly, in other words, skilfully applied indicates that it is a simple or local

malady confined to the surface of the body. In reality, the lesion is merely granulation tissue, like that of the exuberant granulations so frequently found following injuries or wounds, especially on the anterior surface of the metacarpus, metatarsus, hock, etc., where the skin almost comes in immediate contact with the dense hard, bony or tendinous structures of those regions.

The exuberant granulation tissue in these latter parts may be destroyed by the use of powdered sulphate of copper and pressure. When neglected, or improperly treated, whereby the granulation become voluminous, it may be necessary to burn it down with the cautery or slough it off *en masse* with powdered arsenic. *But care must be used with this latter agent.*

Some writers speak well of cement, others of plaster of Paris, but nearly all the more recent authorities advise caustics or escharotics. But if simple, *but methodically applied*, remedies will answer in the successful treatment of canker, why go in for heroic, and often irrational and cruel methods? If the true horn-forming tissues are destroyed, what is the utility of treating a case with violent agents?

In olden times surgeons and physicians and even veterinary surgeons were naturalists, physiologists and pathologists combined. Bracy Clark was a man of this type, and far in advance of his times; he was a contemporary of Blaine, Moorcroft, Youatt, Turner, and many other superior practitioners, who laid the foundation of clinical surgery in this country and were admired by the veterinary profession in other countries. We may at the present time be more learned, but are we better observers than our forefathers?—of course, taking into consideration opportunity. They had no bacteriology in those days, but they could in the majority of instances observe, diagnose and treat just as well as we can at the present day. Certainly in pedal surgery and therapeutics we have not advanced one bit the last hundred years; any more than we have the last seventy-five years in laryngeal surgery and physiology.

The moral of these facts presented is: Don't ignore the old just for the sake of being in the fashion. Modern science proves that many of the old ideas were correctly founded by pure clinical observation.

SCRUTATOR.

COLIC DUE TO IMPACTION OF THE CÆCUM IN THE HORSE.*

By Prof. A. GOTFON, Edinburgh.

In current literature, impaction of the cæcum is scarcely mentioned amongst the many abnormal conditions which give rise to symptoms of colic in the horse. The only references which I can find in the literature at my disposal are so brief and scanty that they throw no light upon it, or on the means by which it may be differentiated from the many other conditions which cause similar symptoms of abdominal pain in the horse.

* Submitted at the meeting of the Scottish Metropolitan Veterinary Association on May 4th.

Friedberger and Fröhner dismiss the subject in the following words—"fecal stasis in the caecum (unless removed) appears regularly to produce rupture of the affected bowel," an opinion which I have reason to believe very closely approximates the truth. They do not point out or attempt to differentiate in any way between the symptoms produced by impaction of the caecum and those due to impaction of the intestine in other positions along with which it is discussed. Similarly, Reeks ("Common Colics of the Horse") says "The present chapter is given over to the description of all obstructions of a subacute type that occur in any position in the large or double colon, with which, until differential means of diagnosis present themselves, I include typhilitic or caecal impaction." Law ("Veterinary Medicine") includes the condition in a general discussion on intestinal obstruction with alimentary matters.

There can be little doubt that the comparative rarity of impaction of the caecum in the horse accounts for the very brief references which have been made to it. Experience of four cases has led the writer to think that certain symptoms are associated with the condition which are more or less peculiar to it, and which permit of its almost confident differentiation from other intestinal disorders of the horse to which, in many of its features, it bears a close resemblance. Three of these cases occurred within a few months of one another, the fourth after interval of a couple of years, but the last case only came under my personal observation in its early stages. It was placed under the care and supervision of my colleague, Prof. Buxton, to whom, before leaving town for a short holiday, I expressed my opinion as to the character of the case. Prof. Buxton reported to me on my return that the course of the illness had been the same as that of the cases which I am about to describe, and that on post-mortem examination exactly similar appearances had been presented. It is a curious coincidence that all these cases occurred amongst the horses of one firm.

Briefly their history is as follows: During the twenty-four hours immediately preceding the appearance of the symptoms of colic the animals had a mild attack of diarrhoea at work, from which spontaneous recovery had taken place, and after which there had been normal action of the bowels. The colicky symptoms manifested were of a mild, subacute type, and bore a close resemblance to those seen in impaction of the colon. The animals showed a marked desire to lie, and when down would lie for an hour or more quite quietly. They showed little disposition to wander round a loose box when on their feet, but would stand still for the most part, and only occasionally move uneasily around or scrape with a fore foot. Continuous dull pain was manifested in this way day after day, the only change observed being in the later stages, when the animals lay almost continuously and could scarcely be forced on to their feet. A striking feature was the small amount of general disturbance apart from depression. The shortest case had a duration of eight days, whilst the first, which was the longest, lasted fourteen days before death. This last animal, a mare, examined twelve hours before death had a fairly strong, good pulse numbering forty-eight to the minute, a normal temperature, respirations normal both in respect of frequency and character, whilst the mucous membranes showed no appreciable change. Her condition was typical of all the cases throughout their course until within a few hours of death.

No faeces were passed during the first two or three days, and on examination the rectum was found empty. The bowels, however, responded tardily, but to all appearances satisfactorily, to a dose consisting of linseed oil followed by aloes. After the purgation had ceased the bowels continued to act, though infrequently, and

faeces were passed in small amount only, a fact which called for little comment in view of the almost complete inappetence. Notwithstanding the apparently satisfactory action of the purge and subsequent action of the bowels, the dull, uneasy pain, constant lying, and inappetence continued, and for this it was at first difficult to find a satisfactory explanation. On a first rectal exploration the bowels so far as could be felt were normal, and afforded no explanation of the symptoms.

On a further and more thorough examination the upper portion of the caecum was felt and easily recognised in the lumbar region, near the centre of the abdomen, lying mainly on the right side but projecting a little over the middle line. The organ was unusually prominent, its walls did not yield to the hand as they do under normal conditions, and its contents were firm, and clearly not of the natural peaseoup-like consistence. The full significance of this state of affairs was not grasped at first, but it soon became clear that a distended caecum, impacted with dry ingesta, accounted for the course and symptoms of the case, and that the purgative though producing purgation had failed to influence the condition of the caecum.

Belladonna, camphor and carminatives did little to relieve the continued symptoms of pain. The administration of oil in combination with stimulants produced a soft condition of the faeces and their more regular passage, but effected no change in the caecum. Food was offered, after the first purge acted, in the shape of linseed tea, boiled linseed, bran and long hay, but was partaken of most sparingly, and later not at all. The more rapidly acting purges in the form of eserine and arecoline were not tried in the first case, but their exhibition in the second and third was not productive of any response, nor did they have any effect, so far as could be ascertained by rectal exploration and later by p.m., on the consistence or amount of food material in the impacted organ.

The cases after dragging along without showing any material change from day to day, suddenly developed the symptoms which are well known in association with rupture of the intestine. The running down pulse, drawn anxious expression, short gaspy respirations, sweating and muscular tremors were all present, and death relieved the animals in a very few hours after their development.

In the third case a method of treatment was tried which, because of its novelty, is perhaps of sufficient interest to be worth mentioning. The orthodox methods of treating impaction had been tried and had failed; the experience of the two preceding cases pointed to the probability of an early fatal termination, and it seemed worth while applying any method of treatment which offered a possibility, however remote, of effecting improvement. It occurred to me that some benefit might be derived, if advantage could be taken of the well-known physiological fact that the water which a horse drinks passes direct to the caecum. If the animal could be induced to drink large quantities of water there was a possibility, small perhaps, but still a possibility, that the liquids by permeating the mass of material impacted in the caecum might assist in softening and loosening it and thus aid in its removal. With this object in view a large dose of common salt was given in water. It had the desired effect so far as thirst was concerned, but its influence on the condition of the caecum, so far as could be judged by rectal examination and subsequently confirmed by post mortem, was not appreciable.

In making the post-mortem examinations the most striking feature on opening the abdomen was the great prominence of the caecum. Its contents consisted of normal ingesta packed within the organ and containing very little moisture, in striking contrast to the peaseoup-like normal condition of its contents. The organ in

each case was ruptured, and some of the escaped contents diffused over the peritoneum. The colon was remarkably empty, an effect due to the combined action of the purge, the subsequent passage of feces and the small amount of food consumed.

Several features of this condition are worth noticing. The remarkably small disturbance of pulse in relation to the duration of the case. The failure of the orthodox methods of dealing with impaction to influence the condition of the caecum although purgation was induced and was followed by the passage of normal feces. The action of the bowels and the almost complete absence of general disturbance are misleading and very liable to result in an underestimation of the continued and increasing gravity of the condition under consideration.

It would not be justifiable to assume that every case of impaction of the caecum must end fatally, but it is quite clear that when this organ is impacted with food material, its walls can only with difficulty be sufficiently stimulated to effect the onward movement of its contents, and that the risk of rupture increases in direct relation to the duration of the condition. A rectal examination permits of diagnosis without great difficulty, but the continuance of the dull uneasy condition and the inappetence after the action of the purge is not without a significance which should lead to the examination of the condition of the caecum, if this has not already been done.

It is not suggested that the condition described is new, but my own experience and that of those with whom I have discussed these cases justifies the conclusion that it is of infrequent occurrence in the horse. Since it receives such scanty reference in veterinary literature, I record my experience in the hope that it may help a little the recognition of and differentiation between the various abnormal conditions which are responsible for subacute colic in the horse.

ABSTRACTS FROM FOREIGN JOURNALS.

NOTES ON LIVESTOCK INSURANCE IN GERMANY.

Ex. Bulletin of International Institute of Agriculture, Rome.

Livestock Insurance originated in private enterprise assisted by Government, and has now assumed a place of great importance in the economy of the Empire, and is administered as an Imperial affair.

There are three forms of association: Local, District and State, all worked on similar lines, the aim being to limit cost of administration as far as possible, so as to devote the funds to compensation, which varies in amount in the local associations with the state of agriculture for the time being. The best use possible is made of all available parts of the carcass, which is assessed when compensating, the end aimed at being to enable the owner to replace the lost animal with another of similar value. Of course there are drawbacks to this action, and from an insurance company's view it is detrimental to profits.

Statistics show that the local associations work more satisfactorily than those covering larger areas, owing to better knowledge of local conditions on the part of the administrators. As a rule they pay 15 per cent. higher compensation, or practically 10s. a head more, their mortality rate is as 2.38 per cent. —2.51 per cent. The Government subsidy is allotted *pro rata*.

In Alsace-Lorraine insurance was started in 1889 with a capital of £1,500, to deal especially with horned stock. The association became very active in improving the hygiene of cattle and promoting local branches. Government subsidy was either fixed or temporary according to local needs. In 3 years 70 branches had been formed, covering 20,415 head of stock valued at £321,113.

In Bavaria, in 1896, the State founded a mutual stock insurance scheme, incorporating existing local associations; these latter paid half the indemnity, the State the other half, the value was 7s. 10d. in case of dead animals and 8s. 10d. on compulsory slaughter, on condition that the carcass produced 1-15th of its value. The State subsidy commenced with £25,000. Sale of products reduced calls by 34.49 per cent. All classes of stock are accepted, horses between 8 months and 15 years, with a maximum of £50.

In the Grand Duchy of Baden cattle insurance is regulated by laws passed in 1890 and 1898, by which the local associations are treated as subject to State control, and the working is similar to the Bavarian, but insurance is compulsory on at least 2/3rds of the stock owners of a district. Half the indemnity comes from the local funds, the other from the associated funds, but in case of an epizootic the State comes to the aid of the local association, for which purpose there is a special reserve of £10,000.

In Württemberg the central agricultural Bureau controls the numerous local associations, the State subsidy being used for initial expenses and as a reserve fund. In 1908 it stood at £2,500.

In Saxony there is no general livestock insurance, but in 1898 such was imposed on beasts for slaughter, and in the following year it was extended to equine stock.

LIVE STOCK INSURANCE IN SWITZERLAND. Ex. Ia Clinica Veterinaria.

In Switzerland livestock insurance is carried on by three large mutual associations, two of which confine themselves to equine stock, while the third, "The Federal Guarantee," also covers cattle. These associations take all risk to which stock are exposed, as well as death from disease, accident, castration, slaughter by order of the authorities, also diminution in value from accident not involving death. The three societies, although of different nationality, work together but by slightly varying methods.

The Swiss and German adopt the system of fixed indemnity and sliding premium, they guarantee the owner full amount insured as long as funds permit, and *pro rata* after due notice in case of deficiency.

The French society adopts the system of fixed premium and sliding indemnity with the reserved right of reducing payments during epizootics, etc.

In 1909 £22,332 were paid as premiums. Insurance is compulsory and the State grants a subsidy in times of stress. In this year 17 Cantons availed themselves of this aid, to meet a loss of £100,000. The Cantons subscribed £32,000 and the Federal Government a similar sum. Insurance against

death has had excellent result in the betterment of hygienic conditions of stock, and is rapidly advancing, and in some instances can be worked on as low a premium as 1 per cent.

LIVE STOCK INSURANCE, AGRICULTURAL CONFERENCE, MILAN. Ex. La Clinica Veterinaria.

The Congress appreciates the effectiveness of local mutual insurance associations, but asks Government for help in times of epizootics. Also asks for Government Veterinary help in stamping out contagious diseases. Appreciates the efforts of insurance societies in improving hygienic conditions. Considers insurance of beasts for slaughter should be compulsory.

EXTRACT FROM REPORT OF V. S. N. FOSS, Municipal Abattoirs, Ufa, Russia. From the author's original Esperanto.

The insurance is voluntary and the Government subsidises £1 for £1. The premiums are 5d. for large stock and 2½d. for small stock per head.

The result of the year's workings are, as may be imagined, a great increase in the confiscations. Formerly the butchers tried to hide cases, while now they produce everything they find.

Tuberculosis has been found in 75 head of cattle and 1 pig; 9 carcasses were entirely condemned, 5 halves and 2 heads, 62 chest viscera.

Cysticerci were found in 32 head of cattle and 14 pigs. Destroyed, 3 cattle and one half; 10 pigs. Four pigs were stamped "measly" when the parasites were few, only 1, 2, or 3. Four cattle were also condemned for peritonitis. Other diseases in which only viscera were condemned need not be specified, as no payment was made in such cases. Income was £116 13s. 6d. and outgoings (as compensation) £98 16s. 9d., leaving a balance in hand of £17 16s. 9d. If the time before May had been counted when only half compensation was paid the account would stand: Income, £136 4s.; Outgoings, £104 4s.; Balance, £32.

EXTRACT FROM A LETTER FROM GOVT. V.S. S. ORLOVSKY, ODESSA. Author's original Esperanto.

In reply to your inquiry re Live Stock Insurance in Russia, I am very sorry to say it is very unsatisfactory. Many local associations have started but have closed on account of loss. It has been found very difficult to investigate the cause of death, and owners have taken unfair advantage of this. Some private societies cover animals for fire only, not against death or deterioration.

Lately a new private society has been started in Russia for Live Stock Insurance with great aims, but it will probably fail because it has no mortality tables (there being no reliable ones obtainable) and because salaries and swindling claims will swallow more than the income.

Comparing the conditions of Life Insurance, about which there is a large amount of literature, one is bound to come to the conclusion that to be successful it must be mutual, under honorary control; this being the system in Germany, where Livestock Insurance is carried on successfully.

W. R. C.

ROYAL COUNTIES VETERINARY MEDICAL ASSOCIATION.

An ordinary general meeting was held at the Laboratory of the Board of Agriculture, Alperton, on Tuesday, April 16th, by the kind invitation of the President, Stewart Stockman, Esq., who occupied the chair. There were also present: Messrs. R. C. Tennant, S. Slocock, P. J. Simpson, J. Willett, R. Page Bull, J. Coleman, W. Pauer, T. B. Goodall, Sidney Villar, A. L. Butters, and G. P. Male, Hon. Sec.

Visitors: Messrs. Brennan de Vine, Charles Roberts, and W. G. Wragg.

The minutes of the previous meeting were taken as read and confirmed.

The Hon. Sec. reported two members in arrear with their subscriptions, to both of whom he had written, and had received a reply from one, who said he had intended to resign in 1906.

It was agreed to allow the matter to stand over for the present.

Apologies regretting inability to be present were announced from Prof. McCall: Messrs. J. B. Baxter, F. W. Hanks, Sydney Pennington, L. Barnard, C. S. Harris, H. F. Standley, J. H. Parker, W. Wilson, H. C. Jagger, James East, John Varney, D. Wyllie, J. Hatch, E. J. Mellett, J. S. Hurndall, and G. E. King.

Mr. NORMAN CLIFFORD, M.R.C.V.S., Newbury, was unanimously elected a member.

Capt. O'RORKE was nominated for election at the next meeting, on the proposition of Major Harris, seconded by Mr. Male.

Congresses. The PRESIDENT reported that the Royal Sanitary Institute was to meet at York on August 3rd, and a Congress of the Royal Institute of Public Health was to be held in Berlin from July 24th to the 28th.

The Hon. Sec. reported that he had been in communication with Messrs. Thomas Cook and Son, and had found that it was possible to attend the meeting in Berlin from the Tuesday night until the following Monday morning at an inclusive expenditure of £8 10s.

Mr. WILLETT proposed that Mr. Percy Simpson should represent the Association at York.

Mr. SLOCOCK seconded the motion.

Mr. SIMPSON said he might be going to York, and under those circumstances there need not be any expense to the Association.

The PRESIDENT thought that if Mr. Simpson attended on behalf of the Association the expenses should be paid.—The motion was carried.

The Hon. Sec. said that in view of the International Congress a question had been raised as to whether a delegate could be sent to Berlin.

The PRESIDENT did not think it was worth the money.

Mr. SYDNEY VILLAR said he expected to go to Berlin and should be glad to represent the Association.

It was agreed that if Mr. Villar went to Berlin he should act as delegate of the Association.

Next Meeting. The Hon. Sec. read the following letter from Mr. C. E. King:—

"At present it is my intention to attend the R.C.V.A. meeting on the 16th, but as I am pretty busy it will depend upon train arrangements and whether I am too full up to get away. If I should not be able to turn up will you be kind enough to make my excuses and at the same time renew my invitation to the Association to hold its Summer Meeting at Abingdon. I shall be very pleased if the members will accept my hospitality, and I will do what I can to make the meeting, if it is decided to come, a pleasant and enjoyable one. Oxford is a very good centre, and perhaps it can be arranged to make the journey from there to Abingdon, which is a very beauti-

ful one, by river. I believe the boats take about an hour to do the journey, so I should think members would arrive here in good time for luncheon. With kind regards and best wishes for a good meeting, believe me, faithfully yours, Geo. Edwd. King."

On motion from the Chair, it was agreed that the meeting should be held at Abingdon, and on the motion of the HON. SECRETARY, duly seconded, a hearty vote of thanks was accorded to Mr. King for his kind invitation.

A FEW NOTES ON TWISTS OF THE INTESTINES.

By Mr. J. WILLETT.

[This appeared in our issue of May 4, p. 691.]

The PRESIDENT thanked Mr. Willett for his interesting communication, and said it was beyond him, as he pretended to no knowledge in that direction. As was well known, when a man dropped out of practice he missed seeing many interesting things and had to leave the discussion on some subjects to other people.

Mr. SLOCOCK said the subject was a very important one to practitioners and Mr. Willett had brought forward some new ideas. For his own part he had never pretended to be able to distinguish between a twist of the large and small intestine so accurately as Mr. Willett seemed to believe could be done. Having regard to the original work in the paper, and the importance of the matter, he thought it would be well to adjourn the discussion in order that the paper might be before the members prior to the debate. It would be a very poor compliment to Mr. Willett if the discussion was not a good one.

Mr. VILLAR said it was rather a question of time, as Mr. Stockman was prepared to give a demonstration and that might have to be cut short if the discussion was taken on Mr. Willett's paper at once.

Mr. WILLETT said he had no objection to the discussion being deferred.

On the proposition of Mr. Slocock, seconded by Mr. Villar, the discussion was adjourned to the meeting to be held in London in the Autumn.

Mr. PERCY SIMPSON proposed that the paper be printed and circulated in order that members might come better able to discuss it.

Mr. SLOCOCK seconded the motion, which was carried.

SPECIMENS.

Mr. PERCY SIMPSON exhibited the fractured pelvis of a horse, the most interesting part of the case being its history. He was telephoned for on a Sunday afternoon to see the horse after it had been bought on the Friday at the Repository in London and driven as far as Maidenhead, and had there fallen lame. He was asked to write a certificate saying it did not answer to its warranty as to being in a fit state to work. To his surprise he found nothing below the stifle, but on rocking the horse detected crepitus, and a rectal examination showed fracture of the pelvis. The history had to be taken with a grain of salt, because the man desired to get rid of his lame horse, but he stated that he bought the horse and an old 'bus, and the idea struck him to buy an old 'bus horse and run the two horses down to his place at Swindon by road. He put the horse in at the Lane and went as far as Hounslow. The horse was a little fidgety at first and went a bit nappy, and he wired to say that the horse was not quiet in harness and he should return him. He then drove him from Hounslow to Maidenhead, a distance of 17 miles, and on going up the hill from Maidenhead he noticed the horse had become distinctly lame, and four miles further on it was so lame as to be unable to proceed. The horse was destroyed and the pelvis was found to be very badly fractured. He himself believed that the horse was nappy, and had the 'bus pulled on to him by the other horse, the 'bus hitting him on the rump and causing

fracture. It was extraordinary that the animal should travel a distance of 17 miles on the road before giving in.

A second specimen was a fracture of one of the five bones of the carpus, from a pony which slipped when going out of the stable. He thought it was rather unusual to get such an extensive fracture.

Replying to the President, Mr. Simpson said the fracture occurred from the stumble. The pony came out of the stable, slipped and went down on one knee, and the hair was not even taken off the skin. The history of the case was out of all proportion to the extent of the damage.

The pony was 12 years of age and the horse five years old, and the latter was kept nearly a week before it was shot, owing to the possibility of legal proceedings. The horse was about 15.2 hands, something like a light hunter, and he believed it started sound from London. There was no trouble with the diagnosis. In fact he had no difficulty in diagnosing either case.

The HON. SECRETARY (Mr. G. P. Male) recalled a case within his own experience. When having lunch one day he saw a pony going past the window appearing a little stiff behind, and went out and found the man was asking for the pony to be shod. On his pointing out that it was lame the man replied that it always went a bit stiff. On examining the pony per rectum he found the symphysis to be fractured.

At another time he was called in a great hurry to see a horse and told the owner there was a fracture. Some days afterwards he went to the same place and asked if the mare had been destroyed and was told she had not and was a lot better. The owner said he had had somebody else to see her, and had been told there was no fracture at all and that she would get all right. He made an examination per rectum and found a fracture of the pelvis, which was in about five pieces. He thought that showed there need not be so much lameness even with so serious a fracture.

On the motion of the PRESIDENT, a vote of thanks was accorded to Mr. Simpson for his interesting specimens.

THE INTERNATIONAL CONGRESS, 1914.

The PRESIDENT, who is also the Honorary Secretary of the International Veterinary Congress to be held in London in 1914, raised the question of subscriptions towards expenses of this gathering, which he said would be very considerable. He stated that at a meeting of the Committee at 10 Red Lion Square, it was decided to ask the Veterinary Associations throughout the country to co-operate in the collection of subscriptions. He thought it would be a good arrangement if each Society would start to collect subscriptions from its members and send forward the list with amounts as subscribed by the members of each particular Society, and as he understood that many gentlemen preferred to split the subscription up over a period of three years, it would be as well to state the gross amount, indicating in each case how the generous donor proposed to subscribe it.

Mr. VILLAR said that there were many members like himself who belonged to more than one Association who would like to subscribe on more than one list.

The PRESIDENT replied that he was in a similar position, but the matter could easily be arranged according to the wishes of the subscriber, and the gross amount of a man's subscription would appear on a general list apart from those of the Societies.

The President started the Association's list by offering to subscribe £20 as a member of the Royal Counties. Nine others also promised various sums of from three to ten guineas, some of these sums being partial subscriptions.

On the proposition of Mr. Willett, seconded by Mr.

Simpson, it was agreed that the Secretary should circulate the members of the Association with regard to the matter, and that a complete list of subscribers should be obtained and forwarded to the Honorary Treasurer.

It was announced that the first list of subscribers from this Society consisted of nine members, who together had promised £80.

After tea, which was kindly provided by the President, the members adjourned to the Laboratory where the President exhibited a large number of specimens.

Mr. STOCKMAN, going round the specimens, said: The first shows the lesions—ulceration and congestion—that you see in the stomach and intestines in so-called bracken poisoning. I am working to find out what this disease really is, but I cannot say with very much success so far. This specimen is from an ox, and I think about fourteen of its companions died. The specimen I show you is the fourth stomach. The lesions are always the same. Personally I do not think the condition due to bracken poisoning. I have come to the conclusion that it may be a poison, but a poison of the type of ricin, that is to say, it is a proteid vegetable poison which causes general lesions as well as local ones and gives rise to a high temperature. There is no common poison which produces a rise in temperature up to 108, and constantly in this disease the temperature goes up to that point. We gathered several forage plants from the pastures, and one lot that came to the laboratory produced one experimental case of the disease, but it was not very marked; in fact the animal got better. When it appeared that the animal would recover I thought we had better kill it and have post-mortem examination, and we found typical lesions of so-called bracken poisoning in the rectum. It had been fed on a weed called tormentil. We obtained some more of this weed, but never produced another case. My idea now is that mixed up with that weed was the plant that we were looking for, that is the actual poison. There is an incubative period varying up to three or four days. If you take the animals off the pasture, cases of the disease do not cease to appear for about four days. After the incubation period animals begin to be very dull, diarrhoea comes on, and there is passing of blood and straining. They get quite wild, and finally become comatose before death. The illness lasts about 40 to 70 hours after it is first noticed. It is usually an acute disease that goes on very quickly. It is a seasonal disease. I used the bracken from a field in which the disease was notified, and at the time it was notified, to feed animals at the laboratory, but never produced it with bracken. The season is about September to November. A curious thing about it is that some cases are reported to occur in byres, and in nearly every case there is a bracken connection, sometimes there has been littering with bracken. I think it is confined to particular localities, several of which I know.

Replying to a statement by a member that he used a large quantity of bracken and had never had a case, Mr. Stockman said he knew that, and if the disease is bracken poisoning, it is by bracken under some condition which requires to be studied, but he did not think it was due to bracken. If it is, and I experiment with a cwt. of the stuff from the actual place where the disease has broken out, as I have done, and at the time the disease is occurring in the field, I ought to obtain poisoning. We all know that certain plants are poisonous only at certain times of the year. It may be the ricin type of poisoning, like the castor oil seed (if you want to poison a man give him a castor oil seed). You can immunise against this

poison. I believe in Russia it was a common method of poisoning. The lesions caused by ricin are general inflammation of the mucous membrane of the intestines, and ulcers and hæmorrhages practically throughout the whole intestine. There are also subcutaneous hæmorrhages and higher temperature.

The next specimen was a typical case of John's disease showing the crinkling of the bowel, together with a part of the large intestine which did not show the same crinkling although it was from the same beast. It showed the curious waxy appearance of the bowel. It was pointed out that affected animals might show no more than a mucous enteritis, the bowel being covered with a creamy sort of mucus, and that you may get that when you cannot find the bacilli. Infected intestines had been sent to the laboratory a year ago, and portions were fed to two cattle. As the price of feeding stuffs was very high, these two cattle were killed a few weeks ago as the experiment was thought to have failed, for no symptoms were evident. Both were found affected on post mortem examination eleven months after feeding. He had tried the avian tuberculin test in practice, but had stopped using it because people had sent up for tuberculin and tested all their animals, and when he wrote for the results he found they had sold the reactors, and had no post mortem evidence to furnish regarding the value of the test.

Replying to a member: What a negative test is worth? he did not know, but if the temperature rose from 102 to 104 stayed up he thought it was a reaction (tuberculosis excluded). There was not enough experience of the test yet to assess its value. It took us years to work out the value of tuberculin in tuberculosis, and we were now in the position to work out this test.

The next specimens shown were specimens of foot and mouth disease lesions in the pig, exactly resembling what you get in cattle except that the hoof separates at an earlier date. Lesions on a pig's tongue were also shown and explained.

Lesions of foot and mouth disease in the sheep were also shown.

Lesions of the disease on the teats of cattle were shown, and in one case they were co-existent with lesions of cowpox. The cattle in life had suffered from two diseases, cowpox, and foot and mouth disease.

(The members then examined a series of microscopic slides).

Mr. Stockman also demonstrated a rapid method of diagnosing mange in horses or scab in sheep. He said: This method is not necessary where there are plenty of parasites, but when you have few acari and a lot of scrapings, and have to wash them free of grease you have to use a good deal of fluid, and it is laborious to search the fluid drop by drop under the microscope.

The method consisted in washing the material with a large amount of alkaline fluid, precipitating the solids, including the acari, rapidly in a centrifuge, and then examining with the microscope the comparatively small amount of precipitate for acari. To prevent examining the same place on the slide twice, slides ruled into squares the size of a low power field are made use of.

A sheep was exhibited on which the parasites could be seen with the naked eye.

Mr. Stockman also explained and demonstrated the way in which abortion vaccine as sent out from the laboratory is used in practice. The bacilli are grown in a medicine bottle and the bottle is sent out to the veterinary surgeon who adds sterile liquid himself.

He also exhibited an apparatus he had designed for sucking the fluid from the bottles directly into the hypodermic syringe without contamination.

CENTRAL VETERINARY ASSOCIATION (IRELAND).

A meeting was held at the Gresham Hotel, Dublin, on Wednesday, April 17th. Present: Messrs. John Holland, Athy, in the chair; J. F. Healy, ex-President and Treasurer, Middleton; J. W. Nolans, Birr; S. W. Percy, Athlone; P. J. Howard, Ennis; J. Dawson, Enniskillen; with Mr. W. W. Kilroy, visitor.

The minutes of last meeting were read and confirmed.

Apologies were received from Messrs. A. J. Moffett, C. Tracy, and B. P. J. Mahony.

It was decided to send a subscription of £5 5s. to the International Veterinary Congress Fund, and also a donation of £2 2s. to the Veterinary Benevolent Fund.

A Committee was formed consisting of Messrs. Holland, Winter, and Healy, to decide what instruments, if any, should be bought by the Association, and what arrangements should be made for their safe keeping and despatch to members requiring them.

It was arranged, if possible, to hold a practical demonstration at the next meeting, in Cork, on the 9th July, Mr. Winter promising to operate by the new method on a couple of rigs, if they could be procured for the occasion.

The TREASURER produced his accounts, showing a balance to credit of over £30, which was considered satisfactory.

NOTES ON CLINICAL CASES, by E. C. WINTER, F.R.C.V.S. (Read at the last meeting, March 1st).—Adjourned Discussion.

STRICTURE OF ŒSOPHAGUS.

Case I. Subject a hunter gelding, five years old, in owner's possession about three months, taken up from grass about a week before. Horse showed symptoms of choking in the morning, slavered at the mouth, and seemed greatly distressed. I saw him six hours after when he was easier, but still would not feed nor drink. Gave a little linseed oil with trouble and passed a probang, no obstruction in the Œsophagus, but great distress shown in passing instrument. Tried massage of muscles of neck which were rigid, relief in about half an hour. Horse sold a month afterwards, and lost sight of, until he turned up similarly affected in the possession of a cavalry officer. Tried massage of the muscles along the course of the Œsophagus and morphia hypodermically into the muscles, with good results. Horse had a slight recurrence of the affection a month afterwards, and for the last month is apparently all right. Query—What is the trouble? No swelling of the Œsophageal tube is apparent.

Case II. A pony hunter gelding, turned out to grass all right: on taking him up to get fit he showed great distress on being galloped and would not feed afterwards. Examination showed rupture of the Œsophagus and dilatation in its lower third almost in the chest, prognosis unfavourable. Operation volunteered, but not recommended. Query—What can be done in these cases, owing to the risk of stricture after the operation?

Mr. S. W. PERCY commented on the danger of administering linseed oil in such cases, and in fact on the inadvisability of using linseed oil at all in veterinary practice, as, in his opinion, it is a most dangerous drug, particularly if not absolutely fresh. He also suggested intra-Œsophageal injection of cocaine and morphia in such cases.

Mr. HOWARD mentioned, after conversation with Mr. Winter, that he had seen this case before it came under

Mr. Winter's observation, and he agreed practically with Mr. Winter's treatment, stating he had great faith in massage of the muscles of the neck in such cases.

Mr. HOLLAND believed that the affection was mainly a nervous one, and should be treated with nerve sedatives.

Several members mentioned incidentally cases of choking in cattle where nerve sedatives injected into the Œsophagus had a good effect.

Mr. WINTER, in replying, pointed out that this was not an ordinary case of choking. He did not see what harm a little linseed oil could possibly do, whether the case was choking or not. At the same time he agreed with Mr. Percy that rancid linseed oil was a very dangerous drug, but he would not on that account condemn the oil altogether.

PICKED UP NAILS.

Case I. A thoroughbred yearling colt picked up a six-inch cut nail in the off hind foot. The nail went through the cleft of the frog and out in the pit of the heel, performing in its course the operation of frog setting. About two inches from the head the nail had bent at right angles and about two inches more stuck out above the heel and narrowly escaped wounding the fetlock joint. The nail was pulled out, and it took a strong pull to get it out, the wound syringed out with a strong caustic, and recovery was uneventful.

Case II. A similar case, but with a much smaller nail, was met with last week in an officer's charger.

Case III. A bay mare, five years old, purchased the day before, came in to be shod. The shoeing smith found her near fore foot so hot and sore that he directed my attention to it. I found a nail in the outside quarter and a considerable amount of matter under the sole. The wound was treated in the usual way but the matter broke out at the coronet two days after, although free drainage was effected below, and the mare got very bad with septic infection and both hocks broke out. She died a fortnight after. Query—How is it the mare did not go lame at the fair or on the road home?

This subject did not meet with much discussion, but several members present mentioned similar cases in their practices.

With regard to the case of the bay mare, it was inexplicable to the members present how the mare could have gone sound up to the time she came in to be shod, except that, as Mr. Winter mentioned, she had been newly shod on both fore feet and purposely pricked in the off one to make her action level.

FISTULE OF THE WITHERS.

Case I. A brown mare, seven years old, had been treated for three months with "washes," under the directions of a registered practitioner in an adjoining county. A fistula was discharging midway down the near shoulder. The probe revealed three sinuses, one running straight up to the withers, six inches long, one running back under the cantle of the saddle nine inches long, and one a similar length running out along the back in an upward and forward direction. A large opening was made in front of the shoulder blade and the sinuses carefully probed for broken bone or other foreign bodies; none such were found. Crude carbolic acid was forced into the sinuses twice a week, and antiseptic lotion freely syringed into them meantime and the lower opening kept patent with plugs of tow. After four weeks the sinuses were obliterated and the wound allowed to heal. Recovery was perfect, and a blister, to restore the wasted muscles, was the only further treatment necessary.

Case II.—A black van mare met with an accident in a collision on Christmas Eve. The stableman treated the only wound visible—a slight one, midway down the

shoulder in front of the scapula—until the 23rd February, when the mare was brought to me, as the wound would not heal. Examination showed a fistula apparently two inches deep and pointing in a forward direction, with a fibrous swelling oblong in shape, and not extensive, behind it. I thought at first that the trouble arose from a nidus of pus in the latter swelling, or possibly a foreign body. The mare was cast, chloroformed, and the swelling cut down on. The enlargement proved to be an elbow bend of the sinus, which ran from there in an upward and backward direction deeply under the scapula for a distance of ten inches. The probe grated on the inner edge of the scapula but no loose bone could be found. I tried caustic irrigation with a view to destroying the walls of the sinus, and pushed also some crystals of permanganate of potash well up to the end of it, as I thought then. A week afterwards it was evident that further trouble existed higher up, as some pus came away a short time after the sinus was syringed out. The mare was again cast and chloroformed, a further opening was made in front of the end of the scapula, and a long probe ran in under the cartilage easily. A horse catheter was then used and this ran easily back to where the cantle of the saddle would rest, about two inches from the median line. On shaving this spot a distinct bruise was seen. A long seton was run from here to the front of, and under, the scapula. After a few days it was found the drainage was not sufficient, and a perpendicular seton was put in behind the shoulder from this one to the elbow, and another from the hinder end of it to midway down the ribs. A week later another seton had to be run from the midway opening (behind the scapula) under that bone, and out at the point of the shoulder alongside the jugular vein, after a few days this seton worked well and some of the others were taken out. The case is now progressing favourably despite all the butchering. It is evident that one shaft of the colliding trap hit the mare behind the saddle and the other in front of the shoulder, midway down. The surprising part of the case is that the mare worked for two months all right, and there was no appearance of any trouble except the small fistula in front of the shoulder, although there was a lot of matter under the skin of the back and under the shoulder blade. There has been a great amount of sloughing of tissue all along the back, and in front of the shoulder, and a great volume of pus discharged.

This gave rise to a very animated discussion, and Mr. Winter mentioned that in the subsequent treatment of the case he found that liberal irrigation with Peroxide of Hydrogen had a better effect on the sinuses than anything he had tried up-to-date, and the mare was now practically recovered, and looked all right, except for wasting of the muscles along the back and on the shoulder.

TUMOURS OF THE SHOULDER.

Within the last twelve months I have had four or five cases of tumours about the point of the shoulder. In all cases they have involved a great deal of muscular tissue and been deep seated, with a nidus of pus and necrosed tissue. In no case have I got any history of an accident, although the original injury must have been a severe bruise of some sort, or a punctured wound. Extirpation, and complete extirpation at that, seems to be the only remedy. Setons seem to do no good, and blistering only seems to thicken the skin and subcutaneous tissues. Some of the cavities have been simply appalling to look at, and the hæmorrhage difficult to control, but all the cases have done well and gone back to work. One such case seemed to originate from

a collar injury half way up the neck, and the nidus was over two inches in. In this case I believe there must also have been direct violence from a shaft, although there was no history of an accident. If extirpation of all diseased or bruised tissue is practised, the resulting wound fills up rapidly, but, if any is left, the trouble begins all over again. In one case, in the middle of last month, a three pound tumour was dangerously close to the jugular vein, and blunt dissection had to be resorted to as the bleeding obscured the seat of operation, and the trouble was too deep seated for the usual hæmostatics to have effect.

These few rough notes were put together for the Meeting on the first of March, and, as I was unable to attend that Meeting, the discussion on them was adjourned and orders issued for them to be printed and circulated, so as to have a full discussion at the next Meeting on the 17th April.

This item gave rise to rather an animated discussion, some Members contending these tumours were due to Botriomycosis. Mr. Winter pointed out that he was quite familiar with this sort of tumour, or chain of tumours, producing Botriomycosis, but the tumours he referred to were in every case either Fibromas or Myomas, and each tumour had a distinct nidus of pus in the centre, was an isolated tumour, and did not recur on complete extirpation.

The Meeting concluded with a vote of thanks to Mr. Winter for the trouble he took in putting these notes together on very short notice, and the members present remarked that they appreciated such notes far better than a lengthy paper, which rarely provoked a good discussion.

Alleged False Description of Oats.

At Croydon Quarter Sessions H. Leslie Hall, corn merchant, of Whitehorse Road, Croydon, appealed against his conviction by the local magistrates for applying a false trade description to certain oats sold to Messrs. Hall and Co. (Croydon) (Ltd.)

The hearing of the case in the Police Court was reported in *The Times* of March 13th.

This was a prosecution by the Board of Agriculture, and a fine of £5 was imposed. It was stated that oats imported from the River Plate and sold in their natural state are properly known as "Plate oats." It was, however, a common practice to subject them to an artificial process, during which water was added. The proper trade description of these, according to the prosecution, was damped, prepared or watered oats. The oats which the defendant ordered and had delivered to him, invoiced as "P. Plate oats," were retailed to Messrs. Hall as "40lb. Plate oats." Owing to the added water the 100 quarters which were supplied were, in reality, only 95 quarters, so that instead of being 20s. 9d. per quarter, as quoted, the buyers were actually paying 21s. 10d. The appellant subsequently allowed 5 per cent. discount. The appellant claimed that he had acted in perfect good faith, and quite innocently, and that "Plate oats" was not an incorrect trade description.

The Recorder (Mr. R. F. Colam) deferred judgment and intimated that he could not see that there had been fraudulent intent on the appellant's part. He thought that the main point raised should be decided by the High Court, and his judgment would be framed with that in view—*The Times*.

Pharmacy and Poisons Acts (Ireland).

HARVEY'S ACONITE-POWDERS.

At the Oughterard, co. Galway Petty Sessions, before Mr. J. B. K. Hill, R.M., and other Magistrates, on April 11th, Mr. John Roe, general merchant and publican, Oughterard, was summoned at the instance of the Pharmaceutical Society of Ireland with (1) keeping open shop for retailing or dispensing poisons, and (2) selling "aconitine, being a preparation of aconite, also emetic tartar, both contained in and forming part of an article called 'Harvey's Aconite-powders for Horses.'" A third summons, at the instance of Sergeant James Shea, Royal Irish Constabulary, was for selling Harvey's aconite-powders without labelling the packet and entering the sale in the poisons book, contrary to the Sale of Poisons (Ireland) Act.

Mr. William Campbell Meeke, solicitor (of Messrs. A. and J. Robinson), who prosecuted on behalf of the Pharmaceutical Society, stated the facts of the case, and mentioned that the defendant had opened a sealed packet of the aconite-powders and had sold the packet opened and with one powder short. Even in the case of a person licensed under the Act it is necessary, he argued, to sell in unbroken packets.

The evidence of Sergeant Shea was to the effect that on November 2nd, 1911, he called at defendant's shop and saw the defendant, whom he asked if aconitine was kept in the shop. The defendant, after a pause, replied, "I keep aconite-powders for horses." Witness asked him how he sold them, and defendant replied, "I don't sell them at all." Witness asked him to let him see them. Defendant took down from a conspicuous portion of a shelf in the shop a cardboard box which was marked

"Harvey's Aconite-powders for Horses." Witness inspected the box and found there were in it two smaller cardboard boxes. He told the defendant he would buy one of these small boxes and asked the price, which defendant stated was 2s. 8d. Witness paid the amount and got a receipt. He told the defendant that it was illegal to sell the powders without being duly registered. The defendant replied, "I do not sell them, but keep them for private use." There was another cardboard box which apparently had not been opened, and it contained more of the powders. Witness saw this on the same shelf. On each side of the boxes were tins of treacle and a quantity of Ellimau's embrocation. The counter over which he was supplied was the one also used for the sale of groceries; and in the same shop intoxicating liquor was sold and supplied, but not over the particular part of the counter used for the sale of groceries. The defendant said that when he took over the charge of the business from his brother George two years previously the powders were then in the shop. The box which witness purchased bore no name and address, but was marked "Harvey's Aconite-powders for Horses"; one side had the following words: "These powders, as their name implies, contain poisons and are so labelled in compliance with the Pharmacy Act." The box was open, and contained five powders instead of six. The directions stated that each packet was a dose for a horse; 2s. 8d. was the price for a full box of six. The powders were in such a conspicuous place that they were unquestionably intended for sale and not for private use. Witness informed the defendant that the legal presumption was that all articles in the shop were for sale. The defendant had not a licence from the County Council, and he did not

tender witness a poisons book. On December 14th witness again called at the defendant's shop and asked the defendant if he still kept the aconite powders in the shop. The defendant admitted that he did, and witness asked him to show them to him; the defendant did so, and witness said that they had been removed from the portion of the shop in which he had first seen them and were now concealed behind an advertisement picture. He told the defendant to remove them at once from the shop.

Mr. Walter Thorp, B.Sc., F.I.C. (Dublin) proved his analysis of five Harvey's aconite powders, which contained 1 grain of aconitine, or sufficient as a fatal dose for at least twenty men; also tartar emetic.

The Magistrates held that the charges against the defendant had been proved, but suggested that as he appeared to have acted inadvertently, a penalty should be pressed for in one of the summonses only.

Mr. Meeke agreed to withdraw the summons on the charge of keeping open shop, and also that under the Poisons Act, on the condition that the defendant paid the cost of the stamps on the withdrawn summonses, and also the fine and costs on the remaining summons before the Court rose.

The defendant gave this undertaking, and paid into Court a fine of £5, with £1 cost on the summons under the Pharmacy Act for selling poison without being properly qualified, with 4/6 the cost of the stamps on the withdrawn summonses.—*The Chemist and Druggist*.

A Crib-Biting Case.

At Limerick Quarter Sessions, before his Honor County Court Judge Law-Smith, Robert J. Cotton, Brerfield, Co. Roscommon, sued James and Philip O'Dea, father and son, residing at Oola, in this county, to recover a sum of £50, money paid for a horse purchased at the last October great Munster fair, the animal being warranted sound and turning out to be a wind sucker and crib-biter.

Mr. L. O'B. Kelly (instructed by Mr. E. Leahy, solicitor), appeared for the plaintiff, and Mr. P. Kelly (instructed by Mr. William Frewen, solicitor, Tipperary), for the defendants.

Evidence for the plaintiff to prove that the horse, a three-year-old black colt by Pop Off, was purchased for £65 from a farmer named Duggan, acting for the defendants, who are farmers. The colt was sold subject to a veterinary examination by Mr. Patrick, v.s., Mullingar, and passed as sound, and to the notification that if the horse was a crib-biter or a wind sucker it would be sent back. Plaintiff subsequently found the animal was a wind sucker and not as such quite value for more than £20. Correspondence ensued, and defendants failing to comply with plaintiff's request to return the money paid and take back the horse, legal proceedings were instituted. It was admitted by the plaintiff that there was no engagement given with the horse, other than a verbal one to the effect that it was not a wind sucker or crib-biter.

The plaintiff was examined and bore out the statement of counsel.

Mr. W. Cargill Patrick, v.s., stated he examined the colt and certified the animal sound and free from crib-biting and wind sucking. He so marked the examination, after telling Duggan that if he had either habit he should be taken back. A fortnight ago witness saw the horse and found him to be a crib-biter and a wind sucker, and most accomplished at both.

DEFENCE.

Mr. Edmund Duggan, farmer, said he resided at Oola, and went with young O'Dea to sell the horse at the fair. On the road they met the plaintiff, and another man later, who bought the colt for £65. The animal was examined by the last witness, who asked was he a crib-

biter. Witness said it was for the previous witness to know that.

Witness, in answer to a further question, said he knew nothing about the horse, other than that he belonged to witness's next door neighbour. Mr. Patrick never said that if the colt was a crib-biter or wind sucker he would have to take him back.

Philip O'Dea said he was the owner of the horse, but he was not present when the sale was effected. Cotton's brother came subsequently to arrange terms of settlement, and admitted there was no engagement given at the sale.

By Mr. Kelly: When Cotton's letter was received to take back the horse, that the animal was a wind sucker, witness talked to a few about it, and they said not to mind it. That was why he did not answer the letter.

James O'Dea, senr., in answer to Mr. Kelly, said he asked Duggan to sell the horse because witness could not do so.

Mr. Kelly said his sons were young men following horses for some years, while Duggan was an elderly man. Was that the reason to shuffle out of the warranty.

The witness said Duggan was after selling 20 horses belonging to neighbours of witness.

His Honour: An experienced man.

The witness: And that is the reason I got him to sell the horse—a fit man to follow the horses on the road, and not have my gossoons hurt.

His Honour: Duggan was experienced in selling horses?—Yes, after selling 20 of them.

His Honour: A knowledgeable man.

Mr. E. C. Winter, V.S., stated he examined a horse by the same dam as this colt, and witness never heard that the animal was a crib-biter. Witness never heard of a veterinary surgeon giving a certificate that a horse was a crib-biter or a windsucker. It was a question very rarely asked with regard to long tails, or that a young horse reared, as such horses were in the open, was a crib-biter.

His Honour said he was satisfied that the animal was a crib-biter and a wind-sucker, and on the day of the sale was so. That was the reason that very innocent gentleman, Mr. Duggan, was selected to sell the horse suffering from this disease at the time. It was now proved that the horse was worth only £20, and accordingly he would give a decree for £48 to cover the expenses. Doctor Patrick was well known in the midlands, and as between his action and that of Mr. Duggan, his Honour absolutely believed what Dr. Patrick stated.

Mr. W. Cargill Patrick: Thank you, my lord.

It is understood an appeal will be lodged.—*Limerick Chronicle*.

Claim for Mare's death.

At Stowmarket County Court before His Honour Judge Eardley Wilmot, John Henry Lewell, Gisligham, sued the Horse, Carriage, and General Insurance Company, Ltd., for £31 9s. 10d., for death of a mare under a policy of insurance, and £4 premium on the same. Mr. Cloughton Scott (instructed by Messrs. Hill and Perks, Norwich, solicitors to the Tenant Farmers' Protection Association, Ltd.), appeared for plaintiff, and Mr. E. P. Ridley (of Messrs. Birkett, Francis and Ridley) for defendants.

Mr. Cloughton Scott, in opening the case, said the claim was for £20, in respect of the insurance upon a mare named "Smart," and £4 in respect of the fact that the defendants wrongly cancelled a policy upon other horses. Plaintiff was a farmer, and had five horses upon his farm. He met an agent of the company named Freeman, who wanted him to insure his horses. Eventually on February 23rd, 1911, plaintiff met Freeman at Ipswich, where the matter was again gone into. Freeman pressed the plaintiff to fill in a proposal form there and

then. Plaintiff replied that he did not know the exact age of his horses, and suggested that the matter stand over for a week. Then Freeman asked what was the average age of the animals, and plaintiff replied, "about eight or nine years." This statement, Freeman added, was near enough, as the horses would be examined, and he filled in the form accordingly, the ages being all given as eight, and the height 16 h.h. The company sent a veterinary surgeon named Mr. R. Davey to inspect the horses, and plaintiff told him that the ages were given between eight and nine. Mr. Davey took a report for defendants, and the ages were accurately given, two being nine years, one eight one ten, and one eleven. That document was sent to the company, and the policy was issued on March 2nd, which date it bore. Before the premium was paid the Company had full knowledge of the age of the mare named Smart, the subject of this claim. The mare was found dead after wards in her box, but plaintiff had no idea of the cause of her death. Knowing she was insured for £25 plaintiff thought that the best and fairest way would be to send for Mr. Davey. He came, and found that when the animal was cut up she had suffered from rupture of the bowels. Plaintiff next wrote to the Company saying the mare had died, and defendants replied, "Retain carcass until a post-mortem is made by Godbold." Plaintiff went to the premises of a knacker named Reed, to which place the carcass had been taken, to tell him to keep the carcass, but he was informed it had been cut up. He wired the Company, saying the carcass had left the farm. An inspector from the company came down, and in an extremely unnecessary way suggested that plaintiff had misrepresented the age of the mare, and subsequently informed him that he had no claim upon them, and the premium would be forfeited, as the animal was not correctly described. This animal was bought at Mr. Simpson's sale at Bury St. Edmund's as eight years of age, for 22½ guineas.

Plaintiff was then called, and bore out counsel's statement, saying Freeman filled in the form of proposal after he had objected to it.

R. Davey, horse dealer, said he thought the mare in question was eleven years of age. The carcass was removed to Reed's place on his instructions.

Mr. Ridley said the Company were carefully protected by their policy against what was unfair, and when there was cause for suspicion they could bring the case to Court, as in this instance, and hear what the other side had to say.

His Honour said what the Company were suspicious about, a little enquiry would have shown was a genuine case.

Mr. Ridley said the Company were entitled to have 24 hours' notice before the carcass was parted with. It was a condition precedent to any claim under the policy.

His Honour said the Company might have a claim, if there was any, against their agent, for carelessness. A horse might be burned to a cinder, and then a man would not be able to retain the carcass. He could not see any doubt in this case, and there was no suggestion as to fraud. Judgment was given for plaintiff for £25 6s. 8d.

OBITUARY.

BARTON.—On April the 30th, at Upper Norwood, Williamina McKay, the beloved wife of Frank Townend Barton, after 18 months illness and suffering, borne with splendid courage and devotion.

CORRESPONDENCE.

UNQUALIFIED ASSISTANTS.

Sir,

The remarks of Mr. Bower on the above subject will be read with interest by practitioners. Any attempt to deal with the question by the adoption of Cromwellian tactics is bound to end in failure. It is not an easy matter to define, under the existing law, what duties an unqualified assistant may perform, provided his employer does not represent him to the public as being qualified. As a matter of fact the public prefer an unqualified man with experience, to a qualified man who lacks this essential. A large proportion of veterinary practice, at any rate in country districts, is more concerned with the Art than the Science of the calling, and this fact is soon ascertained by the young graduate if he lack experience in this class of work.

In order to render unqualified assistants a thing of the past it is necessary to supply qualified assistants possessing at least a sufficient knowledge of practical details.

Whether the present system of teaching is capable of carrying this out is a matter on which opinions may differ. One thing is quite certain, viz. that the opportunities for obtaining clinical knowledge suitable for country practice do not exist in the teaching schools, and the only manner in which this knowledge can be obtained is for the student to become a pupil with a country practitioner.

As matters stand at present, it is quite possible for a student to become qualified although he may never have had any practical acquaintance with obstetrics. True, he may know Fleming's work on the subject from cover to cover, and carry in his mind vivid recollection of obstetrical diagrams as displayed in the lecture room, but when he comes to apply his theoretical knowledge in the stable or cow-shed, surrounded by a crowd of wiseacres, he receives a rare awakening.

The art of the calling cannot be learned from books or lectures, but must be acquired by actual observation and by assisting at the various details.

And not only is there the art of dealing with the patients, but also the art of pleasing the owners of the animals.

Now no reasonable individual expects that the young graduate could possess these attributes to the same extent as the practitioner who has a long experience. But we should insist that he has sufficient practical knowledge to carry out the ordinary duties of the profession. How is this to be obtained? By making it compulsory that every candidate for the diploma shall produce a certificate of having attended as pupil with a practitioner for a certain period. The student of human medicine is not compelled to produce such a certificate, but instead he must furnish certificates of attendance at hospitals, and also of having been in attendance on a certain number of midwifery cases. It is impossible to ascertain by either written or oral examinations the amount of practical knowledge that a student possesses with reference to certain subjects, hence the system of compulsory attendance is the only way out of the difficulty.

When such certificates are compulsory at the veterinary final examination, and when matters are arranged so that the clinical examination will be on a par with that exacted in human medicine, then indeed the young graduate will have nothing to fear from his unqualified rival.

Lucrative Government posts, appointments in Public Health Departments, etc., cannot be obtained by all graduates, while in spite of the advent of the motor car, there is still demand for the private practitioner, provided

he is able to prove his utility to the public. But in order to accomplish this he must possess something more than an intimate knowledge of text-books, or of the intricate science of bacteriology. "Colic, castration and cow-calving" look simple subjects in books and lectures, but are very different in the stable, field and cow-shed, and the young graduate soon learns after leaving College that "the bacteriological tail has not yet succeeded in wagging the clinical dog."—Yours, etc.,

E. WALLIS HOARE.

May 6th, 1912.

Sir,

I see the profession are up in arms again at the employment of unqualified assistants, and if your columns are open to hear both sides I think I may be able to shed a little light on the subject, and having been one of these "outsiders" for sixteen years I think I can claim a little knowledge of the controversy at issue.

Until the era of motors, we heard nothing of the trumpet call to smash the enemy within our gates, but the profession now is in very low water owing to electric traction, and someone has got to be hanged, and as we are easy to get at, they are trying to ring our death knell through no fault of our own.

If "the powers that be" are so anxious to improve the status of the profession why not bring the following gentlemen to the tribunal who, of course, are duly qualified: The professor of the art at Camden Town who published a "wonderful work" in nine volumes with beautiful coloured plates at a price to suit all pockets, for the canvasser will call for instalments as desired; qualified men on the staff of patent medicine vendors; qualified men employing unqualified assistants to do all the work, and when leaving their employ advertising that Mr. Blank was only employed to keep the books (qualified men in the Midlands please note!); qualified men taking contracts at 4/- per annum, and others of a more generous nature working for nothing; qualified men giving free advice through the press; qualified men holding honorary appointments at institutions for lost cats, and instructing the charwoman how to become a "cat specialist"; qualified men touting for orders at shows and repositories. I think this list will do for a start and, if necessary, I can furnish a few more.

It must be remembered that qualified assistants are generally "birds of passage" with little or no interest in their employer, but for ever on the look out for a Government appointment, and then take wing, leaving everything to a new man, and of course the practice suffers. Moreover, they require the services of an unqualified man to do nearly all the work which is considered to be *infra dig*, and it is a well known fact that unqualified assistants are not so fond of looking upon the wine when it is red.

If these gentry will put their own house in order, we shall then hear less of the iniquity of the unqualified man.—Yours truly,

"HONI SOIT QUI MAL-Y-PENSE."

VIVISECTION AND THE VETERINARY PROFESSION.

Sir,

There are two letters from laymen that appear in your issue of May 4, that ought not to pass unnoticed. Mr. Richardson, writing in *The Referee*, contrasts one young qualified man with the whole army of unqualified operators, much to the detriment of the former, and builds up an argument, but a very poor one, against the abilities of all qualified men.

Mr. Petley gives away his case by assuming in the last paragraph of his letter that the veterinary profession has lost its standing and that the unqualified man has been the great factor in the fall. As a matter of fact unqualified men are not nearly so plentiful as they used to be, and those few that exist retain their position and hold of the public by some characteristic, connected most probably with the personal equation.

It is perhaps quite natural that youth should take an almost abnormal interest in the matter of emasculation or castration. A race of eunuchs would possibly be less deeply interested. In nine cases out of ten when you read a layman's letter to the press criticising our profession, this matter of castration crops up. They say our members ought to be taught "practical surgery—like castration." If one were to ask an eminent human surgeon what he thought about the surgery of 90 per cent. of veterinary castrations in this country, and especially since the standing method became the vogue, I think the answer would be that the testicles are truly removed, but the less said about the surgery of the matter the better. It is because there is so little scientific surgery about the operation that the unqualified man often competes successfully against the qualified one. When I am castrating, or watching others at the job, I often think of the travesty of "the art of veterinary surgery" as evidenced in this operation. The public dictate largely to us in this matter as to how we shall proceed (the layman is excluded from witnessing a human surgeon operate) and if we refuse to act as they wish, some eager slasher is given the job, or an unqualified man is imported into the neighbourhood (occasionally under the aegis of a qualified man, who of course does the operation himself, but doesn't care much about it) from whom the importer draws a commission.

So much for castration and its surgery. Now, what about education? Mr. Richardson seems to think that if the three years course were substituted for the present four years one, and more practical surgery taught, the unqualified man wouldn't stand as good a chance as he does at present, and the young graduate would be better fitted to be of use in his profession at once. Less education is a cry that will not make headway nowadays, and most men will agree that education never made a man a worse practical performer, providing that perseverance, adaptability and energy accompany it.

The matter here, again, is one of the personal equation. As to more practical surgery being taught, it takes a man almost a lifetime to become perfect in the art and science. Experience alone will make him a master. When he is a master he will (if he is a veterinary surgeon) often ask himself scornfully what should these men know about my art?

Instruction from practical men who are also qualified, and some of whom really are capable men, may still be had by the graduate who requires it, and pupillage is not discouraged but encouraged by the powers that be. There is an old saying, "If there were no fools there would be no fairs," but the gullible public that thinks it knows will always preponderate, although a 20 years course of instruction or longer is really what it wants. As long as the gullible and indiscriminating public exists the unqualified man will always have a field for the display of his cheap attributes. The law can only intervene successfully against malpractice by an unqualified man when those who administer it and bring the charges under it are educated and intelligent enough to appreciate the full flagrancy of the act committed; and just as it takes a legal gentleman to point out a flaw in legal procedure, so it requires veterinary evidence to bring home a charge of veterinary malpractice.—Yours faithfully,

G. MAYALL.

NEW COAL MINES REGULATIONS.

Sir,

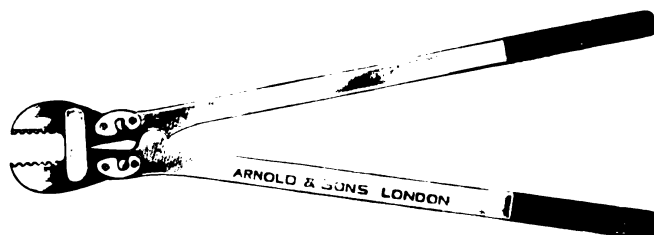

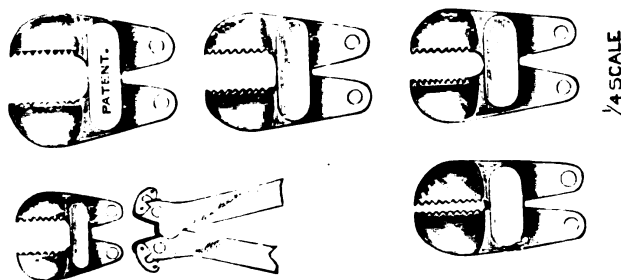

Probably many veterinary surgeons will now be consulted by their clients concerning the various new guards or protectors for the eyes of ponies working underground. They should remember that anything to decrease the range of sight will increase the risk to the animal. It is necessary for the wearer to be able to see anything approaching from behind and the amount of room in which to turn round. Further, if it will cause any injury or inconvenience having to continually look through small wires, or if any of the mechanical arrangements can, in case of accident, be driven on to the eye to damage it. Also, the conditions of heat and moisture will have to be taken into consideration.—Yours faithfully,

COLLIERY PRACTITIONER.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1245.

MAY 18, 1912

VOL. XXIV.

THE ONE PORTAL SYSTEM.

The proverbial hard-headedness of Yorkshiremen was well illustrated by the reception given to the revolutionary resolution which Mr. Arnold Richardson recently submitted to the Yorkshire V.M.S. The resolution—"That, in the opinion of this meeting, our one-portal system is prejudicial to the interests of our profession" was introduced by its mover in an eloquent and persuasive address. But, in the subsequent discussion, member after member arose and spotted the weak point at once. They recognised the address as being earnest, clever, and courageous, but almost entirely irrelevant to the resolution. It was a good argument in favour of a high educational standard for veterinary students, and it advanced some reasons for the creation of a new diploma in public health work. But it contained not a solitary excuse for destroying our system of one-portal entry to the profession. All the members of the Yorkshire V.M.S. saw this; and therefore they voted unanimously against the resolution.

Mr. Richardson commenced by making it quite clear that he was speaking absolutely in an individual capacity—that he was representing no one but himself. This declaration was not unnecessary; for, without such an assurance, we might have suspected one University, or veterinary school attached to a University, of departing from the understanding which has always governed the relations between our profession and the Universities.

Sir Rubert Boyce, when he established the Liverpool School, fully acknowledged the value of our one-portal system to us, and reiterated his desire that we should always retain it. Sir Christopher Nixon, when he initiated the Dublin Veterinary College, assured us that we need not fear any interference with our sole power of licensing to practice. The Senate of Edinburgh University has attached the Dick College with the same clear reservation—that we should retain the one-portal system. So also with the arrangement between London University and the Royal Veterinary College—our sole right to license graduates for practice is fully recognised.

Half of Mr. Richardson's address is devoted to an argument in favour of University teaching and the value of University associations to students. Has he overlooked the fact that every Veterinary teaching school is now associated with a University? The fact that University teaching would be good for Veterinary surgeons if it were distinctly and specially arranged for them, is no argument in favour of each University being empowered to grant a license to practise. Surely some special knowledge

of the requirements of a veterinary practitioner is needed upon the diploma-granting body; and no University Senate possesses that knowledge. Mr. Richardson perhaps a little over-estimates the importance of public health work and laboratory training in the education of the average practitioner. They are and always will be much more important than they once were, but they will never be the most important subjects to the bulk of practitioners. The large majority of practitioners will always be engaged in serving the public by the practice of medicine and surgery; and no one outside of such experience can estimate the quantity and quality of knowledge necessary to make the most useful practitioner.

Mr. Richardson introduced some references to the Veterinary Surgeons' Bill, and these are very interesting. In one particular some correction is required. Mr. Richardson says "When the Bill was submitted to the profession originally it contained clauses the objects of which were the stamping out of quackery and the non-professional castrator. . . . Now these clauses are to be deleted. Votes for the Bill have been recorded, but the benefits have been withdrawn. If the Bill were submitted to the profession to-day without the original clauses it would be rejected." These are surprising utterances: for the fact is that the clauses in question were deleted from the Bill before it was submitted to the profession at all. They were deleted, at the instance of the Privy Council, early in 1908. Two Council elections have been fought upon the Bill since then—in 1908 and 1909. And at each the profession's verdict has endorsed the Bill—with increased emphasis in 1909.

But in another particular Mr. Richardson deserves our gratitude—we may thank him for a new argument in support of the Bill. He states that we are in this dilemma—we must either obtain our Bill, or drop the one-portal system. We quite agree, but few of us will have any doubt how to choose. The first alternative means a small fixed subscription from each member, and this will preserve the uniformity of our diploma and the independence of the profession, and retain all our affairs in the hands of those best fitted to manage them. The other would split up the profession into several tiny fragments dependent upon different Universities, at each of which our education would be guided by the ideas, and modelled to suit the convenience of the preponderant medical faculty. We shall always be a very small body, and, therefore, unity and independence are essential to us—Mr. Richardson proposes that we should give up both, without offering a single valid reason for doing so.

THE OPERATION FOR ROARING : A SUGGESTION.

By J. J. O'CONNOR, M.R.C.V.S.

Professor, Royal Veterinary College, Dublin.

When one opens a larynx of a living or dead animal which has been operated upon for roaring, he is struck by the deformity caused by the left arytenoid cartilage projecting towards the lumen of the larynx, although the laryngeal ventricles have been completely obliterated. One also observes that this arytenoid is quite movable—that it can be made to sway in and out by means of the finger, thus leading to the supposition that it may also be impinged upon by the inspired air and made to vibrate and cause a noise, not so shrill, however, but softer than that caused by the vocal cord when it is left free to vibrate, as in the case of the roarer not operated upon.

An interesting case came under my notice the other day. A very good, well-bred hunter mare, which had run with distinction in point-to-point meetings, was brought to me for the roaring operation. As I was about to operate, a gentleman present recognised the mare as having been operated upon already, two years ago. However, I proceeded with the operation to see if anything further could be done. No trace of the operation wound could be discovered until the skin was shaved, when a faint line could be seen representing its site. On opening the larynx both ventricles were found obliterated, but the left arytenoid was decidedly encroaching on the lumen of the larynx, and it appeared somewhat larger than usual. On placing the finger between it and the thyroid cartilage it could be made to move farther towards the middle line.

My idea is—in addition to stripping the ventricle to remove a strip of mucous membrane from the outer lateral aspect of the arytenoid, thus making a wound which in cicatrising will draw the arytenoid away from the middle line and fix it to the thyroid, thus making it less movable and preventing its coming in the way of the inspired air.

I would suggest this additional stripping being performed on horses already operated upon for roaring, but without success, provided, of course, that the failure was not due to ossification of the larynx. I would not advise both sides of the larynx being operated upon when only one side is affected: operating on the non-affected side of the larynx appears to me to have no real justification. It seems unnecessary mutilation of the organ, and must be much more likely to be followed by untoward results—such as dyspnoea soon after the operation, and ossification of the cartilages later on. The fact that it is not necessary is shown by the number of successful cases in which only the affected side has been operated upon.

In the case referred to, the owner had the horse examined when he purchased him, and the veterinary surgeon did not detect that the horse had been operated upon for roaring, but passed him sound except for the noise.

I may mention here two other cases of roarers operated upon, interesting on account of the long time which elapsed before improvement occurred, and from the fact that they were operated upon by a trephine opening in either thyroid cartilage, through which only a small portion of the mucous membrane was removed from the apex of the ventricle and from the inside of the vocal cord. One horse was tried at intervals up to 12 months after operation without signs of improvement, but on being tried 18 months after the operation there was very marked improvement, and an absence of distress previously present. The other horse showed no improvement until six months after the operation: it was then very marked. Both horses were extremely bad roarers.

In neither case was there any thickening of the thyroid cartilages where they were trephined, in fact a slight depression could be felt here.

TORSION OF THE UTERUS IN A HEIFER.

As it is some time since a case of this trouble has been mentioned, I venture to record my experience at Mr. Atkinson's Farm, St. Bees.

Subject. Red shorthorn heifer.

History. At the full period of gestation mild labour pains were noticed from twelve to fourteen hours before the owner, having seen no water bladder, made a manual examination, and found that there was "no passage."

Thinking the case would be one of premature labour, I went with all confidence of having an easy case. On arrival I did not wait to observe all the external symptoms of torsion which one used to rhyme off in college days, but immediately called for soap and water, and inserted my hand into the vagina, when the actual state of affairs was indicated by the spiral folds of mucous membrane winding round to the left, forming a complete twist a little further forward.

Satisfied as to my diagnosis, I had the cow driven out into a sloping grass field, cast on the left side, and the feet, fore and hind, secured. Then commenced rolling her over to the left. After a few turns I was able, by following the direction of the folds, to touch a leg, which I endeavoured to stick to whilst the heifer was being rolled. Half-a-dozen turns with the heifer in the dewy grass did not improve matters much.

Having now reached the bottom of the incline, our animal was allowed to rise, when she bravely marched, with the rest of us, to the top, during which time I had decided to try a twitch with plenty of length of rope in it; this I eventually fixed on to a leg, and screwed it up, until I had drawn pretty near together the shank of the twitch and the calf's leg, which was now wedged in the vagina. Taking a firm hold on the twitch with both hands, I ordered the animal to be again rolled. On inserting my hand after a turn or so, I found, at last, a straight passage. The fœtus was upside down, and the head to one side and underneath the body.

With a little trouble delivery was effected, to my surprise, of a live, healthy calf.

The heifer required attention for a few days, on account of a bruised vagina, but ultimately made a good recovery.

C. F. SHAWCROSS, M.R.C.V.S.

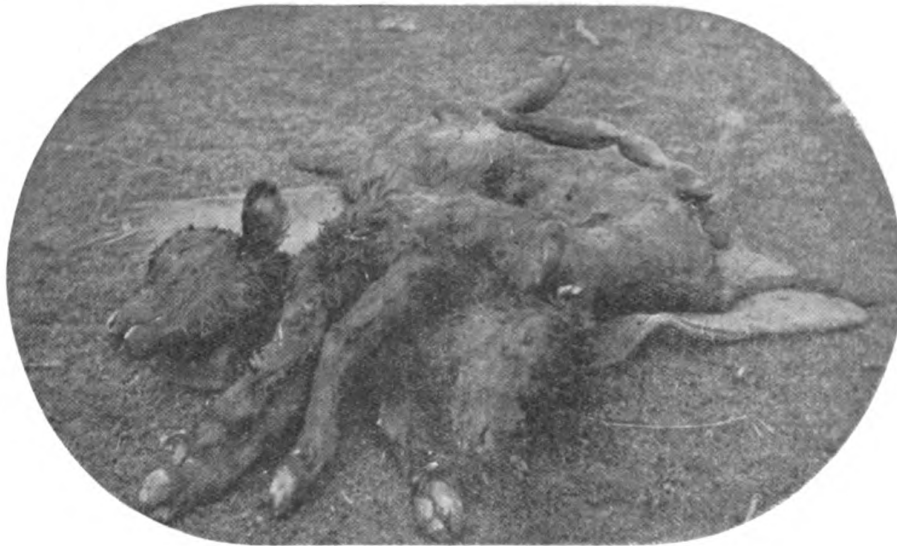

Herewith are two photographs of a monstrosity which occurred in my practice a short time ago. I do not think any explanation is necessary, except to say that the two calves were perfect in every

detail, joined together by the abdominal wall along the median line, and were alive at the time I commenced to deliver them. Both were heifers. They were by a "Polled Angus" bull, out of a cross-bred Alderney cow, which I am pleased to say made a good recovery, despite the fact that I was about four hours in delivering the calves.

W. L. GASCOYNE.

Lutterworth.

[Some details of the delivery would have been interesting—Ed.]

VETERINARY CINEMATOGRAPHY.

I wonder whether it has ever occurred to any member of our profession, what a book the cinematograph would be as applied to Veterinary Science. There is no end of scope for such an enterprise, for the subjects depicted could be made highly instructive to Veterinary Surgeons, and possibly sometimes amusing. By the use of such living pictures much could be taught of practical value to students and in a manner calculated to impress the subject matter on their minds a great deal better than all the "telling" in the world. It is well known among us students that we never once have any practical demonstration on the handling of cattle, sheep, or pigs at college, and many a man securing a country assistantship for the first time knows next to nothing of the practical side of the business. If a film could be exhibited at every V.M.A. weekly meeting it would undoubtedly attract an enormous attendance—not only of students but also of qualified men. I further suggest that the photographs should be "taken" by an expert employed solely by the R.C.V.S. (or some such body) and that the films should be the property of such body, and be used exclusively for the benefit of Veterinary students and practitioners. The expert could travel to the meetings of the

various Veterinary Societies and give a short and sweet highly instructive Veterinary entertainment.

To support the cost of films and machinery, and the experts' wages, etc., a small contribution might be asked of the members present at any such meeting. The expenses would not be great after all, and who knows, the year's takings might even show a profit. The variety of pictures is unlimited, and among others that have crossed my mind are: (1) Catching and restraining animals for operations; (2) Methods of restraint for all the animals we deal with and for whatever purpose; (3) How to sling an animal when down; (4) How to set fractures in various ways on various animals; (5) Proper methods of administering draughts or drenches, pills, powders, electuaries, etc.; and applying blisters and other ointments, lotions and dressings of all kinds; (6) Methods of castration and speying in different animals and birds; (7) Procedure followed at post mortems; (8) Depiction of all the many operations both common and otherwise; (9) The distinctive attitudes of animals when afflicted with various diseases such as Traumatic Pericarditis of oxen; Sleeping or Mad staggers, Laminitis, Tetanus of horses, Rabies, Hemiplegia of Dogs, and others; (10) Parasitic life, showing all the various ticks, lice, acari, flukes, worms, etc.; (11) Extraction of teeth in the domesticated animals,

Rasping of ditto, and the different instruments employed for these purposes; (12) Processes of Preparation of Carcases for food, including pictures dealing with Meat Inspection; (13) Improvised methods of removal of injured cattle or horses from one place to another; (14) Transport of animals by ship or rail, with methods of getting them aboard, etc.; (15) Lameness in horses, and the peculiarities in gait as arising from different causes; (16) Parturition cases; (17) Botanical pictures showing poisonous grasses and plants, etc.

And from an "amusement" point of view: (1) Cub, Hare, Stag and Fox hunts could be shown; (2) Football, Cricket or other matches between our College and others; (3) Annual Sports; (4) Exhibitions of Buck-jumping and expert riding in the "Far West"; (5) Lassoing of Cattle, etc.; (6) Whip-pet Racing; (7) Horse Racing; (8) Pigeon-flying; (9) Polo; (10) Breaking in colts; (11) Training of wild and other animals; (12) Zoo life; (13) Pictures from Dog, Horse and Cattle shows, and many other items of interest and amusement from all parts of the world, could be employed.

What are the opinions of others on this matter? It seems to be there is no end of scope for such an enterprise.

HAMILTON KIRK,
London. Class D Student.

ABSTRACTS FROM FOREIGN JOURNALS.

PERITONEAL TUBERCULOSIS IN THE HORSE.

Zschokke records (*Schweizer Archiv.*) a case of a saddle mare, nine years old, which was admitted to the Zurich Veterinary School for treatment as suffering from ascites and progressive loss of strength and condition.

The mare presented an exaggerated abdominal circumference and was "saddle-backed." The subcutaneous fat appeared very reduced, and the ribs were apparent.

The mare, hitherto a very vigorous animal, had become apathetic, although the appetite was still fair. The rectal temperature was 100.9 F., the pulse from 48 to 50, and the respirations 18 per minute. The pulse was regular and fairly strong, and the sounds of the heart were normal. Percussion and auscultation of the chest revealed nothing abnormal; and neither cough nor catarrh was present. The conjunctiva had a normal tint; and the lymphatic glands did not show the least engorgement. The left hind limb alone showed a slight œdema in the region of the cannon.

Percussion of the right portion of the abdominal wall yielded a tympanic sound, attributable to gas contained in the large colon. The abdominal wall, which was very tense, was insensitive. Rectal exploration revealed no gaseous distension of the intestine; the uterus was normal, and the kidneys, which were well accessible, showed no lesions.

Along the course of the posterior aorta, however, the hand detected some swellings which gave the

sensation of hypertrophied lymphatic glands. It was not possible to demonstrate either liquid contents in the abdomen, or abnormal sensitiveness in one point of the abdominal cavity. The mare had never shown colicky pains, and the fæces were normal.

Ascites is rare in the horse, and especially rare without co-existent symptoms of hydropsy in other organs. Nevertheless the typical form of the abdomen, the "saddle-back," and the sonority to abdominal percussion, combined with the absence of voluminous contents in the intestine and in the uterus, permitted no other diagnosis than that of ascites. The author suspected the development of a tumour which had caused stasis of the portal system, and pronounced the mare incurable.

Post-mortem, from 80 to 100 litres (= 140 to 175 pints) of serous fluid were found in the abdominal cavity. The peritoneum showed a great number of villous red patches, resembling placental cotyledons which were as abundant upon its parietal as upon its visceral portion. The mesenteric glands were voluminous, and had a yellowish tint. The gastrointestinal mucous membrane was normal. The liver, spleen, and kidneys were normal, as were also the thoracic organs, with the exception of a slight engorgement of the bronchial lymphatic glands.

Microscopical examination by aid of Ziehl's staining method revealed the existence of bacilli of the shape and size of tubercle bacilli. The author therefore regards the case as one of serous tuberculosis.—(*Annales de Méd. Vét.*)

[It is not stated whether the microscopical examination included the lymphatic glands, nor, indeed, what it did include.—*Transl.*]

BOVINE HÆMATURIA.

Roger, in a very long article (*Répertoire de Laquerrière*) makes a complete study of this disease, and draws the following conclusions:—

Bovine hæmaturia is a chronic affection, and manifests itself by intermittent attacks of abundant hæmaturia, without thermic reaction, which cause profound anæmia and progressive cachexia, leading up to death.

This hæmaturia is endemic in the west and the centre of France, and is also observed in Germany, Belgium, and Italy. It may be met with in various places sporadically. It is associated with the presence of vegetations or ulcers in the bladder.

The disease has been attributed to various causes; and the author, after reviewing the different agrees with none. No specific microbe is known; and though Arnold, in Germany, has described coccidia in connection with the disease, numerous investigations have failed to reveal these in France. In the epithelium of one bladder the author found oval forms not showing any clear structure and not resembling any parasite actually known. While reserving a final opinion upon the nature of these bodies, he is strong inclined to regard them as epithelial cells undergoing a special degeneration. He admits the inflammatory nature of the disease, regarding it as an inflammation of toxic origin; but

the precise nature of the etiological agent remains problematical.

These lesions commence in the chorion of the mucous membrane, and consist of a nodular neoformation of vasculo-connective tissue, which is inflammatory in its origin. The process shows two tendencies in its development—a *vascular* and a *connective tissue* tendency.

In the immense majority of cases the vascular tendency predominates, and only allows so much of the connective tissue as is necessary for the framework to subsist. Everything seems to be transformed into new vascular tissue. The epithelium remains intact.

The connective tissue tendency appears in certain cases, concurrently with the vascular tendency, and a fibro-angiectasic vegetation, without participation of the epithelium, is then produced.

In some cases, much more rare, the epithelium participates in the formation of the neoplasm, and a very vascular papilloma is developed.

In all cases the lesions become pediculated after a certain time, owing to the contraction of the vesical walls and the flow of the urine.

Lesions of the kidneys, ureters, and urethra are exceptional. The most characteristic, the most frequent, the most precocious, and the most serious lesion of bovine hæmaturia is the angiomatous lesion.

The author regards the fibro-angiomatous lesion as indicating a defensive reaction of the organism, and as being in all cases a favourable form of the disease.

The nature of the pathological process in the disease may be looked upon as the evolution of an inflammatory nodule towards the angiomatous, the fibro-angiectasic, or the papillomatous form. Hæmaturia is caused by rupture of the vessels of the lesion, perhaps under the influence of augmentations of pressure caused by contraction of the bladder.—(*Annales de Méd. Vét.*).

INFECTIOUS PNEUMONIA OF SHEEP.

Infectious pneumonia of sheep, or more correctly, *Septicæmia pluriformis ovium*, appeared in eight veterinary official districts of East Prussia in 1909, in the acute, sub-acute, and chronic form. Chiefly it affected lambs, and more rarely yearlings.

In the acute form the lambs suddenly refuse food, are dull and feeble, and finally become unable to rise. If forced to their feet, they stagger a few steps forward, and then fall down again. Often the abdomen is considerably distended. The visible mucous membranes are pale rather than reddened. There are no symptoms of pneumonia. As a rule death takes place in one or two days, more rarely in three or four days.

Post-mortem, the lesions are exclusively those of septicæmia. The blood is fluid and black-red; the large parenchymatous organs are dull in aspect; and the spleen, liver, and kidneys are generally swollen. Small hæmorrhages are present under the epicardium; and the mucous membrane of the small intestine is reddened, dull, and swollen. The lymphatic glands of the body, especially the retro-pharyngeal, sublingual, and sub-maxillary glands,

are swollen, dark red, and juicy. The lungs, as a rule, show no special alterations.

When the course of the disease has been longer, other alterations are found in addition to the foregoing. Opaque, hæmorrhagic fluid is found in the peritoneal cavity; and hæmorrhages exist under the serous membranes, upon the kidney, and under the capsule of the liver, where they sometimes attain the size of a three-mark piece.

In the sub-acute and chronic forms of the disease, feverish catarrh of the upper air passages and the conjunctival mucous membrane appear at the beginning of the illness. In addition, the animals show a dull appearance, loss of appetite, stiffness in progression, swelling of the limbs, accelerated respiration, and cough.

In this form, post-mortem examination very often reveals firm brown-red portions of the lung which are devoid of air, and the existence of fluid in both pleural and pericardial cavities. The pleura is opaque, and covered with a deposit.

A serum against this disease has been sent out from the Department of Animal Hygiene of the Kaiser Wilhelm Institute, Bromberg. It is not yet possible to definitely estimate the value of this preparation.—(*Berliner Tier. Woch.*)

SCLEROSTOMIASIS IN FOALS.

Numerous observations upon this disease in foals were made by Prussian official veterinary surgeons in the year 1909. Apart from the aneurisms of the mesenteric arteries, post-mortem examination revealed manifold pathological processes of interest. Examples of these are—infarct in the cortical substance of the kidneys with hæmorrhage into the renal capsule, and the neighbouring sub-peritoneal connective tissue—embolic infarct in the spleen with rupture of the splenic capsule and hæmorrhage into the peritoneal cavity—rupture of the wall of the aneurism in the posterior mesenteric artery and hæmorrhage into the peritoneal cavity—thrombosis of both renal arteries.

At the post-mortem examination of one cachectic foal the colon and cæcum were found beset with numerous nodules the size of a nut, which contained a thick, greenish-coloured pus and, in each case, a specimen of the *Strongylus armatus*. A similar nodule was also found in the lung. The kidneys were affected with chronic inflammation in consequence of numerous embolisms, and in some places showed cicatricial contraction. The anterior mesenteric artery was filled with firm thrombotic masses containing numerous worms.—(*Berliner Tier. Woch.*)

DISTOMUM HEPATICUM IN A HORSE.

Heigenlechner, district veterinary surgeon of Holzkirchen, records (*Münchener Tier. Wochenschr.*) this unusual occurrence. A horse, which had shown no positive symptoms of any kind except anæmia, loss of appetite, and debility, was slaughtered on account of cachexia.

Post-mortem, the liver was found to be severely affected with *Distomum hepaticum*.—(*Berliner Tier. Woch.*)

W. R. C.

THE BIOLOGICAL ROLE OF SPERMOTOXIN IN FECUNDATION.—By M. R. TUSHNOV, M.V.Sc., Kazan, Russia.

Arguing from the present state of our knowledge of the mechanism of immunisation, I concluded that it would be possible to set up an immunity, not only against infection, but also against a normal physiological function such as fecundation. This opinion is supported by the well known physiological fact that women seldom become gravid during lactation, yet during this period menstruation frequently occurs, so that it appears that the failure of impregnation is due to some cause apart from anything in the uterus. Acting on this idea I formulated a theory that my procedure was to influence the ovum, to change the nature of its function without affecting the female system.

Many preventatives to pregnancy are known but few are efficient, so that the question has not only a scientific interest, but also a practical value.

I chose rabbits for experimentation, and my success with these animals leads me to suggest trials on the human subject, but this is a matter for further consideration and outside the immediate scope of these experiments.

I divided the rabbits into two groups, one for experiment, the other for control. Doe rabbits received intravenously, intra peritoneally or hypodermically, rabbit semen, just taken from a recently castrated testicle, dissolved in physiological solution 1:8000. After inoculation the does were repeatedly served by bucks, and all remained infertile from 5 to 18 months, after which they were killed and carefully examined.

I also took does 8 to 10 days pregnant, these went their full time but did not conceive again.

I made in all 27 experiments all of which were positive. Most careful autopsy revealed no change in any of the organs; the does did well, came in season, but did not conceive in spite of repeated coitus. The offspring of does inoculated after conception were healthy and fertile, but their dams were sterile.

The longest periods of sterility occurred in does inoculated several times, at intervals of some days, and considerably exceeded that of those inoculated with a single large dose. From further experiments, I believe that the spermatotoxin is not harmful to the ovum which develops normally, but the spermatozoon which penetrates it perishes.

My work is still incomplete, but it appears that I have solved the main question of voluntary artificial immunity against pregnancy, but still here is a whole series of problems to be solved. Undoubtedly the method of inoculation will be modified, but even in its present crude condition it is efficient. It may be taken as a fact that the oftener the system is inoculated the greater is the certainty of immunisation.

Conclusions :—Living fresh spermatozoa repeatedly inoculated into the blood stream or peritoneum or subcutaneous tissue in fixed doses at stated intervals, are capable of establishing in the

blood of such animals, spermatotoxins, poisonous substances capable of destroying spermatozoa.

Presence of these spermatotoxins—cytotoxins—brings about more or less long continued immunity against fecundation, in no way interfering with the health of the system, whose functions are unchanged and normal.

Possibly the immunity observed arises from a change in the chemiotaxis of the ovum in the negative, or on account of the death of the spermatozoon in the ovum caused by the presence of a substance toxic to the spermatozoon.

Translated from the author's original Russian by V. S. N. Foss into Esperanto, and from this by F. E. P.

[A CORRECTION.—Last week the translations on Animal Insurance were inadvertently initialed W. R. C. This should have been F. E. P. We regret the oversight.]

YORKSHIRE VETERINARY MEDICAL SOCIETY.

A meeting was held at the Hotel Metropole, Leeds, on Friday, April 26th, at 4 p.m. Mr. A. McCarnick, of Leeds, the president, occupied the chair, supported by the following members: Messrs. H. G. Bowes, Leeds, hon. treasurer; J. Clarkson, Garforth, hon. secretary; W. Crawford, H. Walpole, Whitley; J. W. Lazenby, Tadcaster; A. W. Noel Pillers, Liverpool; A. Ellison, Harrogate; J. A. Dixon, A. W. Mason, G. A. Barber, S. Wharam, G. E. Bowman, Leeds; J. Bell, Brighouse; F. W. S. Clough, W. Ackroyd, Halifax; S. Chambers, Kirkheaton; G. Whitehead, Batley; J. McKinna, Huddersfield; T. W. Pawlett, York; and H. M. Holland, Keighley. The visitors present were Messrs. E. Wilkie Davidson, Wetherby; G. H. Locke, Manchester; and Arnold Richardson, Liverpool.

The HON. SECRETARY read the notice convening the meeting. The minutes of the last meeting were taken as read on the motion of Mr. Mason, seconded by Mr. Ellison.

Messrs. G. H. LOCKE, of Manchester, and J. W. DAVIDSON, of Wetherby, were nominated to membership. Mr. CLARKSON said he was sorry to have to announce the resignation of Mr. Herbert Nixon, of Sheffield, who found it inconvenient to attend the meetings.

Letters or telegrams of regret for non-attendance were read from Messrs. Abson, Sampson, and Deighton.

The HON. SECRETARY read the report of the Council to the effect that Messrs. Bowes, McKinna, Mason, and the Hon. Secretary had been appointed to represent the Society on the Council of the National Association. Mr. Clarkson further reported that the long desired demonstrations had at last been arranged, Mr. Pillers having consented to give a series at the Hotel Metropole in the course of a few week's time, of which due notice would be given to each member.

THE "ONE PORTAL" SYSTEM.

Mr. ARNOLD RICHARDSON in moving, "That our one-portal system is prejudicial to the interests of our profession," made it quite clear at the outset of his remarks that he was speaking absolutely in an individual capacity—he was representing no one but himself.

In presuming to attack a principle that has been considered sacred for at least half a century, I know I am exposing myself to the ridicule of the entire profession. In every department of Veterinary politics,

save one, it has been assumed that there is room for a divergence of opinion—the merits of the present Bill, the principle of taxation, the School curriculum—upon these we may differ and still be considered entitled to the respect and confidence of our fellow-members. But to regard with indifference that which has been hitherto considered as the main line of defence, to be unconscious of the benefits, seen and unseen, which accrue to us as a result of our one-portal system—is to be guilty of a condition of mind for which there is no reasonable hope of forgiveness in this world or the next.

I entered the profession through this sacred arch some 20 to 25 years ago, and from that day to this I have never heard but one fellow-member openly admit that the system was anything but an unmixed blessing. The fact being we have grown up to consider our one-portal system an essential to our continued existence as a corporate body, and have ceased to permit ourselves even to entertain the possibility of any change. Such a position in regard to any subject is illogical. There are no such things as unalterable laws and fixed principles. Progress and change are inseparable.

Our attitude towards any existing institution should be one of unbiased inquiry. What is its object? How did it arise? Does it continue to exert a beneficial influence? If, upon inquiry, we fail to discover the supposed advantages but are rather led to believe the balance of influence is in the opposite direction, we are, however, bound to use what little influence we may possess to make such changes as may beneficially affect the profession and the public whose interests we are supposed to serve.

That is the position in which I find myself to-day. I fail to see any special advantage in retaining our one-portal system, and I hold that in many respects we should benefit if it were abandoned.

Let us take a bird's-eye view of our history.

Originally the work of Veterinary Surgeons was performed by anyone whose tastes ran in that direction, without any special training. Throughout time animal diseases have existed, and we may safely assume there was never a period in the history of our race when animal ailments were entirely ignored. From prehistoric times down to the present day the healing art as applied to the lower animals has been practised. Centuries B.C. there were hospitals for the treatment of the diseases of lower animals in the more ancient civilisations such as China, and probably elsewhere. But up to comparatively modern times no race of separated practitioners existed. The old Horse Leach and Cow Leach usually exercised their healing arts in conjunction with the business of farriery. By degrees the process of separation between these two occupations took place, until the practice of Veterinary medicine and surgery became a distinct profession and claimed the right to rank side by side with other learned professions. The process culminated in the granting of the Royal Charter in 1844. At that time the necessity of definitely restricting the mode of entry into the newly-fledged profession was essential. Hence the one portal.

But regulations which at the birth of a profession might be essential may become too restricting when the process of development becomes more mature. Trees require supports as saplings, but grow better without them when firmly rooted. Seventy years ago Veterinary education, in common with all other forms of education, was in its adolescent stage. University extension was then unknown, and barely anticipated. The changes which have taken place in regard to educational matters affecting every department of life during the last 50 years have been such as to compel us to-day to inquire whether we have availed ourselves of these changes to the extent we might, and made progress proportionately.

Progress and educational advancement are inseparable—a fact which we as a profession have unfortunately

overlooked. The modern educational movement which has been so pronounced during the last 25 years has developed on well-defined lines. The Educational Department has wisely co-ordinated our educational system, and determined that our Universities shall become increasingly the recognised centres of educational activity. The nation as a whole has accepted the principle as sound. Our Universities are the culminating point of our educational system. The various degrees of education—Elementary, Secondary, Higher, are definitely organised and co-ordinated. Our educational system is now a national one, and all the higher forms of education are incorporated within it—Theological, Medical, Legal, Dental Arts, Naval Construction, Engineering, etc.—every branch of educational activity finds its home in our University system—with what results? Every department of educational activity has benefitted enormously by the movement, and made progress just in proportion to the extent they have taken advantage of this educational expansion and thus secured recognition and support.

In the provincial universities particularly, the development in the direction of applied science, has been most remarkable.

But the veterinary profession has failed entirely to obtain any kind of support, and the cause is not far to seek. Our teaching institutions are practically private concerns, and the R.C.V.S.—the Corporate Body—has to all intents and purposes a separate existence. True it determines the nature of the curriculum and alone examines those who aspire to membership, but apart from these it has nothing whatever to do with the Colleges as such. As a result both the schools and the Royal College have failed to establish a claim to any outside financial assistance. One because of their semi-private character, and the other because it has no legitimate purpose to which it could apply an income. The fact is we are the subjects of a self-imposed isolation.

Hitherto the veterinary profession has been run on entirely selfish lines, and we have failed to realise that our profession is not a private monopoly but a public trust. When veterinary politics are under discussion speakers as a rule seldom touch upon anything except that which is calculated to affect the pockets or the position of the members. Our governing body, the Council, is verging on bankruptcy, and our profession is face to face with a crisis, and one of two courses must be quickly adopted—either a form of taxation to bolster up our antiquated one-portal system, or a policy of reconstruction and reform to bring ourselves into line with modern ideas and true educational principles.

Whether we care to confess it or not, the fact remains that we have not succeeded in obtaining that amount of State recognition that we think we are entitled to. The dividing line educationally between our profession and the sister profession is still too broad, and those who have its true welfare at heart should be prepared to face existing facts, and adopt a policy calculated to facilitate its intellectual and social advancement.

I believe that which stands in the way of our progress is our one-portal system.

Its abolition would benefit the profession as a whole. In the first place because we should gain in prestige through the closer educational association with other learned professions.

The educational equipment of a V.S. does not consist solely of the amount of information he acquires as a result of attendance at a course of lectures or clinics, but largely in those subtle and varied influences which are brought to bear upon him during his collegiate life. Our present system of isolation and detachment from the educational associations of university life are a social handicap. The reform of veterinary education must be on the line of raising the standard and bringing each teaching institution, if possible, into

touch with the local University, and the diploma to practise made equal to that of a university degree.

Secondly we should gain in social advancement. We may not care openly to confess it, but it is unfortunately true that as a profession socially we do not exercise the influence that the importance of our work deserves. The faults may not be all one side, and the reasons may not be such that one cares to discuss. But with a few honourable exceptions, we have not hitherto even associated ourselves very closely with the movements which have for their object the general, social, and moral advancement of our fellow subjects.

I am unwilling to admit our unfitness, and would rather attribute the cause to the narrow outlook fostered by our insular form of training. Our profession as a socio-political force is practically unknown. The absence of any such influence is a weakness to ourselves and a loss to the community of which we form a part.

I believe a closer association with the medical and other professions for educational and training purposes would facilitate a closer association in the main work of the future members of our profession—namely, the controlling and organising of the supply and distribution of animal foods and prevention of animal diseases. Further, I think as a profession we should ultimately gain enormously by the abolition of our one-portal system by the liberation of our profession from the narrow, self-centred form of control which the system makes inevitable.

Hitherto we have been controlled by a Council whose policy has been largely determined by selfish interests. Our rights have been enforced, our interests have been considered, abuses have been checked. Our Councillors have faithfully served the profession, and I do not wish to advance an adverse criticism. But the outlook of the Council has been limited by the horizon of the profession. The time has arrived when we can afford to widen our outlook. As a profession we are firmly established—we can safely abandon our defensive attitude, and, having leisure to look beyond the boundary of our own private interests, we can examine our relationship to the great community in which we live.

In doing so the first thing we should observe would be the disparity between the greatness of the State and the smallness of our profession. This pulsating mass of humanity we term "the State" has needs, has claims, which we have hitherto ignored. We have been so busy looking after our own interests that we have forgotten the rights of the community. Our Council has largely regarded the profession as a private monopoly. I would urge that we regard it as a public trust. The State has claims upon us which we are neglecting. We cry out loud enough for recognition and for the appointment of whole-time men to various positions in the interests of public health, but we have done practically nothing to equip ourselves for the positions we demand.

The fact is our system is at fault. The demands upon the Veterinary Surgeon of the future are greater than can be met by a Council of management as at present constituted. If we are to perform our duty to the State efficiently we must be willing to change our policy.

Our profession was founded and our teaching has been directed on the assumption that the main if not the sole duty of the Veterinary Surgeon was to perform the ordinary work of a physician and surgeon to the lower animals. This idea we have outlived, and the future of our profession will largely be concerned with preventive work and service in relation to public health. Our present system is too rigid. Every candidate for admission has to prepare himself to satisfy a board of examiners appointed by a Council whose outlook is narrow and whose liberty is restricted by law. The consequence being the issuing forth of members who

are not qualified to fill the appointments they claim the sole right to occupy.

Our only escape from this humiliating position is the abandonment of our one-portal system and the liberation of the profession from the cramping influence of a too rigid and inelastic system of control. Already the Universities are supplying in D.P.H. and D.V.H. that which is lacking in our educational outfit, and it is highly probable that in the near future public health appointments will be given only to those who have obtained this special qualification.

It is not to the credit of our governing body that this admittedly necessary additional qualification should have been initiated by an outside body. But it does prove that the Senate and Council of a University are more alive to public needs, and better able to meet those needs than our own Council. I am strongly of the opinion that a closer association between our existing schools and the Universities will be of immense benefit to both the schools and the profession as a whole; and if this closer association lead ultimately to the granting by each University having an affiliated Veterinary School of a degree or licence to practice, we as a profession would rather gain than lose.

The supposed advantages of the one-portal system vanish when examined without prejudice. The number of individuals entering the profession would not necessarily be increased, the standard of education would not be lowered—the Senate and Council of no existing University would be in danger of conferring a degree upon imperfectly trained men. Instead of the existing stereotyped system of instruction, preparing each student to satisfy one set of examiners—there would be a healthy rivalry between the teaching institutions, facilities for specialisation, the result of which would be the general raising of the whole standard of Veterinary education.

Not only would the profession as a whole gain by the abolition of our one-portal system, but the teaching institutions would reap an advantage. In the first place they would at once establish a claim for State recognition and State support. So long as we conduct our profession as a private monopoly it will be practically impossible for us to obtain State support or private patronage, either for the better equipment of our teaching institutions or for the purposes of scientific research. Grants and endowments are largely determined by custom. At the present time the Universities are the recognised centres for advanced education, and they receive both State and private support. But so long as we remain in "splendid isolation" we shall fail to obtain any substantial recognition in this form. Hitherto Veterinary education has not attracted the patronage which its importance deserves. This we all deplore. But have we not ourselves to blame?

Whether we agree with the principle or not, it is true that endowments for all forms of educational purposes are generally given with an amount of local and sentimental bias: and if we wish to enjoy the advantages which such endowments would give to our Colleges we must bring them into line with other departments of higher education, and affiliate them to the Universities, and be willing for such affiliation to carry with it the right of conferring a degree to practice. Our present system tends to become stereotyped, and progress apt to be checked.

The future of the Veterinary profession should not be regarded solely from the point of view of the existing practitioner, but also from the standpoint of the State in regard to public health. The training of the prospective Veterinary Surgeon has hitherto been directed almost entirely in the departments of Veterinary Medicine and Surgery, and matters concerning public health have been very inadequately taught.

In this respect we may have to entirely recast our

curriculum. Should this take place under existing conditions we should be simply turned from one rut into another. This we should endeavour to avoid. It has become almost essential to provide a dual qualification. One conferring the right to practice the art of Veterinary Medicine and Surgery, and the other a higher or special qualification to equip for public health appointments.

As a matter of fact this particular reform has already been anticipated and we are in the somewhat anomalous position of the R.C.V.S. granting a diploma to practice, but the higher and more advanced qualification being arranged and controlled by an outside body. This in itself proves that our system is at fault. Our Council was either bound down by regulations and unable to move in the matter, or insufficiently enlightened to take the initiative. If we as a profession are to keep well abreast of the educational needs of the times we must have greater liberty to expand, and power to adapt our methods to needs as they arise.

In matters of this kind the Council and Senate of a University being composed almost entirely of educational experts would be as well qualified to ensure the proper education of prospective Veterinary Surgeons as our Council as at present constituted. Further the affiliation of our Schools to the local Universities would tend towards economy in working, and also towards increased efficiency. Much of our course is practically identical with that of the Medical Course—Botany, Materia Medica, Histology, Zoology, Physiology, and Pathology—there is so much common ground that the course could be so arranged that Veterinary students could receive instruction in association with those taking another degree. The advantages of this would not be felt only during the student career but throughout life through association.

As to the supposed advantages of the one-portal system I am open to receive instruction, and probably many present will avail themselves of the opportunity of enlightening my ignorance. The present is an important epoch in the history of our profession.

That something must be done is evident to all. The alternative to the abolition of the one-portal is the system of taxation proposed under the new Bill. I believe the profession is prepared for a revolt against this new tax. It has only one object—at least it will accomplish only one object, and that is the continuance of the one portal. The advantages which those who are its advocates expect the profession to reap are purely visionary. When the Bill was submitted to the profession originally it contained clauses the objects of which were the stamping out of quackery and the non-professional castrator. In all the correspondence that appeared in our papers these two results of the passage of the new Bill were hailed as the herald of the dawning of a new day for every practitioner. Now these clauses are to be deleted. Votes for the Bill have been recorded, but the benefits have been withdrawn. If the Bill were submitted to the profession to-day without the original clauses it would be rejected. My chief objection to the Bill is that it places an income in the hands of a body of Councillors who have no power whatever to use it to the interests of the profession as a whole. It would lead to evils without any compensatory benefits. Any scheme which had as its object the strengthening of the teaching institution might ultimately benefit the profession. But the Council is so constituted and its powers so limited that no such income could be used wisely.

The one object which the supporters of the Bill emphasise is the approaching bankruptcy of the Royal College. I frankly confess that I regard our financial difficulties as a blessing in disguise. They will compel us to action. We have to choose between taxation and reform. Taxation to maintain an obsolete system, or

reform to bring ourselves into line educationally with other learned professions. Abolish the one portal and taxation becomes unnecessary.

I must apologise for having detained you so long, but in concluding allow me to thank you for your courtesy in permitting me to bring the matter before you, and for your kindness in giving me so sympathetic a hearing. I should be delighted if you would couple with your courtesy and kindness your unanimous support in voting for the resolution which it is my privilege to submit, "That in the opinion of this meeting our one-portal system is prejudicial to the interests of our profession."

After the resolution had been formally seconded,

Mr. J. A. DIXON said that every medical man who had discussed the one-portal system with him had expressed his admiration of it (hear, hear)—and had offered the opinion that his own profession would benefit by the adoption of such a system. Mr. Richardson had not established any case for the abandonment of the one-portal system. The many groups who practised medicine disregarded the letters attached to a man's name and simply asked, "Is he M.D.?" The other letters counted for nothing. Physiology of the domesticated animals was not identical with physiology of the human subject, which was highly specialised. When he was at College the lectures on physiology could practically be disregarded. Everything had to be learned from "Smith." Nowadays, when the veterinary profession was generally regarded as a decaying business by the public, it seemed to him that they were possessed of the entire sympathy of the world because they would soon be out of work. (Hear, hear). He did not think proper attention to the subject would be given by the Universities. He thought they should go in for better teaching, and not be so anxious to throw in their lot with medical men and dentists.

Most Universities were absolutely dominated by medical men. Most of the students were medical students, and more attention was paid to them, the rest being regarded as subordinate. Similar arguments to those of Mr. Richardson were brought forward when the late Sir Robert Boyce enumerated his points in a plea for the establishment of a Veterinary college. I didn't agree with him then and I don't now. The medical profession would say, "We have to teach you your own business," and there would be less recognition from the medical profession than at present. He agreed with Mr. Richardson that something should be done with regard to public health. It was high time that a separate degree was instituted to show to the public that Veterinary surgeons were educated in matters appertaining to the public health.

Mr. J. CLARKSON expressed appreciation of Mr. Richardson's courage in introducing something which was unpopular among the ordinary members. He thoroughly agreed with Mr. Richardson's simile concerning a sapling, but as a tree now fifty years old, their profession needed no such support as suggested. They had no suggestion that men were coming in at the back or side doors, or were squeezing into the profession. He thought the one-portal system ideal—there was no suggestion of one man being weaker than another. The system was absolutely unassailable, and it was, in addition, as Mr. Dixon had pointed out, the envy of the medical, and all other professions, that all the men should be equally qualified. He was extremely glad of Mr. Richardson's assertion that the notions in the paper were entirely his own ideas, as he thought perhaps Mr. Richardson's ideas were the result of an atmosphere or that he was a missionary of a school of thought that had evolved itself recently. (Hear, hear). He did not know whether or not he was entitled to any credit, but he did a large amount of work in connection with the

removal of the school from Edinburgh to Liverpool, and if he had thought that "this" was the result of "that." (Hear, hear) he would feel inclined to ask himself if he had, like Frankenstein, created a monster to destroy him. (Hear, hear.) The one-portal system was their most cherished possession, and he did not think Mr. Richardson had addressed a single argument against it. (Hear, hear.)

Mr. H. G. BOWES prefaced his remarks with the observation that whatever the movement might lack, it certainly did not suffer for want of eloquence on the part of its proposer. He admitted that there was room for a good deal of improvement in the teaching, and particularly in the direction of preparing men for public health work. The old type of school was probably the best school in the world for bringing out practitioners. Some of the old teachers of the old practical school brought out better practitioners than would be evolved under the new methods. Nothing Mr. Richardson had said was an argument in favour of abolishing the system. The fact that the schools might require improving could not be laid to the charge of the one-portal system, which, as Mr. Clarkson had said, was one of their most cherished belongings.

He had never yet spoken to any of his medical friends without their expressing admiration for the one-portal system, and wishing that they could have the same thing in their profession. In Germany, perhaps the most up-to-date State in the world educationally, every medical man had to pass a State examination to licence him to practice, and no matter what his University degree he must also satisfy the State authorities.

The mixing of students was highly desirable, and he would be pleased to see all their schools affiliated with the University; and he would also be very pleased to see the universities giving University degrees in Veterinary pathology. Still he would retain the diploma as a licence to practice. Uniformity strongly appealed to him. No examination would turn out uniform men, however uniform the examination might be. Whatever system they had there would be men who would acquire knowledge in different degrees, and an examination could only do its best—it was faulty—but it was the best devised scheme up to the present. They must test a man's knowledge, and a University examination would be no better than the examination as conducted at present; it would not be uniform. (Hear, hear.) They should retain their one-portal system where licencing was concerned. The mixing of students one with the other was an excellent thing. It rubbed off the corners. Veterinary surgeons were, he admitted, too insular, or had been in the past. If they looked at the medical schools they must bear in mind that though they were all connected with the universities there was a separate staff and building for the medical school, as in Leeds for instance, and in almost every other town. The medical school, although a part of the University, was a separate school, and if there was a Veterinary Department the students would still be much to themselves.

As to the suggestion for the joint study of certain subjects, it was impracticable and unsatisfactory for one professor to teach students belonging to different branches of the same profession. They must specialise to the students in the Veterinary school. He was very much opposed to the resolution.

Mr. ACKROYD (Halifax) said that Mr. Richardson was on the wrong horse so far as most members of the profession were concerned. He believed that if Mr. Richardson were carefully to go over the reasons he had given in his paper, he would find that they were not leading him to an alteration of the one-portal system at all, but simply to the association of their students with other students. Mr. Richardson had not pointed out any disadvantages of the one-portal system.

All his arguments led, not to the abolition of the system, but to an extension of their educational system, which would bring them into touch with the universities; and he was not quite so sure that they would share some of the rich things that the medical profession enjoyed, even if they did join the universities. What advantage had a student at Liverpool College over, say a student at Dick's College in so far as professional education went? The thing they wanted, it seemed to him, was a better system of education, perhaps a wider outlook, and he thought they ought to stick to the one-portal system through thick and thin. In fact he did not think Mr. Richardson's arguments tended to support his resolution, but rather they tended to support a wider and better system of education only.

Mr. MCKINNA agreed that to get the hall-mark of a university would be beneficial. Did not Mr. Richardson think that that would meet a great deal of the feeling with regard to the higher status of the profession? "Our social standing," he declared, "depends mainly upon our individual selves." He never felt proud of his profession until he visited Germany where all the schools were Government-aided and had an equipment second to none. Medical men envied the one-portal system, and wished that they had a similar system instead of having so many back doors into their profession. Unfortunately the public did not enquire closely as to a medical man's qualifications.

Mr. WHARHAM said they were bound down by many Acts of Parliament which up to the present had hindered their progress. But, for all that they were in his opinion progressing slowly, and as regarded the one-portal system, there was no doubt that many other bodies would have to adopt it. They were in no sense very far behind any foreign country, and in foreign countries State aid was received while no grants were received here. Mr. Richardson contended that the abolition of the one-portal system would result in a larger income to the College, but how that would be brought about he failed to see.

With regard to economies of the school, he thought something could be done by having a central examination. His idea of the one portal system was to have one centre for the holding of all examinations. He believed that they were turning out a very much better class of man than that they had ever done before and they compared very well indeed with students of any other profession, and were quite equal to the work that that they were called upon to do. Another argument in favour of the abolition of the one-portal system was that it would increase their social standing. That standing, he might say, was gradually becoming better, and was improving quite as rapidly as that of any other profession.

Mr. RICHARDSON, in reply, again emphasised the fact that he had spoken entirely for himself, and in view of the feeling of the meeting he should have great pleasure in withdrawing the resolution. In reply to the various speakers he pointed out that it would be a great advantage to the veterinary profession if they were incorporated with the university system. He should like their diploma to practice to be raised to the standard of the university degree for the universities ranked higher educationally than the veterinary colleges did. (Cries of "No, no.") The Royal College of Veterinary Surgeons did not rank as high educationally as those various departments of science that were incorporated with the university system. (Voice: The standard of medical examinations is the same.) "If we were incorporated," Mr. Richardson went on to say, "we should have the equivalent in the veterinary profession of the M.D."

Mr. Clarkson, he said, thought the one portal system was an ideal one because it stopped all back door entries. He suggested that there should be a national inspector whose business it would be to see that the

form of teaching was kept up to a proper standard, so that unqualified men should not be put forward in that country. They were all agreed that it was absolutely essential that their standard of education should be improved. The teaching, and the method of teaching, should be improved. He had been asked if he could give any opinion as to the work which had been done in connection with the Liverpool University, and he should like to say that certain things had happened which had rather retarded matters. Sir R. Boyce, for instance, had died, and that had interfered greatly with the progress of the school. He would withdraw his resolution.

Mr. CLARKSON remarked that he had a distinct recollection some years ago of a resolution being withdrawn. It was sometimes necessary not to be too kind, and it was folly sometimes to be a little weak. He thought that they regretted their withdrawal on that occasion.

Mr. RICHARDSON: I quite agree, but my idea in withdrawing was because of my seconder.

The resolution was then put to the meeting and was lost, only Mr. Richardson voting for it.

THE CONTROL OF TUBERCULIN.

Mr. H. G. BOWES, Leeds, moved: "That in the opinion of the Yorkshire Veterinary Medical Society the time has arrived when the Government should take steps to control the use and prevent the abuse of Tuberculin for cattle."

Mr. BOWES said that our time was getting on, and he did not wish the subject, which was very important, to be hurriedly considered, he would withdraw the resolution and would bring it forward at another meeting.

Mr. McKINNA proposed that a hearty vote of thanks be given to Mr. Richardson for his address, and he also thought that Mr. Clarkson should be congratulated on inducing him to address the gathering. It was courageous of Mr. Richardson to introduce the subject.

Other speakers also referred in eulogistic terms of Mr. Richardson's remarks.

Mr. T. PRATT, of Ripon, then presented a very valuable collection of pathological specimens and antique and other horse shoes to the Society, of which he was one of the founders.

Mr. MASON, in thanking Mr. Pratt for his kind gift, expressed the hope that they would have the pleasure of seeing Mr. Pratt at their gatherings for many years to come. It was, he said, the Jubilee of the Society next year, and he thought it would be a happy suggestion if Mr. Pratt could be prevailed upon to accept the presidency. He could assure Mr. Pratt that the Standing Council would stand by him and give him as little trouble as possible in the working of the Society.

Mr. PRATT, referring to the vote of thanks, said he would not care to accept the duties of office without consideration. He was a man who did not court publicity.

At the conclusion of the meeting the members and visitors were entertained to tea at the invitation of the Society.

WESTERN COUNTIES

VETERINARY MEDICAL ASSOCIATION.

The 29th annual meeting was held at the Royal Clarence Hotel, Exeter, on Thursday, 25th April, when those present included Messrs. P. G. Bond, Plymouth; F. P. Bennett, Paignton; G. H. Elder, Taunton; G. H. Gibbings, Tavistock; G. D. Lansley, Axminster; R. E. L. Penhale, Torrington; and E. J. Thorburn, Crewkerne.

A telegram from the President (Mr. Whitmore),

regretting his inability to be present having been received, Mr. Elder was voted to the chair.

Letters, apologising for absence, were also received from Prof. Hobday, Messrs. Wm. Ascott (Hon. Sec.), W. H. Bloye, T. Olver, Wm. Penhale, W. P. Stableforth and J. Toms.

The minutes of the last meeting were read and confirmed.

CORRESPONDENCE.

Castrator, Swine Fever Order. A further communication on this matter was read, and it was resolved to allow the correspondence to lie on the table.

Affiliation. A letter from Prof. Gofton was read and discussed, and it was resolved, on the motion of Mr. Gibbings, seconded by Mr. Penhale, "That this Association become affiliated to the National Veterinary Association, and that Messrs. John Dunstan, of Liskeard, G. H. Elder, of Taunton, and the Hon. Sec. for the time being be elected representatives to serve on the Council.

Mr. Shipley wrote thanking the Association for the donation of five guineas to the Victoria Veterinary Benevolent Fund.

Letters from the Cornwall County Council on the subject of Local Taxation Licenses for Armorial Bearings were read, but as a test case had already been decided, it was deemed that no further action was necessary.

Attention was drawn to the receipt of complaints as to the delay in obtaining the Association's instruments, the explanation given being that it often happened that several members applied at once, and the recent restricted railway service prevented prompt return.

The HON. TREAS. (Mr. Bond) presented his annual report and balance sheet, showing a credit balance of £18 13s. It was resolved that the same be approved and adopted.

ELECTION OF OFFICERS.

President. Mr. R. J. COLLINGS, of Exeter, was unanimously elected President for the ensuing year. Mr. Bond, in moving his election, mentioned that Mr. Collings had for many years taken a deep interest in the work of the Association, as also had his father before him, who was one of its founders and first hon. secretary.

Vice-Presidents.—Messrs. H. E. WHITEMORE, C. H. GOLLEDGE, F. T. HARVEY, and R. E. L. PENHALE were elected.

Hon. Treasurer.—Mr. P. G. BOND was re-elected, and thanked for his past services to the Association. Mr. Bond suitably acknowledged.

A letter from Mr. Wm. Ascott stating that through stress of private business he desired to be freed from the duties of Hon. Secretary for two or three years at least, after which he would, if so wished, resume them, was read.

The CHAIRMAN paid a high tribute to the interest Mr. Ascott always took in the welfare of the Association and to the valuable services he had rendered as Hon. Secretary for many years, and expressed deep regret at his decision.

It was unanimously resolved, on the motion of Mr. Bond, seconded by Mr. Penhale, "That Mr. Ascott be asked to reconsider the matter, and to continue his services for another year."

Correspondence between Prof. Stockman and a Mr. Alf. Mansell, of Shrewsbury, on the subject of "Suppurative mammitis" sent to the meeting by Mr. Stableforth, was read, but no action was taken.

An interesting discussion on Prof. Hobday's improved operation for "Roaring" here ensued, all agreeing that up to the present the operation was not attended with sufficient beneficial results to justify country practitioners to unreservedly recommend its performance.

The CHAIRMAN proposed that the best thanks of the Association be conveyed to Prof. Hobday for his demonstration at Plymouth, and also to Mr. Bond for the use of his yard, and his kind hospitality on that occasion. This was seconded by Mr. Gibbings, and unanimously agreed to.

A vote of thanks to Mr. Elder for presiding concluded the meeting.

WM. ASCOTT, *Hon. Sec.*

Alleged Fraudulent Conversion—Lymm Farmer's Claim.

At the Manchester County Court on Tuesday, May 7th, an extraordinary case came on for hearing before his Honour Judge Mellor, K.C.

Alfred Edwin Darbyshire, of Tanyard Farm, Lymm, claimed from John Kay and Co., Ltd., carriers, Gorton, the return of a horse or its value, £40, and £10 damages for detention or alternatively damages for the conversion thereof by the defendants. The defendants, on the ground that they bought the horse under a bona-fide contract, claimed an indemnity from John Russell, Veterinary Surgeon, of Manchester, and on similar grounds Russell claimed an indemnity from Joseph Taylor, horse dealer, of 6, Willis Street, Warrington.

Mr. F. B. Merriman (instructed by Messrs. Fowden, Newton and Valey, Manchester), appeared for the plaintiff. Mr. S. Horowitz (instructed by Messrs. H. and W. Page, Manchester), appeared for Messrs. Kay and Co., Ltd.; Mr. T. G. R. Delm (instructed by Mr. Josiah Smith, Manchester), appeared for Russell; and Mr. E. C. Burgis (instructed by Mr. Thomas S. Steel, Warrington), appeared for Taylor.

On the application of Mr. Burgis, Taylor was substituted as defendant and counsel stated that he would appear for all the defendants.

In opening the case for the plaintiff, Mr. Merriman stated that on the 5th August, 1910, the plaintiff turned out a horse to grass in one of his fields at Lymm, and next morning he found it had disappeared. The matter was placed in the hands of the police. In December last the plaintiff's brother saw the animal in Whitworth Street, Manchester, in a lorry belonging to Messrs. Kay and Co., and immediately recognised it as the long-lost property of his brother. The plaintiff was informed, and along with his brother and father they went to Manchester and identified the horse as the plaintiff's property.

Plaintiff gave evidence bearing out his counsel's statement, and produced a photo of the horse stolen from his farm.

Cross-examined by Mr. Burgis: He identified the horse by its four white legs, white face, and white patches on its back. In 1908 its near front hoof was run over by a lorry, and the marks were now on the hoof. It was a bay horse. There were very many horses with white patches on the back. He agreed that when a horse had had a sore back and the hair grew again it was white. Many horses had sore backs. He did not attach much importance to the fact that his horse had white patches on its back. He was certain the horse was his. It would lie down when in the stable at night. There was no difference in the horse's behaviour whether it had a bit in its mouth or had a halter on.

Plaintiff's brother and father and a teamsman also corroborated. They were certain the horse was the one which disappeared from the plaintiff's farm.

Mr. Munro, Veterinary surgeon, Altrincham, stated that in April, 1908, he attended to the near front hoof of the horse, which had been run over by the wheel of a lorry. The marks were now on the hoof. He had no doubt about the horse being the one in question.

Cross-examined: He denied that the marks on the hoof were caused by a diseased bone. He did not agree that the hoof was nothing different to the other hoofs.

Mr. Burgis, addressing his Honour, stated that he would prove the history of the horse since 1907. He would call the different gentlemen through whose hands it had passed since that time. At the time it was alleged that the plaintiff's horse was stolen this horse, now in the possession of the defendants, was actually working on a farm in Lincolnshire. He would also prove that the horse put out its tongue and continuously kept it out immediately the bit was put into its mouth, and that so soon as the bit was taken out its tongue went in; a fact which the plaintiff had not spoken of. Further, this horse was never seen lying down in the stable, which the plaintiff swore he had seen his horse do.

Mr. T. M. Wilmot, farmer, Newton-on-Trent, stated that the horse was knocked down to him in the Lincoln Auction Mart in April, 1907. He sold it a few days afterwards to Mr. Brown. Towards the end of March, 1911, Taylor bought some horses in Lincoln and at the latter's request he arranged to buy two or three more for him, and despatch them along with the others Taylor had bought, so as to make up a truck-load. He bought two horses from Mr. Russon, of South Carlton, Lincolnshire, one of which was the horse he had sold in 1907 to Mr. Brown and despatched to Taylor, at Warrington. He had since identified the horse in Manchester. He could have picked it out of a hundred.

Mr. Robert Brown, farmer, Cherrywillingham, Lincolnshire, stated that in 1907 he bought the horse from Wilmot, and had it constantly in use on his farm until February, 1911, when he sold it to Mr. Russon. He identified it by the fact that it always had its tongue out when it had the bit in its mouth. He could further identify it by its general markings, by its "cow-legged" walk and also by the fact that it had a black spot in front of the hip bone on the near side.

Cross-examined: There was nothing remarkable about the marks on the hoof. He did not agree that the photo produced was that of the horse in the possession of defendant.

Mr. Stephen Wright, waggoner, in the employ of Mr. Brown, corroborated. The horse did not lie down in the stable at night.

Henry Russon, farmer, Saxilby, proved that he purchased the horse from Brown in February, 1911, and sold it the following April to Wilmot. He identified it by the fact that it always had its tongue out when in a bridle, height, colour, markings, etc.

Mr. Fred Russon and Mr. J. W. Hall, waggoner, corroborated.

Joseph Taylor said he was a horse dealer at Warrington. He received the horse from Wilmot. He kept it a month and then sent it to Bradshaw's Repository, Whitworth Street, Manchester, where he sold it to John Russell, veterinary surgeon.

John Duffy, foreman in the employ of Taylor, stated that he unloaded the horse from Lincolnshire. He saw it in the stable at Warrington frequently during the month Taylor had it. He subsequently took it to Bradshaw's Repository.

Thomas Jubb, carter, in the employ of Messrs. Kay and Co., stated that the horse always had its tongue out when in a bridle. It never lay down in the stable.

John Russell, veterinary surgeon, Manchester, stated that he bought the horse from Taylor and sold it to Messrs. Kay and Co., and Mr. Howarth, manager for Messrs. Kay and Co. proved that he bought the horse from Russell.

Mr. J. B. Wolstenholme, veterinary surgeon, of Manchester, stated that in his opinion the marks on the hoof were the result of a diseased bone. There was

nothing extraordinary about the hoof and he had seen many horse's hoofs the same.

In answer to His Honour, Mr. Burgis stated that the horse was outside the Court.

The horse was then brought into the paved corridor of the Court and inspected by the Judge in the presence of representatives of either side.

Mr. Burgis pressed his "mistaken identity" plea and urged that the onus was upon the plaintiff to prove beyond all doubt that the horse was his. This he had not done, as there was certainly doubt about the cause of the marks on the hoof, on which plaintiff laid such great emphasis.

His Honour said he had never had a case in which so many respectable witnesses had been called on each side, and that made the case all the more difficult for him to deal with. Having seen the horse he agreed with the witnesses from Lincolnshire, that it did not agree with the photo of the animal lost by the plaintiff. He was met with a direct conflict of evidence. He saw the black spot spoken of by Mr. Brown and certainly the horse had its tongue out, and immediately the bit was taken out the tongue went in. As regards the hoof, he found very similar marks on the other front hoof of the horse, and he had come to the conclusion that the plaintiff had not discharged the onus upon him and there would, therefore, be judgment for the defendants with costs.—*Warrington Guardian*.

CORRESPONDENCE.**TREATMENT VERSUS EXPERIMENT.**

Sir,

"Scrutator" has given us valuable food for reflection. In considering any method of treatment it is well to look back and to ascertain if any real advancement has been made. We must all admit that Mr. Pillers has drawn our attention to some valuable points in connection with the successful treatment of canker, more especially as regards the technique of applying pressure. He is entitled to due credit for this—in fact far more so than if he had directed his energies to ascertaining the pathology of the disease.

In reality, very little credit is given to anyone who sets out to discover successful treatment for the common diseases met with in every-day practice. But let someone—especially if he sports the title of "Professor"—announce to the profession that he has discovered some micro-organism as the causal factor in a disease, and he is instantly looked up to as a "Sir Oracle." And, if the disease be one which is seldom or never met with in the British Isles, so much the better. It does not pay, nor is it considered fashionable to trouble one's head about common diseases, no matter how serious or fatal they may be. Take, for example, "milk fever." Successful treatment was discovered for it by a practitioner, and this discovery has proved of far greater importance to the owners of stock than any amount of laboratory experiments or work carried out by the manufacturers of fancy names for imaginary microbes. Yet Schmidt by no means received due recognition in Great Britain. Had he brought forward some special bacillus and filled pages of professional journals with a description of its morphology, etc., but omitted to trouble about the treatment, no doubt he would have been lionized, and would have received due attention from the hero-worshippers.

It is comforting to think that we have advanced in the diagnosis and treatment of common affections in the present day, but is this advancement real or imaginary? If we consult the older authors and compare their views with those of modern authorities, we find that, as pointed out by "Scrutator," there is little if any advancement made in connection with many diseases. No doubt in the present day theories are put forward in greater profusion, but there is a tendency to revert to the older methods.

Take, for example, the disease so-called "colic." Do we know anything more concerning it than Percivall or his contemporaries? Fads in the treatment of the conditions included under the term we are familiar with, but we are reverting to the practice of the older authors in prescribing aloes and avoiding opiates. Even with the possession of such agents as Eserine, Arecoline, and Barium chloride the time-honoured Aloes is still largely employed.

Some, indeed, pin their faith to the former mentioned agents, and prescribe them in every case as routine treatment, the therapeutical dogma being that if the case be a curable one, the treatment will prove successful, if incurable then the agents will hasten the fatal termination. Is this advancement on the old-time treatment? Does it require skill? Instruct a groom how to administer a hypodermic injection and he can do as much for the case as a qualified

man—if the above dogma be considered correct and rational.

It would prove of distinct benefit to the profession if more practitioners followed the example of Mr. Pillers and devoted attention to improved methods of treatment of common diseases. We care not whether the origin of the treatment be old or new, so long as it proves successful. And what we require is that the treatment, as proved by actual practice, should be superior in its results to those generally employed.

Investigation of this kind should be encouraged, and it is of equal, if not of more importance than the work of the bacteriologist, so far as ordinary practice is concerned. What does the owner of an animal care about abstruse theories as to the causation of a disease, if we are unable to carry out successful treatment?

There is far too great a tendency for practitioners in the present day to avoid giving the results of their experience. The reason is not far to seek. They receive little encouragement, and anything they bring forward is, of course, "well-known for years," according to the Solomons of the profession. Strange however it is, that these very cautious critics seldom or never attempt to do anything original themselves. And if they do happen to possess any special knowledge on a matter of importance, they carefully keep it secret, and assume an air of superiority while endeavouring to pour sarcasm on those who attempt to improve our clinical medicine and surgery.—Yours, etc.

"DIOGENES."

PARTURITION CASES IN MARES.

Sir,

Anything written on this subject from a practical point of view is always welcomed by every practitioner who is frequently required to attend these cases by himself, often far from home and without the necessary appliances handy. On careful perusal of Mr. McTurk's article, what he advances as to when embryotomy should be employed is nothing new, as it will be noticed in only one instance does he tell us how long the mare had been in labour, although we all know from experience that we scarcely ever see a patient when showing first signs of foaling.

As a rule when we arrive on the scene things are in such a state that ten or fifteen seconds are ample time to make our minds up, as to the very tough work ahead in severing the different parts of the foal. These cases of course are where the foal is firmly wedged in the passage with the head or legs outside the vulva and the parts greatly swollen. Where there is room, and the mare not having been long in labour with a mal-presentation preventing the foal coming forward into the passage, I should be sorry indeed to make my mind up in such a short time as the ten or fifteen minutes advised by Mr. McTurk. In many cases we are called to the foal is alive, remaining so for a long time, and while there is a living foal every device should be tried before resorting to the knife. "Make haste slowly" should ever be the watchword, as undoubtedly the best results are obtained, by deciding on your procedure and carrying it out despite many distracting remarks from outsiders. No hard and fast line can ever be adopted in these cases, everything depending so much on the conditions encountered in each individual case.—Yours faithfully,

J. KERR-CALDERWOOD, M.R.C.V.S.

Clitheroe, Lancashire.

THE WIDER QUESTION.

Sir,

In your issue of May 4th appeared the abstract of a report by Mr. J. A. Gilruth, and a reprint of a letter by Mr. C. J. Richardson. Is not the one an almost sufficient commentary on the other? Mr. Richardson has, perhaps unconsciously, touched upon a large question. Twenty years ago his remarks might have held weight. To-day the question is a much wider one and requires a much more capable handling. To-day the Veterinary profession has to produce men capable of filling positions under the Board of Agriculture, in the Army Veterinary Service, and in municipalities, which very, very few graduates of thirty years back could take

up; and with this it has also to provide men who are to take the rough work of country practice which, although much of a better kind has been added, still carries the elemental work of the "Ferrier" and the Cow-leech. Apparently Mr. Richardson would pull down professional attainments to their level, for he treats us to some irresponsible arguments of the old style "practical man." It is but a one-eyed way of looking at the matter. Many men, and almost all women, usually consider such questions only from a wholly personal point of view. Their only possible is, "What is this going to do for ME?" Doubtless if we could hear the opinion of the prospective Public Health official it would be a clamant call for University degrees, or a selection of letters after his name. He would sacrifice to his own conceit and selfishness that portion of the duty of the profession to the community which does not happen to line with his own professional proclivities. And agriculture—the one industry which cannot be safely disregarded by any civilised nation which desires to live—would receive as little consideration from him as the higher branch of the profession gets at the hands of such men as Mr. Richardson.—Yours faithfully,

COM. SOUTHTON.

UNQUALIFIED ASSISTANTS.

Sir,

Recent correspondence on this subject has interested me and led me to hold forth my views. To my mind one reason why there are so many unqualified assistants is apparent, and it is this—that no qualified ones can be got to take many of these positions.

A very short experience as an assistant in a busy country practice (a practice which could be still more developed by a man of gentlemanly demeanour) in the South-East of Scotland has led me to believe that no self-respecting graduate would perform the duties that some practitioners expect of their assistants. To give you an idea—in this practice to which I refer, the only mode of conveyance provided for the assistant was a secondhand and well-worn bicycle, and an undersized pony, the latter moulded not on the most ideal pattern, being the unfortunate possessor of two excellently developed spavins, a ewe neck, and consequently a well-marked tendency to star-gazing—a pleasant hack with a probang slung across your shoulder and two quart bottles of mange dressing in your pockets, or, as was more generally the case, a tooth rasp, mouth gag, two 12oz. bottles and a 1lb. cleansing drink. Thus mounted you were sent forth to perform your noble duties and minister to the wants of the dumb, equipped more after the manner of a plumber's "mate" than a veterinary surgeon's assistant. Moreover, you were expected to get over perhaps 30 miles, make five or six calls, and please your client, your patient, and your principal, satisfy yourself, and be back in an incredibly short space of time—to "mitch" was an awful crime. Home returning rarely the groom was to meet you, so you had to attend to the comfort of your weary and decrepit steed, and even should the stable boy be seen coming to your assistance he would often be promptly dispatched on another errand. This saddling and unsaddling process was considered part of the assistant's sphere of duties.

The assistant's evenings were busily occupied in the scientific occupation of bottle-washing, dusting the pharmacy, oiling hobbles, cleaning slings, etc., etc. Market day in the town was a busy one for the assistant also; he was expected to deliver various and sundry parcels of medicine to the different clients cars standing at the many hotels and livery stables. Another of the various duties that this practitioner expected was to run on household messages. Across a table frequently would be flung a pile of correspondence with the short demand, "paust them lethers"—and no more.

On one unfortunate occasion that we met in consultation regarding a most unusual case, his language towards me in the presence of numerous stable servants was of the most obscene and degrading imaginable, and his accusations were that I had made a wrong diagnosis, and employed improper treatment. Such was not the case—as events proved; I was

absolutely right, he was absolutely wrong; and a sneaking apology stole along. Now, is there any wonder that the majority of the general public have no respect for the profession or its members? Is there any wonder that unqualified men are employed in so many cases? No. Would any self-respecting graduate come to perform the various duties under the various circumstances I have outlined? No. In conclusion: Innocent graduates beware! Know thyself—and thy employer also.

"FINSEN."

Sir,

Mr. Hoare's remarks in your last issue are very interesting and much to the point. However, the matter he touches upon has a rather ancient history. Ever since the foundation of the first veterinary school (in Lyons in 1761) a similar controversy has from time to time been going on. Even the great Lafosse, who never graduated from any veterinary school for the simple reason there were none in existence in his early career, criticised the erroneous or imperfect teachings of the College professors and the incompetency of the young veterinary surgeon just leaving the schools. Similar criticisms have been hurled, also from time to time, at the insufficiency of teaching and the lack of practical experience of young practitioners in this country since the foundation of the Royal Veterinary College in 1791. We can indeed go back further than the date of the establishment of the first veterinary school, and read in some of the musty and worm-eaten old tomes and find authors who condemned their contemporaries for lacking practical experience, being quacks and wanting in knowledge of their business. And no doubt similar bickerings will continue for all time.

Though a school may be ever so well equipped as is possible under conditions of situation, competency of staff, sufficiency of funds and suitable apparatus, it can never make students practical men; it can only give them general principles and some living examples and post-mortem specimens to illustrate the text. But at the same time, a teaching institution should not lack the sense of proportion and devote more time to bacteriology and physiology, which appear to be constantly changing ground, than to clinical medicine and clinical surgery, which rarely change yet enable the student to picture in his mind the situation and appearance of a disease, the course it runs, the treatment adopted, and the termination of the case.

If the classical and often stereotyped lectures were abolished and the principles and practice of medicine or surgery taught in the stable, in the yard, or on the operating bed much time would be saved and great benefit on the student bestowed. The knowledge obtained through the eye and hand is more lasting and better retained than that taken in by an often inattentive ear. This plan of teaching medicine in the ward rather than in the lecture theatre was suggested and adopted by Sir William Osler, Regius Professor of Medicine at Oxford, when at the Johns Hopkins University Medical School. Of course even this system of instruction should be supplemented in our branch of medicine by the practical experience to be obtained only in the practice of a general country practitioner.

The most essential knowledge the average student of today requires is that of the common or garden diseases of cattle, sheep, and pigs; normal and abnormal parturition, and that generally possessed by the farmer, stableman, cowman, shepherd, or pigman. This the schools cannot and never can impart as now situated. As it is at the present time too much attention is given to endeavouring to cram into the often unassimilative mind of the student those diseases which the majority of practitioners have never seen and are not likely to see. The future town practitioner, Colonial, Board of Agriculture, or Municipal candidate, although in the minority are better catered for than the future country practitioner, who is in the majority and of much more importance to the community at large than all the rest put together.

Speaking from many years actual experience in various parts of England, I am of opinion the common or everyday ailments or disorders of farm animals are the most

important, but they are usually passed over by the teacher inexperienced in them as superfluous. If a census could be taken of the mortality of domesticated animals in Great Britain it would probably show that quite nine-tenths of the total arose from what is regarded as common ailments. Therefore it seems to me that greater attention should be given in teaching the commoner maladies.

Assuming the R.C.V.S. is going to do away with unqualified assistants or unqualified practitioners, is the public going to be better served by the employment of inexperienced or unskilful, although legally qualified assistants?

I am informed that even now unqualified practitioners but experienced and often commonsense men are thriving in country districts that cannot be held by duly qualified men, in consequence of their lacking practical experience.

Unless the R.C.V.S. is going to see that before a student obtains his diploma he is really qualified to practise the art and science of veterinary medicine and surgery it will be failing in its duty towards the public, and therefore cannot expect the public to appreciate a certain class of man it is turning out.

A farmer, dairyman, pigowner or flockmaster will not care one jot about veterinary science if its practitioners cannot save his animals when they should be restored to usefulness. He will prefer the handy man or unqualified practitioner without a scintilla of science or the least certification. He looks at veterinary services from his point of view—a commercial, and not an academic, one. He will leave the academic aspect to the garret philosopher, misanthrope, churl, or crank. Can one blame him?

But while advancing this, I do not consider that one should expect too much of a recently qualified man; at least not as much as from a practitioner of 30 years' standing or experience or study. Some critics do not take into consideration, when comparing their many years experience with that of the recent graduate, that they were once young and stupid. Probably they are so ignorant that they are ignorant of the fact. They should go back to the time when they had just left college and compare their then practical experience with that of the present day recently qualified man. Still the young practitioner with M.R.C.V.S. after his name should have enough common knowledge and experience to enable him to avoid making an ass of himself, and to prevent himself bringing his profession into contempt or ridicule.

Some of the old men boast of their experience because they have been in practice and muddled through life for many years; many of them seem proud to say they have never opened a professional work nor read a veterinary periodical, nor attended a veterinary society since the time they left their college; not a few are ignorant of the recent advances made in practical knowledge, and more than one are very primitive in their methods. Such men as these, never having moved out of the groove in which they were professionally born, consider themselves quite competent to act as critics. They are like ants, wise unto themselves. Others again are, as Bacon would say: Crafty because they condemn studies while at the same time they make use of them. Still others do not play cricket: although fond of batting they shirk the fielding, that is to say, they are parasites—in other words they live on the brain of others but do not give any of their experience in return.

Before concluding there is another point that should not be overlooked, and that is: Are those members of the Council who now keep unqualified assistants, or allow their dispensers or clerks to do the work of a veterinary surgeon, or who receive fees for training nurses who may ultimately become quacks, going to practise henceforth what they now preach?—Yours faithfully,

"OBTUSE ANGLE."

ON "SEEING PRACTICE."

Sir,

Reading your leading article about newly qualified men, I should like to tell you what I did, or had to do. After passing my second exam. I made up my mind to go and see practice, because practice in the College was very little so far as experience went.

I then left the College for four years and saw practice in all parts of the kingdom, always doing, if possible, locum work, and in two cases assistantship. It is one thing seeing things done (assistant) and having to do them yourself (locum). Keep changing from one place to another, that is the secret. I could write a lot on what I have seen and the men I have met.

When I felt I was getting confidence in practising I then had a start for my diploma. After I got it I had no fear of starting to practise on my own.

Men enter the colleges much younger now than they did. Now supposing a man enters at 18 and at 22 passes his third, I think four years would be well spent in seeing practice in different parts, he would then be just over 26.

No veterinary surgeon should be allowed to employ an unqualified assistant unless he was a member of one of the teaching schools. Trusting this letter may be of some use.—Yours faithfully,

"THREE YEARS COURSE."

AN IMPROVED METHOD OF TREATING CANKER.

Sir,

I should like to ask your indulgence for a little space in your paper for just a few lines concerning "An improved method of treating canker." I only wish to refer to the method of applying pressure.

In January, 1891, I became a pupil of Messrs. J. and A. Lawson, Manchester, and I was early instructed in the art of making these rolls or pledgets of tow of various thicknesses for the securing of pressure. My immediate tutor in this particular direction was Mr. Wm. Johnstone, M.R.C.V.S. who at that time was associated with the above practice. I have a private letter from Mr. Johnstone, dated May 1st., and I give an excerpt referring to the method of pressure, "It is at least 40 years old, as I have used it myself for that length of time, and I am sure a good many others have done the same." During the last 13 years more than 50 cases of canker have passed through my hands, and I have always used that principle in obtaining pressure for the simple reason that I knew no other method.

I may say that in 1902 I demonstrated it to my friend, Mr. W. J. Watt, M.R.C.V.S.—Yours, etc.

HARRY LOMAS, M.R.C.V.S.

7 Ordnance Road, London, N.W.

[The rolls used and shown by Mr. Pillers are long cylinders (roughly, like a piece of lead pencil) about 6in. in length, of different diameters, and rolled hard; the smaller, about ½in. diameter by 6in. long, are inserted first. None of our correspondents have specifically described this shape, and we doubt if ever they have seen or used them.]

RE INTERNATI NAL CONGRESS.

Sir,

Don't you think it is rather an unsound proposition to bring before the profession that a comparative large sum of money should be raised to cover the expenses of entertaining foreign veterinary surgeons whilst in England. We know that the Royal Veterinary College is hard pushed for funds and that the Royal College of Veterinary Surgeons are selling their stocks to live, and some members are already generously giving a guinea a year to help stave off the evil day.

We are a poor profession, and those who are interested in the benevolent associations frequently complain of lack of funds. It is difficult to see what possible good the average practitioner will obtain from the Congress he will be asked financially support, and it is obvious that the bulk of the funds will ultimately find their way from the veterinary profession into the pockets of the catering trade.

I do not wish to be too much of a damper, still with the governing bodies discussing the possibility of ensuing bankruptcy, it does appear to be unwise to suggest the expenditure of thousands of pounds in entertainment. Believe me, very truly yours,

GUY SUTTON.

Canine Distemper.

PROPHYLAXIS

CANINE DISTEMPER VACCINE PROPHYLACTIC, P.,D. & Co.

A polyvalent vaccine prepared from cultures of several strains of *Bacillus bronchisepticus* (Ferry)—the specific micro-organism of canine distemper.

This vaccine is administered subcutaneously as an immunising agent against canine distemper. It is supplied in sets of three bulbs, which provide a series of graded doses sufficient for one dog.

Price, 4/0 per set.

TREATMENT

CANINE DISTEMPER VACCINE COMBINED (Curative), P.,D. & Co.

Prepared from several strains of *Bacillus bronchisepticus* (Ferry), *Staphylococcus pyogenes (albus and aureus)*, and *Streptococcus pyogenes* of canine origin.

This vaccine is administered subcutaneously in all forms of canine distemper and its sequelæ. It is supplied in sets of six bulbs, which provide a series of graded doses for one case.

Price, 7/6 per set.

Further particulars will be sent on request by

THE 'RECORD' PRECISION SYRINGE.

The FINALITY of Hypodermic and Serum Syringes.

"The **"Record"** Precision Syringe is a piece of delicate mechanical workmanship well deserving its name. It meets **all requirements as regards aseptic conditions and accuracy and it is always ready for use.**

It consists of **metal and glass** only. The glass barrel is ground inside perfectly true to cylindrical form. The Nickel vacuum piston is "ground in" into the glass barrel by precision machinery so as to fit hermetically, it slides smoothly, yet tightly, **without any lubricant.**

The cover is fixed on the cylinder with a **bayonet-fastening**; for the purpose of **thorough cleaning** it is provided with a segmental incision, by means of which it can be detached from the piston-rod by sliding it off side-ways. When **completely** taken apart the Record Syringe **forms 3 parts only : cover, piston and barrel.**

The **Needles** are provided with the original "Progressive" flat mounts. By this arrangement a good hold is afforded to the operator.

The fixing of the needle itself in the mount, by means of a smooth longitudinal guide arranged above the screw threads prevents the needle from breaking off in the mount.

EVERY SYRINGE IS GRADUATED BOTH IN C.C. AND MINIMS.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1246.

MAY 25, 1912

VOL. XXIV.

THE COUNCIL ELECTION.

The Annual Report and the voting papers are circulating amongst us once more. This year's Council election, while to all appearance a quiet one, is both interesting and important. Twelve candidates are competing for nine seats; only five of the twelve are retiring members, and only one other has previously served upon the Council. In any case, therefore, the election must introduce a considerable element of new blood upon the Council; and while, as usual, there are some candidates whose success is quite certain, there may be keen competition for the remaining places.

One rule should be observed at this election—no vote should be given to an opponent of the veterinary Surgeons' Bill. It is true, of course, that the Bill has long ceased to be matter of real controversy within our ranks. The last election at which it formed a test question was in 1909; and there has since been no attempt to reverse the more than emphatic approval of the measure which the profession pronounced at that time. But the Bill is now at a very critical period of its course through Parliament, and it is very important that we should again signify our whole-hearted endorsement of it, and so strengthen the hands of its promoters. There is sure to be a large majority of successful candidates who support the Bill—there are more candidates in favour of it than there are seats for them. But by voting only for candidates pledged to support the Bill, we can render our verdict an absolutely unanimous one.

The Annual Report—a quiet, business-like record of much varied work—should provide ample material for discussion at the forthcoming meeting in Dublin. There are many subjects—the balance sheet, the Bill, the unqualified assistant question, and the work of the Examination and Parliamentary Committees—all of which, being embodied in the Report, will be open to discussion. In the evening there will be a revival of the official dinner of the R.C.V.S. under the presidency of Prof. Mettam. We hope that some Englishmen will make the journey to Dublin, though they usually attend the London meetings in such poor numbers that they are hardly likely to visit Ireland in great strength.

It remains to be seen what use Irishmen will make of probably the first opportunity of attending the Annual General Meeting that many of them have ever had. They are not likely to lack in *esprit de corps*—probably they will rally round their President in numbers which will put the lethargic English section of the profession to shame.

Let us hope they will, for more reasons than one.

A good meeting and dinner in Dublin, by the mere force of example, might infuse new life into future gatherings in London. And certainly it would be a well-deserved compliment to an able and conscientious President, who is now nearing the close of a year of office, every duty of which he has executed with credit to himself.

MEDICAL GRADUATION OF PROF. WOODRUFF.

In the latest pass-lists of the Conjoint Board of the Royal Colleges of Physicians of London and Surgeons of England, we see the name of Harold Addison Woodruff, M.R.C.V.S.

All practitioners will join us in congratulating the young Camden Town teacher, who is now a member of two professions.

To graduate in medicine while actually engaged in veterinary teaching is an onerous undertaking. It has been done repeatedly—two of Prof. Woodruff's own colleagues, for instance, accomplished it many years ago—but the amount of work it demands is so great, and is spread over so long a period, that every man who succeeds in it fully deserves the credit of very exceptional courage and perseverance, no less than of ability.

SOUTH EASTERN VETERINARY SOCIETY.

The first general meeting of this newly-formed Society was held at the County Hotel, Canterbury, on Wednesday, May 8th. The Association was formed at a well-attended and representative meeting of fellows and members of the Royal College of Veterinary Surgeons practising in the county held at Canterbury on Wednesday, January 3rd, the instigator of the movement being Mr. Theo. C. Toope. Mr. James Crowhurst (F.) (President of the Society) presided, and among others present were Messrs. W. H. Crowhurst (F.), G. W. Dunkin, Major Edwards, A.V.C., Canterbury; J. B. Martin (F.), Rochester; Thomas Huband (F.), Kingsdon, Sevenoaks; F. B. Eve, H. Hogben, Folkestone; J. Richardson, Deal; T. Hibbard, Chatham; W. W. Gulliford, Hyde; Thomas Hogben, Ash; E. Ebbets, Rochester; E. Morgan, Faversham; E. L. Dixon, Margate; R. Roberts (F.), Tunbridge Wells; and Theo. C. Toope, Dover (Hon. Secretary).

The great difficulty in reaching the place of meeting owing to lack of railway facilities was responsible for the absence of many who, though fully sympathising with the movement, replied by letter or card stating they found it impossible to come. Amongst these were Messrs. J. A. Todd, Worthing; E. M. Perry, Eastbourne; Thos. Skelton, Epsom; N. Almond, Kingston-on-Thames; M. Moss, Sevenoaks; A. W. Reed, Bromley; F. Robards, Dartford; R. H. Pinching, Horsham; R. A. Thrall, Croydon; T. H. Tranter, South Croydon; R. W. Pitcher, Eastbourne; W. Burt, Brighton; J.

Washford, Romney; Charles Roberts, Tunbridge Wells; P. L. Austen, Pembury; J. Baker Cole, Ramsgate; W. Caudwell, Chertsey; F. C. Golden, Coventry; C. Stewart, Hove; A. Moore, Bromley; P. Perkins, Hastings; L. C. Welfare, Chislehurst; Arthur Whicher, Bexhill, and others.

The PRESIDENT, in opening the meeting, said it was with great pleasure that they met in Canterbury. The business to be transacted at that meeting was of great importance to veterinary surgeons in the South-eastern district.

The SECRETARY reported that he had sent notices of the meeting to every member of the Society, in fact to every member of the profession in Kent and Sussex, and in the south of Surrey, because he was not sure exactly how many members there were of the Society at present. With the notices he had sent post cards and had received thirty-five cards back out of a hundred. Twenty-five of those had stated the intention of the writers to be present that day, but since, he had received two or three letters from members regretting that they would be unable to attend. Messrs. Morgan, Nonington; Pugh, Sevenoaks; P. Gregory, Tonbridge; Prof. Cave, of Wye College; C. Crowhurst, Maidstone, were among those who were unable to attend.

The minutes of the preliminary meeting of the Society, which were taken as read, were adopted.

The SECRETARY said the first business was to receive the draft of the rules which had been suggested by the Committee. They were copied with slight alterations from the Yorkshire Veterinary Medical Society. The Committee had thoroughly considered them, and he took it they were about as perfect a set of rules as could be found.

Mr. ROBERTS said the tendency now was to delete the word "medical" from the title of veterinary surgeons' societies, and he thought it would be best not to start with the title "South Eastern Veterinary Medical Society" and afterwards have to recede from it. He thought it would be better to call it "The South Eastern Veterinary Society."

Mr. GULLIFORD did not think it wise to delete the word "medical," because they as veterinary surgeons were just as much medical men as human doctors were. He could not see why the word should be deleted, and he thought the title "South Eastern Veterinary Medical Society" made it more explanatory.

Mr. MARTIN advised that the word "medical" should be dropped from the title of their Society, remarking that they were veterinary surgeons.

Mr. ROBERTS said they were all veterinary surgeons, but some medical men held two qualifications, those of surgeon and also doctor of medicine. Veterinary surgeons had only surgeons' qualification, and he thought they should call themselves a Veterinary Surgeons' Society, and that they should not make any pretension to assuming medical degrees.

The PRESIDENT said he agreed with Mr. Roberts' suggestion. They would be strong enough to stand on their own, without encroaching on medical societies. He thought it would be quite sufficient if they called themselves "The South Eastern Veterinary Society."

Mr. HUBAND seconded, and it was agreed.

The SECRETARY read the draft of the suggested rules. They had, he said, an unwritten rule that the places of meeting for the Society should be alternately in the east and west of their district.

(After slight alterations had been made)

Mr. ROBERTS proposed that the rules as amended be adopted. He said he thought they were very complete for the guidance and governance of the Society, and that if they lived up to them they would be a very happy Society.

Mr. MARTIN seconded, and it was carried.

FEES OF VETERINARY INSPECTORS.

The SECRETARY said that the Committee had gone carefully through the list of fees now paid and had made various recommendations which he thought it would be best to submit individually for the meeting's approval. He believed if they took a firm stand in that matter they would get much better treatment in the future.

The PRESIDENT said that matter had been taken up in consequence of his attendance at a meeting he called to complain of some of his fees being stopped by the Clerk of Sessions at Maidstone. He went there to ask for an explanation, and he took the opportunity of bringing before the notice of the County Council that the fees allowed him were very inadequate, and especially for attending cases of mange. He also complained of the fees allowed for valuing horses suffering from glanders. He did obtain a partial remedy, the County Council agreeing to allow ninepence a mile one way instead of sixpence. He thought he had managed to get in the thin end of the wedge. In complaining of the fees allowed for valuation of horses, he asked them if it was true that they meant they only allowed 7s. 6d. for valuing any number of horses affected with glanders, and the Clerk said his construction was correct, that that was the fee for valuing any number of horses affected with glanders. He got that reply from the Clerk on May 16th, 1911, and he (Mr. Crowhurst) had striven ever since to bring the matter to a head. He met Mr. Toope and talked the matter over with him, and he believed that that Association had arisen out of it. The letter he received was dated from the Sessions House, Maidstone, and was to this effect: "With reference to your request for re-consideration of the fees allowed to veterinary surgeons for valuing horses affected with glanders, I am directed to inform you that the fees were fixed after careful consideration, and as far as the Council are aware they give general satisfaction." He could not believe that. The letter continued "If officers are not satisfied I should suggest that those who are not satisfied should send a joint deputation on what particular scale they are unsatisfied, stating what allowance should be substituted for those in force, and the question will receive further consideration from the Committee that deals with these matters. W. B. Prosser, Clerk, County Council."

He (Mr. Crowhurst) believed they had simply to put that matter before the County Council, pointing out what they thought a right and just remuneration for their services, and he had not a doubt but that they would be allowed.

For each ordinary visit to inspect animals suffering with mange they were allowed 5/-, and if the distance they had to go was under two miles they got no mileage. He considered that to be unreasonable. That was brought before the Society's committee, and they suggested the fee should be 10/6 for inspecting three horses suffering from mange, and £1 1s. for inspecting over three horses. The Committee discussed the question of fees for an hour, and they wanted the members to give their opinion upon the fees suggested, as to whether they agreed with them or not.

For attendance rendered necessary upon the report of an inspector a sum not exceeding a guinea was allowed, but he was not one of those who had received any of those guineas. (Laughter.)

For attendance at markets they were allowed half-a-crown an hour, but he hoped there was not a gentleman present who was satisfied with half-a-crown an hour. It was not a professional fee by any means. The Committee suggested the fee should be from £1 1s. to £2 2s. When he examined between 500 and 600 head of cattle

he did it at half-a-crown an hour, which was too absurd. It was for them to appreciate their own services.

Mr. MARTIN (Rochester) said the County Council valued veterinary surgeons at the figure the latter valued themselves.

The PRESIDENT said he believed that was so. For glanders or Farcy the Committee considered the fee for testing any number of horses up to eight should be £3 3s., and for each horse above eight one shilling.

For attendance to value a horse or horses the fee was 7 6, and they might have to value ten or twenty horses for that. Whatever number there was they could only claim 7 6. The Committee suggested the fee should be 10 6 for each horse. It would not be likely they would have any great number of horses to value, and 10 6 would certainly be an honest fee for each horse.

For sheep scab the fee was 5 - and 2 - for every additional ten or part thereof, provided the remuneration did not exceed £1 1s. in addition to train allowance. It often took some time to find the acari, and the Committee suggested the fee should be not less than £1 1s. Then again they were often sent to a flock of sheep when it was thought to be recovered, and they had to make a more careful examination, and unless every sheep was carefully examined they could not be at all sure it was free from scab. In that case they should be paid for the great responsibility they had to take. For post-mortem examination in cases of glanders they were allowed half-a-guinea. When they considered the great risk they ran in attending those post-mortem examinations of glandered horses, was such a fee right and reasonable? He was always very careful in those cases, because he was so sorry to see men run the risk of losing their lives. He was told he was nervous, and too anxious. He did not mind that, however. He would ask them as veterinary surgeons and inspectors engaged in that duty to consider the risk and also the responsibility - for, as they know, if they made a mistake there were plenty of their own profession ready to find fault with them - whether they were not justified in asking for a guinea for post-mortems instead of half-a-guinea. It was considered in case of disinfectants they should be allowed a shilling. That was only for disinfecting their own hands. He was asked what the charge was for and he said he had some respect for himself and did not want to take the disease away with him.

For every ticket given at the order of a local authority they got 1 - in cases of mange, so for three certificates they got 3 -.

For travelling by railway they were allowed second-class fare, and for cab hire from a station a mile one way 1 6, and for travelling other ways a mile one way ninepence. When at Maidstone he told the County Council Committee they allowed him second class fare, but that when he got in a cab they allowed him to pay the usual fare of 1 6 per mile, and that when he got to his own carriage he came down to the threepenny rule. He told them he could not afford to travel so cheap. They said there was something in it, and they allowed him ninepence instead of sixpence. The Committee thought they were justified in asking a shilling a mile one way. Those of them who used their own motor cars got threepence, so that it would be seen the County Council treated veterinary surgeons very badly indeed, and did not allow them anything like what they allowed the common cabman.

He thought the Committee had tried to put the matter on a fair basis without wanting to be extravagant. They were simply asking for justice.

Mr. MARTIN said he should call that a strike among veterinary surgeons. The speaker referred to the great responsibility resting upon them in cases of sheep scab. A farmer wanted to move his sheep from one field to another perhaps, and they were sent by the County Council to examine the sheep. They had to make sure,

because if they said the sheep were not suffering from sheep scab they were moved from market to market and the inspectors were responsible. Was it not ridiculous to take that responsibility for 5 -? If they were willing to take such a responsibility for 5 - he thought they were "mugs." In cases of glanders or for post-mortems the fee allowed was 10 6. For 10 6 they had to decide whether it was a case of glanders or not, and it did not matter how many cases there were in a stable they only got 10 6. Were they going to submit to that? The County Council valued their services just as they liked, but if they were loyal to themselves they could demand more, as the coal strikers had done, and he was sure they would get what they asked for.

The SECRETARY said in addition to the members present he had received several letters from members who were also inspectors. One was from Mr. Austen, Pembury, who was fully in accord with anything that meeting did. He stated that he had tried in the past to bring about some action among veterinary inspectors, and he hoped the meeting would have a little more success than he had had, as he could not get them united in the matter. He hoped the Society's efforts to raise the fees allowed inspectors might be successful for "from my past experience I have more faith in dynamite or an earthquake; however, if the inspectors be unanimous and firm in their demands, a committee man told me recently we should get what we ask for, and that committee man was a member of the Animals Committee."

When he (the Secretary) was in Yorkshire the fees allowed there were even worse than those in Kent. They were simply scandalous, and they decided to call the veterinary surgeons together. About ninety per cent. of them attended, and they drew up a scale of fees which particularly suited them. Personally knowing the Chairman of the Contagious Diseases Committee of the West Riding, he suggested the only way to enforce their right was to threaten the resignation of every inspector. They did that, and the document tending their resignations was duly signed. He (Mr. Toope) with a deputation attended a meeting of the Contagious Diseases Committee, and they had a great deal of discussion, and they were treated in the most bare-faced manner. The Chairman of the Committee neglected the other members of the deputation and attacked him (Mr. Toope), knowing him as an agitator. He had an unhappy time, and the deputation was ordered to retire. Before retiring he said he had something to hand the Chairman, and as he was going out he handed in the resignations. The Chairman read it, and in a very courteous manner said he hoped the deputation would come back in half an hour's time. The deputation had decided the matter for the Committee, for they got all they asked for and more.

Mr. DIXON said he was sure, while no one wished to curtail or stifle discussion on that important question - the Committee had considered it very carefully, and they had heard the fees paid in the past and also the suggested fees they should charge in the future - he thought it would save time if they at once formulated some scale - a definite scale, and that it be put into form. He understood a committee would meet the Kent County Council and he agreed that that ought to be done. He would propose that their President, with the meeting's assistance, formulate the fees that they considered a fair and equitable charge in each case (This was agreed to.)

The PRESIDENT said it appeared in the past that different charges had been made. What they wanted was a uniform charge - a definite charge.

Mr. DIXON proposed that the fee be £1 1s. for attending each case of mange and an allowance for mileage.

This suggestion the meeting accepted.

The PRESIDENT said he was getting old, but he was anxious to help the younger members of the profession. For a man to have to go to an auction market and stand there examining cattle at 2/6 an hour was too absurd. He wanted to get the feeling of the meeting on that. The Committee recommended that the fee should be from £1 1s. to £2 2s. They did not want to ask for anything but what was right and reasonable.

Mr. HOGBEN (Ash), who is the veterinary inspector at Sandwich Cattle Market, said he usually got to the market at a quarter past seven and remained there till half-past eleven, his fee amounting to about 15/- as a rule. He had to make out the certificates for pigs as much as possible beforehand, and then fill in the names at the market. At the last market there were 670 pigs and he wrote out nearly a hundred certificates. That was besides bullocks and sheep in the market. There were 55 bullocks in one auctioneer's sale and 50 in another. He had nearly 200 bullocks to inspect, and he should think about 700 to 800 sheep. He charged extra for the writing he had to do at home. He thought the work he did was worth a guinea. If one had a hundred loads of pigs to inspect it stood to reason that a lot of time was taken up. He wrote to Mr. Prosser on the matter, but he replied that nothing more could be allowed except the ordinary scale. Sandwich was one of the markets where certificates had to be made out.

Mr. MARTIN asked Mr. Hogben whether he considered the work he did was worth £1 10s. for the day.

Mr. HOGBEN said the day before he had nearly four hundred head at a sale at Sandwich, and he charged four hours for that.

The PRESIDENT said he thought they ought to consider the number of stock inspected. For himself he would be satisfied with a guinea at a local stock sale, but at Canterbury, Faversham, and Sandwich Markets he considered the work was honestly worth £2 2s.

Mr. GULLIFORD (Hythe) said he had to attend at Newingreen where there were sometimes 9000 or 10,000 sheep. He left his home at 7.30 and did not get back till 3.30, and he thought that was worth more than a guinea. Some sales he attended in the off season there were perhaps only twenty bullocks. The fee came to 15/-. For such sales he got 2/6 an hour, but the fee must not exceed £1 1s.

Mr. ROBERTS said he considered an inspector should be paid a guinea and not be paid by the hour, such method being unprofessional.

The PRESIDENT said the larger markets were worth £2 2s., but he thought £1 1s. would be fair for the smaller ones.

Mr. HUBAND proposed that the fees be £1 1s. for ordinary markets, and £2 2s. where the numbers were considerable.

Mr. EVE seconded.

It was suggested that 400 beasts and 1000 sheep should constitute a large market for which the fee should be £2 2s. and for anything under those numbers the fee should be £1 1s.

Mr. HIBBARD (Chatham) said if 399 beasts and 999 sheep constituted a small market one more of each did not constitute a large market. He thought it would be better to fix the fee at £2 2s. for a market that took over four hours, and anything under four hours' work £1 1s. if that satisfied the meeting, but personally it would not satisfy him as he considered his time was worth more than 5/- an hour.

Mr. DIXSON proposed that £2 2s. be the fee for all markets.

Mr. G. W. DUNKIN seconded, Mr. Roberts supported, and this was agreed to.

The PRESIDENT said the Committee thought the fee for attending cases of glanders and farcy and for post-

mortems should be £1 1s., while for the valuation of horses affected with glanders they suggested a fee of 10/6 for each horse.

Mr. DIXSON (Margate) said he thought a fee of 7/6 hitherto allowed for any number of horses was ridiculous. He considered 10/6 for each horse was a fair charge. In an outbreak at Margate when there were five cases of glanders and the horses had to be destroyed he charged 10/6 for each of the five horses he had to value, and he also charged 10/6 for the post-mortem examinations and his Council allowed it.

The PRESIDENT said boroughs fixed their own fees, but they as veterinary surgeons wanted the same fees for boroughs and under the County Council without any distinction whatever. It was generally accepted that the fee of £3 3s. for mallein testing was fair and reasonable. Then they came to the fee for the valuation of horses. They were dissatisfied with that, and they contended that the fee should be 10/6. The post-mortem examinations were dangerous, and those who carried them out risked their lives, and he thought they should charge a guinea for them. A fee of 10/6 for examining each horse was only fair and reasonable.

Mr. Dixon seconded, and the fees suggested were agreed to.

The PRESIDENT said the Committee considered a fee of a guinea should be allowed for examining a flock of sheep supposed to be suffering with scab, and if they were recovered they thought the guinea was still well earned.

Mr. EVE said it was too little.

Mr. HUBAND said he thought if there were 250 sheep or under the fee should be £1 1s., but exceeding that and up to 500 the should be £2 2s., and another £1 1s. for every 200 in advance of that.

The PRESIDENT said if they examined 250 he thought they were entitled to a guinea for any number up to that, while for any number above 250 he considered they should have £2 2s. The rub came not in detecting the disease but in eradicating the disease. If he found one affected with scab then he should be satisfied with a guinea for a flock of up to 250 and with £2 2s. for a flock above that number. They had to bring their own microscopes, etc., and they were asked to accept a very great responsibility.

Mr. ROBERTS said they required not only to say out of 250 sheep that one was affected, but they had to indicate when making their reports that so many in the flock were affected say, for instance, 27. They had to find one definitely for diagnosis. The point was, after having diagnosed the disease, to be quite sure that they were clean before they let them at liberty again. Referring to the question of dipping, the speaker said he did not think the Board of Agriculture prescribed for sheep to be dipped often enough. He thought they should be dipped oftener than they were.

Mr. EVE seconded the proposition that the fees be £1 1s. for a flock up to 250, and £2 2s. for a flock above that number.—This suggestion was agreed to.

The PRESIDENT said for every post-mortem examination the fee allowed was 10/6, but the Committee considered it should be £1 1s. The County Council did not allow anything for microscopical examinations if they were sent to a case of supposed anthrax and took blood from the ear, but they could only charge 10/6 for the post-mortem.

Mr. HOGBEN (Folkestone) said he generally charged £1 1s. for cases of suspected anthrax, and when he had had to make a special report he charged £1 1s.

Mr. ROBERTS said he thought for microscopical examinations they should be allowed a fee. They were there to arrange things for themselves with the County Council. He knew the latter body would not allow a fee for a microscopical examination if charged alone. They ought to have it very definite that the fee for

microscopical examinations should be 10 6; for inspection of stock suspected of anthrax, or where others had been in contact the fee should be 10 6; and for a post mortem examination the fee should be £1 1s.

Mr. HUBAND seconded Mr. Roberts' proposal, which was carried.

The meeting agreed that they ought to be allowed mileage at the rate of one shilling one way. Every mile to be charged and the first two not exempted.

The PRESIDENT said they must appoint a committee to lay the matter of the fees before the County Council at Maidstone. They wanted to elect men best fitted for the office, men who would carry weight with the members of the County Council.

The meeting decided that the President, Mr. Roberts, Mr. Martin, Mr. Dixon, and the Secretary should form the deputation to attend before the County Council.

AFFILIATION WITH THE N.V.A.

Mr. ROBERTS (Tunbridge Wells) proposed that the Society be affiliated with the National Veterinary Society. He said he knew that nothing but good could come out of it, as everyone of them ought to be engaged in the great national movement.

The SECRETARY read a letter from Mr. Martin on the absolute necessity of the affiliation of the Society with the National Assoc. Mr. Martin wrote in his letter:—

"I note in your Agenda item '3, the advisability of affiliation with the National Society.' I have belonged to that body for many years; it is only by organising ourselves into a strong solid body, with the object of concentrating our whole force to bring to bear on Parliament its irresistible claims for financial support to our poverty-stricken profession. As a deputation of our members have already waited on the President of the Board of Agriculture this requires following up with the indomitable persistent courage of the Suffragists. The Government have wasted large sums over appointments in the Insurance Bill, £40,000, the first quarter, and the land scheme shows they could well afford to subsidise to our poor College as a useful institution in the country. I hope you will get the Kentish veterinarians to rally round you. I found some apathetic in the past."

The SECRETARY said the cost to be affiliated to the National Assoc. would be 1 0 per head for each of their members. They were entitled to one representative besides the Secretary for every twenty-five members. They had thirty to thirty-four members at the present time. Several not having definitely decided as yet.

The PRESIDENT and the SECRETARY were appointed to represent the Society on the National Association.

The SECRETARY reported that the Society was asked to enter the National Congress to be held in 1914 and they were also asked to subscribe. He would ask Mr. Roberts, who took great interest in the matter, to explain.

Mr. MARTIN said when they got funds they would subscribe.

Mr. ROBERTS said he thought it a most worthy thing as it would give a fillip to their profession in this country such as it had never had before. To show the enormous importance that it would be to the veterinary profession he had only to point out that the Congress was recognised by the Board of Agriculture and by the Home Office, and it was clear they would get some assistance from them. They wanted to raise some £5,000, which was the sum Sir John M'Fadyen, who was working very hard, hoped to get for entertaining the Congress in London in 1914. He (Mr. Roberts) hoped they would all keep it seriously before them, and do all they could to help the Congress.

Mr. MARTIN addressed the meeting. In the course of his remarks stated that he was delighted to see such a

good meeting that day. He quite anticipated that they would have a small meeting. He had experience in the formation of those societies, for he formed the Southern Counties Society over thirty years ago. He was pleased to see more enthusiasm, more interest in the veterinary profession. He thought they would find some difficulty in a small county in finding members to write scientific papers. He had no such difficulty in his time, for there were many scientific men ready to write papers for him. But what they wanted to do now was to show their worth in the eye of the public to show their ability, and to prove that they were useful in protecting them from eating unwholesome meat and drinking unwholesome milk, and by that means they would elevate themselves in the eye of the public. Young men were now educated and well up in bacteriology, and they could discover the bacilli in different diseases. The older members must continue to study and to keep abreast of the times in science, or else they would find the young men fresh from College and well-educated supplanting the older men by securing the appointments by Corporations and others.

PRESIDENTIAL ADDRESS.

JAMES CROWHURST, F.R.C.V.S., Canterbury.

Gentlemen,—You having done me the honour of electing me your first President, I beg to thank you most cordially, and must say I am most anxious to do all I can in the interests of this Association during my year of office. I trust we may not forget our motto, "Vis unita fortior," which, if put into practice, will carry us on to a successful issue. May we each uphold the honour and dignity of our profession, and endeavour to advance science and to practise our calling scientifically.

In comparing the opportunities afforded by other countries with that of our own, we may justly be very dissatisfied with the neglect shown by the Government to our profession. It is truly astonishing, considering the stupendous value of the live stock in this country, that no assistance has ever been offered to the Veterinary profession by a grant in aid for research and investigation. Enormous sums have been spent in stamping out disease, and a false step has been taken at great expense by creating a staff of laymen to supplant the Veterinary Surgeon, and the consequent want of success is patent to the local practitioners. If the way sums of money spent in the futile attempt to stamp out Swine Fever could be shown in a total it would astonish the country. And the end of it is not yet.

That veterinary surgeons were capable and practical in doing this work is proved by their success in ridding the country of Cattle Plague, Pleuro-pneumonia, and Foot and Mouth Disease, and had they been listened to and trusted, millions of money, and what is of more importance, many valuable herds of cattle would have been saved by promptly slaughtering when Cattle Plague was first discovered in this country. I well remember it was in August, 1865, I reported to Government the first outbreak that occurred in the County of Kent, but it was a fortnight later before the late Professor Brown was sent here; there was then only one cow alive out of 16. A meeting was called in Canterbury at once, I implored them to slaughter and stamp out the disease immediately. I was only laughed at, and told to cure them; the disease was allowed to spread all over the country before any steps were taken by the Government, and that the famous herds of shorthorns that had taken generations to create were swept out of existence before any effective measures were adopted, is a matter of history. The same dilatory methods were adopted in the case of Pleuro-pneumonia and Foot-and-Mouth Disease; and lastly, Swine Fever.

It will be remembered, too, how hard Mr. Hunting worked before he could get any practical measures taken to prevent the spread of Glanders, and to stamp it out.

I have looked with astonishment to see Tuberculosis spread over our herds, and at the great loss of human life as a sequel, and yet no practical measures taken to prevent its spreading. Here again a great mistake has been made by putting the Surgeon over the Veterinary Surgeon, and placing the cart in front of the horse, by building sanatoria, etc., and neglecting all practical measures to prevent the further spread of this disease. The human surgeon is worse than useless in a cowshed amongst its inmates. As an instance—only the other day I was asked to visit a supposed case of Anthrax. The superintendent of Police informed me that two men were supposed to be affected with Anthrax which was supposed to have been got from the cows. I found over thirty cows were affected with Cow Pox, and that the two men had taken this disease whilst milking. The men were greatly relieved from my report. Even the justly celebrated Dr. Koch could be deceived, and all honour is due to Sir John M'Fadyean for his courage in disputing the conclusion that the bacillus of Tubercle was not the same in cattle as in man. It is a serious loss to humanity that the medical men are not more generous to the Veterinary surgeon. I remember the time when they were not on the high pedestal they sit on now, and their practice of bleeding their patients every spring and autumn is within my time.

Veterinary surgeons have no cause to be discouraged, but they must combine and demand their right to be the better fitted men as Inspectors of Dairies, Cowsheds, and also of Meat.

I very much regret that Veterinary practitioners are by no means fairly treated by the Board of Agriculture or by Agricultural Colleges. These are doing all they can professedly to assist the Agriculturist by the first-aid lectures and leaflets, to the direct injury to the local Veterinary practitioner. The V.S. is left to fight for his position and earn a meagre living. There are no grants in aid, no hospitals formed for them, no beds endowed, no bequests, no pensions on retirement after 50 years' service as Inspectors, and no retaining fees; generally being only paid when at work, and certainly not overpaid then. I am unaware that any leaders in our profession have ever taken any practical measures to render any assistance in obtaining more reasonable fees for Inspectors throughout the country. This ought to be done. "*Vis unida fortior.*" The human surgeon has shown how this is possible. Where are our leaders?

I wish to call attention of our members to the scale of fees allowed by Insurance Companies. They should either be improved or refused altogether.

A fee of 3 6 is offered to drive a distance of five miles, examine a horse and report thereon. I have written across such a request, "I consider this an insult to the Veterinary profession," and returned it. A case came to my notice the other day where an unqualified person was sent to examine for a company, and after an accident the same unqualified man was called by the owner; and after death the company refused to pay, as their conditions were that a qualified Veterinary surgeon must be employed. Personally I have never accepted an agency from any company, and think such undesirable.

The inspectors for the R.S.P.C.A. are now giving evidence before magistrates and experts, and their evidence is generally accepted, some of them stating on oath they have passed two, some three, stiff examinations. The inference from this is obvious. Giving evidence at the Court at Margate a short time since, the inspector and a veterinary surgeon swore that the horse had sidebones and ringbones, and the foot greatly misshapen.

The horse when a foal was trod on by the mare, the foot was not greatly misshapen, nor had it either ringbone or sidebone. I wrote to the Society requesting them to send some disinterested expert to examine the horse, but they declined. I have the support of a very reputable and honourable veterinary surgeon to substantiate my opinion in this case. It is most damaging to the profession when there is such direct cross-swearing on matters of fact, and some investigation ought to be made in the interests of the profession. I admit there always will be differences of opinion in our profession, as in others, but a line should be drawn somewhere.

The Board of Agriculture are now applying to farmers' clubs for information as to the prevalence of John's disease. I should have thought they would have asked the veterinary inspectors throughout the country rather than agriculturists. Their application has been sent to me by the Canterbury Farmers Club. I also call attention to another communication from the Board, on bovine tuberculosis, asking for information from Agriculturists who have been making their own private investigations. I certainly think in Germany and France such information would have been sought from the veterinary profession.

In the interest of the profession I welcome the new rule that unqualified assistants should not be employed, and I think a similar rule should be applied to quacks covered by their own sons. A new system of quackery also should receive our attention—the purchasing and using new remedies supplied by certain druggists, the ingredients not being disclosed, testimonials being freely given by members of the profession for them. Surely this must be damaging to the profession. If you compare the drug list of to-day with one of 20 or 30 years back, I think it will be very instructive. You will there see that recent remedies are offered to stud grooms and agriculturists who are plainly told that the very same remedies are sold to veterinary surgeons. Preparations of arsenic, ammonia, blisters, liniments, etc., etc., are better prepared by the practitioner himself. He knows exactly the strength, and can vary as he chooses. Our instrument makers, too, not content to supply members of the profession only, sell direct to the stud groom and farmer—with instructions as to use. This has been largely brought about by village lectures given by veterinary surgeons from agricultural colleges. Professedly they are helping the struggling professional brethren by teaching first aid, but they do not confine themselves to that, teaching, as a client of mine told me, very much more. However, I am thankful to say matters have improved in some respects lately, a little *esprit de corps* being shown, but there is certainly still room for more.

Great changes have occurred in the teaching of our profession, and I should be glad to see the apprenticeship reinstated. A student found by temperament to be unfitted for the profession could drop out before any great expense is incurred, and I am convinced more practical men would result from that system.

It was decided to hold the next meeting of the Society at Tunbridge Wells in September.

The members of the Society, who were joined by Sir George Collard, were entertained to tea by the President and Mrs. Crowhurst.

THEO. C. TOOPER, Hon. Sec.

THE DISEASES OF ANIMALS ACTS, 1894 TO 1911.—The Board of Agriculture and Fisheries have appointed Leonard Frank Eady, M.R.C.V.S., and William Jackson Young, F.R.C.V.S., to be assistant veterinary inspectors (non-established), for the purposes of these Acts.

CENTRAL VETERINARY SOCIETY.

A general meeting was held on Thursday, May 2nd, at 10 Red Lion Square, London, W.C., the chair being occupied by the President, Mr. R. J. Foreman. The following fellows signed the attendance book: Messrs. W. S. Mulvey, P. W. Dayer-Smith, J. W. McIntosh, Prof. H. A. Woodruff, W. L. Harrison, Sydney H. Slocock, Sidney Villar, Prof. G. H. Wooldridge, A. Rogerson, Prof. J. Macqueen, E. Lionel Stroud, J. Willett, James Rowe, F. W. Willett, W. Perryman, D. Stewart, R. F. Wall, R. Bryden, H. Simpson, Henry Gray, G. Gordon, J. F. Macdonald, F. O. L. Walpole, G. W. Lucking, Ralph Bennett, Wm. Hunting, H. King, G. Sutton, H. D. Jones, W. Roger Clarke, T. S. Price, W. Willis, A. L. Wilson, and Hugh A. MacCormack, Hon. Sec.; and four visitors.

On the motion of Mr. Smith, seconded by Mr. McIntosh, the minutes of the previous meeting were taken as read.

SPECIMENS.

Mr. LUCKING showed the second and third cervical vertebrae of a pony. He could not say whether the trouble had been the result of a fracture or a tuberculous growth; there had been a lot of swelling, which came up suddenly, as in the case of a fracture. The animal lived about six months after the first appearance of the mischief. In reply to the President, Mr. Lucking said that there were no signs of paralysis, but the animal could not move its neck much.

Mr. LUCKING also submitted a double fracture of a sesamoid from a hunter. In the case of the first fracture the bone got sound again, but the year following there occurred another fracture of the same bone. In reply to an enquiry, Mr. Lucking could not account for the fracture; it was in the foreleg of the animal.

Mr. ROGERSON narrated, in this connection, an instance of a horse employed in working a capstan. The rope attached to the capstan, which was revolving, became twisted; there was a chain and a hook at the end, which were not attached to anything. These swung round, hitting the horse behind the fetlock, with resulting fracture of the sesamoid bones. It was very unusual for the sesamoid to get fractured without some violent blow from outside, and the specimens were therefore unique.

Mr. MULVEY said that he had two cases of fracture of sesamoid bones during the last hunting season, both due to blow resulting from overreach.

Mr. LUCKING, replying to an enquiry from the President, said that in the case of the hunter, the latter had been treated for the first fracture, and was ill for about six months.

The PRESIDENT considered that in the case of the sesamoid bones of the pony, it was not a fracture but probably a tuberculous growth.

Mr. MACDONALD exhibited a morbid specimen belonging to a horse—a vanner—which had been at work about five years in London, and had not lost a day's work. One morning this animal, which had eaten his breakfast, and was just being walked from the stable to the van, suddenly staggered and dropped; he got up again, but died in about a quarter of an hour. The post-mortem showed chronic abscess in the wall of the ventricle; there was a little pus in the centre. The animal had never seemed to suffer from the abscess, was always a good worker, never flinching. Yet there had been this lesion in the heart for some considerable time.

ELECTION TO COUNCIL OF NATIONAL ASSOCIATION.

The PRESIDENT read the communication from the National Association setting forth the conditions of election, and he further read the rule (No. 36) governing

the procedure of the National Association in this connection. It being determined that six members of the Central Veterinary Society should be chosen, the names of the following gentlemen were put to the meeting, and their election carried:—Messrs. R. J. Forman, Prof. Macqueen, H. Gray, A. L. Butters, S. H. Slocock, and J. Willett.

A WAR OFFICE REGULATION.

Mr. WALL desired to bring before the meeting the fact that the War Office were asking members of the profession to put down their names in connection with the purchase of horses in the event of mobilisation. Retired officers and civilians were to be employed to purchase and inspect animal—the rate of pay offered by the order was, £3 a day and expenses, while the veterinary surgeon was to receive £1 a day, and £2 a day if he placed his premises and employees at the disposal of the Government. The speaker considered the difference in the pay implied an insult to the professional men, and hoped something might be done to point out to the War Office the injustice of this proposal. At least they should put the inspecting officer and the veterinary officer on an equal footing, and acknowledging this in the rate of pay.

Mr. Wall did not know whether the proposition was intentional on the part of the authorities, but thought something should be done.

Prof. WOOLDRIDGE supported Mr. Wall. Doubtless in the event of war and mobilisation members of his profession would do their best to assist at the various barracks, but in times of peace such discrimination was unfair, and it was not desirable that the terms should be suspended in black and white to the disadvantage of the profession. It would have been better to have avoided the mention of any fee.

Mr. VILLAR considered that the matter could be better discussed, if the printed document were before the meeting.

After some further discussion, it was proposed by Mr. Willett, and seconded by Mr. Gray, that the Secretary be asked to communicate with the War Office and request a copy of the Order.

DEPUTATION TO THE SOCIETY FOR THE PREVENTION OF CRUELTY TO ANIMALS.

The PRESIDENT read the communications that had passed:

Gentlemen,—A deputation consisting of Messrs. Hunting, Willett, McIntosh, and myself were received by the General Purposes Committee of the R.S.P.C.A., on April 13th last on a number of objections, a copy of which we had sent in advance. I addressed them as follows:

As President of the Central Veterinary Society I beg to thank you for receiving this deputation, and to express a hope that our meeting to-day will clear up some misunderstandings.

No one more highly values the work done by the Royal Society for the Prevention of Cruelty to Animals than the veterinary practitioner, and if we do not always see quite eye to eye it is because we veterinarians have a duty to our clients, as well as to the claims of humanity.

Many of us are directly responsible for the condition of studs of working horses, and whilst we have no desire to shirk our responsibility we feel very keenly that there are cases in which justice is not done to the horseowner, or to the Veterinary attendant.

When you wrote to our Secretary asking for an outline of the points we desired to discuss, we sent a list of six; and to these I will now direct attention.

No. 1. The majority of drivers are respectable, but not very intelligent men, and are liable to err from ignorance. They take out their horses with simple faith that

the owner or horsekeeper has satisfied himself that they are fit for work.

Sores may be produced without their cognisance, and lameness may arise from many causes—some painful, but many of such a nature as to not amount to cruelty.

We suggest that instead of subjecting the man to the indignity of arrest and detention, proceedings might more often be taken by summons, and the horse sent to his stable.

No. 2. The late Mr. Justice Hawkins many years ago expressed his disapproval of officers acting as Prosecutor, Witness, and Advocate. It seems quite obvious that this must lead to over zeal and exaggeration. It affords the prosecution a great advantage, as the trained officer is usually dealing with an ignorant defendant.

No. 3. Evidence as to the nature of lameness may safely be given by an untrained person, when the intensity of lameness is well marked; or when some obvious cause is visible. But in the majority of cases a correct diagnosis can only be made by an expert.

Your officers are very much inclined to undervalue the difficulty of diagnosing lameness, and to give positive evidence when an expert would hesitate. They seldom fail to find "heat and tenderness" in a lame case. They do not invent the symptoms but they mistake fidgetiness for tenderness and detect heat by retaining their hand on the lame leg longer than on the sound one. Some even find heat in a limb without comparing the state of the other leg. Another term frequently used and often misleading is—"Very Sensitive," as applied to horses with sore shoulders or withers. There are many horses that having once had an injury never forget it, and always resent having the parts touched; and there are highly nervous animals that seem to show pain when touched, that have no trace of any painful spot about them.

These terms are misleading, and have often convicted an innocent man.

No. 4. That witnesses exaggerate when they desire to win a case is beyond dispute—it is recognised in every kind of case, but in none is it so easy to do as in dealing with symptoms shown by living animals. To bring forward specific cases of this is very difficult, we do not desire to have individual inspectors reprimanded; and proof of exaggeration would require, in most cases, great trouble and expense.

No. 5. Most Veterinary practitioners can adduce instances of fear on the part of clients to complain of what they consider grievances. A horse is sent home for some trivial reason, and Veterinary advice is given to send it out again; but the owner replies, "I had better not. I shall only get into worse trouble." In cases of unsuccessful prosecution, owners quote such remarks of inspectors as, "You won't get off next time" or "It won't be long before I have you again."

When asked to send a complaint to the Society's Jermyn St. offices, they decline, under the belief that they would only suffer again.

No. 6. Intrusion on private premises without notice is clearly illegal. It seems only the barest justice, in a case of probable prosecution, that the examination of a horse should be conducted by agents of both parties—the Veterinary Surgeons both of Society, and of Owner.

The unarranged visit is open to another objection—that the trained inspector questions and cross questions stablemen and horsekeepers, and uses their statements in the witness box. And they do this with no warning that what is said may be used against him.

We have put forward these points as being our objections to the methods of the Royal Society for Prevention of Cruelty to Animals, and the procedure of their Inspectors. We venture to think some alterations might be made which would lead to greater fairness to

horse-owners, and to not less care and kindness to animals."

Their Chairman then answered each point *seratim*, almost as we anticipated:—

1. That under the present system there was no chance of getting wrong addresses; or of another animal being substituted. He added a point that was new to us, viz., that magistrates practically insisted upon a charge instead of a summons.

2. The Chairman explained that the Society could not incur the expense of having counsel for each case.

3. That this was a matter of individualism, and they could not see how they were able to deal with it.

4. Practically the same answer as to No. 3, with addition that they did not seem to think it mattered very much as it was now left for the magistrate to judge for himself.

5. They were very surprised at this objection, and asked for cases to be reported to the Society.

6. They did not see how this could be altered, as it would lead to great waste of time, and could not see the necessity of notifying the owners' V. S. at all. A lady present, on the committee, drew attention to the rule which provides for notification to the owner of a visit of inspection; but we gathered that this rule was more often honoured in the breach than the observance.

Mr. Hunting replied in detail to a number of the answers of the Chairman, and Mr. Willett, Mr. MacIntosh and I added facts and arguments in support of our position.

The Chairman informed us that he was a magistrate and gave an instance of Veterinary evidence which I am bound to admit seemed sufficient to shake a magistrate's faith in Veterinary experts.

He also appeared to think that the V. S. assumed too dogmatic a position in relation to what was and what was not cruelty.

On the whole we received the impression that the Committee thought that no case had been made out against their methods of procedure, and that when a rare error was made it was fully accounted for by defective judgment on the part of individuals.

MR. GRAY'S COMMUNICATION *re* THE ROYAL VETERINARY COLLEGE.

MR. HUNTING said that at the last meeting he had been unable to hear clearly the paper which had been read by Mr. Gray. Now that he had seen the printed copy, it appeared that Mr. Gray's proposition had been hurriedly thought out and hurriedly written. A number of points in it were of no importance; others were extremely controversial, and some he might describe as not very lucidly expressed. All would agree with the statement by Mr. Gray to the effect that "the Royal Veterinary College should receive liberal financial aid from the State, so that it could be so equipped as to bring the teaching and the means of investigation up to the level of modern requirements." Towards the close of the paper, however, Mr. Gray had put this question: "Are we going to meekly allow the College to obtain this grant from the Government, and then to continue this competition, unfair now, because we when students supported the College to exist?" The two paragraphs were, the speaker said, mutually destructive, and required no answer, unless from Mr. Gray, who might try to reconcile the contradiction. He had difficulty in understanding why Mr. Gray brought forward his proposition. There was a time for everything, but the time when the College was financially pressed and was endeavouring to get money from the Government was not the time at which to attack it; a little chivalry would have suggested letting the College alone till a more convenient time. Mr. Gray had stated that "the sole

object of the Royal Veterinary College when founded was for veterinary education," and the speaker would inquire if that were not still its object? Again, Mr. Gray said: "But as time went on and the original subscribers dropped out a new type of subscribers replaced them, whose motive generally for becoming a subscriber was a commercial one." It was well not to impute motives to anyone, but the speaker had as much right to assume that those who subscribed their two guineas did so from a benevolent motive as Mr. Gray had to say that the transaction was a commercial one; he believed that out of possibly two hundred subscribers not one hundred derived any personal benefit; some might get more than their due, but the majority honestly subscribed their two guineas to a public institution. There were apparently only two specific objections made against the College by Mr. Gray; one that they sold medicine at less than cost price. The speaker considered that if the charge were 1s. a bottle it was not often that the medicines would be sold at very much under cost. The other objection brought by Mr. Gray concerned the charge of 5s. a week for the keep of a big dog, such as a Great Dane, but the speaker would point out that not only the Great Dane but the Pomeranian was kept for that sum; there was one set price, and that only to subscribers. He could not help regarding these two objections as somewhat paltry. Mr. Gray had suggested, as an alternative to the methods of the College, the "taking in animals only belonging to the poor and getting subscriptions from a sentimental public," and he had compared the College to "Our Dumb Friends' League" and "The Animals Institute." Whether these latter institutions sold medicines at cost price or not he could not say, but he did not imagine that they did the veterinary surgeons in their neighbourhood any good, nor could he think that dependence on a sentimental public would encourage scientific teaching. There was, of course, a gratuitous charitable practice conducted at the College, and he felt that all would agree as to its necessity. It was not possible to teach students without subjects to show them, and without a "cheap" practice there would be fewer subjects than now. Moreover, with a cheap practice the students could "try their 'prentice hands," and could conduct operations which would not be allowed by the owner, say, of a hundred-guinea hunter, who was paying.

With regard to the paragraph at the end of the proposition, to the effect that the Royal Veterinary College was "no longer a necessary institution to the country, as there were several other self-supporting ones that did not enter into competition with the practitioners," the speaker would have thought that Mr. Gray must have regretted having written such a paragraph; had the speaker been the author of it in a mistaken moment he would have made a public apology at the earliest opportunity. The Royal College had not ceased to be a necessity in respect either to teaching or research work, which had been most brilliant, while the clinical work was of as high an order as that of any other college in the kingdom. The post-graduate course, too, was second to none in Europe. There was a strange want of proportion about Mr. Gray's paper. Here was an institution of old and prominent standing against which the objections raised were too small a charge for keep of dogs and for medicine! During the American Civil War one of the biggest battles happened to be fought on and around a farm. The farmer worried the General and bullied the Department of War for compensation, and was told that he would get it in time, when the matter could be gone into. That did not satisfy the farmer, who looked up the President, Abraham Lincoln, and explained how his farm had been damaged, and insisted upon immediate compensation. President Lincoln told him that his action reminded him of an incident on board a Mississippi steam boat. A certain

place on the river was rendered highly dangerous by snags, rocks, and currents. Steering the boat himself, it was all the captain could do to get safely through. One day, in the middle of the Rapids, a little boy who had been playing about the deck ran up to him and said, "Hi! captain, stop her, turn her round; I have lost my apple overboard." Lincoln added, "And I think, my man, you have lost your apple overboard." The speaker considered that Mr. Gray's case was fairly described as one in which he had "lost his apple overboard."

Mr. WILLETT said that Mr. Hunting with his well-known skill had evaded the real point of Mr. Gray's paper in an admirable manner, that point being, the speaker assumed, the competition of the College with its former students in London. Mr. Willett doubted if there were many veterinary surgeons in London who had not, at one time or another, felt that competition. It was not necessary to go often to the cheap practice at the College to see people sitting there who were well-dressed and owned a class of dog which made it reasonable to think that they were well able to afford a veterinary surgeon outside. It was difficult to avoid this state of things and for the Professors to discriminate between one and the other. He would suggest as an alternative that no one should be admitted to the cheap practice without a letter from some responsible person—veterinary surgeon or layman—saying that they were unable to afford proper treatment outside. In regard to shoeing horses, a minor matter, the speaker knew of several cases in which horses had been sent to the College to be shod, which had previously been done by private practitioners, who were told that if they would shoe as cheaply they could have them back, but there was a natural disinclination, say, to come down from 6s. to 5s. a set. With regard to horses, doubtless many people subscribed, just for the commercial saving in examination and treatment. He knew of an owner of eight horses who always sent a poor man to the College with his horses to the cheap practice, and the horses had been fired and treated for a small fee. How was the professor at the College to know that the owner had more than one horse? For the foregoing reasons he made his suggestion about a letter from a responsible person. At the same time he did not wish it to be understood that he was not in sympathy with the College in its application for a grant.

Mr. McINTOSH, with every admiration for the teaching of the College, hoped nothing said at that meeting would diminish the chances of a grant from the Government. But certain methods adopted by the College he strongly resented. He would cite instances of practice. One of his firm's horses had been taken there with colic. The account was duly rendered, accompanied by a circular inviting subscribers, and holding forth—underlined in red ink—the benefits to be obtained in the form of cheap medicine and cheap advice. He wondered what the Council of the Royal College of Veterinary Surgeons would think of an individual member who issued such a circular to another man's client. He knew several large owners, subscribers to the College, one, a particular friend of his own, who paid his £2 2s. with the one object of getting his horses fired and blistered at a cheap rate. That practice should not be allowed, and if he had been in general practice he would have done his best to prevent it.

Mr. VILLAR stated that although he was neither a London or suburban practitioner, and was in no way connected with the Royal Veterinary College, he, as a member of the profession, regretted that Mr. Gray had chosen to exploit his somewhat extraordinary views at so inopportune a moment, and he quite agreed in this with Mr. Hunting.

The Royal College of Veterinary Surgeons and the Royal Veterinary College as scientific institutions probably never stood higher in public esteem than at

present, but the financial position of both was deplorable. One of them to his knowledge was rapidly passing into a state of insolvency—and now one of these institutions was applying to Parliament for power, by the Veterinary Surgeons Bill, to raise funds, and the other was applying to Government for financial aid—surely this was a time when all well-wishers of the profession should unite and assist these old established bodies to regain their position. If it were not possible for all to be loyal, let them at least be business-like, let them get the money, and if need be dispute afterwards its method of expenditure.

It was not clear what Mr. Gray intended his deputation to the Board of Agriculture to represent. Apparently it was to point out that it would be wrong to grant funds to the Royal Veterinary College because this Institution was no longer necessary to the country, but generally the ideas expressed in the paper were vague and confused. As Mr. Hunting had pointed out, it was difficult to follow a man who thought the Royal Veterinary College should receive liberal financial aid from the State and yet stated that the College was not a necessary institution.

Mr. Gray had gone on to suggest that the Royal Veterinary College should depend for its existence upon subscriptions from the sentimental public, and had pointed out how well "Our Dumb Friends League" and some other Society had done in this way. For some years the speaker was professionally attached to the Home of Rest for Horses, a very excellent Society, but amongst its rules was one that no horse should be fired in its infirmary, and that no horse should be admitted that had been recently fired or that was suffering from Quittor—the committee who managed it objected to severe operations. Yet Mr. Gray apparently would have the whole veterinary profession—for the profession was moulded at the teaching schools—ruled by such sentimental persons as governed the Royal Society of Prevention of Cruelty, and such like bodies.

Mr. Gray's reference to hospitals was irrelevant: no human hospital could be compared to the Royal Veterinary College as the conditions were so different. The whole profession was under a great debt to the teaching schools, especially at the present time. The reason for their bad financial condition was the paucity of students, whose fees were their chief source of income. Some might suggest that the increasing use of motors and mechanical traction was the cause of this paucity of students, and to some extent that was so, but what was a much greater reason was the present standard of the matriculation examination. If Latin or Geometry were made non-obligatory it would lead to a great access of students. It was to the credit of the teachers of our schools that there were no greater opponents than they to a reduction in the severity of the examination, recognising as they did that the profession would suffer if less educated men were admitted. What was Mr. Gray's motive in raising this question? Could it be that he had become infected with the prevailing spirit of unrest, and was trying to emulate the political leaders of trade unions, and stir up strife? If this were so, he might be quite certain that the Central Veterinary Society would never support so ill-considered a statement as this.

Prof. WOOLDRIDGE also considered that Mr. Gray was ill-advised to put forward his proposition at the present juncture. [Mr. Gray: "I was not advised at all." Prof. Macqueen: "I should think not!"] Mr. Gray's attitude reminded him of the Biblical story of Balaam and his ass reversed. Mr. Gray started with a blessing and ended with a curse. The speaker scarcely felt that he was called upon to depend the College; it would have been more dignified to have ignored it. It was difficult to see any point in the statement that

"the sole object of the Royal Veterinary College, when founded, was for veterinary education;" unless it were made with a view to saying that the object no longer existed. The paper was apparently an indictment of the Governors of the College for the way in which they carried on its business or transactions, and that suggested that they no longer had education at heart, but had some ulterior motive. He would challenge anyone to point to a single member of the Board of Governors who derived personal benefit to the extent of one half-penny. The object, the speaker contended, was still veterinary education. Mr. Gray had complained about the small subscription required in order to qualify a subscriber to participate in the privileges of the College, which had led to competition, and he had followed that complaint by saying that "those who are in a position to become subscribers were not likely to be influenced so vitally on the question of paying a reasonable fee." According to this, the amount of the fee, whether large or small, was of no importance. Mr. Gray had also said that the College was neglecting its duties, and by way of proof pointed to the establishment of such institutions as "Our Dumb Friends' League." Mr. Gray had adverted to the number of the hospitals in London. Did that gentleman suggest that the number was accounted for by neglect on the part of the first of the Institutions? The fact that there was work for a number of these hospitals did not imply neglect on the part of one. The main point of Mr. Gray's argument was competition with practitioners. The Royal Veterinary College had a practice, but it supported no fewer than twelve veterinary surgeons, who would otherwise increase competition in London. If the College were done away with and the surgeons employed let loose, he questioned whether Mr. Gray would not lose as many clients as he did under the present system. It is quite possible that some of them might be able to earn bread and cheese even in the West End of London, and certainly Mr. Gray and other practitioners would not be much better off. He did not feel disposed to discuss with Mr. Gray the question of the duties of the professors. Mr. Gray had further contended that not one practitioner was directly or indirectly represented on the board of governors; there was, however, a London practitioner on the Board at the present time which disproved the statement—most of Mr. Gray's "facts" were of this nature. To quote again, Mr. Gray asked: "Are we going to meekly allow the College to obtain this grant from the Government and then to continue this competition, unfair now, because we when students supported the College to exist." What would the authorities of Mr. Gray's school, wherever it was, say if that gentleman went to them now and pointed out that at one time he paid his school fees there and honoured it with his presence, and suggested that they were consequently in his debt, and demanded a voice in the government of that school? Did anybody ever hear of such an absurdity? The speaker's attitude to his own school was the reverse of that; he felt that any success he had achieved was due to that school in the first place, and then to the Royal Veterinary College, which had completed his education. He felt that he owed a debt to his school and college and not that they were under any obligation to him. He would put another phase of this question to Mr. Gray: Had he knowledge of any member of the profession who, having asked the members of the staffs of the various colleges for advice, had been refused? [Mr. Willett: "No."] It would surprise members perhaps to know the number of letters, asking advice in specific cases, which the Professors of the Royal Veterinary College received from town and country members of the profession; and this advice was willingly and ungrudgingly given. He thought Mr. Gray might recognise that he owed something to the Institution; that he had received his education there, that he

had received more than *quid pro quo*, and with the result had been able to make, to say the least of it, a reasonable living. The contention that the Royal Veterinary College was no longer a necessary institution was too absurd for words. Could Mr. Gray point to any institution that was absolutely essential? No institution of any character whatever was essential, but surely that did not justify the abolition of all institutions. The speaker considered that it would have taxed even the ingenuity and agility of a Chancellor of the Exchequer to have reconciled Mr. Gray's opening remarks and his concluding statements.

Mr. GUY SUTTON was the next speaker. He said: Could the College be rightly described as "a very active competitor," in spite of the fact that its charges for the keep of both horses and dogs were admittedly too low. With regard to carriage-horse practice, certainly the neighbouring practitioners did not suffer much. There was a very good reason for this. With regard to the shoeing, after all was said and done, what did the competition amount to? Is was a small forge, with one fire, and if they tried to increase the amount of their shoeing, they would probably find it difficult to do so. As to the charges made for dogs, here the College undoubtedly missed a certain amount of revenue. The people who sent their dogs there would still do so if the charge was 10s. per week instead of 5s., and very little of their clientele would be driven from their doors and distributed amongst their neighbours by the increased fee. Regarding the competition in the examination of horses for soundness, there was not a dealer in London who sent horses to the College if he could possibly persuade his clients to send them elsewhere.

Prof. MACQUEEN, while considering that Mr. Gray was perfectly free to express himself in any manner he chose, believed that very few London practitioners would agree with the terms of his indictment, or would care to assume the attitude of moral turpitude that Mr. Gray would appear to have taken up in regard to the Royal Veterinary College. In proof of the fact that no very strong views against competition by the College were held by London practitioners, he would say that two or three years ago he had applied to certain of these gentlemen regarding some repairs to loose boxes at the College and had met with a ready response from every one applied to, a sum of £650 being subscribed. Dealing with the paragraphs in Mr. Gray's paper, he would say that it was not true that the Royal Veterinary College had been founded for the sole purpose of education, that being a subsidiary item, which was not introduced till some years after its foundation. Its original object was "The improvement of farriery by collecting from men of experience and practical knowledge well-authenticated facts relative to the diseases of horses, cows and sheep, their treatment and cure." It was only after the College had become firmly established that education was taken up, and a considerable period elapsed before there was any evidence of tuition beyond the sanction given to the professor attached to the College to take a few pupils.

With regard to medicines and the keep of animals, the charges at the College might be low, but it must be remembered that the subscriber for horses paid two guineas and the subscriber for dogs one guinea a year for their privileges, and in each case this premium had to be considered in estimating the charges for keep and treatment. Though small, the fees were not ridiculously small. The reference to the Brown Institute and the London Hospitals, however useful these Institutions might be, was inappropriate in a discussion concerning the prospects of the Royal Veterinary College: there could be no proper comparison. The principal point was the competition by the College, and, in the speaker's opinion, the College was quite entitled to compete with any practitioner. Indeed, the College had made a mis-

take in not extending that competition when practice was good. This was not the first occasion on which the question of competition had been brought forward. The Governors of the College had, however, always tried to avoid competition. Had competition been their chief aim, or had they realised its advantages, a West-end branch would have been set up fifteen or twenty years ago. Mr. Gray had said "The Governors should consider the fact that the College should be supported mainly by our fees, i.e., those of us who were students there." Again he had said that "there are several other self-supporting ones (Veterinary Colleges) that do not enter into competition with the practitioner." With regard to these statements, What were the facts? In Scotland, the Glasgow and Edinburgh Colleges were in constant competition with the practitioners: they held contracts, attended outside cases and practised in the ordinary way. At Liverpool, on the staff of the Veterinary College there were at least two veterinary surgeons in regular practice. In Dublin, owing possibly to the activity of the practitioners in obtaining positions on the Committee of Management of the College a free clinique was not allowed, and the institution was suffering from the loss.

The London College did not actively enter into competition in practice, but he saw no reason why it should not compete, and if the agitation was continued the Governors should reconsider the position and allow the qualified veterinary surgeons at present engaged exclusively at the College to extend into various parts of London, and conduct practices.

As to representation on the Board of Governors, it would be sufficient to say that direct representation of the practitioners in London undoubtedly existed; Mr. Hunting was a Governor of the College. At the moment when the Board of Agriculture was deliberating upon making a grant to the Royal Veterinary College, Mr. Gray's agitation was most ill-timed, and he would urge members of the Society to do nothing that would interfere in any way with the grant being made.

With regard to Mr. Willett's suggestion of letters from responsible persons in behalf of those taking advantage of the cheap practice at the College, he would say that already letters had been tried without success. It was not difficult in London to obtain certificates of poverty, which was rather hard to define.

Mr. McIntosh had raised certain objections. A horse with colic was brought to the College for treatment. The account was sent in to the owners, and the Secretary enclosed a slip giving the regulations of the College. The speaker could see nothing unprofessional in that course. Mr. McIntosh pointed out a defect, but suggested no remedy. He had complained that horses were sent to the College to be fired and blistered, and suggested that some practitioners must suffer in consequence. The College was open to voluntary subscribers and until Mr. McIntosh could devise some other scheme, it was not possible to prevent persons bringing horses to the College to be fired and blistered. Complaint had been made in reference to the charges for shoeing, but Mr. Willett overlooked the 42s. premium as affecting the low charges. The College had no canvassers, and did not send out to seek for work. When the College put on a set of shoes, four shoes were put on, and when two shoes were removed it did not charge for two new ones. The charges might be low, but they were legitimate. Prof. Macqueen further pointed out that certain rules and regulations of the College now in force were in operation in 1801, and he quoted from a published statement as follows: "The institution was founded in 1791, and was at the commencement supported by private subscriptions. Since 1795 to the present time (1801) Parliament had most liberally granted £1500 per annum to promote and enlarge the

views of the veterinary establishment. The subscribers paid £2 2s. per annum, or £21 for life—the same terms as at present. In concluding, Prof. Macqueen said that it was the business side of the College that was weak. He denied Mr. Gray's contention that the student carried a perpetual claim on the College by right of entry; every student leaving the College had received full value for his money, and he was not entitled to regard himself as a permanent prop of the institution.

Mr. McINTOSH was sorry Prof. Macqueen attempted to justify the issuing of the "circular." He had no objection to the College inviting subscriptions, but surely it is most unprofessional to hold forth, in the manner described, the benefits to be derived by so doing.

Mr. GRAY replied to the discussion. He contended that the speaker had missed his point—that the profession should be represented directly on the Board of Governors, so that they could control the practice of the College. In connection with Mr. Hunting's remarks he would like to point out that Mr. Hunting had not been a student at any existing veterinary school, and had not been a student at the Royal Veterinary College; therefore Mr. Hunting did not represent the former students; and as he had not been appointed by the profession he did not represent the profession directly. He seemed more Royal than the King. It might be true that he (the speaker) had "lost his apple," but he would ask Mr. Hunting the significance of the fact that two Governors, former students of the College, had resigned. Why did the College want a grant? He had been given to understand that the London University would not take over the Royal Veterinary College as one of their schools, until the College was properly equipped and had a properly constituted teaching staff. He could not see why the College should get money from the taxpayer, including the practitioner, unless the profession were directly represented. Prof. Macqueen had said that the College had a right to enter into competition with former students; but it was the former students who had kept, and the present students who were keeping, the professors. Mr. Hunting had, in contradiction of the speaker, said that the Royal Veterinary College turned out more students than Dublin, but the figures published in *The Veterinary Record* showed Dublin had 24 students and the Royal College 19; that indicated a declining use of the latter institution. Prof. Macqueen urged that the student did not keep the Professors, but unless the College were carried on in such a way that a good income was being made of cheap competitive practice, he could not see who did keep the Professors. Prof. Macqueen had, moreover, omitted from the statement of the bye-laws, etc., the fact the veterinary surgeon were not subscribers. [Discussion arose on this point, the issue being that Mr. Gray was requested by the President to accept the fact that veterinary surgeons were subscribers]. Continuing, Mr. Gray said that he had no desire that the Royal Veterinary College should go down, provided it did not continue cheap competitive practice. He could not agree with Prof. Macqueen's statement that the College received good fees. Horses of the value of upwards of £250 or more had been fired there, and wealthy clients of his had told him that they could take their dogs there for a sum of 5/- where he (the speaker) wanted a guinea. He was contending not so much for the few pounds a year he might lose as for the principle of the competition. Unless the Royal Veterinary College would yield to reason, he would do all he could to oppose the grant. When the Board of the College—people in a position of affluence—opposed the profession, why should they be considered. He had, at the same time, good authority for saying that he did not think the College would obtain the grant sought. If, however, the Council of the Institution were amended, he would not oppose but help. What was wanted was that the College should take the pro-

fession more into their confidence, especially as the profession had hitherto subscribed handsomely to the rebuilding of certain stables. In saying that the Royal Veterinary College was no longer necessary, the speaker meant that it was no longer necessary as at present constituted; reconstituted and placed on a better basis with a few business men, including some successful and business-like practitioners on the Board to advise the Governors, the College could do good work.

The proceedings were then terminated with the usual votes of thanks to the gentlemen who had exhibited morbid specimens, and to Mr. Gray for submitting his paper.

HUGH A. MACCORMACK, Hon. Sec.

Royal College of Veterinary Surgeons.

FELLOWSHIP DEGREE.

A meeting of the Board of Examiners for this Degree was held at the College, 10 Red Lion Square, W.C., on Saturday, May 18th. The following is a list of the successful candidates, together with the titles of their respective Theses:—

HUGH BEGG,	"Tympanitis in Bovines."
W. A. SIMSON,	"Bovine Pleuro-pneumonia. Lung-sickness."
ALEX. M. MONRO,	"Milk Fever."

The Examiners were Messrs J. Malcolm, W. Hunting, Prof. Macqueen; Mr. Sidney Villar being in the chair.

FRED BULLOCK, Secretary.

ELECTION ADDRESSES.

To the Fellows and Members of the Royal College of Veterinary Surgeons.

Gentlemen,

I beg to be allowed to offer myself again as a candidate for election to the Council of the R.C.V.S.

My opinions as to the absolute necessity of the passing of "The Bill" are as firmly fixed now as they were when you last did me the honour of electing me.

On all other matters, also, my firm desire is solely for the advancement of the profession, and should you again honour me by giving me your votes my whole-hearted services are yours.—I remain, yours faithfully,

WALTER BURT.

Brighton, May, 1912.

To the Fellows and Members of the Royal College of Veterinary Surgeons.

Gentlemen,

I have again been adopted by the Lancashire, Yorkshire, Eastern Counties, and Liverpool University Veterinary Medical Societies as one of their candidates for election to the Council of the R.C.V.S., and this honour I very much appreciate.

As a practitioner for over 20 years, and one who has always taken a lively interest in the welfare of

the profession, I desire once again to state my views on matters of present importance to the profession.

1. I am a strong supporter of the Veterinary Surgeons Bill now before Parliament, for I cannot conceive a better mode of preserving the financial status of the Royal College.

2. Every endeavour must be made to retain the "One-portal" system of entry to the profession.

3. The relationship between the Board of Agriculture and the country practitioner has improved. It is to be hoped this may be further extended.

4. Local Governing Boards—to wit, County and City Councils—are appreciating to a much greater extent than formerly the value of the Veterinary Public Health Officer. This advance in Veterinary State medicine I hail as a distinct asset to the profession and the public. This movement I am prepared to support to the utmost of my power.

Assuring you of my keen interest in the present and future welfare of the profession, and my desire to help forward all movements in the direction of increasing our public usefulness.—I remain, yours obediently,

WALTER PACKMAN.

The Wylde, Bury. May 20.

THE UNIVERSITY OF MELBOURNE.

CONDITIONS OF APPOINTMENT OF PROFESSOR OF VETERINARY PATHOLOGY, AND INFORMATION WITH REGARD TO THE WORK.

Duties.—The Professor will be required :—

1. To devote the whole of his time to the work of his department except in so far as special permission may be given by the Council under Section 10 of Statute V.

2. To administer the Department of Veterinary Pathology giving such instructions by lectures and otherwise, and conducting such examinations as may be provided from time to time by the Statutes and Regulations of the University.

3. Subject to the control and directions of the Council to be Director of the Veterinary Institute; and, if appointed Dean of the Faculty, to exercise a general superintendence over the educational and administrative business connected with the Faculty.

4. To conduct, upon such terms and conditions as may be agreed between the Minister of Agriculture and the University, any investigations in Veterinary matters which the Minister may at any time require to be made, and to report to the Minister of Agriculture the result of any such investigation.

5. To keep himself, as far as practicable, in touch with the Stock interests of the State.

Tenure.—The Professor shall hold his office subject to the University Acts and the Statutes and Regulations of the University.

Should the Professor desire to resign his office he shall give six months' notice of his intention, such notice to terminate on 31st December.

Emoluments.—1. The Salary of the Professor shall be £900 per annum, but in the event of the Council providing the Professor with a house in the University Grounds, the sum of £100 per annum will be deducted from the salary.

2. In addition, immediately on the arrival of the Professor in Melbourne, the Council will, in the name of the University and from the monies of the University,

purchase an endowment assurance on his life, the policy to be payable at the age of 60, or at his death should that event occur previously, and the amount of the annual premium paid for such assurance will be £100.

Information.—1. The Veterinary Institute is situated on a site comprising four acres, close to the University. The buildings include a Research Institute, a Veterinary Hospital, and a surgical ward, with large operating theatre and necessary adjuncts. For the Chemical, Physiological, Biological, Physical and Histological parts of the work, the University laboratories are used. About £12,000 has been expended on the Institute.

2. Salary and duties will begin on the 1st Mar. 1913.

3. If the Professor appointed shall come from outside Australasia, £100 will be allowed for travelling expenses, and a cable will be sent informing him of his appointment. The appointment will probably be made by the Council in August or September, 1912.

4. Candidates must with their applications submit satisfactory evidence of physical fitness, and any candidate whom the Council may propose to appoint must submit himself for examination, and be passed as physically fit by a physician appointed on behalf of the University.

5. Candidates should not be much over forty years of age, nor under twenty-five.

6. Copies of the latest Calendar of the University of Melbourne may be seen at the office of the Agent-General for Victoria, Strand, London, W.C., and at the principal Universities in Britain and America.

5. Applications for the vacant Chair, together with original or certified copies of testimonials and photograph, must be sent to the Agent-General for Victoria, Strand, London, W.C., to reach him by 30th June, 1912. Six copies should be furnished for the use of the Committee of Selection.

Horses in Mines—Home Office and Appointment of Inspectors.

It is officially announced that the Home Secretary is prepared to receive applications for the appointment of inspectors of horses in coal mines under Section 109 of the Coal Mines Act, 1911. Six of these inspectors will be appointed at an annual salary of £125, rising by £5 a year to a maximum of £175. Candidates must be thoroughly experienced in the care and treatment of horses and other animals in mines, and must have had practical acquaintance with the conditions under which work is carried on underground. The prescribed age for candidates is between 30 and 40 years. The appointments will be made by the Home Secretary on the advice of the Board for Mining Examinations, subject to a qualifying examination.

Applications must reach the Home Office before June 30th, 1912. Particulars as to the appointments and forms of application may be obtained from the Private Secretary, Home Office, Whitehall, London, S.W.

ARMY VETERINARY SERVICE.

We regret to report the death on May 1st, in Bombay, after a short illness, of Colonel John Anderson, retired pay, Army Veterinary Service, at the age of 73 years.

He had a distinguished career, was appointed to the Army Veterinary Department at the beginning of 1860, went out to New Zealand and served for six years in the tediously prolonged Maori War, including the Taranaki and Waikato campaigns. He was mentioned in despatches and received the medal. In 1867-8 he was with the Abyssinian Expedition. He formed and had charge of the sick depots at Koomayloo and

Pioneer's Wells, and was three times employed on special service. Here again he was mentioned in despatches and received the medal. He had a like award for the Afghan War, where he served with the Kurram Field Force, and afterwards the Khyber Line Force as Inspecting Veterinary Surgeon. In the Egyptian War of 1882 he was Principal Veterinary Surgeon with the Indian contingent, being present at the battle of Tel-el-Kebir and the capture of Cairo. He received the medal with clasp and the Khedive's Star. He was well known in the racing circles in the west of India, where he enjoyed a wide popularity.

Extract from *London Gazette*.

WAR OFFICE, WHITEHALL, May 17.

REGULAR FORCES. ARMY VETERINARY CORPS.

Capt. E. Brown is restored to the establishment with precedence next below Capt. J. J. Aitken. Dated May 18.

May 21.

TERRITORIAL FORCE. ARMY VETERINARY CORPS.

Lieut. (Hon. Vet. Lieut. in the Army) H. G. Westgate resigns his commission. Dated May 22.

Maj. H. M. Lennox Conyngham arrived from India on six months leave of absence on 13th inst.

Capt. E. Brown has joined at Woolwich for duty on being restored to the establishment.

Capt. W. J. Dale has been transferred from Shorncliffe to Windsor for temporary duty with the 1st Life Guards.

Lieut.-Col. E. Taylor, Inspecting Veterinary Officer Central Circle, arrived from India on 9th inst., on four months and fourteen days leave.

EXTRACTS FROM STATISTICS OF RUSSIAN VETERINARY MILITARY SERVICE FOR 1909.

The mean strength was 187,957 horses, and of which 71,370 were treated in hospital. Of these 103% died, and 22% were destroyed. The above only includes the actual sick treated in hospital, a large number of cases were treated regimentally, and of these 46% died.

There were 326 cases of glanders; anthrax caused 209 deaths out of 221 attacked; 12,883 horses were vaccinated against anthrax, and one died from the operation.

There were 1627 cases of influenza, and 1457 of pleuropneumonia.

Personal.

Our readers will remember Mr. Leach's serious motor car accident. In addition to a dislocated femur there was a grave complication in the form of injury to the sciatic nerve. Mr. Leach is now able to get about again, the nervous control is becoming gradually more marked, and his medical advisers hope that in a short time he will have regained his strength and activity.

OBITUARY.

JOHN ANDERSON, M.R.C.V.S., Indian Veterinary Service—retired. Graduated, Lond: et Edin: Dec. 1859.

We regret to announce the death of Col. John Anderson, which occurred at his residence in Byculla yesterday (May 1st) after a short illness. Col. Anderson, who had been in this country for nearly forty years, was particularly known in this presidency and other parts of India in sporting circles, and at one time kept large training establishments at Poona and Bombay, his patrons being gentlemen of high standing connected with the Turf. His services were requisitioned by the Bombay Tramway Company when there was an outbreak of surra amongst their horses, and the successful way in which

he dealt with the disease earned him the thanks of the Government. He leaves a widow, in Europe, and several sons and daughters, one son being Capt. M. H. Anderson of the 33rd Bengal (Queen's Own) Light Cavalry, stationed at Secunderabad, and another who is a Police Superintendent at Mombassa, British East Africa.

Col. Anderson was buried at the Sewri Cemetery with full military honours. The funeral cortège consisted of a party of 200 men, rank and file, of the Royal Warwickshire Regiment with band and drums, who met the procession at the Elphinstone Road station, having come from Colaba by train. At the cemetery were many of the late Col. Anderson's friends. The coffin was covered with the Union Jack, and embedded in wreaths and crosses.

After the funeral service, three volleys were fired, the buglers sounding the Last Post. So passed away another old resident of Bombay.—*The Advocate of India*.

Mr. J. Crawford, Bombay, to whom we are indebted for the foregoing, writing under date May 3rd, adds:—

"I would say, in addition, that I think the profession has suffered a great loss by the death of Col. Anderson, who was a venerable, kindly old gentleman of the old class, and one of the most popular members of the profession that has ever been in India."

THOMAS FLETCHER, M.R.C.V.S., Scarborough.

Lond: May, 1855.

Mr. Thomas Fletcher, well known in Sheffield and district for a long period prior to his retirement ten years ago, died at his residence, 46, Westbourne Park, Scarborough, on Wednesday, May 15th. Mr. Fletcher, who was 83 years old, was a native of Newborough, near Peterborough, and after graduating in 1855, practised in Lincoln, and subsequently at Bath. He came to Sheffield in 1868, and established a practice in Ellin Street. Mr. Fletcher took a prominent place in his profession, and was for some years president of the Yorkshire Veterinary Surgeons' Association. He was very well known amongst the farmers in the neighbourhood of Sheffield, and highly respected. In 1891 he extended his practice to Hillsborough, and devoted himself to that branch, leaving his Ellin Street practice in the hands of his son, Mr. T. C. Fletcher. Mr. Fletcher, senr., continued at Hillsborough until 1902, when he retired, and went to live at Scarborough.

He leaves a widow, five sons, and one daughter. His eldest son is Dr. H. P. Fletcher, J.P., of Dronfield, and his second son is Mr. William Fletcher, manager of the Sheffield Billposting Company. Besides Mr. T. C. Fletcher, another son—Mr. Walter Fletcher—is a veterinary surgeon, and practices at Wrexham. The funeral took place at Scarborough on Saturday, 18th.

WILLIAM TAVERNER, M.R.C.V.S., Newton Abbott, Devon
Lond: March, 1882.

Mr. Taverner had practised as veterinary surgeon in the district upwards of thirty years, and was well known and respected. Three years ago he had an attack of heart trouble, but recovered sufficiently to continue his work. A few days since he had a recurrent attack, which was not thought to be serious, but complications set in and he died on Monday, 20th inst. He leaves a widow and two children. Mr. Taverner was a member of the Newton Abbott Race Committee, and was hon. veterinary surgeon at the race meetings, and also for the Newton Fat Stock Annual Show. He also acted in a similar capacity at the Devon Show at Newton last year. He was formerly a noted breeder of foxterriers, but of late years had taken up horticulture and bowling as hobbies. He had little leisure, however, for he was devoted to his profession, and was an extremely busy man. Towards the end he was a great sufferer. Mr. Taverner was 53 years of age.

CORRESPONDENCE.

THE CLAIMS OF THE VETERINARY PROFESSION FOR RECOGNITION.

Sir,

Nobody appreciates true science more than I do. But I certainly think too much is made of those who have discovered a new bug, determined its species and studied its anatomy. Such an one would perhaps be admitted a Fellow of the Royal Society, receive the LL.D. of Oxford or Cambridge, or some other university, and when he died, have his remains interred in Westminster Abbey, or a bust erected to his memory in the Natural History Museum. On the contrary, if one discovered a cure for cancer after every one of the scientific investigators had failed, would he be received into any learned society or recognised as a scientist? No, his results would be so practical, easily adopted and readily understood.

Moorecroft, a graduate of the Alfort Veterinary School, introduced the neutrectomy operation; James Turner discovered the true seat and nature of the lameness now known as navicular disease, and defined its diagnosis; Gamgee prophesied the introduction of cattle plague and speedily advised the course of treatment it required; Chauveau demonstrated the particulate nature of virus; Chauveau and Gerlach demonstrated the ingestion theory of tuberculosis; Bang exploded the hereditary theory of tuberculosis, demonstrated the virus of epizootic abortion and the possibility of a preventive inoculation; Thomassen discovered a certain cure for actinomycosis; Smith and Kilborne worked out the part the insect played in the transmission of piroplasmiasis (five years before Ronald Ross did that of the mosquito), and many others have rendered an account of equally successful results in veterinary practice; but have any of them received that recognition which is justly their due?

Schmidt has done agriculture all over the world an everlasting service; he has unselfishly thrown open his discovery, which will be the means for all time of saving millions to agriculture. Before his time the loss of efficient dairy stock must have been enormous. Unlike contagious diseases, which can be eradicated, milk-fever will always be with us; but now, thanks to Schmidt, it is robbed of its terrors. His services to practical veterinary medicine and to agriculture are as relatively great as Jenner's were to human hygiene when he popularised preventive inoculation against small-pox. Jenner, however, did not discover the method but only defined it. Schmidt did discover his method, which is now so simple in application. Jenner's memory has been greatly honoured. Schmidt has not as yet been recognised in a manner suitable for the benefits conferred. Even the R.C.V.S. and the Royal Agricultural Society of England have not conferred any distinction upon him. Practical veterinary surgeons acknowledge their indebtedness to him, but only silently.

The veterinary profession is not recognised by the leading learned scientific societies in this country. There is not one of our members a Fellow of the Royal Society. The late Professor Coleman is the only one who has had that distinction bestowed upon him; but he was *persona grata*, and an intimate friend of many composing that most autocratic corporation.

Surely the day should not be far distant when some unselfish member of the profession could arise and press forward our claims for scientific distinction. At least a few of our number deserve it. We must not, however, be too selfishly narrow-minded, which is the canker-worm of social progress. Great minds are usually large-souled and modest, and recognise the merits of those below their own level. The opposite easily degenerate and look with disdain on men of other thought or other ways. All knowledge, skill, or action is only relative. A clever navvy is as relatively clever as a clever scientist or practitioner of any science or art.

"HIPPOCRATES."

VETERINARY CINEMATOGRAPHY.

Sir,

Mr. Hamilton Kirk's article on the above is a good one, and is not one to be dismissed as ridiculous. It would be welcomed by those students who have not had the chance or the means of seeing the routine of a busy everyday practice. The average student knows how to handle the various domestic animals, but there are always exceptions to the rule. I have known of a M.R.C.V.S. who did not know how to pick up a horse's fore leg—this of course is an exceptional case. I think that Nos. 1—16, that Mr. Kirk quotes as subjects, are really well worth considering. No. 17 I am not in favour of. I am of opinion that in this case the student will recognise the poisonous plants and grasses when he actually sees them growing in nature far better than if thrown on a screen, and if this were adopted the costly colour cinematography would be essential, if anything nearing perfection was to be realised. The only real method of learning botany to remember it is to study it from the actual living plants.

The amusement tableau could be eliminated altogether. Cub, hare, stag and fox hunts will not help the student in his educational routine, and after all, if amusement is wanted, all the subjects quoted are usually to be seen at the numerous halls with which London is studded.

One thing is quite evident, the student would learn as much, if not a great deal more, than he does at the present form of V.M.A. meetings, if this idea was adopted.

Mr. Kirk goes a bit too far when he suggests every V.M.A. meeting. It would have been better to have suggested every other V.M.A. meeting, leaving the ones in between for the usual essays and discussions. Yours faithfully,

R.V. Coll., Camden Town.

J. F. D. TUTT.

Mr. Hamilton Kirk's article, which was probably suggested by a report in the daily papers about a month ago of some Medical meeting at which there was an exhibition of films depicting the early life of microbes, shows how little consideration he has bestowed on the subject. There certainly is a limit to such an enterprise, and that a narrow one—expense.

The three chief organs by which knowledge is gained are the ear, the eye, and the hand. I agree with him that the eye is better than the ear, but, when it comes to "handling" anything, *neither* of the first two is any good without the last. Does he wish us to imagine that, when a student has witnessed films showing how animals are managed under various circumstances, he is competent as regards the "practical side of the business."

In the medical profession the kind of animal to be treated is the same in the country as in the town, so the student can study everything in the town. Unfortunately, in our profession this is not the case. But, instead of the R.V.C. going to the expense of keeping animals under unusual conditions, surely it is better for the student to go into the country and study them in their natural surroundings.

The minimum time for a student to be at college is four years, and some are there much longer. If we reckon the total vacation for one year at 20 weeks, it gives the most "brainless" student at least 80 weeks in which to learn the practical country business. Certainly many a student who obtains his diploma is sadly lacking in practical knowledge, but this would be best remedied by a license to practise only to be issued to such as can show that they have had a certain minimum of experience under fully qualified practitioners. In other words "Compulsory Pupilage."

As regards the pictures mentioned, most of them illustrate the text books on the various subjects—a fact that Mr. Kirk does not seem to have noticed. As a general rule the operator must be facing the part operated upon, and so the film would illustrate the movements of his posterior more than anything else. How could it be applied to the extraction of teeth? Would the camera be in the animal's mouth? The instruments used in dental operations can be seen at the manufacturers or in their catalogues.

In parturition cases, as soon as there was anything to photograph the chief part of the operation would be over. (12) Meat inspection can be best studied at a public slaughter-house. (13) "Improvised" means "on the spur of the moment," and is therefore a test of the student's ingenuity rather than of his memory. (14) Why not go to the railway depots and the docks (The numbers refer to Mr. Kirk's article).

From the amusement point of view, twelve out of the thirteen mentioned can be seen for the moderate outlay of 3d. at the different legitimate picture palaces. In consideration of the state of the finances of the R.V.C. it would be extremely foolish for it to go to the expense of providing a cheap cinematograph entertainment, and so run the risk of a resolution being passed by the managers of all places at which living pictures are shown requesting powers to prevent the R.V.C. underbidding them.

Mr. Kirk evidently has a preference for secondhand knowledge. Why not go to the annual athletic sports, race meetings, whippet races, etc.? Does he consider it would be too great a tax on his energy? This would explain why he wishes to learn his practical business sitting in a chair—doubtless dreaming of further schemes of endless scope for reducing the students' manual labour to a minimum.

—Yours truly,

ANOTHER CLASS "D" STUDENT.

R.V. Coll. May 23.

Sir,

I have read with interest and amusement Mr. Hamilton Kirk's advocacy of the cinematograph as a teaching medium. Mr. Kirk is young, and enthusiastic, and on both scores he has my admiration. But in the matter of his arguments we must agree to differ—at least for the present. Person-

ally, I look upon all such "aids" as being of the nature of cram, and therefore as a mischief rather than a blessing. I have put in my half century, and I am drawing towards the end of my working days, but I have still a tolerably clear recollection of my first steps from the protection of my teachers to "going on my own"—how helpless and hopeless I felt until I had done enough to be able to bring into use the knowledge which I had previously acquired.

A man who has gained some amount of dexterity by practice, and is not yet case-hardened in the belief of his own superior skill, may well benefit by seeing a more skilful operator at work. For the neophyte there is less to be gained in this way. Surgical demonstrations are not rare at our Society meetings, but if there are twenty men present, how many of these can see sufficient of the details to get the whole of the information offered? Perhaps four or five; probably not more than two. How many serious operations are there which will give us all the information we want through the film on the cinematograph?

No. The man who means to become a surgeon *must do the operations*, then he can begin to compare his work with that of other men, to select and to reject, to improve and to invent. Lectures, text-books, cinematographs, demonstrations even, are little more than spoon-feeding.—Yours faithfully,

SOUTH COUNTRY.

PRACTICES FOR DISPOSAL

GOOD AGRICULTURAL PRACTICE returning about £600 per annum. Estab. 30 years. House contains 2 reception, 4 bedrooms, etc., garden about one acre, good stabling, etc., situated in Eastern County. The practice and freehold property will be sold complete for £1150. Easy terms can be managed. Quote No. 13 V.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains: reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

PURCHASERS are requested to send full particulars of their requirements as we have a number of practices and partnerships for sale which have not been advertised.

Hon. Sec. & Treas.

Practice

SPLENDID OPENING in large district for young energetic and fully qualified Veterinary Surgeon. Practice bringing in £250 per annum, with scope for large extension, to be had gratis. Supported by the local Farmers' Association. Local County Council Appointment at present vacant. Apply to GEO. K. CHARLESWORTH, Solicitor, Settle. Clerk to the Settle Ingleton and Bentham Districts Farmers' Association.

To Veterinary Surgeons

WIDOW of M.R.C.V.S. requires post as canine nurse, dispenser, or clerk. Previous experience. Address, 1066 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

CLASS C student desires situation as dispenser, etc., during summer vacation. Board in return for services. Address, 1065 V.R., 20 Fulham Road, S.W.

To Veterinary Surgeons

M.R.C.V.S., 38, thoroughly experienced in all classes of practice, wishes to make headquarters with a V.S. who he can assist or manage for during the intervals of taking locums this summer. Excellent references. Address, 1069 V.R., 20 Fulham Road, London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,

Boscombe Park,
Bournemouth.

Locum

THOS. DRINKWATER, M.R.C.V.S.

The Beeches, New Mills,
Near Stockport.

At liberty June 1st.

Locum Tenens

L. A. F. DAWSON, M.R.C.V.S.,

Address:

The Cottage, Belton,
Uppingham.

Telephone: No. 2, Belton.

Locum Wanted

EXPERIENCED qualified gentleman wanted to act as locum in a small sea-side practice, from July 1st to 14th, and again from July 28th to Aug. 12th. Terms moderate, reliable references required. Address, 1067 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

VETERINARY Surgeon with an old established practice in a good hunting and sporting neighbourhood, is desirous of meeting with a practical qualified gentleman with view to partnership and ultimate succession. Terms could be arranged. Address, 1068 V.R. 20 Fulham Road, London, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

R.V.C. Annual Athletic Sports

THE Sports will be held at the Tufnell Park Athletic Ground, on Wednesday, June 12th, at 2 p.m. All members of the profession and their friends are cordially invited. Tickets for admission (free) may be had from E. BRAYLEY REYNOLDS, Hon. Sec., R.V. Coll., Camden Town.

Assistantship

M.R.C.V.S., experienced and practical, seeks assistantship, permanency, or locum. Good references. Address, 1061 V.R., 20 Fulham Road, London, S.W.

Instruments

FOR SALE. Farmer Miles' ecraseur with spare chain 30/-, also Dewar's ecraseur 45/-. Both instruments guaranteed perfect order. Owner accepted appointment. Address, 1064 V.R., 20 Fulham Road, London, S.W.

For Sale

OLD established suburban practice, chiefly canine. Convenient premises. Average returns £1000. Open to every investigation. Satisfactory reasons for disposal. Address, 6106 V.R., 20 Fulham Road, S.W.

Wanted

LOCUM from 14th June for about three weeks. Qualified man or practical D student. Address, 7106 V.R., 20 Fulham Road, London, S.W.

Wanted at Once

BY class D student (recently rejected) post as assistant in mixed or country practice. Address, "Spavin," Royal Dick Veterinary College, Edinburgh.

As Manager or Assistant

M.R.C.V.S. desires engagement. Extensive experience city, and forge. Highest references. Address, 1062 V.R., 20 Fulham Road, S.W.

Wanted

BY experienced veterinary surgeon a well established town, or town and country practice, doing £700 or more, cash settlement. Particulars in confidence to 1063 V.R., 20 Fulham Road, London, S.W.

Wanted for July

SOUND practice, £250-£300. Yorks, Northern Counties preferred, or smaller where good unopposed radius for increase. House, stable, etc. Full particulars. Address, 5106 V.R., 20 Fulham Road, London, S.W.

Wanted Immediately

ASSISTANT, fully qualified, abstainer, to manage branch practice (town and country) cycle, references and terms to live out. Usual bond. Address, 3063 V.R., 20 Fulham Road, London, S.W.

Partner Wanted.

PRACTICAL qualified partner in a large horse and dog practice on the South Coast. Premium for half-share £300. Easy payments might be arranged. References given and required. Open to full investigation. Address, 2052 V.R., 20 Fulham Road, London, S.W.

Genuine Country Practice

IN Western county for immediate disposal through ill-health, suit young energetic man. Price very moderate to quick buyer. Particulars in confidence to intending purchaser. Address, 1052 V.R., 20 Fulham Road, London, S.W.

As Assistant or Locum

VETERINARY surgeon desires permanency in good class country practice. Experienced, bloodstock, cattle, reliable, hard worker, used to taking charge, good obstetrician, horseman, single, 35, excellent references. Address, 5038 V.R. 20 Fulham Rd., London, S.W.

To Vendors.

WANTED Veterinary Practices and Partnerships. Surgeons wishing to sell the whole or a share of their practices are invited to communicate with Messrs. Peacock & Hadley, Veterinary Transfer Agents, 19, Craven Street, Strand, W.C., who will be pleased to introduce likely purchasers. No charge whatever made unless a sale be effected.

Assistant or Locum

CLASS D student (Xmas) served 3 years pupilage, requires situation. Excellent references. Town and country practice. "Nuclein," Dick's College, Edinburgh

Chlorodyne

CHINOSOL

Active Antiseptic,
Strong Deodorant,
Powerful Germicide.

Practical experience for years past proves that Chinosol in solution or ointment readily penetrates diseased tissue, thoroughly cleanses and keeps healthy all kinds of wounds, favours granulation and speedy healing, mostly without a scar, and promotes the growth of hair. Chinosol is supplied in

POWDER.

CHINOSOL PURE POWDER for therapeutical preparations used *INTERNALLY*.

CHINOSOL VETERINARY POWDER for lotions, ointments, etc., for *EXTERNAL* use.

CHINOSOL CRUDE GRANULAR FORM } for prompt production of disinfecting fluids for odourless disinfection.
CHINOSOL CRUDE POWDER F }

CHINOSOL SPRINKLING POWDERS for disinfecting and deodorizing stables, sheds, styes, kennels, fowl-houses, etc.

Also *ANTISEPTIC DRESSINGS, OINTMENTS, SOAPS, PESSARIES, CHINOSOL BORACIC DUSTING POWDER VETERINARY EQUIPMENT*, etc.

Write for full Price List, also for *POCKET CIRCULAR* for *VETERINARY PRACTICE* giving full particulars of treatment of *MILK FEVER, ABORTION, INFECTIOUS VAGINAL CATARRH* in *COWS*, and a great number of approved formulae.

NOTE.—Buyers of our preparations should in their own interest insist in receiving *ORIGINAL PACKAGES* bearing our trade mark with name and address of the Company and full directions inside, they should reject all packages not answering above description *AS NOT GENUINE* and inform us when such are offered.

Sold by Messrs. **Hewlett & Son, Ltd., London;** **Willows, Francis & Co., London;**
Wyleys, Ltd., Coventry. **Woolley & Co. Ltd., Manchester.**

And all *WHOLESALE CHEMISTS* dealing in *VETERINARY MEDICINES*.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1247.

JUNE 1, 1912

VOL. XXIV.

THE IMPORTANCE OF THE REGISTER.

This week we publish some police court proceedings strikingly illustrative of a truth which not a few veterinary surgeons somehow still persist in ignoring, viz., the supreme importance of the Register as evidence of membership of our profession. A witness's allegations of previous qualification count for little if the current Register is produced and his name is absent from it. Neither would the production of a diploma be of avail—there is no mention of a diploma in the Veterinary Surgeons' Act of 1881, which gave the Register its present authority. Section 9 of the Act reads as follows: "A copy of the Register of Veterinary Surgeons for the time being purporting to be printed and published in pursuance of this Act shall be evidence in all cases (until the contrary be made to appear) that the persons therein named are on the Register of Veterinary Surgeons; and the absence of the name of any person from such copy shall be evidence (until the contrary be made to appear) that such person is not on the Register: Provided that in the case of any person whose name does not appear in such copy a certified copy under the hand of the Registrar of the entry of the name of such person in the said register shall be evidence that such person is on the said register." The last sentence merely safeguards men whose names have very recently been placed or replaced upon the Register. The preceding one establishes the authority of the Register upon the qualifications of any veterinary witness. The case we report is one instance of what may happen to any member who neglects to inform the Registrar of his whereabouts. No doubt the consequences of such neglect may be very unpleasant and serious; but in every case they might have been avoided so easily that it is impossible to feel much sympathy for men who incur them.

FEES OF VETERINARY INSPECTORS.

Early this month, we alluded to the South-Eastern V.M.A.'s attempt to improve the fees of veterinary inspectors in Kent. The result of that attempt will be worth watching. At the Society's recent meeting, reported in our last issue, a revised scale of fees was agreed upon, which a deputation was appointed to lay before the County Council.

The movement may be wholly or only partially successful; but one point should be remembered—whatever measure of success it does gain will be largely, if not altogether due to combination. Veterinary inspectors in other counties might well make careful comparison of the Kentish conditions with their own, with a view to possible action upon the same lines.

SUBACUTE OBSTRUCTION OF THE PELVIC FLEXURE.

I am led to record this case because of its comparative rarity in the particular class of animal of which this note was the subject. So eminent an authority on colic as Mr. H. Caulton Reeks remarks "I have not yet met with a case in a nag animal."

History. The animal in question was an aged thoroughbred mare, the private charger of an officer. Had been kept in the stable for a few days previous to the attack, on account of some slight indisposition. She had been fed on oats, bran, and hay in the usual quantities.

The animal was taken ill at 11 a.m. on the 19th with dull pains, she was slightly tympanitic, and occasionally passed small quantities of faeces. She received—R Ol. tereb. $\mathfrak{z}\text{i}$., Ol. lini. Oi. Later, Chloral hydrate $\mathfrak{z}\text{i}$. was given, and as no progress was made I was called to see her at 1.30 p.m. on the 19th.

At this time she was dull, occasionally walking round the box, then lying down fully stretched, but showing no symptoms of acute pain. Pulse full and regular. Temperature normal. Membranes a good colour, not injected. On exploration, the rectum was found ballooned, and a very little way inside was a large mass filling up almost the whole of the pelvic cavity—undoubtedly an impaction of the pelvic flexure of the colon.

I tried to give the mare an intestinal irrigation with the hose pipe, but she would have none of this. Administered in bolus R P. amm. carb. $\mathfrak{z}\text{ii}$., P. nucis vom. $\mathfrak{z}\text{iv}$. Later, when the animal was down we succeeded in throwing up several buckets of water into the bowel with a Read's pump. This was not retained, but was not violently expelled. Result—a few pellets of dung.

3.20 p.m. Gave R Am. carb. $\mathfrak{z}\text{i}$. (bolus). Cold water enema as before, no result.

5.45 p.m. Injected subcutaneously Eserine 1 gr., one small motion, fluid faeces. This was followed up with a cold water enema, no result; emptied bladder with catheter.

6.45 p.m. Administered—

R	Spts. ammon. aromat.	$\mathfrak{z}\text{ii}$.
	Tinct. nucis vom.	$\mathfrak{z}\text{iv}$.
	Ol. tereb.	$\mathfrak{z}\text{ii}$.
	Ol. lini	Oj.

Long intervals of apparent comfort, starting up periodically, and looking at flank; gave another enema—several buckets as before. Very little result. Found the impaction very slightly softer.

8 p.m. Injected Eserine, 1 grain. Very much flatus, otherwise little result. More enemas; this

time the water was hot, and the animal seemed very comforted by its injection. Result, a little fluid fæces.

10.20. I had been away since 8.45. Long comfortable periods, with occasional restlessness was reported. Pulse good, membranes unaltered. Gave R. Am. carb. $\mathfrak{z}\text{ii}$., P. nucis vom. $\mathfrak{z}\text{iv}$. in bolus.

20th., 12.20 a.m. Hot water enemas given. Passage of considerable flatus. No fæces. Passed catheter, micturition was completed by animal itself. The greater part of the bowel contents were in a liquid state by this time and could be "squelched" by pressure in the flank. The abdomen was massaged. The mass in the rectum is now withdrawn somewhat, and is decidedly softer. Contents of pelvic flexure could be kneaded with the fist. The mare took a drink of water.

Administered Am. carb. $\mathfrak{z}\text{i}$. (bolus). The animal lay down and scarcely moved for an hour.

3.20 a.m. More hot water enemas—five buckets. One was struck with the apparent relief of the animal during the injection. The hand in the rectum was now able to push the mass on, right into the abdominal cavity to freely handle and knead it. The animal was standing, and did not resent this in the case. Following, long quiet periods only broken by the expulsion of large volumes of flatus.

5.45 a.m. Administered Aloes $\mathfrak{z}\text{iv}$. (bolus). Having been with the animal sixteen hours or so I then left with instructions for hot enemas, etc., and to administer Am. carb. $\mathfrak{z}\text{i}$., nux vom. $\mathfrak{z}\text{iv}$. at 11.30 a.m.

3 p.m. I saw the mare again, good pulse, membranes very little altered, no rise of temperature, a little restless sometimes, usually very quiet and dull.

4.15 p.m. Administered Ether $\mathfrak{z}\text{ijss}$.

6 p.m. Condition unchanged. Left instructions with reference to enemas, etc.

21st. 9.30 a.m. Reported very quiet night, has not lain down at all. No motion of the bowels. Pulse is strong, membranes and temp. normal.

10 a.m. Had the mare walked out. Passed a large semi-solid motion.

12 noon. Passed a large motion. After this recovery was uninterrupted.

I consider recovery would have taken place earlier had the aloes been administered before. That the stimulants were doing their work, and doing it well, was shown, however, at 12.20 a.m. q.v. on the first night.

J. R. HODGKINS, Capt. A.V.C.

Dundalk.

SADDLES.

The recent article and illustration of a saddle devised by Major Eassie, A.V.C. to remove the possibility of saddle galls has undoubtedly given rise to much interest.

The horse was first driven in a sort of curriole harness in pairs, in front of a springless two-wheeled chariot, which afforded a very uncertain position for the charioteer.

The Libyans, a fierce tribe inhabiting Northern

Africa, seem to have been the first in the then known world to discover that they could control the horse better from his own back than from their precarious perch in the chariot, and they forthwith became the first cavalry of which we have record.

Some, however, would award this honour to the Persians, who were a nation of horsemen, as it is known that Xerxes, employed an immense body of cavalry at the invasion of Greece. The Sagartians, a nomad tribe, who are said to have understood and practised the use of the lasso, supplied 8,000 horsemen for the Persian army on this occasion. If one may judge from reproductions from stone and papyrus, the first saddles were merely a form of saddle cloth. The cavalymen would quickly learn to fold the cloth thin over the spine and thick immediately on each side of it, so as to prevent pressure on the horse's spine, or injury to the end of the rider's backbone, because in all ages and in every country, the main principle of saddle construction has always been and must remain the same: to introduce a medium between the horse and his burden (it does not matter if the burden be a horseman or goods) whereby the weight of the latter may be transferred to the horse and distributed so as to cause the smallest amount of inconvenience or injury to either. This applies also to harness, pads, rollers, surcingle, and anything bearing weight that crosses the back of a horse.

Now the difficulty lies in the application of this principle, because the back of the horse is irregular in shape and not well adapted for continuous weight carrying. A considerable part, the withers and spine, are so sensitive that very little pressure or friction may cause such injury as to incapacitate the horse from service while the injury lasts, to say nothing of the pain endured by the horse.

The first essential then in all saddle construction, although of a negative character, is vital, and it is that no weight or pressure should be allowed to bear on the withers or spine for a space approximating in front at the wither 3in. from each side of the centre line, and similarly 1½in. at the short ribs behind according to the shape of the horse.

The only part of the horse's back capable of continuous weight-carrying lie immediately outside of, and away from the space mentioned, so far as the configuration of the horse's back denotes weight-bearing capacity, between the blade bones in front and the short ribs behind. Within these limits, the greater distribution of weight over as large a surface as possible the better for the horse. The exception to this rule is in short distance racing only, where it has been found that the best results in speed are obtained by concentrating weight well forward, in the style of seat practised by Tod Sloan, the American jockey. The tissues here are not so sensitive, and a properly fitting saddle can be carried, bearing a rider's weight, day after day, without injury to the horse, given a certain amount of intelligence on the part of the rider. Continuous dead pressure anywhere will result in sores, because the circulation is thereby stopped, and if stopped long enough, injury and mortification will result. This applies to everything that lives. Therefore a good horseman

seizes every opportunity of dismounting, and when possible, also slackens the girths.

During the visit of the Indian Cavalry to this country at the time of the Queen Victoria Jubilee in 1897, it was noticed that they dismounted whenever possible, whereas our own Cavalry and mounted Police seemed to think it to be their duty to stick on until they became so cramped that they could hardly dismount.

It appears that in very early times saddles were built on saddle-trees in every country throughout the world, with the one notable exception, that of the South American Gaucho's saddle, which, for the work required of it, was almost perfect. Saddle trees are therefore essential except, perhaps, for very light weights and short spells of work, such as might be expected from exercise work only.

All saddle trees consists of four members, a front arch, a rear arch, and two side bars. The side bars should be shaped so as to coincide as nearly as possible with the curvature of the horse's back, making allowance for any stuffing or other medium to be placed between them and the horse. This medium should be no more than is necessary, because, as every horseman knows, the nearer he is to his horse the better his seat, and therefore the better his control of the animal. The arches which connect the side bars fore and aft should be strong enough to resist the tendency to open, which the wedge shape of the horse's back causes in wear, and they should be made so as to clear the withers and spine under every conceivable circumstance. This is the true essence of saddle-tree construction. With regard to the medium to be placed between the saddle tree and the horse's back, that is usually wool, in serge or leather linings, but other materials such as horse-hair or pulverised cork are frequently used successfully. Folded blankets or felt are excellent because of their evenness. No one article can be described as the best for every purpose under all circumstances, but the essential to aim at in every case is evenness of surface; softness of itself being of secondary importance, and a desirable quality mainly because it neutralizes defects and inequalities of fitting in the tree, and so assists in the more perfect distribution of weight.

One is struck by the remarkable resemblance between the saddles of countries so far apart as Mongolia, the Jordan, and Mexico. In all three, rawhide plays an important part in strengthening the tree, in place of plates and rivets. The shrinking power of this article during evaporation is almost beyond belief until tested.

The Arab saddle, the most picturesque of them all, has a high horn in front and a high cantle behind. The Mexican saddle bears a marked resemblance to it in that respect, and is almost equally beautiful, while more perfect for the work required for it. The Mexican uses the horn of his saddle for his lasso, round which he makes a turn with it, after having successfully secured the steer, and he then pays out as the strain comes. The Arab does not know the use of the lasso, although it is stated that its use is not only known but practised in some parts of our Indian Empire.

The Arabs probably obtained their first knowledge of horsemanship from an earlier civilisation in the East. They improved on their gear, and took it with them to the West early in the seventh century, when they conquered the Moors and Berbers of Mauretania. When the Moors in their turn conquered Spain early in the eighth century they took their horses and saddles with them, and the Spaniards again took them to Mexico when they in turn conquered that country in the 16th century.

An examination of the Arab bit as it is found in the Soudan, Nigeria, and Morocco as compared with the native Mexican bit would seem to conclusively prove its correctness, as they are different from any other bits in the world; while the peculiar curb shows that they are unmistakably the same family. Nor is this persistence of type so very strange when we consider that in the East ploughing is yet done in the very earliest primitive fashion.

That saddles occupied a much higher position in the economy of the State, relatively, in older times than they do to-day is well known. Without the aid of the saddle Alexander could not very well have conducted his campaign with such success as followed his arms, nor could the Roman Eagles have flown so far.

The saddle invented by Major Eassie is said "to protect the back in such a way that horses that are even suffering from injuries may continue at work without retarding the healing of the part." As it was observed at the time of the illustration and article, by the Editor of this Journal, it is most ingenious, and let us hope that it will be an infallible preventive of saddle injuries, that are of more concern to Cavalry than any other thing.

J. F. D. TUTT, Class B.

R.V.C., Camden Town, N.W.

SOUTHERN COUNTIES VETERINARY SOCIETY.

The thirty-first annual meeting was held on Tuesday the 14th inst., at the Royal York Hotel, Brighton, when the President, Mr. W. Hunting, was in the chair, and the others who signed the attendance book included Messrs. A. H. Archer, Southsea; J. T. Angwin, Arndel; W. Burt, junr., Brighton; G. W. Bloxsome, G. H. Livesey, Hove; J. B. Dier, F. Marks, East Grinstead; J. H. Lockwood, Brighton; R. Roberts, Tunbridge Wells; W. Shipley, Great Yarmouth; P. J. Simpson, Maidenhead; S. H. Slocock, Hounslow; F. G. Samson, Mitcham; H. Smith, and J. Alex. Todd, Hon. Sec., Worthing, together with Mr. H. E. Brookman and Mr. F. Hunting (visitors).

On the proposition of Mr. Slocock, seconded by Mr. Roberts, the minutes of the last meeting as published in *The Veterinary Record*, were taken as read and confirmed.

The HON. SECRETARY announced that apologies and expressions of regret at inability to attend had been received from Major General Fred Smith, Professors F. Hobday and G. H. Wooldridge, London, and Messrs. R. Burt, E. Whitley Baker, A. L. Butters, W. Caudwell, W. Coveney, W. A. DellaGana, E. R. Harding, H. H. Jeffries, J. B. Martin, P. Perkins, G. Parr, C. Pack, H. Redford, C. Roberts, C. H. Spurgeon, F. T. Walder, and A. Whicher.

CORRESPONDENCE.

The HON. SECRETARY submitted a letter from Mr. A. H. Archer, enclosing copies of two letters which he had received from the Scientific Department of the H. K. Mudford Co., Philadelphia, relative to the paper which he read at a recent meeting of the Society on the Causes of Milk Fever. Mr. Archer wrote that he thought the fact that their puny efforts sometimes exercised much more influence and became spread over a wider area than they anticipated or realised, might be both gratifying to the members of the Society and also act as a stimulus to further effort.

Mr. ARCHER remarked that since he forwarded these two letters to Mr. Todd he had received two or three further communications on the same subject, and also a copy of the *American Veterinary Review*.

A letter was read from Mr. T. Faithfull Davies, calling attention to an International Congress on Comparative Pathology which would be held at Paris in October next.

Mr. William Shipley, of Great Yarmouth, had written a letter appealing for support for the Victoria Benevolent Fund, but the President suggested that inasmuch as Mr. Shipley was present at the meeting, he could not do better than invite him to amplify the contents of his written communication.

Mr. SHIPLEY, in responding to this invitation, said that he thanked them very much for the opportunity they had afforded him of saying a word for this deserving fund. It was only recently that he had been appointed Secretary, and on going through the books he had been very much surprised to see how few subscribers they had got in the Southern Counties. Their Society had been very good in voting them a subscription every year, but he was rather afraid that subscription had been the means of stopping a lot of individual effort, because he found they only had four subscribers in Sussex, four in Surrey, and four in Kent, while Hampshire did not appear to give them a single one. It was pitiful the amount of distress which existed and which ought to receive proper recognition at the hands of the profession. He was pleased to say they were slowly increasing their income and last year it amounted to about £180, with which they were relieving twelve pensioners, but this was not nearly what they ought to have as a Society if they were to deal with all the calls that were made upon them. At the present time they had one old practitioner living in the Southern Counties who would be practically destitute if it were not for the little assistance this Society was giving him until such time and the probability of an old age pension. He had also had the widow of another veterinary surgeon in the Southern Counties recently appealing to him, and who they had been unable to help for the simple reason that they had not got the funds. What he would like to see was the receipt of a sufficient income every year to give cases like this at least 10s. a week, and surely that was little enough for a widow with five or six children, or a man whose health had broken down in practice. He felt certain that if they could only realise the amount of distress which existed they would one and all willingly become annual subscribers. Their present income as he had stated was about £180 a year, but they wanted at least £380. There was another thing he would like them to do, and that was if any of them knew of any deserving cases they would bring them to the notice of the Society, although he was afraid that until their income increased they would not be able to do much more than they were now doing.

Mr. LIVESEY asked if Mr. Shipley could tell them how much of the Society's income, if any, was derived from investments.

Mr. SHIPLEY replied that their income from investment was £57 a year, but they felt that they ought to

carry on their work on a permanent subscription list, leaving the dividends or interest from any investments they might have free for meeting any special cases. For instance, only recently they had a case of a widow in the West of England who was left with an income of about £50 a year derived from property, but the Sanitary authorities stepped in and demanded alterations, and other work which swallowed up the whole of that income for one year, and they had to make the woman an immediate grant.

The PRESIDENT remarked that he was sure Mr. Shipley's appeal required no words from himself to commend it to them, and he hoped he would get several more subscribers.

CONGRESS OF THE R.S.I.

On the proposition of Mr. Roberts, seconded by Mr. Slocock, it was decided that Mr. Archer should attend as representative of the Society, and that he should be offered a sum not exceeding four guineas towards his expenses.

Mr. ARCHER, in acknowledging his appointment, remarked that it would give him great pleasure to attend as their representative, and he would do his best to make it as profitable as possible for the Society from an intellectual point of view.

Mr. ROGER DE COVERLEY MOORE, of Fareham, was proposed for election as a member at the next meeting by Mr. Archer and seconded by Mr. Roberts.

HON. SECRETARY'S REPORT.

Four meetings of the Society have been held during the past year, namely, at Brighton on the 30th March; at Portsmouth on the 13th July; at Aldershot on the 28th September; and at London on the 6th December. The Attendance Book shows the following numbers: 12, 13, 23, and 21 respectively, or an average of 17.2 per meeting. The Aldershot meeting was rendered particularly interesting by the kindness of the General Officer Commanding in Chief (Aldershot Command) in affording an opportunity for the inspection of the Army Veterinary School, and the members and visitors were also entertained by Col. E. H. Hazelton and Staff to tea. The thanks of the Society, too, due to Mr. Gerald Bloxsome for contributing a paper on "Some Debatable Points of Unsoundness in Horses," to Mr. A. H. Archer for a paper on "Milk Fever," and to Col. L. J. Blenkinsop, D.S.O., A.V.S. (P.V.O. Southern Command) on "The Possibility of Preventing the Present Conflict of Veterinary Evidence in Police Court Cases," each of which gave rise to a most interesting and instructive discussion. The annual dinner of the Society was held at the Holborn Restaurant, London, on Wednesday, December 6th, and was attended by a company of about twenty. The Society now comprises 75 members, including officers and honorary associates, as compared with 73 twelve months ago. Four new members had been elected during the year, and for the third time in his eight years as Honorary Secretary an obituary list was happily absent, though he was sorry to have to report that they had lost two members (Mr. Porch and Mr. J. F. Simpson) by resignation.

The HON. SEC. reported that the Hon. Treasurer was unable to be present, but Mr. Baker had written him, giving him a rough outline of the financial position, and stating that a detailed statement would be forthcoming at the next meeting. The balance brought forward from the previous year was £41 0s. 7½d.; subscriptions had brought in £24 6s. The expenditure had been £29 6s., and they had a balance in hand remaining of £36 0s. 7½d. The expenditure included the sum of £12 to Messrs. Arnold for the set of dental instruments which had been acquired for the use of the members.

On the suggestion of the President, the adoption of the balance sheet was left over till the next meeting.

Mr. LIVESSEY moved the reception and adoption of the Hon. Secretary's report, and suggested that they should couple with the proposition their best thanks to Mr. Todd for his past services.

Mr. STUART: I should like to second that. Mr. Todd is one of the best secretaries we have ever had, and I hope he will continue with us for many years. (Applause).

Mr. ROBERTS wished to give the proposition his most hearty support.

The PRESIDENT said he should have liked to have seconded it himself, because he felt perfectly certain from his own experience of Mr. Todd and his work that he could not be replaced. (Applause).

Mr. TODD: Gentlemen, I can only say I am very much obliged to you.

ELECTION OF OFFICERS.

Mr. STUART said that he would like to propose the re-election as President of their old friend, Mr. Hunting. (App.) He had done very good work for them in the past, and although they had missed him from one or two of their meetings during the past year they all knew the cause of that, and they trusted his health would permit of their seeing a little more of him during the coming year. (Hear, hear). He really did not think at the present time they could find any man who would adorn the position so well as Mr. Hunting, and he was sure it would give the greatest pleasure to every one of their members if Mr. Hunting could see his way to take on the office for another year. (Applause). He would also like to take that opportunity of thanking him for his past work.

Mr. BURT had much pleasure in seconding this proposition. They had not seen as much of Mr. Hunting as they would have liked, and he thought he might at least give them the privilege of having him for their President again for another year. As they were aware, Mr. Hunting's health had not been of the best during the past year, and he had been too ill to attend on two or three of the occasions on which their meetings had been called, but they had suffered as much as he had by his absence, and they all hoped his health would be better during the coming year. (Applause). He was sure if Mr. Hunting would only consent to be their President again for another year they would benefit a great deal. (Applause).

Mr. HUNTING: It is very kind of you gentlemen, but it seems to me to be rather a curious position. As Mr. Burt has said, I have not attended half your meetings, and—

Mr. BURT: We know that was not your fault.

Mr. HUNTING: Well, would you accept it as a sort of atonement for past sins if I were to take it on again.

Mr. BURT: We should with pleasure.

Mr. STUART: Yes, and consider we were well repaid.

Mr. ROBERTS: I am sure we also hope you will have better health.

Mr. HUNTING: Well, I think you may take it as settled then. (App.)

Vice-Presidents.—Mr. J. T. ANGIN, of Arundel, was elected in the Place of Mr. W. Burt, who retired by rotation, on the proposition of Mr. Stuart, seconded by Mr. Samson, the other three Vice-Presidents, Messrs. G. H. Livesey, of Hove; C. Roberts, of Tunbridge Wells, and S. H. Slocock of Hounslow, were re-elected.

Hon. Sec.: Hon. Treas.—Mr. J. A. TODD as Hon. Sec., and Mr. E. WHITLEY BAKER, as Hon. Treasurer. These re-appointments were taken as a matter of course.

Executive Committee.—The President, Hon. Sec., and Treasurer, and Messrs. G. H. Livesey, C. Pack, R. F. Wall, and R. Roberts were again appointed on the motion of Mr. Burt, seconded by Mr. Stuart.

Place of next meeting.—The President reminded the members that Mr. Baker in his letter had suggested the desirability of a meeting being held at Salisbury.

Mr. STUART thought the President for the year had the call for the summer meeting, and suggested that if they went to Salisbury for the September meeting Mr. Baker and the other members in the west would be satisfied.

The PRESIDENT pointed out that it did not follow that he should choose London.

It was eventually decided on the the proposition of Mr. Burt, that the next meeting should be held on Thursday the 27th June, in London at Red Lion Square.

Mr. R. ROBERTS remarked that there was one matter which was not on the agenda, but which with the permission of the President, he should like to bring forward. They all knew the importance of getting good men on the Council who would support the Bill and all that belonged to it, and he should be glad if the members could be notified through their Secretary that Mr. Walter Burt was again standing for election. Last year, if they would remember, they took things a little too easy, with the result that Mr. Burt was displaced, but he had consented to stand again, and he hoped their members would make every effort this time to see that he got elected. His name had been put in early, so that he would get the benefit of the foreign vote, and he believed several of the English Societies would be willing to support his candidature. Personally, he was most anxious to see him back on the Council again, because he was a real hard worker, and held right views regarding the government of their profession.

Mr. STUART and Mr. Livesey heartily supported the suggestion of Mr. Roberts, and

Mr. SHIPLEY, as a fellow worker with Mr. Burt on the Council for a little while, remarked that the younger members of that body undoubtedly appreciated his presence there very much. He happened to know a little bit about electioneering in the veterinary profession, and he did not think they should spare any effort to bring Mr. Burt's candidature to the knowledge of the profession. As it was, they got far too many teachers from the schools and representatives of the Board of Agriculture and the Army Veterinary Department on their governing body, and they very much wanted a few more practical Provincial practitioners there. He thought they should all do their utmost to further Mr. Burt's candidature.

Mr. SLOCOCK also heartily supported what the previous speakers had said. He had only been on the Council a short time, but it had been long enough to know that there would not be a single member who would not be pleased to welcome their friend back again. Personally, he had come to regard Mr. Burt as one of the best workers they had had on the Council, and he hoped there would be no hesitation in returning him all right this time.

Mr. BURT in expressing his thanks for the kind wishes which had been expressed for his success, said that they might take it that if returned, as he hoped to be, he would do everything in his power to advance the best interests of their profession. They had got to either stand or fall by it, and he was not the sort of man who, if it was possible to help it, would allow it to fall. If at any time he could do any good for their profession he was only too pleased, and he trusted that with their assistance he might be able to do some small amount of service for it on the Council once more. He did not wish for one moment to deprecate the work which the older men had done, but at the same time one was apt as he got old to get the idea that the present was good enough. They did not always recognise that there were younger men coming along, and that the present was not good enough for them. The status of their profession

at the present day was in his opinion not good enough, and if it was possible for them to improve it he thought they ought to do so. At all events, if it was his privilege to be elected to the Council again it would be his great aim to improve the status of the profession, because with an improved status there would come more money and better opportunities. (Applause).

The suggestion that the Hon. Secretary should notify all the members of Mr. Burt's candidature and ask them for their support on his behalf was unanimously agreed to, and it was further decided that copies of the letter should also be sent to the members of the Royal Counties, the Central, and the South Eastern Counties Associations.

SPECIMENS AND CASES OF INTEREST.

Mr. ANGIN submitted the off hind pastern bone, and also a photograph of the horse "Lark's Egg." This horse, he explained, fractured the off hind pastern on June 2nd, 1907; in April, 1908, it ran second in Lady Giffard's point-to-point races; it won the same race in the following year by twenty lengths from the previous year's winner; it broke down in training in March, 1910, and it was eventually shot on the 4th October, 1911.

Also a piece of a horseshoe nail which he had found in the Oesophagus of a mare. In this case he said the animal had been treated for gripes, and when he was called to the mare he found her in very severe pain, and he was unable to do more for her than ease the pain by giving her morphia. At first he suspected a ruptured stomach, but on making a post mortem examination he found the piece of nail had pierced the Oesophagus, making two distinct holes through it.

Mr. ROBERTS remarked that it was certainly very unusual for a horse with septic pleurisy to show colicky symptoms.

Mr. G. W. BLOXSON exhibited the bony stifle joint of a horse which had suffered from Gonitis.

The PRESIDENT remarked that just previous to the meeting Mr. Shipley had mentioned two or three interesting cases, and perhaps he would not mind repeating them for the benefit of the other members, as they seemed to be quite unique.

Mr. SHIPLEY explained that the cases their President had referred to were three or four cases in which horses had fallen into a bed of nettles. In one of the cases the horse fell while in the hunting field, and in another the animal broke through a fence and rolled over on to a bed of nettles, while the third case was one which was brought to his notice while waiting at a wayside station for a train. In all the cases the condition was very much the same, there was a general paralysis of that side or part of the animal which had fallen on the nettles, and at first he must say the symptoms were alarming, but after a time they went off, and the animals became all right again.

Mr. SMITH remarked that he had seen horses feeding on nettles and he had never seen any bad results.

Mr. BURT: The nettles were mixed with grass, I take it?

Mr. SLOCOCK: They will eat nettles when they have withered, but not when they are green. There is also another peculiarity about nettles which some of you may not have noticed. The little dwarf variety that stings very sharply do not sting a horse, whereas the ordinary variety will.

FURTHER NOTES ON JOHNE'S DISEASE IN CATTLE.

By JAS. T. ANGIN, M.R.C.V.S.

This Paper is written with the hope that my efforts may at least stimulate you to a good debate on a subject which of late years has been so prominently written and spoken about in most of our Veterinary Societies, and

in a large number of Agricultural Journals all over the Globe.

In July, 1907, I read a paper on this subject before the Southern Counties Veterinary Society, and ever since that time I have been working on this disease, and have accumulated a considerable amount of data which I intend to bring before you later as regards the clinical aspects of this disease, you will also see from the specimens before you that I have not neglected the Pathological and Bacteriological aspect either.

In practice one is always a little chary about bringing the latter side of the work too prominently before the public or one's clients, as I find not only the farmer but gentlemen whose intellectual powers one would hardly like to doubt, treat one's remarks with a certain amount of incredulity.

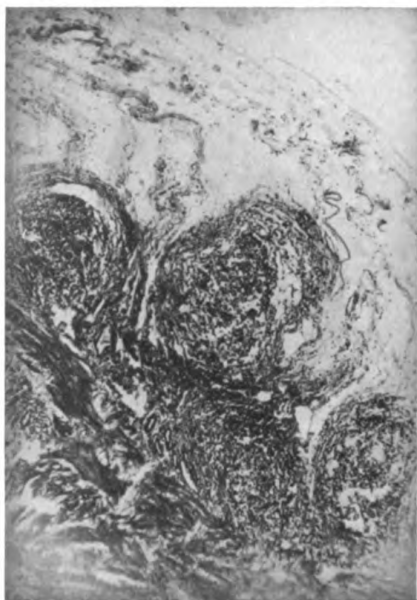

At the present day it is most essential that a practitioner should have a thorough knowledge of Pathology and Bacteriology and the various methods of applying the latter science as one of the chief aids to correct diagnosis of the numerous diseases one meets with in daily practice. I do not mean you to infer from this that we should attempt to turn ourselves into expert Pathologists, but we should not fail to use this means as a very sure aid to diagnosis, and when we have exhausted all our powers we may remember that we have gentlemen at the head of our Veterinary Schools, well-known Pathologists, who are only too willing to assist us and to correct us in our endeavours, however feeble they may be.

Coming to the subject of this paper, viz., Johne's disease, you are all probably aware of the origin of the name. If I remember correctly it was named by Sir John M'Fadyen, after Professor Johne, who was one of the original discoverers of the bacillus which is the cause of the disease.

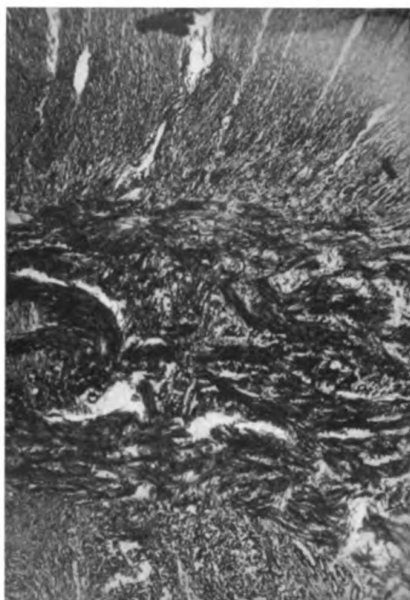

History and Symptoms.—The history of these cases is invariably the same. The animals do not thrive; they have a staring coat, an inexperienced eye can easily recognise that there is something wrong, and they can easily be detected when standing in the byre or with the herd among healthy animals. The affected animals may be feeding just as well as the healthy ones; for the appetite as a rule remains normal, and some cows will feed well, up to the last. In fact I have seen them when unable to stand from extreme emaciation still continue feeding; again in other cases one may get a varying appetite, but in the majority of cases feeding and rumination go on normally to the last. They always have a very persistent and fetid diarrhoea with a steady loss of condition, although in some cases this diarrhoea may vary in intensity. This depends on whether the animals are kept indoors and fed on dry foods, or turned out where they can get moist herbage to feed on. This diarrhoea has a most offensive odour. (Although Profs. Craig says he did not observe this in the cases brought before his notice. *V.R.* Sept. 25th, 1909). The discharge is of a very fluid nature and of a bubbly appearance; what could be described as air vesicles seem to form upon the surface of the faeces.

The period over which this diarrhoea may last without causing excessive emaciation varies according to how the cow is fed and treated. I have seen it last intermittently for eighteen months, in other cases I have seen a cow die after calving in six weeks. It has been observed in a great number of cases, and noted by other clinicians that cows the subjects of this disease, especially cows that have had three or four calves, are more inclined to waste away and die immediately after calving than at any other time. Mr. C. W. Townsend, F.R.C.V.S., in a paper on this subject before the Lincolnshire V.M.S. (*V.R.* June 26th, 1909, p. 870), also states that he has observed that some cows that are in a fair condition, or that show very little noticeable wasting, were practically reduced to skeletons within a month after calv-

ing. This rapid falling away is no doubt due to some systemic change at the time of parturition. I have known a cow the subject of this disease develop a severe attack of "Milk Fever" shortly after calving, she recovered from that but eventually succumbed to Johne's disease.

In advanced stages the eyes appear very sunken, due to wasting of the orbital tissues behind, but they maintain their brilliancy, and the animal usually has a very good dew on its muzzle. They are naturally hide-bound, due to loss of subcutaneous areolar tissue and fat, one never sees any local swellings in such places as the dew-lap,* inter maxillary space, or throat. They seldom have a cough, or no more than is usual in an ordinary healthy cow when feeding (for every cow I have ever seen has at some time or other greeted me with a cough).

Cows in this state are very difficult to get in calf, and I have one in my own shed now under observation regarding this very point, personally I think she is in calf, and diarrhoea is considerably abating. As a rule these cows are not worth keeping, for many reasons, not only that they rapidly lose their milk and are useless to the dairy, but they are no doubt the source of infection to others in the herd. One must bear in mind that the symptoms I have just described are not peculiar to this disease; I have here a report of a post mortem made on a Jersey heifer which showed nearly all the above symptoms, but on P.M. proved to be a case of parasitic abomasitis. This latter disease, with parasitic gastritis, tubercular enteritis, and intestinal troubles due to poisons, are some of the diseases which have similar symptoms, and they should always be borne in mind, when one is confronted with the foregoing history.

Post mortem Notes. 15th August, 1911.

Jersey Cow, six years old, from the Duke of Norfolk's dairy. The subject of Johne's disease and parasitic abomasitis. Slaughtered.

Very emaciated, barren, dry.

Before death, profuse diarrhoea. Lungs and lymphatic glands showed no tubercular lesions, submaxillary and other glands normal in size and free from nodules.

Liver. Not much enlarged but in an advanced state of schirrosis with enormously enlarged bile ducts, containing large numbers of "flukes" and granular gritty matter.

Spleen. Rather smaller than usual.

The fourth stomach showed a most peculiar condition of the mucous membrane; the normal folds of the mucous membrane being quite twice their size, and when the stomach was held up the membrane hung in a sac or bag-like condition from the walls, this being due to a large quantity of transparent, colourless, viscid fluid underneath the mucous membrane; there were a large number of milk white spots on its surface.

Mesenteric Glands slightly larger than normal, when cut into a quantity of milky fluid flowed from them, but this was not so pronounced as I have seen it in more advanced cases where emaciation is in its last stages.

The Caecum showed very slight thickening but in patches there were areas of petechiae with distinct extravasation of blood in the superficial layers of the epithelium.

Mucous membrane. The jejunum and duodenum showed the usual thickening and wrinkling of the tissues. In the ileum the mucous membrane showed, on the mucous surface, a condition best described as a cauliflower thickening, but not very much raised from

the surface. There was no ulceration to be found in any part of the alimentary tract.

Kidneys apparently normal and surrounded by a considerable quantity of adipose tissue.

The carcase after slaughtering soon set and was quite bright; the only grounds for condemning it as unfit for human food would be the emaciation.

Microscopical Examination.

Mesenteric glands. The Johne's B. appear in fair numbers, mostly in clumps, together with a round, acid fast object which the writer regards as most likely a spore; it is difficult to stain, it often appears as a Diplococcus with the near sides slightly flattened, making it like a bean. There are no crystals to be seen.

Small intestine. In all the slides made a large number of crystals are to be seen. They are 6 to 8 microns in length by 4 in breadth, oblongs and prisms. They polarise feebly, and evidently withstand the action of H_2SO_4 . They vary in shape and size. No Johne's B. are to be seen in any of the slides made, but a few non acidfast bacilli, most likely B. Septicus and B. Coli Communis appear. The cells are granular and uneven.

Sublumbar glands. Only traces of Johne's B. Quantities of non acidfast dots and crystals are to be seen.

Spleen, no organisms. It appears normal.

Abomasum. (a) Clear fluid. A very large number of columnar epithelial cells and a quantity of small oval bacilli appear, the bacilli are not acidfast. No crystals are to be seen. (b) Smear from white nodule. Quantities of a small non acidfast bacilli are to be seen and some very small round epithelial cells. (c) Scrapings from the mucous membrane revealed a large number of small worms, belonging to the species S. Convolutus.

Post mortem Notes.

Jersey heifer, 18 months old. Extremely emaciated.

Six weeks previously this heifer, though not scouring, was in fair condition, and was sent to bull. Shortly after a persistent diarrhoea set in, and the animal rapidly lost flesh, and had a very emaciated appearance. The animal was slaughtered on Oct. 22nd, 1911.

Thorax. All the organs appeared to be normal, and there were no signs of tuberculosis in any of the glands or carcase.

Abdomen. Nothing abnormal was visible.

Stomach. This organ when opened showed the peculiar appearance similar to the preceding case, the mucous membrane being covered with white spots and hanging in sac-like folds. Of course this condition is confined to the abomasum, the other portions of the stomach were normal, but did not contain large quantities of ingesta. The bowels contained a quantity of very fluid faeces, the mucous membrane was injected and red, and in places showing signs of petechiae.

Mesenteric glands. Normal.

Microscopic examination of viscera revealed no signs of Johne's bacilli, but from scrapings of the stomach large numbers of the S. Convolutus were found to be present.

I may state here that I was called in to see this heifer, and that the owner informed me that he was sure he knew the whole cause of the trouble, simply that she had been "over-bulled." I mention this simply to show what ignorance we have to contend with, and how old-fashioned ideas will be retained.

Another feature of this disease is the age of the animals attacked. One seldom sees it at all pronounced in animals under two years old, it is mostly seen in animals from three to eight years of age. I know of a herd at the present in which this disease is very prevalent, but the young stock, especially a bunch of young heifers due to calve in the spring, are looking as well

* In the Northampton Daily Chronicle a gentleman writing under the name of "Agricola," says: "In some cases they fettle under the jaw, others slobber their cud." Jan. 7th, 1911.

as anyone would wish to see them. How many of these, four years hence, I wonder, may develop this complaint?

DIAGNOSIS.

Clinical Diagnosis. This must be conducted on the lines of eliminating any possible doubt of any other disease being present. Failing that, one may rightly suspect John's disease, and then confirm this diagnosis with the aid of the microscope. One should not be too ready to condemn a cow for this disease just because she scours.

It is wise to take the temperature of the suspected case morning and night preparatory to the animal being tested with tuberculin. I have here a series of temperature charts taken over the period of a week from four different cases, and it is interesting to note that in three out of the four the temperature is markedly sub-normal, especially those with severe diarrhoea. It is wise to test all suspects with tuberculin, and I make this a regular practice.

No. III. Jersey cow, 5 years; severe diarrhoea all the week; feeding badly. Slaughtered March 21st.

No. IV. Jersey cow, 5 years; faeces not quite normal, but feeds well; has gained a little flesh. Slaughtered February, 1909.

I have never had the semblance of a reaction to tuberculin in a cow suffering from this trouble. I should very much like to know if any practitioner has ever found this to be otherwise. I hope to refer to this later under the heading of susceptibility. Personally, if I get no reaction I take it that there is no tuberculosis present, and as yet I have never been deceived; this I consider confirmed from the result of numerous post-mortems.

I have also had the milk from two pronounced cases analysed quantitatively by Dr. Lander, of the Royal Veterinary College.

These figures indicate that the samples are of a very good quality both as regards fats and soluble components (sugar and proteids).

	No. 1.	No. 2.
Specific gravity.	1034	1031
Fat	6.2	8.0
Solids not fat	10.8	9.6
Ash (mineral matter)	913	792

The faeces may be examined for the presence of worms, and as regards other diseases, one must rely on any history that may be forthcoming and on one's personal observation, and especially the latter.

Post-Mortem Appearances. On opening a carcass immediately after slaughter, one will observe nothing of an abnormal character. In carcasses that have not been bled the bowel may appear a little anæmic, abnormal thickening of the bowel wall may be detected by taking a loop between the finger and thumb. It is wise to remove the whole of the bowel, with the mesentery and its lymphatic glands, on a careful examination of the mucous membrane being made, one will observe a varying condition in the different parts of the bowel, one portion being often more affected than the other. Both the large and small are often very much thickened; the pyloric end of the small bowel usually does not show the lesions so markedly as the jejunum and ileum. The ileac portion is the most prominently thickened; here one's attention is attracted by the peculiar thickening of the mucous membrane, which, in an advanced stage, will be so much thickened as to represent the convolutions of the brain. This condition differs from the normal wrinkling in that on gently stretching the bowel these wrinkles do not disappear. Again, in the diseased condition one notices that the wrinkling is much more pronounced and the elevated ridges are much thicker, and are really permanent folds. The large intestine may be thickened in a similar fashion, though the ridges are wider apart and it does not present the convoluted appearance of the small intestine. The caecum often shows considerable numbers of hæmorrhagic patches which vary very much in size—from that of a threepenny piece to a shilling. There are never any signs of ulceration in any part of the gut. The mesenteric lymphatic glands are usually enlarged but to no very great extent, and often so slightly as to appear normal. On cutting into one of these glands one observes that it may be a little paler in colour than normal, and that an abnormal quantity of fluid runs out, of a slightly milky colour but very watery in constitution. With the exception of a very emaciated carcass—the absence of any quantity of adipose tissue, these are practically all the microscopic lesions visible at a post mortem, of course one does often come across other pathological conditions present, such as schirrotic liver from liver fluke, abnormal growths, echinococcus, etc.

Microscopical Diagnosis. This can easily be done in one's surgery. Carefully remove some of the largest mesenteric glands, also a small portion of each region of the small intestine, and two or more portions of the large intestine where the thickening is well marked. Wash these parts carefully and make scrapings in the usual way, details of which I will not burden you with. The bacilli are in many cases so unevenly distributed that unless many parts are examined there is a chance of missing them, but on the other hand, in some cases they are exceedingly numerous in every part.

Preparation of Slides.

Take suspected mesenteric glands and intestine, cut the gland and scrape cut surface with scalpel. Put a small piece of the scraping on a No. 1 or No. 2 cover, rub another cover over it, separate and allow to dry. Fix by passing over the flame of a spirit lamp or Bunsen burner a few times. Then stain in 1 "Soloid" Fuchsin (Basic), Absolute alcohol 3 c.c., 5% Aqueous carbolic acid 22 c.c.

Put a few drops on a cover and hold over spirit lamp till steam rises (do not let it boil), continue for 5 minutes. Wash in water, then decolorize in: H₂O. 75 c.c., H₂SO₄ 25 c.c., for two minutes. Now the stain will be removed from all but John's B. Wash in water, dry and counter-stain in:—Methylene blue, (Burroughs & Welcome) 1 tablet; H₂O. and Alcohol, each 7 c.c. for a few seconds (about 10) but be careful not to over-stain; wash in

water. Dry between filter paper, then in the air till quite dry. Mount in Xylol balsam.

Preparation of Sections.

Harden fresh Mesenteric glands, which have been cut in several pieces, in methylated spirit for a month, change the spirit several times. Take a slice about 1-6th in. thick in the direction you want the section and soak in water for 24 hours changing the water frequently, then transfer to a mixture of gum and loaf sugar, gum water 5 parts, sugar water 3 parts, for 24 hours. Take out and drain. Put on Microtome, cover with gum (no sugar) and freeze, cut sections. Transfer to water and wash away all traces of gum; stain in Carbol fuchsin as for smears. Decolorize in H_2O . 4 c.c. H_2SO_4 1 c.c. Wash in water. Dehydrate in absolute alcohol, clear in Clove oil, and mount in Xylol balsam.

Johne's bacilli may be stained by the Ehrlich-Weigert method if preferred, in which case proceed as for smears, but stain in: "Soloid" Gentian Violet, 0.1. Absolute alcohol, 7 c.c., freshly filtered aniline water, 63 c.c., put some in a watch glass and float prepared cover in it, warm till steam rises (do not boil) and continue for $\frac{1}{4}$ of an hour, wash in water and decolorize in HNO_3 1 c.c. H_2O 4 c.c. till the smears appear light green. Wash well in water and then counter-stain in: "Soloid" Bismark brown, 0.1 gm., water 14 c.c. for 5 minutes. Dry and mount in Xylol balsam. In this preparation Johne's B appear blue, or else brown.

Note—The Gentian Violet will only keep for about 24 hours.

Morphology.

The Bacillus of Johne is a small rod about 2 to 4 microns in length. It is slightly curved, and sometimes larger at one end, it is "banded" and when it is slightly out of focus looks like a dumbbell dark at each end and light in the middle. The bacilli stain readily with Ziehl-Neelson's and by the Ehrlich-Weigert method and are acid-fast and gram positive.

SUSCEPTIBILITY.

There is little doubt that some cattle have a greater susceptibility for this disease than others, and they rapidly succumb to the disease when once contracted. I am of opinion that some do eventually recover, but these never show the continuous diarrhoea for any long period, although they may have it intermittently. I know of a Jersey cow I was on the point of condemning six months ago, which is now practically well and sound. Of course this may not have been Johne's disease, but simply a verminous infection from which she has recovered. She did not react to tuberculin. The only thing is to have patience, keep the animal under continuous observation and await any further developments. Many animals no doubt have a natural immunity *under normal conditions* as in all other diseases. There is no breed of cattle immune, but I am of opinion that Jersey cows are as susceptible to this disease as any—similarly to the known fact that on the mainland they seem more prone to tuberculosis than in Jersey. On the other hand I have been given to understand that this disease is at present very prevalent in Jersey whereas tuberculosis is not.

METHODS OF INFECTION.

There is little room to doubt that the primary, and probably the only method is by deglutition, and that the infection is taken into the animal's system in the different foods, and in water. This naturally brings us to the questions: How long an animal takes to develop symptoms? How much infective material is necessary to cause the disease? What is the best course to take as regards infected areas to stop its further spread. Probably it is many months before an animal takes in sufficient infective matter to start the disease, and again a considerable period before the bacilli develop in such

numbers as to cause any clinical symptoms, this period may be put roughly from about eight to eighteen months, and from the time of undoubted clinical symptoms, with care and treatment life may be extended over another twelve months or more, but complications such as milk fever, or calving often considerably hasten the end.

INFECTED AREAS.

It is a well known fact that this disease may lie dormant on a farm for several years and then, for no apparent reason, break out and cause considerable loss to the farmer.

In October 1909 I was called to two Guernsey cows suffering from severe diarrhoea. I treated them in the usual way for scour without any beneficial result; I suspected Johne's disease. On the 22nd, I injected both cows with tuberculin, but neither reacted. As the animals steadily lost flesh I advised the slaughter of both, I had them removed from the farm to a slaughter-house, where I examined them, and had no difficulty in detecting the P.M. lesions, the microscope revealed the bacilli in large numbers. This farm is situated near the coast, and these cattle are kept on a certain portion and never shifted, they have three meadows over which they run these being, on the land side, surrounded by fallow; these meadows are never laid up for hay as owing to their conformation they would be very difficult to mow, the cows are fed on the usual food, roots, hay, oat straw, cake and oats during the winter, and turned out for a few hours during the day. I should also say that a large stack of ensilage is made every year and the cows are given a certain amount at each feed, but this is made from seeds and clovers especially grown for the purpose. No fresh animals have been imported into the herd, and only such heifer calves as are necessary are kept to maintain the numbers. There is no bull kept, but I have satisfied myself that the two bulls that these cows have been sent to are on farms where this trouble is not known, or, I should say, I have had no outbreak there of any kind during the last eight years.

My client on being questioned informed me that five years ago he had three cows showing exactly similar symptoms; and that as whatever they gave them did them no good, and as they looked like dying they were "got rid of." Personally, I blame the meadows, as during these years there must have been an enormous quantity of infective matter spread over them, and if no fresh infection had been imported the virus must have been able to sustain life there, and, when climatic conditions were favourable, to reproduce the disease in apparently healthy cows.

To disinfect pasture land, the only thing to be done is to give the meadows a rest, remove all cattle from them for several months, dress the surface with salt and lime, and see that the drainage is not neglected, for this latter is, I think, a most important point which is often overlooked. When these meadows are again fit for pasturage, I always advise grazing horses or sheep on them first, simply to keep the cows out of them as long as possible. All infected or suspected animals should be separated from the others, their faeces destroyed, or thoroughly disinfected, and never used for dressing pasture land, and I think it advisable not to put it on fallow.

Although little is actually known as to the resistance of this bacillus or its spores outside the animal body, one is led to think that they must have an existence of which we know very little. We will know a great deal more I hope shortly, as Messrs. F. W. Twort, M.R.C.S., L.R.C.P., and G. L. T. Ingram, M.R.C.V.S., have discovered a medium on which they have successfully made a culture of this bacillus. For a full report of their experiments I will refer you to the proceedings of the Royal Society B., vol. 84, 1912, also to a report in *The Veterinary Record*, April 20th, 1912. It is interesting

to note that the method of culture is on media containing a dried and powdered growth of certain acid-fast bacilli, which have been previously killed, that the Timothy grass bacillus is one of the most suitable for the purpose, and that they have produced John's disease by inoculation. There is little doubt that in time some toxin will be prepared; whether this will prove a diagnostic or curative agent we must wait patiently to see; perhaps if not a curative for this disease it may prove of some use in tuberculosis; there is a big field of investigation open here.

I have a rather interesting set of microscopic slides, all of which have been obtained from recent cases, which I propose to show you stained by the two methods already described in this paper. The only point I should like to draw your attention to is, that in all of these specimens you will notice, in large numbers, what I must describe as small spherical bodies, usually together in pairs, similar in shape and size to diplococci; they are distinctly acid-fast, as they retain the same colouring as the bacilli, and all these slides have been thoroughly decolourised before counter-staining. I should like to have your opinion whether they are spores or distorted bacilli, but they appear to be much larger than the bacilli present in the slides.

DISCUSSION.

Mr. SIMPSON asked Mr. Angwin if he had had any experience of treating with avian tuberculin.

Mr. ANGWIN: Never.

Mr. SIMPSON: Personally I have not either, but I believe another member of our profession who lives at Reading has, and that his experience has been that when you test with ordinary tuberculin you get no reaction, but that if you test with avian tuberculin you find you do. I should also like to know whether Mr. Angwin considers the disease hereditary.

Mr. ANGWIN: I should say not.

Mr. SIMPSON explained that he had asked the latter question because in one herd of cattle that he had had to deal with the case had been distinctly hereditary. Grandmother, mother, and daughter had all been attacked by it, and they had all died.

Mr. ANGWIN: Can you give me their ages when they died.

Mr. SIMPSON replied that he was afraid he could not, but the last one was in its second calving when it died.

Mr. ANGWIN: I think that would rather point to its having got the infection after birth, because in two years an animal would have plenty of time to get the infection into its system. This disease takes a very long time to develop, and that is the worst feature—it is so insidious.

Mr. ARCHER desired to congratulate Mr. Angwin on the very excellent paper he had read. Personally, he had seen a good deal of this particular disease in days gone by, but unfortunately at the time when he came into contact with it it was regarded as intestine tuberculosis, and the animals were destroyed under that impression. He agreed with Mr. Angwin in almost every particular with regard to the course of the disease and its nature, and also with regard to the infective properties. It was not a very highly infective disease. At all events, they might get three or four animals in a herd, and no more, and if it were very infectious they would get more. He also quite agreed that some pastures were much more favourable to it than others; the pastures he had found most affected were those which were more or less swampy. Mr. Angwin had not said anything as to treatment, except that some cases did recover. He was quite ready to believe that there were a few cases that recovered, but not when diarrhoea had set in to any extent. He also agreed that during parturition it seemed to develop in the animal very rapidly. The drug he had found most effectual is powdered

cinnamon, given with iron, but whether these cases had really been cases of John's disease or not was not certain.

Mr. ANGWIN remarked that he had never tried cinnamon, and really he did not think it was much use trying anything, once the animal was really suffering from the disease. In post mortem examinations which he had conducted—and it was to the post mortem examinations that they must go for their diagnosis—he had never seen any of the symptoms usually shown in tuberculosis, and that made one inclined to think they must be two distinct diseases, and that one could not thrive where the other existed.

The PRESIDENT said that it only remained for them to thank Mr. Angwin for his paper and post mortem specimens, and also the two other gentlemen who had brought cases of interest to their notice.

Mr. ARCHER proposed, Mr. SAMSON seconded, and Mr. BURT in supporting it, remarked that they were greatly indebted to men like Mr. Angwin who gave up time which might be far more pleasantly spent to making these investigations. He thought he was deserving of their heartiest thanks for the trouble he had taken and the time he must have devoted to the preparation of his paper and the photographs.

Mr. ANGWIN, in reply, said that it had been a pleasure to him to do what he had. As Mr. Burt had told them, these investigations had been spread over a period of five years now, but he was amply repaid by the results. He only wished there were a few more members who would come forward when their Secretary asked them for papers, and give a little time occasionally to putting down a few notes for the benefit of their fellow-practitioners. They did not come there as professors or experts, but to exchange their views and thus help each other to keep abreast of the times. If they did not do their best to keep their profession abreast with the times they must be left behind. He hoped that in future the Secretary would not have any difficulty in obtaining plenty of offers of papers or notes on cases which they could discuss for their mutual advantage.

On the proposition of Mr. Stuart, seconded by Mr. Roberts, the customary compliment was then paid to the President for presiding, and the proceedings terminated.

J. ALEX. TODD, *Hon. Sec.*

MIDLAND COUNTIES VETERINARY MEDICAL ASSOCIATION.

The quarterly meeting was held at the Swan Hotel, Stafford, on Tuesday, May 14th, Mr. W. H. Brooke, of Handsworth, the president, occupied the chair. There were also present: Messrs. R. C. Trigger, Newcastle-under-Lyme; J. J. Burchnall, Barrow-on-Soar; J. W. Coe, Hanley; H. Thackeray, Stafford; R. Over, Rugby; Burndred, Hanley; A. B. Forsyth, Cannock; L. W. Heelis, Solihull; J. DeVill, Uttoxeter; H. L. Pemberton, Bridgnorth; J. A. Gold, Redditch; J. Martin, Wellington; F. J. Taylor, B. Devine, Birmingham; W. G. Thompson, Stafford; R. Murray, Rugeley; J. R. Carless, Shrewsbury; G. Smith, Tunstall; Hutchinson, Cheadle; E. H. Woodcock, Eccleshall; and the Hon. Sec., Mr. H. J. Dawes, West Bromwich.

Apologies for unavoidable absence were announced from Sir John M'Fadyean, Professors McCall, Dewar, Penberthy, and Macqueen, Messrs. W. Perryman, D. Forwell, R. L. Forrest, T. Slipper, T. Chambers, W. T. Brooks, C. M. Barber, W. Dale, John Blakeway, James Blakeway, T. Ludlow, F. H. Gibbings, T. J. Brain, J. L. Duckworth, Prince, G. Thornton, E. J. Burndred, P. C. Woolston, F. L. Gooch, F. W. Barling, W. Blunsom, F. V. Steward, J. Marriott, R. Hughes, C. E. Dayus,

P. M. Evershed, J. Bainbridge, W. S. Carless, O. G. Hills, A. Over, G. Wartnaby, and others.

THE PRESIDENT'S HOSPITALITY.

The company were entertained to luncheon by the President, and before leaving the table Mr. Trigger proposed the health of their host. He expressed the appreciation which they all felt at his kindness, and added that it was the wish of every member that Mr. Brooke's year of office might be successful in every way.

The President briefly acknowledged the compliment, and said his only regret was that a greater number of members had not found it possible to accept his invitation.

REPORT OF THE COUNCIL.

"A meeting of the Council of the Midland Counties' V.M.A. was held to-day. There were present: the President, Mr. W. H. Brooke, in the chair, Messrs. Burchnall, Coe, Thackeray, R. Over, Trigger, Pemberton, Gold, Martin, Devine, and the Hon. Sec.

It was recommended that the President or the Hon. Sec., as they may mutually decide, be asked to represent the Association at the Annual Congress of the Royal Sanitary Institute, to be held at York on July 29 and following days.

It was recommended that the next quarterly meeting of the Association take the form of a picnic to Trentham, the fixing of the date and the making of the necessary arrangements to be left in the hands of the following local practitioners: Messrs. Trigger, Smith, Coe, Tart, and Burdred."

On the motion of Mr. Trigger, seconded by Mr. Martin, the report of the Council was adopted, and the recommendations contained therein endorsed unanimously and without discussion.

NEW MEMBER.

Mr. W. G. THOMPSON, of Stafford, duly nominated at the previous meeting, was elected a member of the Association on the motion of the Hon. Sec., seconded by Mr. Pemberton.

THE INTERNATIONAL CONGRESS.

The Hon. Sec. drew attention to the forthcoming International Veterinary Congress, which is to be held in London in 1914. He had noticed in the reports of the meetings of other Associations that something was being done towards raising funds for the entertainment of visitors. A large sum of money would be wanted, and the Midland Association, which prided itself on being one of the largest and most influential Associations in the country, would not like to be behind in a matter like this. He thought they might set aside a sum each year for the next two or three years as a contribution towards the fund which was being raised. On this matter in order, he would move at the next meeting of the Association, "That a sum of not less than £100 per annum be subscribed out of the funds of this Association for the next three years towards the cost of holding the International Veterinary Congress in London."

The Hon. Sec. said the profession all round would be encouraging, and individual support of the movement was being sought, as well as the assistance of Associations such as this. In other countries a Congress of this character would be subsidised by Government, but in England they were not so well favoured, and they had to bear everything themselves. He understood that at least £2000 would be required to defray the expenses, for he was sure the profession would like to entertain the foreign delegates in a manner worthy of the occasion.

The Hon. Sec. added that he should be pleased to receive any subscriptions from individual members and

forward them to the proper quarter. In any case, they as an Association must be prepared to do something handsome, and he was glad to think their funds would allow of that being done.

PRESIDENTIAL ADDRESS.

W. H. BROOKE, M.R.C.V.S., Handsworth.

Gentlemen,—Permit me to thank you sincerely for the honour you have done me in appointing me your president. I have serious doubts as to whether the mantle has fallen upon the proper shoulders, but as it is your wish, I will, with the kind co-operation of your long tried Secretary and my own personal friend, endeavour to maintain the prestige of our Association, trusting you will accord to me the same cordial support that I have seen meted out to my predecessors. It is now close upon twenty years since I joined this Association, as a result of a call from our Secretary, and at the outset I felt not a little hesitancy in obtruding my presence into such an august assembly, but by and bye that sort of feeling wore off, and I am pleased to say I have now almost reached its antithesis, and look forward with pleasurable anticipation to what has become a gathering of old and tried friends. This has, I am sure, been the experience of well-nigh all of us, and I hope, remembering our own kind receptions, none of our number may be found wanting in cordiality towards newly elected and younger members, and in doing our best to make them feel at home, so develop their best that it may become an asset to our Association in the future. It is customary on such occasions as these to review to some extent things veterinary. We have read or listened to numerous presidential addresses just lately. Still, I hope you will permit me to make a few remarks without deeming it too serious an intrusion on time more valuable in other directions.

Perhaps what is affecting the town practitioner most nearly just now is the serious loss of horse practice through the extensive inroad made by motor traction, and it behoves us to watch carefully for means to recoup ourselves. The extending recognition of our services in Public Health compensates us to some degree, and the generally increasing regard by the public for the welfare of household pets is also a help. I think, too, we may with some profit turn our attention to bird pathology. No doubt some of us are asked incidentally with other work to advise for ailments of bird pets, which really should not be outside our province, but we frequently have to hand such cases over to others who are mainly empirics. The country veterinary surgeon cannot be so hardly hit, for with him cattle and draught horses must always be present. I suppose the day is yet far distant when a jumping motor will displace the hunter.

Research in the bacteriological and physiological laboratories have made much possible to us that was not available to a previous generation, and the aim of the general practitioner should be to digest, assimilate, and carry into effect all the useful practical points evolved. The last twenty years has seen great developments in general surgery, and although in our practice it has not the diversity seen in the human branch, still our own general practitioners have a much stronger right to the title of surgeon than our brethren of the sister profession, who now appear, with only rare and trivial exceptions, to have settled the whole of this class of work on the specialist. What, I think, hinders the general adoption of new methods in surgery is the fact that our anatomical knowledge has, with the lapse of years lost much of its definite exactness, which is so necessary to success, and could we get an occasional paper from some of our expert friends who would brush off the dust which encrusts some of our anatomical

detail, it would be of much service. May I also suggest that much valuable data might be accumulated by a society like our own in special fields of observation, such as has been from time to time alluded to in *The Veterinary Record*. Definite and continuous observations noted at the time by a recording line—a procedure which I fear most of us in the hurry of practice are apt to neglect—would be of great assistance to our profession, and to ourselves in facilitating future diagnoses, and in rendering our treatment more exact. The post-mortem examination, for which we have frequent facilities, should never be neglected, and ought to be regarded as a pilgrimage in the cause of science, and when carefully and systematically carried out rarely fails to add a stone to the edifice of accurate knowledge. Closer observation and consideration would often do away with much of the conflicting evidence which we find ourselves giving in police and other courts, which to the lay mind seems to be so frequently contradictory, for we have to remember that we are invariably in the position of sworn testators, and not making pleas for our clients in the light of advocates.

We may, I think, with profit discuss many of the apparently simple issues concerning which we often find so great disparity of opinion, and between ourselves arrive at something like definite conclusions as to what constitute the more debateable phases of cruelty which frequently cause a certain amount of animus between ourselves and draw some discredit upon our calling in the lay mind, which fails to appreciate our difficulties. The small surface sore, so often distorted into disproportionate importance, might be a little less regarded; and the working of old and decrepit animals, in which cruelty is so often inflicted, receive a little more attention. I have long thought that the funds of humanitarian societies would be profitably expended if a system of inspection of such animals were adopted, and that the Act might be much improved by the insertion of a clause demanding the inspection of all horses over the age of, say, 12 or 14 years prior to their changing hands, to ascertain their fitness for further work, and what that work should be. Chronic foot lamenesses, too, which are responsible for much pain, are generally overlooked altogether, especially if bilateral.

The treatment of canine diseases has become a most important branch of the town practitioner's practice, and although this subject has of recent years received more consideration, there is still much to be done. Distemper and skin diseases have perhaps had something like their meed of attention, and there has also been some development of canine surgery, but many other diseases remain *in status quo*, particularly those of the nervous system, and we are urgently in need of the expert pathologist to help us in this direction. That troublesome disease, chorea, so insidious in its onset, and refractory to all present known treatment, which so often affects the very best of our animals, has never, so far as I am aware, had its pathology fully investigated. Human pathologists tell us of its frequent association with rheumatism, of the usual concurrence of an endocarditis, causing cerebral embolism affecting the motor cells of the cortex and corpora striata of the lateral ventricles, which stands as a most reasonable cause to account for the presence of motion without volition. How many records of post-mortem examinations of hearts, or even of general post-mortems, have we put on record following deaths from distemper with cerebral lesions— for cerebral all cases of chorea must be, whether as incidental to distemper or otherwise. Only the versed pathologist is qualified to inquire into the minute but all important changes in which so much trouble originates. I throw out these matters for your consideration, and trust you will not think my address trenches upon the lines of a paper.

Our politics have been so largely touched upon by other presidents in their addresses, and by others well used to deal with them, that I can pass them over by simple allusion without, I hope, detracting from their importance. Our serious pecuniary position should be a matter of concern to all of us, and the passing of our Bill, which I trust may be expedited by all possible means, and met by an unanimous *esprit de corps* among our members, will, I hope, level up our position and make it substantially secure.

Our strengthened union by means of the reconstituted National Veterinary Association has been found vitally necessary, by the crisis in which our medical friends have recently found themselves in the matter of the Insurance Bill. We shall, I am sure, before long, have to stand our ground to something of equal importance to ourselves in upholding the rights which, without presumption, we are conscious are our own, and which adverse influences from many and various sources would take from us. I need not particularise the details of the veterinary surgeon's province in the domain of Public Health. They have of late been prominently before you. But I trust when the time arrives for such matters to be settled once and for all, we may be prepared as a profession and united as a body.

The Hon. Sec. moved a vote of thanks to the President for his address, and expressed the hope that he would allow it to be included in the minutes of the meeting.

Mr. GOLD seconded the vote of thanks which was carried.

JOHNE'S DISEASE.

By BRENNAN DEVINE, F.R.C.V.S., D.V.S.M., (Vict.),
Vety. Dept., City of Birmingham.

Mr. Chairman and Gentlemen,—In attempting to give you a description of John's disease, I would like you first to understand that the subject was not my own choice, but that of the Council of this Association. Secondly you must not expect this paper to be exhaustive on the subject, as it has been written at odd moments and irregular hours, whenever I could spare a few moments from work during an extra busy period.

Although John's Disease has been recognised as a distinct condition for some few years, its contagious character and its lesions are not so generally understood as they might be, considering its great prevalence. The actual research on this disease has been carried out in different countries.

I have little of my own to tell you that is original on the subject, but I wish in the following pages to discuss the main points of interest, and to place before you a combination of the up-to-date modern views, as described in the published records of several investigators. As the subject must naturally be of great interest to us all as practical veterinarians, and is at the present time attracting the attention of many veterinary scientists in different countries, I hope that my remarks will prove interesting, and trust they will promote a good discussion. If I am so far successful I am sure the remarks of the other members will fill up the many deficiencies of this paper.

Nomenclature. It may in the beginning be interesting to note the different names under which the disease has been described. Like many other newly discovered diseases, each investigator has adopted that term which he thought most descriptive of or suitable for the disease.

The following are the principal names under which the disease has been described:

Chronic Enteritis.
Chronic Bacterial Dysentery.
Chronic Bacillary Enteritis.
Pseudo Tuberculous Enteritis.

Infectious Enteritis of Cattle.
Specific Chronic Enteritis of Cattle.
Diffuse Hypertrophied Enteritis of Cattle.
Chronic Bovine Tuberculous Enteritis.

Hardly any of these names are sufficiently distinctive for the disease, as there are many forms of enteritis in cattle due to causes other than Johne's bacillus; whilst those titles which include the word "tuberculous" are apt to be misleading, as it suggests it is a form of bovine tuberculosis. Sir John McFadyean, in an article in the *Journal of Comparative Pathology*, Vol. XX, suggested that the disease should be known as "Johne's Disease," and under this name it is now generally known in the English speaking world. It is a short, unmistakable name, not likely to be confounded with any other disease, and at the same time it pays to Johne, the discoverer, that appreciation and recognition of his work which he so richly deserves.

History and Distribution. In 1881, Hansen and Neilson, each described cases of chronic enteritis occurring in cattle in Holland. They pointed out that the intestinal mucous membrane was hypertrophied and thrown up into folds. The contagious character of the disease was at that time suspected, but it was not until 1895 that Johne and Frothingham discovered the causal organism and its contagious character was proved. Johne found in the intestinal mucous membrane of affected cattle acid-fast bacilli, microscopically indistinguishable from tubercle bacilli. Johne and Frothingham at that time considered the disease a form of tuberculosis. Following their discovery the disease does not appear to have been recognised until eight years later, when Barkus, in 1903, described cases occurring in Holland. Since that time, the disease has been seen and described by Bang in Denmark, Van der Sluys in Holland, Lienaux and Van den Eckhout in Belgium, McFadyean and Stockman in England, Borgeand in Switzerland, Bongert and Meissner in Germany, Matthis and Lechlaine in France, Pearson and Mohler in America, Horne in Norway, Neilson in Laaland, etc. From this list we see that the disease is present in many countries, more particularly in the North European countries. The non-recognition of the disease in other countries is probably because bovine diseases have not been so actively investigated there. No doubt as the disease becomes better known it will be recognised in other parts of the globe.

As the disease in its early stages is such an insidious one, and is not generally known, it would be difficult at the present date to fix approximately the percentage of cattle affected in this country. I believe the disease is much more prevalent than many of us suspect. I have seen as many as four cases in one day at the Birmingham slaughter houses. While Jersey cattle hold the reputation of being free from tuberculosis in Jersey, many of them are said to be subjects of Johne's Disease. There is no doubt the disease is prevalent in many parts of the United Kingdom.

The Causal Organism. Johne's Disease is caused by an acid-fast bacillus microscopically indistinguishable from the tubercle bacillus. In affected animals, the bacilli are found in the intestinal mucous membrane, and in the mesenteric lymphatic glands and their ducts. Morphologically and in staining reaction, the bacillus closely resembles the tubercle bacillus of the bovine type. It is non-motile, aerobic, and non-sporing. Its average length is 1 to 2 microns long, and occasionally some may be found measuring up to 4 microns. The bacilli are slender straight rods, and are usually seen in clumps. Some of them may be found slightly curved, especially those on the outer edges of a clump. The clumping of the bacilli is characteristic, and is of importance from a diagnostic point of view. According to McFadyean, some of the longer bacilli show alternating staining, while the shorter forms stain uniformly. The bacillus is non-motile and aerobic. It stains best by the Ziehl

Neilson stain, but will also stain by the Gram. It does not stain well with the aqueous solutions of the aniline dyes. The bacillus will live for a considerable time outside the animal's body. According to Twort, cultures may be kept under anaerobic conditions for three months and will afterwards develop if placed in a suitable medium and temperature.

Cultural Characters. Many unsuccessful attempts have been made to cultivate the bacillus artificially outside the bodies of bovine. Messrs. Twort and Ingram, working in collaboration at the Brown Institution Laboratories, have succeeded in cultivating the bacillus on a special medium. In the proceedings of the Royal Society, B. Vol. 84, 1912, they state as follows: "Growth occurs between 28° C and 43° C or perhaps a little beyond these limits, the optimum being about 39° C, but it is always slow. The reaction of the medium should be distinctly alkaline. The degree of alkalinity possessed by new laid eggs is very suitable, and if this is in any way lessened in the medium there is a marked diminution in the rapidity and the amount of the growth. No growth occurs on any of the artificial media in general bacteriological use, such as peptone, bouillon, agar, gelatine, serum, potato or egg, even when such substances as glycerine, sugars, amino-acids, fresh blood, etc., are added. It is absolutely essential that certain previously detailed bacteria or extracts from them be added to one or other of the media before any growth of Johne's bacillus takes place. Of the bacilli tested, undoubtedly the most suitable for adding to the media is the Timothy grass bacillus. Certain strains of human bacilli are also very good. On the egg-Timothy grass bacillus—medium, Johne's bacillus when taken from the animal body will grow as tiny discrete colonies which usually become visible in three to five weeks. At first the colonies are round, smooth and dull stone white, they are slightly heaped up, and as growth increases this becomes more marked, while the colour turns to a dull light yellow. Later the colonies may coalesce and the growth show some wrinkling, while the colour may turn to a light yellowish brown. If the first culture taken from the diseased tissue is sub-cultured on to a fresh tube of medium, visible growth occurs on this in a few days, and may reach its maximum in two months instead of three. When inoculated into fluid media containing a suitable bacillus or bacillary extract, such as ordinary glycerine peptone bouillon, made alkaline and containing 1 per cent. of alcoholic extract of the Timothy grass bacillus. Johne's bacillus grows as tiny whitish grains which settle to the bottom of the tubes or flask. These gradually increase in size and number, ultimately reaching the size of a millet seed. Cultures are not easily killed by diffused daylight, as we have had them standing before a window on a bench for some weeks without any apparent harm. Johne's bacillus would also appear to be fairly resistant to the action of disinfectants, since two of our strains were isolated from material which had been subjected to the action of a 1 per cent. watery solution of Eriocolin at 37° C for two hours. In this respect it is no less resistant than the tubercle and lepra bacilli.

Susceptible Animals. Johne's Disease chiefly attacks cattle, and it is most common in animals from three to six years old. It is rarely seen in calves. Sir John McFadyean, in his tenth annual report of the Royal Veterinary College, published in the *Journal of the Royal Agricultural Society of England*, 1907, reports having met on post mortem a case in a deer. It is important also to note that sheep are not immune. Mr. Stockman, while investigating a disease known as "Scrapie" in sheep, has met with cases of Johne's Disease in that animal, but the lesions found in the sheep are not so pronounced as those found in the bovines. The fact that sheep and deer are both capable of contracting the disease points to their being possible factors

in its spread. Hence, they must necessarily be taken into consideration when instituting prophylactic measures. Attempts have been made by several investigators to artificially inoculate the disease into other animals without result. Bang attempted to inoculate guinea pigs, rabbits and goats. Meissner in addition to these animals has tried mice, but all have proved negative. Liénaux, of Brussels, in a paper on the subject delivered at the ninth International Veterinary Congress, held at the Hague, 1909, claimed to have been successful in conveying the disease to guinea pigs, but Liénaux's results have not, so far as I am aware, been confirmed, and the view is now held that the disease which Liénaux's experimental animals contracted was avian tuberculosis.

Incubative Period. After the entrance of the virus into the body of a healthy animal, some considerable time elapses before any noticeable symptoms in the animal are apparent. The development of Johne's Disease is as a rule slow, and naturally depends to a certain extent upon the age, environments, strength and vitality of the animal. The presence of any debilitating disease would naturally tend to shorten the incubative period. Bang inoculated a calf by feeding with infected material. This animal showed signs of diarrhoea eight months later. This is the shortest period I have seen recorded in which the disease developed after inoculation. In most cases the animals do not exhibit any clinical symptoms before 11 or 12 months after inoculation. The disease develops more quickly in animal at grass than in those which are constantly housed. This may be explained by the latter being usually fed on a more concentrated and better diet than grass, thereby keeping up the tone of the system.

The long period of incubation would seem to indicate that the disease runs a sub-acute course, and that clinical symptoms are not developed for a long time unless some complicated illness or other condition arises, such as pregnancy, and this gives the organism a chance of developing at an earlier date. Generally speaking, the incubative period may be placed at from eight to twelve months.

Spread of the Disease. The causal organism is only found in the alimentary canal in affected animals. It has never been detected in the respiratory tract, and is not found in the milk or urine. The faeces must then be regarded as the medium by which the disease is spread. Animals may be inoculated by intravenous or intra-peritoneal injection of the virus, as well as by feeding on infected material. One must conclude that the mouth is the port by which the virus naturally gains entrance to the body. If the faeces of an animal contaminate the water, grass, or other food stuffs, non-affected animals will contract the disease from them.

SYMPTOMS.

As a rule affected animals are from three years old and upwards, though it is occasionally seen in animals as young as 12 months. The commonest symptom is a progressive anaemia and emaciation. Diarrhoea is frequently present, though this is not constant. In affected animals the diarrhoea is intermittent, coming on at irregular periods. Although diarrhoea is present in the majority of cases, it is possible for an animal to be affected with Johne's disease for a long time without showing any symptoms of diarrhoea. Bang records a case of a cow which had died from the disease, yet she had never shown any diarrhoea symptoms. Mr. Ingram, M.R.C.V.S., late of the Brown Institution, first drew my attention to the intermittent character of diarrhoea in Johne's disease. Since then I have observed this intermittency in three affected animals, their faeces at certain periods being normal in consistency and at other times diarrhoeic. Affected animals exhibit no febrile symptoms such as elevation of temperature, cold ears, etc.

During the periods when the diarrhoea is present there is a sudden diminution in the milk secretion and a great loss of flesh, and with each attack the animal gets gradually weaker. Each succeeding attack of diarrhoea occupies a longer period than the preceding one. The attacks of diarrhoea do not seem to be amenable to any form of drug treatment. In animals kept at grass the periods of diarrhoea are of a long duration; in fact the animal becomes so weak and poor that it is usually considered a "waster," and is knackered. In housed animals that are well cared for the diarrhoea does not seem to persist for long periods, though each attack leaves the animal poorer and weaker than before.

Through the courtesy and kindness of Dr. Twort, I was permitted to examine at the Brown Institution, London, a Jersey bull affected with Johne's disease. This animal, I was informed, had passed through various periods of diarrhoea, but at the time I examined him the faeces were fairly stiff, though I noticed they contained an appreciable amount of undigested food stuff. This animal was anaemic and emaciated, the temperature of its ears and horns was normal, the coat was dull and slightly staring, the visible mucous membranes were very pale, and the eye appeared clear and bright, but slightly sunken. The animal generally had a thin wasted appearance. Three days later I met another case in a cow at Birmingham Cattle Market. This cow exhibited similar symptoms to the Jersey bull, but in addition the animal was lame in both hind feet and was blowing very badly, respirations being 73 per minute. The cow was slaughtered the same day, and I had an opportunity of making a post-mortem examination. The lesions which I found I will describe later.

The clinical symptoms of Johne's disease frequently develop after pregnancy, and in the majority of cases its presence is not even suspected until the diarrhoea and emaciation are ushered in. Even then one cannot always rely on these symptoms in order to be certain it is Johne's disease we are dealing with.

LESIONS.

The lesions found on post-mortem examination are confined to the bowels, the mesenteric lymphatic glands and vessels. The mucous membrane of the intestines is very much thickened, and thrown up into folds, producing a very striking corrugated appearance on the lining of the bowels. Being under the necessity of condensing into the small space of a paper, I cannot give in detail the results of many post-mortem examinations which I have carried out on animals affected with Johne's disease. In most cases which I have seen on post-mortem, the mucous membrane of the affected portions of the bowel in the fresh condition showed diffused areas of a pinkish or slightly congested appearance. The surface of the mucous membrane is covered with a peculiar greyish yellow, thin jelly-like material. This yellow slimy substance can easily be scraped off. If one spread a portion of the bowel out and slightly stretch it, the branches of the lymphatic vessels appear thickened and cord-like, and show up clearly through the mucous membrane. Previous to the disease being so well known as it is at present, it was frequently mistaken for tuberculosis, and most investigators, when describing it, made a special point of the absence in the bowels of anything of the nature of ulceration, which is frequently seen in true tuberculosis of the bowels.

I mention this point specially, because I have a specimen of bowel here to-day taken from a cow affected with Johne's disease with what appeared to me to be beginning ulceration. Early last month I made a post-mortem examination on a cow, which I have already mentioned was in Birmingham Cattle Market. In this animal the heart, lungs, liver, spleen, and kidneys appeared to be normal, the mucous membrane of the small and large intestines showed hypertrophy and corrugating, but this

was most marked in the large bowel. In addition, I also found at three different points in the bowels (two in the caecum and one in the colon) what appeared to be a form of ulceration. Each lesion was a small tumour or swelling in the mucous membrane. The highest point of each one in the lumen of the bowel was congested, and the centre of the congested area necrotic. I had already seen this in one former case of Johne's, but not nearly so well marked as in this one. Of course these necrotic lesions may be only complications occurring coincidentally with the Johne's lesions.

The mucous coat of the intestines is the only one which seems to be involved in Johne's disease. This coat is hypertrophied sometimes to four times its normal thickness; the membrane becomes so expanded without a similar expansion taking place in the muscular coat of the bowel, that the mucous coat is necessarily thrown into the characteristic folds which we see on opening the bowels. The lymphatic vessels and mesenteric lymphatic glands are also swollen; the glands on palpation are softer than normal, and on section are moister; on section, the mucous membrane appears to be filled with thick serum; on sections of the bowels examined microscopically the villi on the mucous membrane appear altered; they are irregular in shape and thickened. Epithelioid cells are lodged in the tissues round the villi, and in the mesenteric lymphatic glands and their ducts. These epithelioid cells are very large and have acid-fast bacilli in their interior. The bacilli are not isolated, but are found in masses clumped together.

Very rarely do you find Johne's disease and tuberculosis in the same animal. I have seen only one case during the past three months. I have made a thorough search for tuberculosis during the past three months in all cases of Johne's disease which I have had an opportunity of examining on post-mortem (13 in all) and not in one have I succeeded in detecting any traces of tuberculosis. If an animal affected with Johne's disease is slaughtered during diarrhoea, and a scraping from the bowel is examined microscopically, enormous numbers of acid-fast bacilli will be found; but if the animal had not recently been affected with diarrhoea previous to the examination, the bacilli may be rather sparse and difficult to find. Indeed, in some cases it may be necessary to examine scrapings from several different portions of the bowel. This may occur in cases which microscopically seem very pronounced.

The lesions as they occur in sheep are described by Stockman in *The Journal of Comparative Pathology*, vol. 24, part I. He states as follows: "The lungs and heart were normal; the liver very fatty; the kidneys were normal; the rumen, reticulum, and omasum were also normal; but the abomasum showed a few small areas of congestion. The small intestine was thickened and showed numerous small hæmorrhages under the mucous membrane. The surface of the mucous membrane was coated with a white creamy mucus, but it showed no corrugation similar to those found in Johne's disease in cattle. The large intestine showed zebra markings and a few small hæmorrhages under the mucous coat."

In scrapings from affected portions of the bowel and mesenteric glands he found on microscopical examination acid-fast bacilli. Besides these specific lesions, evidence of Johne's disease is usually manifest by a very emaciated and markedly dropsical condition of the carcass. Although in one or two cases I have seen the anasarctous condition of the carcass was not present, in most cases it is a most noticeable condition. Frequently the loose cellular tissue seem more or less bags of fluid. In such cases the carcass neither dries well nor sets well. The extent of this dropsical condition of the carcass is not necessarily an indication of the degree of the bowel alterations. I have seen marked bowel lesions with little emaciation or dropsy, and marked emaciation or dropsy with comparatively slight bowel alteration. But

while the extent of the carcass and bowel alterations are not necessarily co-related in extent, yet as a general rule there seems to be a relation.

DIAGNOSIS.

The early diagnosis of Johne's disease, as of other specific contagious diseases, is important from a prophylactic point of view. By recognising the disease in a herd at an early stage, one has a better opportunity of preventing its spread and more quickly and economically eradicating it. We are all aware that bovines are the subject of other forms of diarrhoea and wasting than that seen in Johne's disease, and unless we have some means of making a reliable diagnosis, we are liable to confound the disease at certain times with chronic tuberculosis, or in other cases with parasitic enteritis. When tuberculosis is suspected it can be definitely settled by injecting the animal with tuberculin, and if there is no reaction it excludes the possibility of tuberculosis.

The point, then, to be considered is, what is the best means of detecting the disease, particularly during its early stages. It is the absence of the characteristic clinical symptoms (*i.e.*, diarrhoea and emaciation) of the latter period which renders diagnosis at first rather difficult. The faeces or scrapings from the rectum may be microscopically examined for the presence of acid-fast bacilli. The method I adopt for taking a scraping of the bowel is as follows:

The rectum is emptied and syringed out with clean water. Then a watch glass is passed with the hand into the rectum, and with the edge of the watch glass the bowel is scraped from within outwards. Portions of the scraping are thinly spread with a platinum loop in a cover glass, fixed by heat, stained by the Ziehl-Neelsen method, and examined microscopically with oil immersion lens.

Although this method is successful in a certain percentage of cases, failure to find the organism does not necessarily prove that the animal is free from the disease, for, as I have already intimated, the organisms may be very numerous in such a scraping at certain periods and comparatively sparse at other periods. This shows of course that microscopic examination during the life of the animal is useful but not infallible.

In 1909, Bang, of Copenhagen, employed tuberculin prepared from avian tubercle bacilli as a medium for diagnosis of Johne's in cattle. The dose he injected varied from 15 to 35 mm. and he asserts that animals affected with Johne's disease re-act when tested with this form of tuberculin, as tuberculous cattle do to the ordinary tuberculin.

In 1910, Horne, of Christiania, experimented with avian tuberculin on a suspected calf, the animal having previously failed to act when tested with the ordinary tuberculin prepared from bacilli of the bovine type. He records that when he injected hypodermically the avian tuberculin the animal gave a rise of 3.8 F. eight hours afterwards. At later periods he tried the ophthalmic and cutaneous methods of testing on the same animal, and states that he got a positive result on both occasions.

In 1911, Male, of Reading, in a paper read at the meeting of the Royal Counties Veterinary Medical Association, gives a record of his results in the application of avian tuberculin on two herds in which cases of Johne's Disease had been met with. Those animals which he considered re-actors gave an average rise of 2.5 F. In a private conversation with Mr. Male, he stated that he had been successful in eradicating Johne's Disease from both herds.

Although these results would seem to be positive, and point to this form of tuberculin as being useful as a diagnostic agent in Johne's Disease, I am still of the opinion that we ought not to be too hasty in accepting it as such until we have seen the result of its applica-

tion on large numbers. So far it has only been employed among a few. When it has been more extensively used we shall be in a better position to gauge its usefulness and know what reliance we can place upon it. We know that when ordinary tuberculin was first introduced there were many contradictory reports regarding its action, and it was only after a large number of statistics had been collected and sifted that it was placed in its true place. Hence in this early and experimental stage of the use of avian tuberculosis as a means of diagnosis for Johne's Disease it is necessary, to a certain extent at least, to receive the results with a modicum of caution. As the causal organism has now been grown outside the animal body, we may reasonably expect to see in the near future a reliable diagnostic agent being prepared from the organism itself. If the Tuberculosis Order becomes law, and veterinary inspectors are given power to seize animals affected with open tuberculosis, it will be difficult in some cases to decide at once if the animal is affected with tuberculosis or Johne's Disease. As each one is a contagious disease which we hope to eradicate, it would facilitate matters if both diseases were included in the same Order.

PROPHYLACTIC MEASURES.

All infected or suspected animals should be isolated and housed. If they have been previously housed, the stalls or boxes occupied by them should be thoroughly disinfected, their faces when removed should be covered with quicklime and should not be spread on pasture land. If this is not possible it should be kept for several months before being used. If the suspected animals are in milk and are in fair condition I think it advisable to slaughter, as rapid emaciation may set in, and affected animals which get into low condition never regain a well nourished one. As a preventive, Meissner recommends subcutaneous injections of an emulsion of lymphatic glands from affected animals.

MEAT INSPECTION.

In the case of foreign meat which is of course imported unaccompanied by the offal, it is impossible to tell if the animal has been affected with Johne's disease, and the carcase is judged on its merits. Newly slaughtered animals that are affected, in which the carcase is drop-sical and does not set well are condemned, but if the carcase is well nourished, dry, and sets well, there is to my mind no justification for condemning it.

In conclusion, I must express my thanks to those who have assisted me. First to Mr. Malcolm, who assisted me with his advice on many points. To Mr. Hotherstoll I am indebted for acquainting me with cases of Johne's disease he met with in the markets. And lastly, to Messrs. Twort and Ingram who have provided me with cultures of Johne's bacilli which I have with me to-day.

DISCUSSION.

Mr. TRIGGER first complimented the essayist upon the manner in which he had prepared his paper. He was free to confess, what was no doubt true of many others in the room, that although he had several times met with Johne's disease, he could only recall a few cases in which he was certain it was Johne's disease until after the post-mortem. He had experienced considerable difficulty in distinguishing it from tuberculosis of the bowels during the lifetime of the animal. He had noticed that the diarrhoea was intermittent in this disease, which was not the case with tuberculosis of the bowels, and he believed, also, in Johne's disease there was a thirst which was not to be seen in other cases. There was undoubtedly a characteristic appearance about Johne's disease which enabled them to recognise it at once upon post-mortem. He had yet to learn of any treatment that was of the slightest avail, and as he had not heard of anyone successfully combating the disease,

he believed the better plan was to slaughter the animal straight away.

Mr. GOLD said Mr. DeVine had dealt with the subject in a most lucid manner, and it had been a great pleasure to listen to him. To his mind, the most interesting part of the paper was the announcement that two gentlemen had been able to cultivate the bacillus outside the body of the animal. As a country practitioner he came across this class of case in different herds, and he was often at a loss to know what to do, either by way of treatment or in advising clients. Anything definite, therefore, which he could learn about this disease he was anxious to know. They had to be very careful in distinguishing between Johne's disease and tuberculosis of the bowels. Personally, he had tested two or three herds with avian tuberculosis with results that were more or less satisfactory. Mr. DeVine told them that his experience was that the disease was most common in animals three years old and upwards, but in his district he had seen it in yearlings. In young animals he generally found that it ran a very severe course. He believed there were lots of cows slaughtered suffering from this disease which showed little of what might be called the diarrhoea symptoms. He had had no result whatever from treatment. They certainly ought to be able to differentiate between Johne's disease and tuberculosis of the bowels; probably Mr. Trigger had not as much faith in the tuberculin test as some people. The clumping which Mr. DeVine had referred to was a useful characteristic, and he thanked the essayist for reminding them of it. It was a serious matter that the incubative period was as long as from eight to twelve months, because they never had an opportunity of detecting the mischief at a period when it might yield to treatment. The smell had often enabled him to suspect what was the matter.

Mr. FORSYTH said that unfortunately he had not had the opportunity of following his cases up in a scientific manner, but there was one peculiarity he had noticed about his cases. That was, that they occurred on ground that was over-run with poultry. If it was not exactly an avian bacillus, he fancied it was closely related to it. He had never noticed anything different in the smell of the discharges. The only slight aid he had ever had to diagnosis was that it did not respond to the treatment which was generally successful in ordinary cases of diarrhoea.

Mr. MURRAY said he would like to know whether any attempt had been made to get an extract from this bacillus on the same principle as the extract which had been obtained from the bacillus of tuberculosis, with a view to its being used as a diagnostic agent. He had had no experience of the disease, but from what he had heard that afternoon, it seemed to be very difficult to distinguish it from tuberculosis, both clinically and pathologically. The bacillus seemed to belong to the same class of bacillus as tuberculosis. Tuberculosis of the bowels was chronic and in many cases, to begin with at all events, the diarrhoea was intermittent, whilst very often they had considerable thickening of the mucous membrane of the bowels. In the case of wasters, he thought the ordinary tuberculin test was not of much use, because he had seen animals in the last stage that gave no re-action to the test.

Mr. COE said he was glad to say he had had very few cases of Johne's Disease. He would like to ask Mr. DeVine what he suggested should be done after the animals had been tested with avian tuberculin. Would he care for them to go to Birmingham Cattle Market? If he found them there, would he object very much? Was there likely to be any curative serum or vaccine discovered? He heard that a number of cattle had been tested at Derby, but he did not know with what result.

Mr. J. R. CARLESS said he had always found great difficulty in making a satisfactory diagnosis. At one

farm, where his client kept a valuable shorthorn herd, this disease proved a very serious loss to him. Time after time some of these animals would waste away and they had to be destroyed. He made several post mortems and always found that the mucous membrane in places was in a very remarkable condition, thickened in places and then for some space the bowels would be quite normal, and then more thickening and a patch of inflammation. As far as treatment went, he had met with no success, and he had tried practically everything he could think of. He thought the best thing in the long run was to have the animal slaughtered and buried or cremated. As far as treating the land was concerned, he was a firm believer in dressing the pastures with salt. At one farm where he had done that he had been very successful.

The PRESIDENT said he was particularly indebted to Mr. DeVine for stepping into the breach that afternoon and delighting them all with such an able and instructive paper. He himself was a town practitioner and therefore did not see much cattle practice. He was, however, much interested in the subject of Johne's disease and was especially struck by the mention of avian tuberculin. Mr. Forsyth had mentioned that he noticed the disease was prevalent on ground that was over-run with poultry, and it seemed as though the only distinction was in the culture. Beyond the clumping that had been referred to, there did not seem to be much to distinguish it from ordinary tuberculosis. He should like to ask why avian tuberculin was suggested rather than have a serum derived from Johne's disease itself.

Mr. DeVine, in reply, said he was afraid he had been a little misleading in one respect. Most of them seemed to think that Johne's disease was difficult to detect. He thought that every veterinary surgeon ought to be able to detect it, and certainly on a post-mortem. The lesions were so characteristic and if there was the least doubt about it, their opinion could be verified by making a microscopical examination. Still, it could nearly always be detected by the naked eye. He did not think there was any other disease where they could get the same lesions. The thickening of the mucous membrane and the condition of the mesenteric lymphatic ducts were safe guides. With regard to the living animal, he hinted that it would be difficult to differentiate between Johne's disease and tuberculosis, but where they got diarrhoea they generally got an enormous quantity of bacilli in the feces. Mr. Trigger thought there was an unusual thirst. He (Mr. DeVine) thought there was thirst in all cases of diarrhoea, because of the great quantity of fluid that was lost to the body. Wherever they had tuberculosis in an advanced stage there was coughing, but there was no coughing in Johne's disease, except as a complication. There was also an elevation of temperature in other diseases which was not found in Johne's. With regard to diagnosis on post mortem, if they had tuberculosis of the bowels there was ulceration of a distinct type, which was absent in Johne's disease. Mr. Gold said with regard to the bacilli he could not tell sometimes whether it was Johne's disease or tuberculosis when examined microscopically. Well, he did not know anyone who could, but in Johne's disease, there was the clumping together, which was a characteristic of the utmost importance in enabling them to come to the right conclusion. Mr. Forsyth's point about affected animals having been on ground overrun by poultry was a very interesting one, and it might be that there was some connection between Johne's disease and avian tuberculosis. As to whether a serum was being manufactured from Johne's bacillus, and why it was not used before avian tuberculin was tried, they must remember that it was tried three or four years ago, and Johne's bacilli had only been successfully grown outside the animal body within the past few months. He did not attach too much importance to avian tuberculin as a

diagnostic agent, and now that they were growing the bacillus artificially in the laboratory they might reasonably look forward to a serum being manufactured which would be useful as a diagnostic agent, and even to a vaccine which might be used as a curative or a preventive agent.

Mr. TAYLOR asked whether there was a sub-normal temperature in cases of Johne's disease.

Mr. DeVine said he did not know about that, but he had never seen any elevation in the temperature.

A vote of thanks to Mr. DeVine for his paper was accorded him on the motion of the President, seconded by Mr. Heelis, and also for his bringing such an interesting example of an affected bowel, and microscopic specimens for inspection.

A SPECIMEN.

Mr. J. R. CARLESS brought with him as specimen, cervical vertebrae of a cob mare, fifteen years old. She had an accident when turned out as a young animal, injuring herself in the curious way shown in the specimen. She got her own living, but held her head sideways when grazing, and although she was not worked she had bred twelve foals.

The PRESIDENT said they were always grateful to members who brought specimens or interesting cases, and in the name of the Association he thanked Mr. Carless for showing them this one.

Before separating, the members present had tea together.

H. J. DAWES, F.R.C.V.S., Hon. Sec.

A "Vet's" Qualifications—Challenge at Bridlington.

At the Bridlington Police Court on Saturday afternoon, May 25, during the hearing of a summons against Arthur Mews, a pork butcher, of Quay Road, for cruelty to a pig. Leonard Morris Verney, veterinary surgeon, who was called for the defence, had his qualification challenged by Inspector William Roberts, of the Royal Society for the Prevention of Cruelty to Animals, who prosecuted.

Mr. Verney swore he was a qualified veterinary surgeon, but when a copy of the official register of the members of the Royal College of Veterinary Surgeons was produced by the inspector, Mr. Verney was unable to find his name. He said his diploma was at home, and that he had seen his name in a register. He swore he qualified in London on July 30th, 1900.

The Bench suggested an adjournment for Mr. Verney to prove his qualifications, but Mr. West, solicitor for the defence, withdrew Mr. Verney's testimony, and defendant was fined 30s. for cruelty.

The Bench stated they would afford Mr. Verney an opportunity to prove his qualification next Saturday if he cared to avail himself of it.

Mr. Verney, who had been practising in Bridlington for some years, seemed to be greatly embarrassed, but he maintained his possession of the qualification most emphatically to the magistrates, and stated that the Register he had been shown his name in was in possession of a veterinary surgeon at Hunmanby, but he could not explain why his name was missing from the official Register.—*The Daily Mail* (Hull).

Unlawful Use of a Description.

At the Tamworth Borough Sessions, on Wednesday, May 8th, before the Mayor (Mr. H. W. Harston), Ald. A. Dyer, and Ald. A. J. Bartle.

Robert Henry Rymer, 1 Victoria Road, Tamworth, was summoned on the information of John Marson, ex-inspector of police, on behalf of the Royal College of

Veterinary Surgeons, not being on the Register of Veterinary Surgeons, and not holding at the time of the passing of the Veterinary Surgeons Act, 1881, the veterinary certificate of the Highland and Agricultural Society of Scotland, that he did on March 30, 1912, at No. 1 Victoria Road, unlawfully use and take an addition and description, to wit, veterinary surgeon.

Defendant pleaded not guilty.

Mr. John Matthews prosecuted on behalf of the Royal College of Veterinary Surgeons. Defendant was an assistant to a veterinary surgeon practising in Tamworth some time ago, and since then he had practised on his own account. An assistant to a duly qualified practitioner need not himself hold any qualification, but it was illegal to practise as a veterinary surgeon unless he was on the register. This appeared to be a peculiarly flagrant offence. Mr. Rymer had not only practised as a veterinary surgeon in Tamworth, without any qualification, as he was instructed, but he had issued cards and sent out bills on printed bill heads, and had put up a plate near his front door, on all of which he described himself as a veterinary surgeon. Mr. Rymer was an educated man, and had acted as assistant for veterinary surgeons for some years, therefore he must know perfectly well that all those acts were quite illegal, and rendered him liable to heavy penalties under the Act of Parliament. The Act which dealt with the matter was the Veterinary Surgeons Act of 1881, which embodied the provisions contained in the old Veterinary Surgeons Charter. The Act provided that the Council of Veterinary Surgeons should cause correct copies of the register of veterinary surgeons at least once a year to be printed, and such copies should be admissible in evidence until the contrary may appear that the persons therein named were on the register. If he put in, as he proposed to do, an official copy of the register now in force, and the defendant's name did not appear therein, the onus lay upon him to show he was now on the register, or that he had been admitted a member of the College of Veterinary Surgeons since the register was published. He did not suppose defendant could do that. Mr. Matthews quoted a further provision of the Act, showing that defendant was liable to a penalty not exceeding £20. He produced the sealed copy of the College for the prosecution. He only had one witness, Mr. John Marson, who would produce a copy of the plate which appeared on defendant's house, on which he described himself as a veterinary surgeon, and that of itself was quite sufficient to support a conviction. Authorities showed it was quite clear that the putting up of a plate containing the description of veterinary surgeon was quite sufficient to justify a conviction for a breach of the section. It was not only in the interests of the veterinary surgeons, who were a body of men who had to establish their position and their right to practise at great expense of attending college, and passing examinations, but it was obviously in the interests of the public that their rights should be protected in order that unqualified persons might not attempt to practise the art of veterinary surgery. At any rate, whether an unqualified person did practise or not, he had no right to represent to the public that he was qualified, that was obviously wrong and a forgery, because the persons would naturally assume, seeing a plate of that character on a man's door, that he was duly qualified.

John Marson, Bonehill Road, said there was a plate near defendant's front door, about 18 inches by 15 inches. The inscription on the plate was "Robert H. Rymer" (there was a line underneath that) "late assistant to J. W. Thomas, M.R.C.V.S." (there was another line underneath that), "Veterinary Surgeon." The letters "Robert H. Rymer" were about two inches deep, the next, "late Assistant to J. W. Thomas, M.R.C.V.S.," were in about

one inch lettering; "Veterinary Surgeon" was in the same size letters as "Robert H. Rymer." The plate intended to purport that Robert H. Rymer was a veterinary surgeon. He had searched the Register of Veterinary Surgeons, published by Act of Parliament, and could not find defendant's name in it.

The Register was put in.

Cross-examined: When he went to see the plate he did not see defendant. He had not asked him to take the plate down.

Defendant gave evidence, and said it was wrong to say a man could not practise as a veterinary surgeon. There were as many unqualified men as there were qualified men acting as veterinary surgeons. A man could practise so long as he did not hold himself out to be a veterinary surgeon. That he had never done, he had merely stated that he was late assistant to J. W. Thomas, M.R.C.V.S., veterinary surgeon, so that clients would know him. He gave the order to a man to supply the plate, and he left it to him. If it was wrong he was very sorry. If it was necessary to have it altered or taken down for ever he would have it done.

The Mayor said defendant must know that he had no right to exhibit such a plate.

Defendant: Is there any law to stop me saying I was late assistant to J. W. Thomas?

Mr. Matthews (cross-examining): Do you say you have never held yourself out as a veterinary surgeon?

Defendant: I don't think so.

Will you swear you have not?—No answer.

Mr. Matthews produced to defendant one of his cards, and afterwards handed it to the Bench.

Do you mean to say that card does not hold yourself out to be a veterinary surgeon?—The public all round the country know I am not.

Never mind the public, do you mean to say it does not represent you as a veterinary surgeon?—To some people it might.

Is it possible to hold any other view?—Yes, I think so.

Mr. Matthews produced a bill which defendant admitted he issued. He did not answer whether that bill represented him as a veterinary surgeon.

You sent out that bill, and you know you cannot recover the fees?—Oh yes I can, I can for medicines, if not for the visits.

Mr. Matthews drew the attention of the Bench to the sizes of the type, and said he thought the bill was a more flagrant case than the card. It was palpable that the defendant had represented himself not only on his cards, but on his bills as a veterinary surgeon.

Defendant: It was perfectly well-known I was not a veterinary surgeon in Tamworth.

Mr. Matthews: If it was perfectly well-known you were not a veterinary surgeon, why do you represent yourself to be so?

Defendant: Where at?

Mr. Matthews: On these cards and bills.

Defendant: There might be a little mistake in the printing. I merely held out that I was late assistant to Mr. Thomas. Had I wanted to represent myself as a veterinary surgeon, I should have described myself as R. H. Rymer, veterinary surgeon.

The magistrates consulted, and the Mayor afterwards stated that they considered the case was entirely proved, and that defendant had no right to use those letters at all. He would not have thought a gentleman like himself would have bothered, because he appeared to have some amount of ability at that sort of thing, and was known in the district. They must protect that institution, and defendant would be fined £5 and costs.

Defendant: Thank you, sir.

On the application of Mr. Matthews, the magistrates allowed a witness's fee for Mr. Marson, and an advocate's fee of £2 2s.—*The Herald* (Tamworth).

F.R.C.V.S.—A CORRECTION.

In the list of passes published last week the name Alex. M. Monro should read ALEX. MONRO.

Personal.

MULVEY.—On the 22nd May, at Skansen, Chelmsford, the wife of W.S. Mulvey, F.R.C.V.S., of a daughter.

OBITUARY.

Major DANIEL CHAMBERS PALLIN, late A.V.C., Gillingham, Kent. New Edin: April, 1874.

WILLIAM DUNK ROGERSON, M.R.C.V.S., 360 Richardson Street, Middle Park, Melbourne, Victoria, Australia. Graduated, Lond: Dec., 1867.

Mr. Rogerson died on Dec. 17th, 1911, from pneumonia.

Colonel John Anderson, A.V.D.

A correspondent writes:—

Your announcement last week of the death of Col. John Anderson, A.V.D., brings back memories of that remarkable personality. Known throughout the length and breadth of India, one might almost write Asia, for his extraordinary knowledge of the Arab horse and his enthusiasm for racing, there is one side of his life probably quite unknown to the present generation.

It was in the sixties that a war was being waged in the Antipodes, with an enemy as remarkable for cunning

as ferocity. Two columns were converging on one point, and a message of vital importance had to be sent from one to the other through the heart of the enemy's country. It was John Anderson who volunteered to carry this, and succeeded in getting through and delivering it. He was the first veterinary officer to be mentioned in Despatches, for this act of gallantry could not be officially overlooked. One further fact was never, we believe, referred to by the authorities, but Artillery officers who were present in the New Zealand War will remember that in the storming of one of the enemy's stockades, every man but one was shot down at one of the guns. John Anderson and a sergeant worked the gun between them for the remainder of the day.

You have recorded his extensive war experience, but only those privileged to serve under him know of his enthusiasm and endurance on service. During the Egyptian War of 1882, having remained behind at the Base to complete his arrangements for the sick, he rode across the desert alone during the night, in order to be present at the Battle of Tel-el-Kebir, and provide for the sick and wounded animals of the Indian contingent. His report on this Campaign you published a few months ago.

It will be some years before this remarkable man is forgotten in India. His extraordinary knowledge of horses and racing matters, his absolute integrity, his infectious laughter and gaiety, and the bigness of his heart will long be cherished by his friends—who were legion.

Several communications are unavoidably held over.

Canine Distemper.

PROPHYLAXIS

CANINE DISTEMPER VACCINE PROPHYLACTIC, P.,D. & Co.

A polyvalent vaccine prepared from cultures of several strains of *Bacillus bronchisepticus* (Ferry)—the specific micro-organism of canine distemper.

This vaccine is administered subcutaneously as an immunising agent against canine distemper. It is supplied in sets of three bulbs, which provide a series of graded doses sufficient for one dog.

Price, 4/0 per set.

TREATMENT

CANINE DISTEMPER VACCINE COMBINED (Curative), P.,D. & Co.

Prepared from several strains of *Bacillus bronchisepticus* (Ferry), *Staphylococcus pyogenes* (albus and aureus), and *Streptococcus pyogenes* of canine origin.

This vaccine is administered subcutaneously in all forms of canine distemper and its sequelæ. It is supplied in sets of six bulbs, which provide a series of graded doses for one case.

Price, 7/6 per set.

Further particulars will be sent on request by

APHRODISIAC FOR VETERINARY USE.

PHOSPHRODINE

A compound Elixir of Yohimbehe, Damiana,
Nux Vomica and Phosphorous.

Price, 3/- per pound.

Prepared only by

Telegrams, "Forty.London."

Telephone, London Wall 171
Central 12530

WILLOWS, FRANCIS, BUTLER & THOMPSON
LIMITED,

Wholesale Druggists,

40 ALDERSGATE STREET, LONDON, E.C.

Professional Advertisements.

These will be received up to Thursday morning.
Five lines or under 2/6 (exclusive of heading): for two insertions 4/-; for three 5/-; after three 1/- each.
Each line above five—first insertion 6d; after first 3d.
Average—seven words in a line.

These Advertisements will not be inserted unless prepaid, and if replies are to be received at this office an extra sixpence must be included.

Lincolnshire V.M.A.

A Meeting will be held at the Griffin Hotel, March, on Thursday, June 20th. The chair will be taken by the President, H. H. Truman, Esq., M.R.C.V.S., March, at 2-30 o'clock. Agenda: Routine business. Address by the President. Address and illustrations by S. Stockman Esq., M.R.C.V.S., upon "Contagious Abortion." Members of the profession are cordially invited.

Members are invited to bring forward cases for discussion and to exhibit specimens.

C. W. TOWNSEND, Hon. Sec. & Treas.

Uniform A.V.C.(T.)

FOR SALE. Full dress (silver lace) and mess uniform complete, nearly new; cost £25. Owner transferring to R.F.A.(T.) Address, Sidney Smith, junr. 37 High Street, Lowestoft.

Genuine Practice for Sale

POPULATION 25,000: Vet. Surgeon's place 40 years: Returns £300. No opposition, easily worked, appointments and contracts £50. Splendid house, surgery, stables and kennels combined. Rent £30. Address, 1204 V.R., 20 Fulham Road, London, S.W.

As Assistant or Improver

FINAL year student wishes situation in good mixed practice. Has had good experience in town and country practice. References. Terms, board and lodging Address, 2206 V.R., 20 Fulham Road, London, S.W.

Qualified Assistant Wanted

EXPERIENCED in every branch of practice, probable permanency to suitable man. Salary to commence £160, live out. Apply, W. Woods, F.R.C.V.S., Wigan.

Class C Student

DESIRES situation in country practice near London, for summer. Work for board. Address, 3206 V.R. 20 Fulham Road, London, S.W.

Wanted, Qualified Assistant

MUST be reliable and steady. State salary required, references, height, age, etc. Address, Wynn Lloyd, Carnarvon.

As Assistant

PRACTICAL Veterinary surgeon, post graduate, desires permanency in good country practice, preferably with view to succession shortly. Address, 4206 V.R., 20 Fulham Road, London, S.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,

LOCUM:

73 Victoria Mansions,

South Lambeth Road, S.W.

HUGH R. SINGLETON, M.R.C.V.S.

LOCUM TENENS.

Disengaged July 15th

44, St. Michael's Road.

Bedford.

MR. WALTER G. GREEN, M.R.C.V.S.

"Rosenheim,"

Boscombe Park,
Bournemouth.

Locum Tenens

L. A. F. DAWSON, M.R.C.V.S.,

Address:

The Cottage, Belton,
Uppingham.

Telephone: No. 2, Belton.

Books and Instruments

FOR SALE. Green's Pathology, 7th ed. 5/- William's Pathology, 4th ed. 10/-, Finlay Dun's Materia Medica, 8th ed. 10/-, Balling iron, 2/-, Castrating Clam, (Rack) 7/6, New Docking Machine, 20/-, Firing, Castrating and Docking Irons, 2/- each, Tooth Rasp (guarded) 5/-, Hypodermic Syringe, (3 needles) 5/-, Tooth Forceps (cattle) 2/6. 54 Morbid Specimens in cardboard case, 10/- All above in good condition. W. Rostron, Fence, Burnley

To Veterinary Surgeons

WIDOW of M.R.C.V.S. requires post as canine nurse, dispenser, or clerk. Previous experience. Address, 1068 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

VETERINARY Surgeon with an old established practice in a good hunting and sporting neighbourhood, is desirous of meeting with a practical qualified gentleman with view to partnership and ultimate succession. Terms could be arranged. Address, 1068 V.R. 20 Fulham Road, London, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

R.V.C. Annual Athletic Sports

THE Sports will be held at the Tufnell Park Athletic Ground, on Wednesday, June 12th, at 2 p.m. All members of the profession and their friends are cordially invited. Tickets for admission (free) may be had from
E. BRAYLEY REYNOLDS, Hon. Sec.,
R.V. Coll., Camden Town.

For Sale

OLD established suburban practice, chiefly canine. Convenient premises. Average returns £1000. Open to every investigation. Satisfactory reasons for disposal. Address, 6106 V.R., 20 Fulham Road, S.W.

Wanted

LOCUM from 14th June for about three weeks. Qualified man or practical D student. Address, 7106 V.R., 20 Fulham Road, London, S.W.

As Manager or Assistant

M.R.C.V.S. desires engagement. Extensive experience city, and forge. Highest references. Address, 1062 V.R., 20 Fulham Road, S.W.

Wanted

BY experienced veterinary surgeon a well established town, or town and country practice, doing £700 or more, cash settlement. Particulars in confidence to 1063 V.R., 20 Fulham Road, London, S.W.

To Purchasers

PRACTICES & PARTNERSHIPS for Sale. Messrs. Peacock and Hadley, Veterinary Transfer Agents, 19 Craven Street, Strand, W.C., will be pleased to forward to intending purchasers, who register their requirements, full particulars of anything suitable on their books. No charge to purchasers or for inquiries.

Missing Numbers

OWING to claims for missing numbers reaching us often many weeks after date of issue, we have to notify that claims for non-delivery will not be accepted if the date of origin is later than four weeks from date of due delivery in the case of foreign subscribers, or more than fourteen days after printed date in the case of inland subscribers.

H. & W. BROWN.

CASTRATION.

Barrett's Dressed Castrating Clams cause no Hæmorrhage, Swelling or Stiffness. Two sizes—large and small.

Price, 10/6 per dozen.

Full Directions are sent with all Clams.

Sole Agents:—C. H. HUIH & Co.
12 Red Lion Square, London, W.C.

Telephone—
Central 4639.

"MAGNUM" PESSARIES,

(HEWLETT'S)

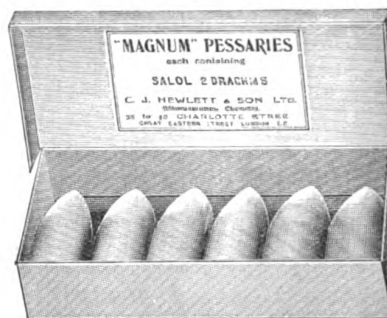

"Magnum" Pessaries are prepared with a medicated non-oily base which is both effective as a Uterine Antiseptic and of special benefit in Parturition both in Cows and Mares.

A "Magnum" Pessary should be inserted directly after parturition in order to maintain the Uterus in a healthy state. It can be inserted with the greatest ease and will keep the parts in a thoroughly antiseptic condition for a lengthy period.

Alkaline "Magnum" Pessaries have recently been recommended to neutralise excessive acidity of Vaginal secretion.

"Magnum" Pessaries are supplied according to various formulæ as below, and Veterinary Surgeons' own formulæ can be made up as required.

"Magnum" Pessaries,		Doz.	12 doz. @	Doz.

Guard for the Eyes for Ponies.

PATENT APPLIED FOR.

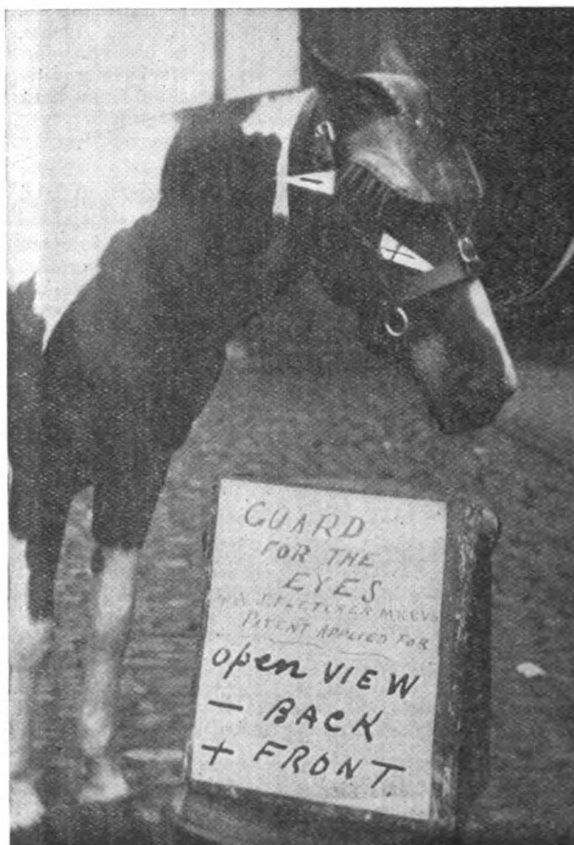

To meet the requirements of the Coal Mines Act 1911, coming into operation on July 1st this year, I have made an attachment that can be fixed to existing bridles.

I consider it an essential that the animal's vision should not be obstructed in the forward and backward view, and as little as possible at the side—to avoid accidents. My guard has been designed for this purpose, leaving a clear anterior and posterior view; further, the strands are arranged at a correct angle and made of material that cannot injure the eye if banged on to it, and, like electric cable wire, can be put back to shape again with the hand. Complete weight 3 lb.

Arrangements can be made for one's own saddler to make.

W. J. FLETCHER, M.R.C.V.S.,

51 Chester Street, Wrexham.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

No. 1248.

JUNE 8, 1912

VOL. XXIV.

THE ANNUAL GENERAL MEETING.

Very little need be said of the Annual General Meeting; but that little must certainly commence with a note of congratulation. The poll was a heavy one—unusually heavy, considering the quiet character of the election—and every candidate elected to the Council is a pledged supporter of the pending Bill. Thus the profession, quietly and almost as a matter of course, has repeated the verdicts of previous years, and again signified its approval of the measure. That approval becomes all the more emphatic from the high polls gained by the candidates most closely identified with the Bill: and will certainly strengthen the hands of its promoters in Parliament.

The discussion upon the Report was quiet, and only two items call for notice. The first—the announcement that £1000 worth of Consols have been sold since the publication of the balance sheet—is certainly depressing. But it will surprise no one who has read and remembered the Report of the last Council meeting; and would certainly supply another argument, were one needed, for the passage of the Bill. The second point relates to the Bill, viz, the suggestion that an attempt should be made to enlist the support of Irish M.Ps. for the measure. Doubtless full weight will be given to this proposal, which may prove a very useful one. Meanwhile, necessarily confining ourselves this week to a brief note upon the strictly business portion of Wednesday's proceedings, we may congratulate Prof. Mettam and the Irish members upon a pleasant and successful Annual General Meeting.

THE "NATIONAL" MEETING, 1912.

The Annual Meeting of the National Veterinary Association will be held in the Town Hall, Manchester, on July 24th and 25th. On the 26th the members are invited by the Lancashire Veterinary Association to an excursion and picnic at Rudyard Lake in Staffordshire.

The papers for consideration are—

Veterinary Education (pre- and post-graduate), by General F. Smith.

Phalangeal Otitis, by Wm. Hunting.

Bovine Tuberculosis, by Prof. Delépine.

Abdominal Surgery in Veterinary Practice, by Prof. Woodruff.

The discussion of the papers will be opened by Prof. Share-Jones, Prof. Macqueen, Prof. Ainsworth Wilson, and Prof. O'Connor.

The headquarters will be the Midland Hotel. This year is the Jubilee of the Lancashire Veterinary Association—the oldest of our local societies—and a full attendance in Manchester might be

anticipated if that event only were to be honoured. With the "National" and its interesting programme we shall expect the meetings in July to make a record. The Local Secretary—Mr. G. H. Locke—will, we feel sure, give any information that may be required, as will the General Secretary.

H.M. INSPECTORS OF HORSES.

Under the Coal Mines Act inspectors of horses in mines are to be appointed. It was expected that veterinary surgeons would have been chosen, but the regulations issued by the Home Office show that an inferior class of person is wanted. The work is to be whole time, the salary £125 a year and retirement at 65 without pension. We much doubt that competent persons will be obtained for the offices, especially as candidates must have had "experience of the care and treatment of animals in mines"—pit horse-keepers?

OUR BENEVOLENT SOCIETIES.

To-day we publish reports of the work of our two benevolent associations—the "Manchester Society" and the Victoria Veterinary Benevolent Fund. The first-named body is also, of course, a defensive union; but at present we only notice the function which is common to both societies, viz., that of benevolence. Between them these two associations conduct the whole of the organised benevolent activity within the profession; and it cannot be said that its sum is creditable to us as a body. The Victoria Society voted little over £150 in relief last year, and the Manchester Society only £103; and in each case the reason is the same. Both Societies would distribute more money if they could; but neither has sufficient to give. Nobody supposes that £250 adequately relieves all the distress existing within our ranks; but, without further support from the profession, the Societies can do no more than they are doing.

A larger membership of these Societies, and a more general interest in their work, would at once help to discover cases deserving of relief which otherwise might remain unknown, and render it possible to assist them—and to do so to more purpose than is now practicable. The grants that can be made at present, however valuable to the recipients, are far from being sufficient in most cases. Ten shillings a week is a small enough sum for a professional man's widow, but even that can only be made possible by an increased support of the Societies by the profession. Every member ought to make a point of subscribing to at least one of these Societies; and the subscription of each is so small that most of us could very well afford to belong to both.

BONY TUMOUR OF THE MAXILLA.

Subject: A Chestnut hackney mare.

At two years old the patient developed, on the outer side of the left inferior maxilla and opposite the position of the 3rd lower molar tooth, a very painful, hard swelling about the size of a goose egg.

The lesion had made its appearance whilst the animal was at the ley and was first seen when the filly was brought up in the early part of October. She was then in very poor condition and had evidently been able to eat only with great difficulty.

At this time I was asked to advise as to treatment. After the application of remedial measures for a few weeks, the acute pain became less evident but the patient still resented any manipulation of the affected part, and masticated food very slowly with the teeth of the opposite side, the head being turned so that the teeth of the left side were carried higher than those of the right. As there appeared to be no reduction in the swelling, a blister of biniodide of mercury was applied, but with no appreciable benefit.

The following summer the mare was cast, and on examining the inside of the mouth it was found that the 3rd temporary molar tooth was ready to be shed. This tooth was removed with the hand. No abnormality appeared to be present in the mouth at that time. The bony enlargement had very much increased in size, and extended to the margin of the masseter muscles and to the inferior border of the ramus, causing a well-marked prominence at this point. The bone was so thickened, too, as to encroach upon the inter-maxillary space.

The point firing iron was applied deeply to the growth, and a biniodide blister again put on. No improvement was observable as the result of treatment, indeed the tumour increased continuously.

It was noticed towards the end of the summer in which the mare had completed her third year that pustules of varying size and in different and remote parts of the lesion made their appearance, burst and discharged a yellow pus.

The possibility of actinomycosis suggested itself to me although the clinical appearances did not quite resemble cases of that disease previously seen in bony tissue. The pustules were not connected with the bone, and a microscopical examination of the pus revealed only staphylococci. The application of a solution of iodine daily for three weeks was followed by a stoppage in the development of the pustules.

The following spring the patient was brought to my infirmary, and I decided to operate on her. She was put down and chloroformed. The skin over the growth was set back, and by means of a large bone saw a piece of bony tissue irregularly circular in outline, about 6 in. diameter and $3\frac{1}{2}$ in. to 4 in. thick in the centre, was removed from the outer side of the lower jaw. It was then seen that within the bony tumour was contained a sharply defined nucleus of much more compact material about the size of a large orange. The line of demarcation between the two structures was very pronounced.

After trephining with a small instrument in three positions on its circumference, the nucleus was easily levered out of its bed with a chisel-like instrument. There was a moderate amount of bleeding from vessels which entered the bony cavity that had enclosed the nucleus, through a foramen near its centre.

On examination of the orifice it was found that by the removal of the nucleus a communication with the mouth had been established in the situation formerly occupied by the 3rd temporary molar tooth, and that the roots of the 2nd and 4th permanent molar teeth had become partially absorbed owing to the pressure exercised by the tumour.

After arresting the hæmorrhage and dressing the wound with antiseptics the mare was allowed to rise.

On the third day after the operation the patient became very lame on the near fore leg, owing to the formation of a large diffuse swelling about 10 inches in diameter which had developed behind the middle third of the scapula. It was very hot, and painful to digital pressure. There was a disinclination to move the limb, and if forced to do so the leg was dragged. Temperature was 104.8. Respiration 34. Pulse 80. Food refused; mare did not lie down.

The following day a similar swelling formed in the left lumbar region.

It was noticed that two papules had developed on the skin near the wound. The next day these contained pus which was collected and examined microscopically and found to contain staphylococci.

An autogenous vaccine was prepared and injected hypodermically.

A reduction of the fever occurred within 24 hours of the application of this remedy. The swellings remained hot and painful but became more circumscribed. Movement was avoided.

On the second day after injection feverish symptoms were further allayed. The patient took a little food.

A reduction of the swelling of the loins and to a slight extent of the enlargement behind the shoulder took place.

Improvement proceeded daily. One week after injection the mare moved about the box fairly well. The swelling of the loins had disappeared, and the enlargement behind the scapula was very small and diffuse, and passed away completely, together with the lameness, three days later.

Seven weeks after operation the wound passage into the mouth was closed. The mare was then turned out to grass, and healing proceeded uninterrupted, but the jaw was very much thickened.

She was then put to work, and when last seen by me—February of this year—the mare was doing well. The thickening of the bone of the jaw had become very greatly reduced.

The composition of the nucleus of the tumour has given rise to much speculation. It has every appearance of being a perverted development of the third permanent molar tooth.

J. P. HEYES, F.R.C.V.S.

FURTHER NOTE ON "AN IMPROVED METHOD IN THE TREATMENT OF CANKER OF THE HORSE'S FOOT."

By A. W. NOEL PILLERS, F.R.C.V.S.

The peculiar interest and comment which my paper, recently delivered before the Central Veterinary Society, has evolved leads me to contribute the following few additional pages upon the subject. I do so with some little hesitation, inasmuch as my interest in the horse's foot is only that of the general practitioner and not of the specialist. The reasons for publishing the original paper were, if possible, to obtain for Mr. J. B. Chadwick the honour of introducing the method there described, and at the same time to show that canker was curable in a comparatively short time when confined to the sole and frogs. The opinion expressed by this latter statement was certainly not generally held when the paper was written. The essay was printed in *The Veterinary Record* for April 27th, 1912 (No. 1242, p. 675, *et seq.*), together with the remarks of those present at the meeting when the paper was discussed. The same number of that journal contained an editorial upon the subject. In *The Veterinary Record* for May 4th, 1912 (No. 1243, p. 689) there appeared an article by "Paracelsus" entitled "The treatment of Canker of the horse's foot," and two letters (p. 698) on "Canker of the horse's foot," by Messrs. T. Aubrey and A. W. Lawson. The following issue of the same journal contained a note by "Scrutator" entitled "The ancient and modern treatment of Canker" (May 11th, No. 1244, p. 704). Roughly speaking, the points raised in the discussion and articles which have since appeared may be grouped under three headings, viz. :—

- (1) That the treatment was not new, but in fact was ancient ;
- (2) That one very respected authority doubted very much whether 20 of the 21 recorded cases were canker at all, and ;
- (3) That the favourable results were obtained by the application of a degree of care and detail not usually bestowed upon these cases.

I propose to consider each of these points in detail, and it is for this purpose that I have again ventured to write upon the subject.

Since reading "Scrutator's" excellent article it is impossible to deny that the method of obtaining pressure described by Budd in 1816 is identical with that mentioned in my paper. The possibility of its recent introduction therefore unfortunately falls to the ground. Perhaps the article by "Paracelsus" also establishes an early claim to this method of applying pressure. The remarks of this last writer would seem to indicate that he has a closer acquaintance with the British Museum than myself. It would certainly have been preferable to have seen his name at the end of an article which depicted a literary style not unknown to readers of *The Veterinary Record*. It is to be hoped that "Paracelsus" has only recently become aware of this ancient method of treating canker, because if it has been in his possession for many years he certainly has taken upon himself the responsibility for the slaughter of many horses which would not have been so treated had he published his knowledge. The title of the original paper was devised to attract the attention of those who possess the means of literary research, and it has borne good fruit. It is upon the evidence of the above two writers that I consider the method has been shown to be an old one, because it does not seem possible for so many practitioners to have used the identical method "over 30 years ago" and yet to have given it up for methods much less satisfactory. The device has been shown to be about 100 years old, but it is nevertheless a good

one, and in the experience of those who have given it a fair trial it appears to be still the most valuable. Incidentally we have learnt that the method of treatment with which we have been accustomed to associate the name of Mr. Malcolm was really devised by another experimenter, *The Veterinary Record*, April 27th, 1912, (No. 1242, p. 685).

Perhaps the most destructive point brought out in the discussion was the possibility of the recorded cases not being genuine canker. Were this true, any real value that might have been attached to two years work and observation would be so much misplaced trust. Unfortunately I did not deem it expedient to go into the subject of symptomatology, and expressed that point in the paper. It occurred to the writer that most of us possessed fairly consistent ideas as to what constituted canker. Assumptions are admittedly dangerous. Each case of canker presents different symptoms, but they all agree, if untreated, in smell ; discharge ; loss of horn ; deformation of frog or sole ; villous-like, fleshy and vascular proliferation of the exposed sensitive structures. In the following list of cases which I am able to record I still consider it inadvisable to mention repeatedly symptoms and clinical pictures which differ only in age and extent. I have, however, added where possible the names of those gentlemen who diagnosed the cases. The risks of including severe cases of thrush has therefore been greatly reduced.

That the satisfactory results mentioned in the last paper were due to great attention to detail has to be admitted, but similar care, in my own case, had always been extended to other recognised systems of treatment. The results of most of my previous cases were gradual extension of the diseased area, and finally slaughter. I can call to mind many cases that so ended which present day experience would certainly have cured. The records of such cases would be valuable for the present note but they are not accessible to me, and moreover one does not feel inclined now to try other less satisfactory methods for the sake of obtaining records. Attention to detail can certainly be paid by most practitioners, especially if they realise that it is time saving in the long run, and capable of yielding satisfactory results. The editorial of *The Veterinary Record* for April 27th, 1912, rightly questions whether other clinicians will experience the same good results as mentioned in my paper. I there gave an account of 13 cures and 2 failures treated by Mr. J. B. Chadwick, together with 5 cures and 1 destruction treated by Mr. J. Abson's assistant, Mr. R. H. Laycock, giving 18 cures out of 21 consecutive cases. Mr. S. E. Sampson, M.R.C.V.S., Sheffield, who has experimented with the method has been good enough to furnish me with his notes of 5 consecutive cases, of which he has cured 4. Mr. J. Abson, F.R.C.V.S., Sheffield, has been kind enough to allow me to publish the progress of his last cured case, the notes of which have been furnished by Mr. R. H. Laycock, M.R.C.V.S. I have added the last case that I have treated which was also cured. Four consecutive members of the profession have been able to carry out the details of the procedure and obtain good results, so that there appears to be no reason why others should not be able to do the same.

APPARATUS REQUIRED.

Nothing further than that mentioned in the previous paper, save that it is essential to have the rolls of tow ready for use before the operation is commenced. They cannot be satisfactorily prepared at the time.

METHOD.

In addition to the description already given it is necessary to clear up one or two points. In the first place it is essential that the pressure be firm and even,

that is, the healthy horn and diseased tissue should occupy the same plane. If the horn projects, pressure on that point will be increased with resulting necrosis of the underlying healthy structures. At the commencement of treatment the pressure on the diseased area will cause its death, but as healthy tissue appears the degree of pressure should be that of horn over sensitive structure.

The longer the diseased sensitive structures are aloof from the influence of pressure, the more villous, vascular and offensive do they become; and conversely, when pressure is applied by means of hard rolls of tow, the more natural do the sole and frog become. At first shreds of tissue can be removed, later caseous material can be cut through, and finally soft horn, followed on section by hæmorrhage, will appear. A bad case passes through these stages fairly quickly, not yielding where it is difficult to apply pressure or making retrogressive changes where this has been slight or omitted.

In my last paper I mentioned one animal with the wall affected that was destroyed, and another that was sold. The cases recorded here also contain a wall infection that was not cured. At present the wall is unsatisfactory to treat, but that difficulty may yet be overcome. It has been my experience, and I am led to believe that others have noticed the same, that cases affecting the wall are those in which treatment of the sole and frog has been neglected, half-hearted or unsatisfactory. It thus happens that the disease has progressed in spite of treatment, or has been brought to the practitioner's notice when the animal could no longer be satisfactorily shod for work. This is often due to the veterinarian's openly expressed hatred of the disease. Early treatment by a suitable pressure obtaining device would prevent this spreading, and wall infection cases would become rarer.

RECORDS OF CASES.

The following notes on seven consecutive cases are instructive:—

Mr. S. E. SAMPSON, M.R.C.V.S., Sheffield.

Case I. Bay Shire gelding, four years old.

Previous history. March 30th, 1911, owner called for thrush dressing. May 27th, animal brought to surgery and affected with canker of near hind foot, all the frog and bars being diseased. Treated consecutively with formalin solution, chromic acid and powdered burnt alum up to Sept. 7th, without satisfactory progress. The lesion had spread considerably and there was lameness.

Lesions. Near hind foot affected on both heels, whole of frog and its junction with the sole.

Diagnosed as Canker by Messrs. J. B. Chadwick, S. E. Sampson, and A. W. Noel Pillers.

Treatment commenced September 7th. Terminated November 2nd, 1911.

Duration of treatment. Eight weeks.

Remarks. Cured. No relapse. Dressed without stocks. Returned to work after about a month's treatment.

Case II. Bay cart mare, eight years old.

Previous history. Affected with canker for about two years. Occasional dressing of formalin solution had been applied.

Lesions. Near hind foot affected on frog and whole of sole except the region of the toe.

Diagnosed as Canker by Mr. S. E. Sampson.

Treatment commenced October 11th. Terminated December 27th, 1911.

Duration of Treatment. Twelve weeks.

Remarks. Cured. No relapse. Dressed without stocks. This animal remained at work throughout treatment.

Case III. Bay Shire gelding, eight years old.

Previous history. First seen on September 19th, 1910, and treated for a month, when the owner gave up treatment. Purchased for experiment October 5th, 1911.

Lesions. Whole of the sole, frog, and sensitive laminae up to the coronary band at the quarters of the off hind foot affected, also whole of frog and part of sole of near fore limb.

Diagnosed as Canker by Messrs. S. E. Sampson and A. W. Noel Pillers.

Treatment commenced October 5th, 1911. Terminated January 1st, 1912.

Duration of treatment. Twelve and half weeks.

Remarks. The fore foot was cured in about eight weeks, but as the horse had become so bad to dress, and having no stocks, he was destroyed. The hind foot was doing excellently, and the wall lesion although bad was much improved. After three weeks treatment the animal went to work.

Case IV. Bay Shire mare, three years old.

Previous history. Treated for about ten months with formalin.

Lesions. Both fore and near hind foot affected. The frog of each foot being diseased; the near fore sole was also affected.

Diagnosed as Canker by Mr. S. E. Sampson.

Treatment commenced October 20th. Terminated December 27th, 1911.

Duration of Treatment. About ten weeks.

Remarks. Cured. Dressed without stocks. No relapse.

Case V. Black gelding, nine years old.

Previous history. Affected for about ten months.

Lesions. Near fore foot affected on the frog and sole up to the wall at both quarters.

Diagnosed as canker by Mr. S. E. Sampson.

Treatment commenced March 3rd. Terminated April 30th, 1912.

Duration of Treatment. About eight weeks.

Remarks. Cured. No relapse to date. Dressed without stocks. Worked throughout treatment, but later became affected on both hind limbs, which were not treated.

General Remarks. Mr. Sampson adds:—"Most cases of canker are curable by Mr. Chadwick's method. Perseverance and determination, together with skilful use of the knife, are nevertheless essential. If pressure is properly applied there is little need of the hot iron or strong caustics, such as nitric and sulphuric acids, in fact they seem contra-indicated. In my cases stocks were not used, and the dressings were not always so regularly carried out as one would have desired."

Mr. J. ABSON, F.R.C.V.S., Sheffield.

Case VI.—Brown van mare, eight years old.

Previous History. None.

Lesions. Whole of frog of near hind foot affected.

Diagnosed as canker by Messrs. J. Abson and R. H. Laycock.

Treatment commenced April 10th. Terminated May 6th, 1912.

Duration of treatment. Barely four weeks.

Remarks. This animal was dressed in stocks and kept at work. Mr. Laycock adds:—"This case went straight ahead from the start, and made a rapid recovery."

Mr. A. W. NOEL PILLERS, Liverpool.

Case VII. Bay Shire gelding, six years old.

Previous History. None Canker was discovered on examining the feet on arrival home.

Lesions. All save the near hind foot affected. The near fore had the whole of the frog, and sole of inside heel and quarter three-quarters length of frog affected.

Also outside heel seat of corn. The off fore was affected on the outside of the frog for its whole length, and the outside heel of sole. The off hind was the worst, being sound only a portion of the sole on each side of the toe.

Diagnosed as canker by the following veterinarians, Messrs. J. R. Barker, T. Eaton Jones, T. Scotson, and A. W. Noel Pillers.

Treatment commenced March 26. Terminated May 31.

Duration of treatment, nine and a half weeks.

Remarks and progress. All the affected feet were dressed in stocks three times a week up to April 13th, when dressings were applied twice weekly. On April 16th the cross irons were found missing from the off hind foot, and marked retrogressive changes were seen when that limb was again dressed. The worst foot (off hind) was completely cured on May 17th, but both fore limbs, although greatly improved, now began to go back. It was found that too great pressure had been employed, and from that time onwards they gradually progressed, being cured on May 31st. The animal remained at work throughout treatment.

CONCLUSIONS.

In the above series of seven cases, representing twelve affected feet, six animals with lesions on ten feet were cured in an average period of about nine weeks.

Addendum.

Since the foregoing was written, two letters on the subject have appeared in the correspondence columns of *The Veterinary Record*, May 18th (No. 1245, pp. 730-732), one entitled "Treatment v. Experiment," by "Diogenes," and another "An Improved Method of Treating Canker," by Mr. Harry Lomas. The latter writer's remarks concerning dates are interesting, but are eclipsed by previous writers. The records of the 50 cases he has treated, together with his methods, would form a most valuable contribution to this subject, and I trust he may be persuaded to publish them in the near future.

ABSTRACTS FROM FOREIGN JOURNALS.

TUBERCULOSIS OF POULTRY.

Raymond and Chrétien, sanitary veterinarians of Paris, say that tuberculosis has now become very common in poultry sent for sale to that city. In 1908, 31 cases were found; in 1909, 63 cases; in 1910, 397 cases; and in 1911 the total rose again to 766 cases. This increasing frequency results partly from an augmentation of the supplies sent from severely infected regions (Holland) and partly from an increased precision in the methods of inspection. The authors, in a long article, treat the subject in great detail; and the following is a summary of the more important points.

The aspect of the plucked bird may and should cause tuberculosis to be suspected. A tuberculous fowl shows emaciation which, though varying in degree, is almost constant in the disease. The muscles, chiefly the pectorals, are emaciated, and the sternum shows a very salient keel. The limbs appear very elongated, as in the case of very young birds. The skin becomes excessively mobile from the disappearance of the fatty tissue, and is sufficiently transparent for the muscles to be seen through it, their colour being a very pale pink. The pileous bulbs are very prominent, and give the epidermis a rugous, sharpened aspect which is

quite special. These characters are significant to an experienced eye, and indicate the necessity for a further examination, which should bear upon the cervical chain of lymphatic glands, the abdominal viscera (liver and spleen), and the articulations.

Description of the Cervical Lymphatic Glands.—There is in birds, on each side of the neck, running the whole length of the jugular veins, a glandular chain formed of from eight to twelve segments. This bi-lateral chain starts from the pharyngeal region and descends along the neck as far as the thyroid body, which is situated in the region of the first rib. Normally the glands of this chain are elongated, slightly oval, reddish grey in colour, very mobile and friable, and of about the size of a small lentil. They are difficult to find in the healthy bird, being imbedded in fat and connective tissue. They must be distinguished from the thymus, which is a paired gland, diffuse, granular, saffron yellow in colour, very adherent to the skin, and having the same relations with the œsophagus, trachea, and jugular veins. Similarly, they must not be confused with the thyroid body, which is placed quite at the base of the neck in the immediate vicinity of the last glandular segment. The thyroid body is larger than the lymphatic gland, and is very swollen at the centre and bright red in colour.

It is certain that this chain of glands is a set of lymphatic organs. If the lymphatic system of a bird is injected at the point of the bifurcation of the thoracic canal, after previously ligaturing its posterior portion, it is seen that each of the anterior branches of the canal communicates respectively with the last gland of each chain, and, further, that each of these glands is in direct relation with that immediately above it by a fine network of lymphatic capillaries.

Histological examination of these glands shows that they are lymphatic organs. One difference, however, exists between their structure and that of mammalian lymphatic glands, viz., the medullary substance is very reduced, while the cortical substance occupies almost the whole of the organ. From this it results that the lymphatic gland of birds is very rich in follicles; and, in each of these follicles, only mononuclear cells exist, to the exclusion of all other lymphatic cells.

Examination of the Abdominal Organs (Liver and Spleen).—The examination of the abdominal organs should be executed in a fashion which will not too greatly diminish the bird's market value if found free from tuberculosis. The authors recommend the following procedure. The bird is placed upon the right side, and the left posterior limb is drawn forwards with the left hand until the femur becomes parallel with the spinal axis. The tibia then forms an angle of about 120° with the femur. The incision to expose the viscera is made just below and parallel to the thigh, starting exactly at the femoro-tibial angle and following the inferior edge of the semitendinosus muscle for about 1.5 in. By separating the lips of the wound the superior edge of the left lobe of the liver and the proventriculus are seen; and, by repelling these slightly downwards and towards the left the spleen is brought clearly to view.

Lesions.—Lymphatic Glands.—In cases of tuberculosis, the glands of the cervical chain, which normally are very slightly apparent, mobile, and fragile in consistence, become more salient, less mobile, and more resistant. They are then easily perceived through the skin in the form of yellowish-white rounded grains, more or less voluminous, and very hard to the touch. When the skin is incised over one of these affected glands, the gland immediately protrudes, and is so hard that the knife cuts it with difficulty. Upon median section, in cases of total degeneration, the tissue is entirely transformed into a caseous solidified mass with thin veins of a yellowish and less consistent material running through it; the whole is enclosed by a thickened capsule. The authors have never found the least trace of calcification. In less advanced cases—at the commencement of the invasion of the gland—soft, yellowish, more or less voluminous tubercles, which are nearly always situated at one of the poles of the gland, are observed. The authors give a histological account of these lesions of the glands, and also of those of the thyroid body and the liver.

Thyroid Body.—The authors have twice found the thyroid partially degenerated, and presenting macroscopic characters identical with those of the tuberculous lymphatic gland.

Liver.—The liver is always invaded in the case of tuberculosis, and its lesions are very variable in their aspect. Sometimes one sees a regular "seed-plot" of small whitish granulations, some almost translucent, clearly defined upon the dark-red ground of the liver. Sometimes, on the contrary, one sees large irregular yellowish-white nodules, which project from the organ and deform it completely. The same diversity of aspect is seen upon section. The organ may be completely strewn with fine granulations at different stages, or it may be traversed by large fibrous bands which are softened in places and enclose large nodular masses between them. In one case of tuberculosis of the turkey, the liver was invaded by irregular bosselated tumours the size of a large walnut, most of which were softened at the centre.

Spleen.—The spleen also is always invaded, and presents the same diversity of lesions as the liver. It may, however, attain enormous dimensions. In one turkey which only showed discrete hepatic lesions, the considerably hypertrophied spleen attained the weight of 610 grammes (nearly 1 1-3rd lb).

Digestive Tract.—Lesions of the digestive apparatus are less frequent. The authors have found them in the proventriculus, the small intestine, the cæca, and the mesenteric glands. Generally they consist of ulcerations of the mucous membrane and an invasion of its different tunics by tuberculous nodules, which project externally, or partially obstruct the lumen of the intestine. The mesenteric glands are very developed, especially in the duodenal loop, where they form a voluminous mass which sometimes unites the two portions of this loop. The nodules of the intestine and the mesenteric glands are always caseous and very rich in bacilli.

Lungs.—When the lesions extend to the lungs they generally form small translucent tubercles, sometimes small caseous conglomerations.

Kidneys.—Sometimes a few caseous lesions, which are always discrete and present no remarkable characters, are found in the kidneys.

Ovary.—The ovary is rarely affected. The few lesions which the authors have observed have consisted of fine caseous nodules situated in the inter-ovular stroma.

Articulations.—Articular lesions are much more common. They are manifested by a variable deformation of the articular region. The osseous prominences diminish or disappear, and the surrounding muscles are pushed back by the articular exudate resulting from chronic inflammation of the synovial membrane. The synovia becomes very abundant, gradually becomes turbid, thickens, and is transformed into a caseous lump free in the cavity of the joint. The internal aspect of the slightly thickened synovial membrane is shagreened and granulating; the epiphyseal cartilages are not altered. The bacilli are always very numerous in the articular exudate and in the granulations of the synovial membrane.

Subcutaneous Lesions.—Twice in the fowl and once in the turkey the authors have found nodular lesions situated in the subcutaneous tissue. The nodules had the size of a large nut, sometimes of a walnut, and were very hard and not adherent to the skin. These masses were constituted by a very consistent caseous lump, in which only a few granular bacilli were found. Situated by preference upon the inferior limbs the nodules seem disposed chaplet-wise; and the authors suggest that they may be isolated lymphatic granulations.

Distribution of Lesions.—The authors give the following figures to show the distribution of lesions in the different organs and regions. Liver and spleen, 766 cases; cervical glands, 164 cases; thyroid, 2 cases; lungs, 23; kidneys, 12; ovary, 3; digestive apparatus, 17; left femoro tibio-patellar joint, 62; right femoro tibio-patellar joint, 3; left scapulo-humeral joint, 10; and right scapulo-humeral joint, 4.

The bacilli are very abundant in all these lesions, and are easily discovered by a simple microscopic examination after staining by Ziehl's method. They are especially numerous in those portions of caseated areas which are undergoing softening.

In the joints, on the other hand, they are especially found in scrapings from the internal aspect of the synovial membrane.

Cultures of the avian bacilli are easily obtained by direct sowing of virulent products upon different media. The glandular and articular lesions are the best for the latter purpose, as the bacilli are generally found there in absolutely pure culture.—(*L'Hygiène de la Viande et du Lait.*)

W. R. C.

RABIES IN A DOG AFTER ANTIRABIC INOCULATION.—RECOVERY. By Prof. M. A. MALCHEV, The Veterinary Institute, Charkov.

In November, 1910, there arrived at the Clinic for small animals attached to the Veterinary Insti-

tute, Charkov, a dog with evident symptoms of rabies. It died in due course, observation during life, control inoculation of its brain, and the discovery of Negri bodies all confirmed the diagnosis.

Another dog belonging to the same owner was isolated and at once inoculated with anti-rabic virus in the Pasteur Institute of the Charkov Medical Association. The inoculations were completed on the 27th November, and on the same day the owner noticed a strangeness about the dog: it appeared excitable, weary, and it vomited. It was removed from home to the clinic, and kept under observation constantly.

On the 29th Nov. careful examination revealed considerable changes in the region of the larynx and pharynx. The eyes were dull and unresponsive. The next day there was a slight drop of the lower jaw, desire to bite at the straw bedding, and difficulty in barking, the eyes became sunken and there was entire loss of consciousness.

On 1st Dec. all the symptoms were more marked; the jaw pendulous, the mouth half open, inability to eat.

2nd Dec. Loss of power and tottering of the legs.

3rd Dec. Complete paralysis of the hind legs, and convulsive contractions of the muscles of the neck.

4th Dec. Loss of power in the front legs, the dog entirely unable to rise. During this day the paralysis of the jaw disappeared, and the dog was able to swallow liquid nourishment. The eyes were more responsive. Defaecation had been suspended, but as the dog lay quiet in the cage an enema was easily administered by means of a long wooden nozzle. This resulted in the passage of a quantity of hard faeces.

5th Dec. Complete paralysis of the legs, insensibility to pricks on the tail or feet. It easily drank liquid nourishment without assistance. The enema was repeated.

7th Dec. Complete paralysis of the hind quarters but slight ability to move the front legs; the dog could not get up. The dog was quiet, barked loudly occasionally, and swallowed easily. Enema repeated.

8th and 9th. The same symptoms.

11th and 12th Dec. Paralysis of the legs beginning to disappear, the dog raised itself on its fore legs and slightly moved its hind quarters. Appetite good, drinks freely. Lies quiet and does not cry as formerly. Enema.

13th and 14th. Paralysis plainly disappearing, natural movement of the bowels.

15th and 16th. Can stand a little on the fore legs but swaying of the hind quarters marked; appetite good, natural defaecation.

17th and 18th. Dog able to stand without swaying and to walk freely, no paralysis. Therefore after three weeks all paralytic symptoms had disappeared, and the animal seemed to have quite recovered from rabies.

23rd. Dog discharged from clinic.

In this case the following point is not clear, viz.: What influence had the rabies on the antirabic inoculation made concurrently?

If we suppose that the dog had become infected under the same conditions as the first dog, or was infected by it, then we must conclude that the antirabic inoculation had a good effect, and was a curative treatment.

If we are to believe the owner, who firmly denies any possibility of infection of the dog which recovered by the first, then we must conclude that the symptoms above described were caused by the antirabic treatment, and that recovery was automatic.

EXAMINATIONS IN SCOTLAND.

At a meeting of the Board of Examiners held in Edinburgh and Glasgow on May 24th for the Written, and on May 28th and 29th for the Oral and Practical Examination, the following gentlemen passed their Final Examination:—

EDINBURGH COLLEGE.

Mr. T. A. McClintock	Mr. J. McAfee
W. Kearney	W. W. Peggie
S. Little	

LIVERPOOL COLLEGE.

Mr. A. W. Allen.

GLASGOW COLLEGE.

Mr. W. H. Macfarlane	Mr. D. Keir
J. L. Taylor	T. M. Menzies
A. S. Ferguson	

The following passed their Third Examination:

EDINBURGH COLLEGE.

Mr. H. E. Jackson	Mr. R. S. Little
G. Atkinson	J. B. Russell
J. Conner	

LONDON COLLEGE.

Mr. K. H. Soutar.

GLASGOW COLLEGE.

Mr. D. Macleod	Mr. J. Dawson
T. Taylor	

The following passed their Second Examination:

EDINBURGH COLLEGE.

Mr. F. Christopher	Mr. D. Marshall
J. D. Tremlett	T. M. Mitchell *
N. Brear	J. J. Plunkett
T. Dalling †	R. Simpson
D. M. Ireland	J. E. Syme
G. C. Lancaster	B. van der Vijver
J. B. Mackie *	

GLASGOW COLLEGE.

Mr. T. M. Timoney	E. E. MacLachlan *
W. Watt	

The following passed their First Examination:

EDINBURGH COLLEGE.

Mr. A. R. C. Bowie	Mr. W. Hay *
B. Philp	C. K. Lomas *
R. Dalling	J. McAllan
J. Edgar *	R. K. Porteous
W. Harley *	J. G. Ross *

LONDON COLLEGE.

Mr. F. J. Andrews *

GLASGOW COLLEGE.

Mr. A. Campbell	Mr. W. Macgregor
J. Robertson	N. A. MacEwan

Marked thus † passed with First Class Honours.

" * " Second "

FRED BULLOCK, Registrar.

THE NATIONAL VETERINARY BENEVOLENT AND MUTUAL DEFENCE SOCIETY.

The annual meeting took place at the Grand Hotel, Manchester, on Thursday, March 21st, at 3 p.m. The President, W. A. Taylor, Esq., in the chair, and Messrs. Woods, Faulkner, Carter, Stent, McKinna, A. Lawson, T. Hopkin, Wolstenholme, Garnett, and Locke (hon. secretary). Apologies were received from Messrs. Hobday, Young, Mason, Shipley, Lindsay and Clarkson.

The PRESIDENT, in a short address, said he would not occupy much of their time, as there were the statements of the Treasurer and Secretary to be presented. As he had on previous occasions said that the Society was one rather of deeds than words, he did not propose to make lengthy remarks. He was glad of the opportunity to vindicate the action of the Council, as complaints had been made that the Society was not doing its best in dispensing benevolence, and was neglecting to advertise itself sufficiently. With regard to the first insinuation he must point out that by the constitution of the Association and its rules the amount of funds at the disposal of the Council was limited, therefore benefactions on a large scale could not be made. Personally he was unaware of a deserving case having ever been denied assistance on proper application.

As to the hint that the Society was not sufficiently advertised, he asked what more could be done? Advertisements appeared, at regular intervals in the veterinary periodicals and the secretaries of local societies were supplied with literature from time to time. If members of the profession would not trouble to read them or avail themselves of the advantages of membership, surely it was no fault of the Association. If there was any laxity it rested with those members of the profession who by their amazing apathy have neglected to become members of the Association. Increase in the number of members meant increased funds, and increased funds would enable us to make larger grants.

He thanked those present for their attendance, which doubtless would have been greater had not the coal strike made railway travelling difficult, and in some cases impossible.

The SECRETARY reported that during the year there had been four Council meetings, and although we had not had a busy year the Society still continued to be of great service to those requiring its assistance.

There had been changes in the Trusteeship, due to the resignation of Messrs. Hopkin and Reynolds, and their position had been taken by Messrs. Sumner and Stent. Mr. Faulkner had been appointed a Life

Governor to represent the Lancashire V.M.A. in the place of the late Mr. S. Locke.

During the year two defence cases were undertaken and won by the Society, and there was at present five cases pending.

The Benevolent branch had eleven names on the books, all receiving various allowances.

The membership remained about the same (260) and it was a matter of amazement why many more did not avail themselves of the great advantage offered.

The HON. TREASURER submitted the balance sheet which, on the proposal of Mr. Lawson, seconded by Mr. McKinna, was received and adopted.

The SECRETARY having read the attendance of members of Council, the following were elected as officers for the ensuing year:

President.—Mr. W. A. Taylor, F.R.C.V.S., Manchester.

Vice-President.—Mr. Wm. Woods, F.R.C.V.S., Wigan.

Hon. Treasurer.—Mr. J. B. Wolstenholme, F.R.C.V.S., Manchester.

Hon. Secretary.—Mr. G. H. Locke, M.R.C.V.S., Manchester.

Council.—Messrs. A. L. Butters, London; J. Clarkson, Garforth, nr. Leeds; E. Faulkner, Manchester; F. W. Garnett, Windermere; Tedbar Hopkin, Manchester; A. Lawson, Manchester; A. W. Mason, Leeds; J. McKinna, Huddersfield; W. Shipley, Yarmouth; E. H. Stent, Manchester; Hy. Sumner, Liverpool; and R. C. Trigger, Newcastle, Staffs.

Auditors.—Messrs. Litton, Pownall and Co., Mr. J. H. Wright, M.R.C.V.S.

Mr. STENT proposed a vote of thanks to the officials for their services during the past year, and Mr. Hopkin seconded. Carried unanimously.

A vote of thanks to the President for conducting the meeting terminated the proceedings.

G. H. LOCKE, Hon. Sec.

VICTORIA VETERINARY BENEVOLENT FUND.

President.—W. Freeman Barrett, M.R.C.V.S.

Vice-Presidents.—P. J. Simpson, F.R.C.V.S., W. Burt, Junr., F.R.C.V.S., H. A. Woodruff, M.R.C.V.S., S. H. Slocock, F.R.C.V.S.

Bankers.—Messrs. Barclay and Co., Ltd., (Great Yarmouth Branch).

Hon. Sec. and Treas.—W. Shipley, F.R.C.V.S., 28 Southtown, Great Yarmouth.

The Council beg to present their report for the year ended 31st March, 1912.

The membership of the Society on the 31st March, 1912, totalled 191, being a net increase of 81 for the year. The subscriptions received, including arrears, amount to £183 17s. 6d., an increase for the year of £70 15s. 6d.

The relief granted amounted to £153 8s., being an increase of £32 over the previous year. Owing principally to the additional membership, increased grants were made in some cases, but it is regrettable that there are still deserving cases which, owing to lack of income, it is impossible to relieve. The amount of income at present available is only £103 15s. 9d., which is insufficient to meet the relief for the next nine months, when the annual subscriptions are due. Every member is, therefore, earnestly appealed to to do what he can to obtain new subscribers, as it is only by this means that the objects of the Society can be obtained.

The Council regrets to report the death of the late President, Mr. Edward Coleman, who always took a keen interest in the welfare of the Society. By his Will, he left the Society a legacy of £1,000 subject to duty, for which the Council is most grateful.

ALFRED H. POWNALL, F.C.A.
J. H. WRIGHT, M.R.C.V.S.

The eight members of the Council who retire by rotation are:—Messrs. F. W. Garnett, F. L. Gooch, T. G. Heatley, F. Hobday, H. A. MacCormack, Sir John M'Fadyean, and W. J. Mulvey, and they have been nominated for re-election. A vacancy occurs on the Council through the retirement of Prof. J. Macqueen, who is unable to attend the meetings. Prof. A. E. Mettam has been duly nominated.

The trustees of the Society are Messrs. W. Shipley, S. Stockman; a third trustee is to be elected in the place of the late Mr. E. Coleman, and the Council recommend Mr. F. W. Garnett, M.R.C.V.S.

The auditors are Messrs. Joseph Woodger, M.R.C.V.S., and Albert E. Lark, chartered accountant. The Council recommend them for re-election.

It is proposed to make the financial year end on the 31st December, instead of March, so as to coincide with the period for which the subscriptions are paid.

The Council fully recognise there is a great work to do and that the members of the profession cannot be aware of the distress that occurs amongst old members and also amongst the widows and children of veterinary surgeons who have died before they have been able to make proper provision for their dependents. It must be apparent that no grant less than 10/- per week can meet the pressing needs of a widow, even if without little children. It is to be hoped in future no grant should be less than that sum. This would entail at present an expenditure on grants alone of £260 per annum, a sum quite impossible with our present income.

In selecting Dublin as the place of our annual general meeting, the Council feel assured that it would be to the advantage of the Fund and to the members of the profession in that country to bring to their notice the good work it is doing. Members of the profession in Ireland are, of course, unaware of our work, or they would not allow us to make grants to applicants there without supporting the Fund. A subscription of 10/6 a year entitles to membership, but when one recalls the facts that we are spending now over £50 a year in Ireland, it will indicate we should have many subscribers there.

The Council feel that, if every member of the fund would endeavour to influence at least one other member of the profession, and point out the good work that is being done, our list should be doubled. It is also desired that subscribers take more individual interest, not only in getting fresh support, but also in investigating cases of distress and reporting to the Council. The Council are aware that many sad cases occur which never come to their notice. The Secretary will be pleased to give any further information.

W. FREEMAN BARRETT, President.

WM. SHIPLEY, Hon. Sec. and Treas.

JOSEPH WOODGER, M.R.C.V.S.

ALBERT E. LARK, F.C.A.

May 23rd, 1912.

} Hon. Auditors.

THE ROYAL (DICK) VETERINARY COLLEGE.

The medals and prizes gained during the past session were presented on Monday, 27th ult., by Mr. C. E. Price, M.P. Mr. A. I. M'Callum, J.P., M.R.C.V.S., presided, and among others on the platform were Sir Robert P. Wright, Chairman of the Board of Agriculture; Councillors Geddes, M'Arthy, Macpherson, and White; Mr. Harry Rawson, Mr. J. Rutherford Hill, and Principal Bradley.

EDINBURGH UNIVERSITY NEW ORDINANCE.

The CHAIRMAN said the outstanding feature of the past Session was that the Ordinance of the University of Edinburgh was passed by the Privy Council without opposition, had received the sanction of the King, and was passed by both Houses of Parliament. (Applause.) He need not tell them that this gave them a new position. They were now affiliated to the University of Edinburgh, and the men who chose to go in for the examination would occupy a position second to none among scientific men. (Applause.) Hitherto the positions that should be occupied in many cases by veterinary surgeons had been occupied by medical men, and the reason given for that was that they were not equipped. Besides carrying through this Ordinance he might mention that the Principal of the College had now been made a University lecturer. Another change that had taken place during the year was that instead of the students having to take a long session of eight months, which was very wearing out as it came near the end, there would be a winter and summer session for the students. He had to congratulate the Principal, the Professors, and the students on a very successful session. With few exceptions, the work had been quite encouraging. In introducing Mr. Price, he might say he was a warm friend of the Royal (Dick) College. He

hoped that his enthusiasm would remain with them when they passed from the old buildings in Clyde Street to the new buildings at Summerhall. The plans had been approved by the Board for the new buildings, and the architect was now putting final touches on, and they hoped before the opening of the Session 1912-13 a beginning would be made with the new buildings.

Mr. PRICE, who was received with applause, alluding to the fact that the College now was affiliated to the University, said they could all of them have an opportunity of taking a higher rank in their profession than ever was the lot of those who preceded them. He felt it was a national disgrace that Scotland could not confer a single veterinary degree, but now with these two degrees—the degree of Bachelor and the degree of Doctor of Veterinary Science—that College stood in the very front rank. There was nothing in the world better than the degrees they were now able to obtain at that College. Of course they must not forget that the inception of this idea was entirely due to their friend Mr. McCallum. (Applause.) He had been working at it to his knowledge for over fifteen years, and though many of the days were dark days, still he never lost faith. Therefore it was a great thing for a man to say, that, having an ideal long before he mentioned it to the Corporation, making the first suggestion when he endowed the Chair of Pathology, he had been able to accomplish this ideal; and he sincerely trusted that this would be an encouragement to the students to lay out for themselves an ideal, and that they would accomplish it as successfully as Mr. McCallum had done. But apart from the matter of getting these two new degrees, Mr. McCallum, as they knew, had taken a great interest in the College, and had contributed very handsomely to the College which was about to be built. (Applause.)

THE BUILDING FUND.

He had been doing all he could to get subscriptions towards the building fund. He thought the men who would be most interested in raising the standard of the veterinary profession and getting a new College erected would be men who were prize-takers at agricultural shows, or, at all events, men who went in for the breeding of prize stock. He took the list of exhibitors at the agricultural show in Edinburgh, and sent a letter himself to each of those exhibitors asking them if they would contribute towards that College. He pointed out to them that they were getting these two new degrees, and that the effect of this would be that it would materially reduce the death-rate among animals, and that they, above all people in the world, would benefit. He regretted to say that so far he had not received a single response in the way of a subscription. They still wanted, he thought, about £4,000 to claim the full amount of £25,000 which they had been able to secure from the Government; and therefore, if these stock-breeders would help them in this, they would be serving themselves as well as the College. Mr. McCallum had referred to the position of the profession so far as the examination of milk and meat was concerned. They were the men who should be able to test everything affecting an animal. It was to them they should look to preserve for them in their cities meat and milk free from tuberculosis.

The prizes were presented by Mr. Price, as follows:—

Junior Anatomy.—Silver medal, J. G. Ross; bronze medal, J. McAllan, M.A.

Biology.—Silver medal, J. McAllan, M.A.; bronze medal, R. Porteous.

Chemistry.—Silver medal, J. McAllan, M.A.; bronze medal, J. G. Ross.

Practical Chemistry.—Bronze medal, J. McAllan, M.A.

Senior Anatomy: Physiology.—Silver medals, T. Dal-ling; bronze medals, R. Simpson.

Practical Anatomy.—Silver medal, T. M. Mitchell.

Histology.—Bronze medal, T. M. Mitchell.

Stable Management.—Silver medal, J. E. Syme; bronze medal, R. Simpson.

Pathology.—Silver medal, R. S. Little; bronze medal, G. Atkinson.

Practical Pathology.—Silver medal, D. Starkey.

Materia Medica.—Silver medal, R. S. Little; bronze medal, G. Atkinson.

Hygiene.—Silver medal, G. Atkinson; bronze medal, R. S. Little.

Medicine: Surgery.—Silver medals, S. Littler; bronze medals, Wm. Kearney.

Obstetrics.—Silver medal, W. W. Pegg; bronze medal, S. Littler.

Clinique.—Silver medal, J. McAfee; bronze medal, S. Littler.

Macfarlane Medal: £20 Prize.—S. Littler.

Silver Medal for Best Essay.—D. R. Williamson.

Silver Medal for the Best Communication.—F. J. L. Croudace.

INCREASE OF PRACTICAL TEACHING.

Prof. BRADLEY, in moving a vote of thanks to Mr. Price, said Mr. Price had always been in very many ways a friend of that institution. He was quite convinced that the whole of the staff of the College had reason to say that the work of the College was now better than ever it was. The teaching was—if he might so express it—much more extensive than it used to be. All the teachers of the College had increased their practical teaching, and an increase of practical teaching was an extremely desirable thing. Furthermore, the staff had been alive to the fact that they were not in the future to prepare men for general practice pure and simple, but that it was necessary to keep a firm hold on the public health side of their teaching. During the past session the teaching of the public health side of their work had increased, and they proposed to extend it a little more. (Applause.) He might say to Mr. Price that the agricultural community was not so absolutely blind to its own interests as perhaps his words might lead one to suppose. It was a considerable indication of the way the agricultural mind was tending when he told them that within the last few weeks no fewer than three agricultural societies—two in Scotland and one in England—had applied to that institution for veterinary surgeons. (Applause.) But further interest resided in the fact that they could not supply them, because, though many were in the habit of saying that the veterinary profession was overstocked, yet it seemed that the veterinary profession was becoming understocked, and if it was understocked at the present moment what was going to happen as soon as municipal bodies and the county authorities had really finished rubbing their eyes? (Applause.)

Mr. PRICE, in acknowledging, said there was no doubt a tremendous future before the veterinary profession, and when they had County Councils and large burghs employing veterinary surgeons they would see there was a great opening for those entering the veterinary profession. The raising of the standard of stock was bound to make the profession a much more lucrative one than it had been in the past.

On the motion of Mr. J. Rutherford Hill, representing the Pharmaceutical Society of Great Britain, a vote of thanks was given to the donors of prizes, and, on the motion of Prof. Giffon, the Chairman was thanked for presiding.—*The Scotsman*.

GLASGOW VETERINARY COLLEGE.

The following medals granted by the Highland and Agricultural Society, the late Prof. Allan Thompson, and Principal McCall, and certificates of merit were awarded in the different branches as follows:

Chemistry.—Medallist and first class certificate, Archibald Campbell; first class certificates, John Robertson and W. A. Macgregor; second class certificates, N. A. MacEwan and John Sturrock.

Biology.—Medallist and first class certificate, N. MacEwan; first class certificate, Archibald Campbell; second class certificates, J. B. Sturrock and Charles M'Pherson.

Junior Anatomy.—Medallist and first class certificate, Archibald Campbell; first class certificate, N. MacEwan; second class certificates, J. B. Sturrock and W. A. Macgregor.

Senior Anatomy.—Medallist and first class certificate, Wm. Watt; first class certificates, Eric E. MacLachlan and T. M. Timoney.

Physiology and Histology.—Medallist and first class certificate, Eric E. MacLachlan; second class certificates, T. M. Timoney and Wm. Watt.

Parasitology.—Medallist and first class certificate, D. Keir; first class certificate, J. L. Taylor; second class certificates, T. Menzies and A. S. Ferguson.

Anatomy.—Allan Thomson gold medal for the best professional examination, Eric E. MacLachlan.

Stable Management.—Medallist, Eric E. MacLachlan.

Materia Medica and Therapeutics.—Medallist and first class certificate, E. F. Angler; first class certificates, Tom T. Taylor, and James M. Dawson; second class certificate, Q. A. Stewart.

Pathology and Bacteriology.—Medallist and first class certificate, E. F. Angler; first class certificate, T. T. Taylor; second class certificates, James M. Dawson and Q. A. Stewart.

Hygiene and Dietetics.—Medallist and first class certificate, Tom T. Taylor; first class certificate, E. F. Angler; second class certificate, James M. Dawson.

Veterinary Surgery, Obstetrics, and Shoeing (written examination).—Medallist and first class certificate, David Kerr; first class certificate, J. L. Taylor; second class certificates, Wm. Macfarlane and Thomass Menzies.

Veterinary Medicine (written examination).—Medallist and first class certificate, D. Keir; first class certificate, A. S. Ferguson; second class certificates, J. L. Taylor and R. M. Lawson.

Practical examination of horses as to age, soundness, operations, etc., David Keir.

Practical examination of cattle and sheep as to age, soundness, operations, etc., D. Kerr.

COAL MINES ACT, 1911.

APPOINTMENT OF H.M. INSPECTORS OF HORSES.

1. Section 109 of the Coal Mines Act provides that the Secretary of State shall appoint fit persons to be special Inspectors for the purpose of examining into the care and treatment of the horses and other animals used in mines, and of enforcing the provisions of the Act relating to horses and other animals, particularly the provisions of the Third Schedule to the Act which are printed on page 3 of this Memorandum.

2. Six Inspectors of Horses will be appointed, one for each of the Divisions into which the United Kingdom will ultimately be divided for the purpose of inspection under the Coal Mines Act.

3. The salary of the Inspectors of Horses is £125, rising by £5 a year to £175.

4. The Inspectors of Horses will be appointed by the Home Secretary on the advice of the Board for Mining Examinations. Before appointment they will have to satisfy the Civil Service Commissioners in a qualifying examination that they have a sufficient general education. The subjects of the examination are stated below.

5. Candidates must be thoroughly experienced in the care and treatment of horses and other animals in mines, and must have had practical acquaintance with the conditions under which work is carried on underground.

6. The prescribed age for candidates for these Inspectorships at the time of examination is between 30 and 40 years. No exception can be made to this rule.

7. The subjects of the qualifying examination are:—

- (i) Spelling and handwriting.
- (ii) English composition (ability to write a simple and intelligible report to a superior officer).
- (iii) Arithmetic (first four rules, simple and compound, vulgar and decimal fractions).

8. The fee for the examination is 10s.

9. A candidate is further required, before he can be appointed, to satisfy the Civil Service Commissioners as to his good character, and that his age is within the prescribed limits, and that he is physically fit for the work.

10. An Inspector upon first appointment is subject to two years' probation. He must give his whole time to the official duties assigned to him, and he may be called on to reside in any part of the United Kingdom. Travelling expenses are paid.

11. An Inspector's tenure of office, increments of salary, and pension, are dependent on good conduct and efficient service. Inspectors may be called on to retire at 60 years of age, and retire in any case at 65.

12. Applications for appointment should be made on the enclosed form, which must be filled up carefully in the applicant's own handwriting, and should be accompanied by one or two testimonials based upon personal knowledge of the candidate, indicating the nature of his experience, and giving information as to his character and fitness for the appointment. The form when filled in should be returned direct to the Private Secretary, Home Office. All applications will be considered impartially on their merits. No recommendations or testimonials are considered unless based on personal knowledge of the candidate's character and attainments. *Candidates are therefore particularly advised in their own interest not to seek political or social influence, which will prejudice rather than assist the candidature.*

Home Office, May, 1912.

Prosecution by the R.C.V.S.

At Droxford Petty Sessions, on Thursday, May 23, before Mr. W. H. Myers (Chairman) and other Magistrates.

Harry W. White, of Wickham, appeared to an information laid on behalf of the Royal College of Veterinary Surgeons "for that he, not being on the Register of Veterinary Surgeons, and not holding at the time of the passing of the Veterinary Surgeons Act, 1881, the veterinary certificate of the Highland and Agricultural Society of Scotland, did, on the 9th March last, at Swanmore House Farm, Bishop's Waltham, unlawfully use and take an addition and description, to wit, a duly qualified veterinary surgeon contrary to Section 17 of the said Act."

Defendant appeared, and admitted unintentionally signing a certificate relative to the condition of a certain animal.

A fine of £1 and £1 7s. 6d. costs was imposed.—Mr. Cromwell Prior prosecuted.—Mr. Myers did not adjudicate in this case.—*The Evening News*, Portsmouth.

Royal College of Veterinary Surgeons.

ANNUAL MEETING.

The sixty-ninth annual general meeting was held in Dublin for the first time on Wednesday, 15th of June. The President, Prof. A. E. Mettam, B.Sc., M.R.C.V.S., presided, and the members present were:—Messrs. George A. Banham, J. H. Carter, George A. Banham, J. H. Carter, Sydney Slocock, W. Shipley, H. Sumner, Frank W. Garnett, George F. Banham, W. Cargill Patrick, Richard Roberts, J. Moore, J. M'Kenny, P. D. Ready, J. J. O'Connor, J. F. Craig, W. Ashe Young, F. Collett Ryan, F. A. Heney, A. J. Moffett, G. N. S. Jarratt, J. V. Daly (Royal Irish Constabulary), Jas. Dawson, J. N. Norris, S. T. Groome, P. J. Howard, D. S. Prentice, F. Kerr, J. J. G. Keppel, W. T. M. Browne, and J. J. Kelly. Mr. G. Thatcher, Solicitor; and Mr. Fred Bullock, Secretary.

The notice convening the meeting was read by the Secretary, Mr. Fred Bullock.

The CHAIRMAN, in opening the proceedings, said: In the first place permit me to welcome all those English gentlemen to the sixty-ninth annual meeting of the Royal College of Veterinary Surgeons, held in Dublin for the first time.

The SECRETARY read the minutes of the previous meeting, which were adopted unanimously.

Letters of apology for non-attendance were received from Sir John M'Fadyean, W. J. Mulvey, R. C. Trigger, S. Villar.

The SECRETARY announced the ballot of members who were elected to the Council in June, 1912, as follows: Sir J. M'Fadyean, 1245 votes; Messrs. R. C. Trigger, 1087; F. W. Garnett, 1072; Major-General H. Thomson, 934; J. T. Share-Jones, 928; J. Clarkson, 912; Major-General R. Pringle, 837; T. Salusbury Price, 761; and W. Burt, 759.

The CHAIRMAN: You have heard the declaration of the poll read by the Secretary: it is therefore my duty to declare them elected for four years of office. (App.) As is customary eight members retire annually, but owing to the decease of Professor Williams last year there was an additional vacancy on the Council. The practice in the past was to take a ballot in order to select

a person to fill the position for the remainder of the period in which Prof. Williams would have remained in office.

As the result of the ballot taken, Mr. T. Salusbury Price was elected in the room of the late Prof. Williams, to remain in office until next year.

Mr. RICHARD ROBERTS, Vice president, proposed a vote of thanks to the Scrutineers. He said it was a very arduous duty, and he was sure that they heartily deserved the vote of thanks.

Mr. F. W. GARNETT seconded the motion, which was passed.

Mr. SYDNEY H. SLOCOCK proposed the reception of the annual report and statement of accounts, which was seconded by Mr. McKenny, and unanimously passed.

The CHAIRMAN: The report is now open for discussion. I understand you have all received copies of the report. It was usual to discuss it taking it page by page. Pages 1 and 2 practically included revision of the bye-laws. They had been revised by Committee and passed by the Council. It was virtually only a matter of re-arrangement and codification, and not a question of alterations.

The Chairman was passing on to deal with the next page when Mr. M'Kenny suggested he was going through the report rather too quickly, as they had not time to read it.

The CHAIRMAN: The report has been in your hands some weeks which should have given you plenty of time for reading it. Proceeding, the Chairman said page 3 referred to Fellowship degrees, the results of the professional examinations for membership and the Walley Memorial Prize. It also referred to the Fitzwygram Competition, which is open to students of the Veterinary colleges, and the result was determined by the total marks of the students in the four professional examinations. Having referred to the Williams Memorial Prize, the Chairman said that the important feature of page 4 was the report of the Registration Committee. This was a very abbreviated report in comparison with the amount of work done by the Committee. (Hear, hear.) The Committee had to deal with all the complaints brought before the Council relating to the work of the profession, as well as with complaints dealing with outside persons coming in on the domain of the profession. It was essentially the penal committee of their profession. Dealing with the record of work of the Parliamentary committee he said that this report also did not fully indicate the duties covered by that committee, and

could not be taken as a criterion of the work accomplished.

The Chairman referred to a case concerning the use of armorial bearings. He said that a member was sued for using the arms of the College; the case was taken to a higher court and lost. As Mr. Thatcher (solicitor) reminded them, the case was fought against the London County Council, and contrary to the advice of their own Counsel.

Mr. HOWARD: With your permission I should like to refer to the work of the Registration Committee. Last year members of the Irish Veterinary Association sent the name of a student to that Committee to have his conduct considered, inasmuch as he had his name advertised as a veterinary surgeon. They had his name brought before the Committee in order that it might deal with the student in a fitting manner. I may say, however, we have been very disappointed with the Registration Committee for not having dealt with the student. The student managed to get some friend of his to say that he had not advertised himself as a veterinary surgeon, and the Committee, in the face of our representations, let him get off free. The student had done considerable mischief in the district, and the Irish practitioners are very annoyed at the action of the Committee.

Mr. McKENNY: It is most unsatisfactory, and I am of the opinion that the matter should be referred back again to the Committee. It is a case which could be proved up to the hilt. You have all the evidence, and you simply take one letter and dismiss all the other evidence before you. I believe it is a matter which should be taken up by this Council.

Mr. REAVY said that as a matter of fact he recollected seeing the man's photograph in a paper, and he had attended at hotels in two different towns. He (the speaker) had tried to get evidence, but was blocked by the police. If the matter came up again they could get evidence.

Mr. NORRIS: I was one of the members of the Council of our Society, and my impression is that we were unable to furnish the Registration Committee with sufficient evidence for them to proceed in the matter. I certainly do not consider the Registration Committee was to blame, as it could not work without evidence. An effort was to have been made by my own Association to get sufficient evidence, but I do not know whether it was done.

The CHAIRMAN: In reply to the discussion, I would say that the Registration Committee always goes fully into the evidence brought before it. The evidence in this case was insufficient, and as Mr. Norris has said, it was true further evidence was to have been laid before the Committee, but that was not forthcoming, and the Committee did not get any additional information.

Referring to the Parliamentary Committee the Chairman stated: I may say, for the information of the members present, the duty of the Parliamentary Committee consists of looking after the interests of the profession so far as they are concerned in Bills brought up in Parliament, as I have already said the work is very arduous and exacting, and is not by any means fully represented in the report.

You will see in the report the reference made to Clause 3 in the Coal Mines Bill in regard to the inspection of horses working underground. The Committee has influenced the Home office, which has promised that the Council will be consulted in the matter.

Another instance of the work of the Parliamentary Committee is the paragraph dealing with Patent Medicines and Secret Remedies. There is a Committee in the House of Commons to consider Patent Medicines and Secret Remedies, and your Council has instructed me to represent your profession and give evidence before that Committee.

Mr. McKENNY: It is an extraordinary thing, because anyone can learn what are the constituents of a patent medicine by paying eightpence. But it is not proposed to stop at patent medicines, but to go further and deal with secret remedies. Well, it is difficult to see where that would end; if such a law is passed it will not end there, but will affect every individual. At the present time there is a growing idea that medicines have a very limited effect on patients. That view is not only held with regard to our own profession, but also with regard to the medical profession, and I will say without the slightest hesitation that it shows a great weakness on our part if such is the case. I deny it entirely. The use of patent medicines is extending daily. (Hear, hear.) In regard to the study of medicine it is no use inflicting on students such a task if in practice it is to be useless. It would be useless if their medicines had no serious or tangible effect upon horses. Each druggist at the present moment, and a great many medical men as well, are employing wholesale "made-up" preparations, and I believe that is due to the fact that the old time habit of making up prescriptions is dying out, and I have not the slightest hesitation in saying that if an ailing horse were to present itself before us now—(Laughter)—there would be few among those who hold the opinion I allude to, that would be capable of writing a proper prescription for treatment of the animal's ailment. I trust that the evil which has been done will be undone. I have some secret preparations—(Laughter)—myself, and I have no intention of letting the whole profession or anybody else get them. (Renewed laughter.) I have had the pleasure and the privilege of serving five years in a laboratory, and I know what I am speaking about, and I know that drugs are not understood by a large number because they have not got the knowledge that I have. (Loud laughter.) The preparations that I have alluded to are most magnificent preparations from a scientific point of view. (Laughter.) [A Voice: Order, you are advertising.] Mr. McKENNY: I have not mentioned what they are. (Laughter.) Instead of doing away with it, we want veterinary surgeons to study it and to compete with druggists. I hope this will never be allowed to throw back this profession. (Hear, hear.)

The CHAIRMAN: The last paragraph on page 5 deals with the Veterinary Surgeons Act Amendment Bill, which is of immense importance to all of us. I am sorry to say that I have heard from Mr. Thatcher that the Bill has not yet been reached, and that we are still, as it were, marking time so far as the passing of the measure is concerned. We are "living in hopes, though we may die in despair." It is absolutely necessary in the interests of the profession that this Bill should be made law as early as possible. It seems to be rather an anomaly that the Imperial Parliament should find such difficulty in passing a Bill which may be termed a local or family Bill, inasmuch as it only affects members of the profession. The money which the College has, and was able to save in the year over and above its absolutely necessary expenses, is spent by the Registration Committee in the protection of the interests of the College, and our hands are cramped by the fact that we are unable to get sufficient money to conduct the College as it should be conducted. It is coming to a serious pass when we cannot get the Bill through. The last election of the Council was an emphatic declaration in favour of the Bill. I believe I can say that the profession, as a whole, regards the Bill favourably, and, in the last election, the opposition was completely defeated, and those in favour got in, headed by Sir John M'Fadyean as highest on the list, with the heaviest voting recorded in our history, except in 1896 when there was another very important matter to be decided. I therefore hope that influence will be brought to bear with a view to getting the Bill passed as soon as possible,

so as to enable the College to obtain the resources so essential to its thorough well-being. (Applause).

Mr. J. J. KELLY: I would like to inquire who has charge of the Bill in Parliament?

Mr. THATCHER replied that it was in charge of Sir Frederick Lowe, the Right Hon. W. Hayes Fisher and Captain Jessel.

Mr. KELLY: The reason I asked the question is that I believe there is a number of practitioners in Ireland who have a very considerable influence with the various members of Parliament in Ireland. By the exercise of their influence they may be able to carry more weight with the Government in getting the Bill through Parliament. I think as the Irish Party has very powerful influence at present, that with judicious handling of that power they may be able to press forward the Bill.

The CHAIRMAN: I am sure the members will be sorry to hear that it is found necessary to sell out £1,000 worth of Consols, so that instead of £7,000 invested in Consols we have now only £6,100. £2,000 have been sold out within the past two years. This again shows how necessary it is that we should have our Bill made law. (Hear hear).

On page 8 you will see that a special Sub-committee has been appointed to consider the Syllabuses of Examinations for the Membership Diploma. The present syllabus has been in existence for twelve years, and it is quite time to have it revised. The Committee has not yet reported in full.

On the same page it is shown that an application has been received from the University of Melbourne for the recognition of their Diploma of Bachelor of Veterinary Science. The University has been informed as to the condition on which such a diploma can be recognised.

Mr. McKENNY thought the Council should be very judicious in their reply.

The CHAIRMAN: I can assure Mr. McKenny that the reply, which has been sent will even satisfy his cautious mind.

The CHAIRMAN drew particular attention to the last paragraph of the report stating "The next edition of the Register of Veterinary Surgeons will be published early in 1913, and members are requested to communicate to the Registrar all necessary changes not later than 31st December next."

On the motion of Mr. J. H. CARTER (Burnley) seconded by Mr. W. C. PATRICK (Mullingar), the report was unanimously adopted.

Mr. ROBERTS, Vice-President, moved a vote of thanks to the Chairman. He said he was sure they were all delighted to see him in the position he now occupied. (Hear hear).

Mr. HOWARD, in seconding the motion, said they in Ireland were very proud that an Irishman (for so he believed he might call him) had been elected President, the most important position which the Council could confer on him.

Mr. McKENNY: There is a little matter I should like to mention—

The CHAIRMAN: If you don't mind, I think the business of the meeting is over. (Hear, hear).

Mr. McKENNY: There are a number of veterinary surgeons here, and I think—

The CHAIRMAN: I cannot allow you to open the meeting again. (Hear, hear).

The vote of thanks having been carried unanimously,

The CHAIRMAN, in reply thanked them cordially for the vote of thanks, and said that in his position as President of the Council it would be his duty to look after the interests of veterinary surgeons in Great Britain and Ireland, in the Colonies, and in foreign countries, for, indeed, members of their profession were all over the world now, and they had graduates of the College in all quarters of the earth. When, however, he fell back to

the position of a member of the Council he would consider it his duty to consider specifically the interests of the practitioners in Ireland, his adopted country. (Applause).

The meeting then concluded.

Foot-and-Mouth Disease.

The Report of the Departmental Committee has been published. The Committee was constituted as follows: The Right Hon. Sir Ailwyn Fellowes, K.C.V.O.; Sir C. D. Rose, M.P.; Sir Harry C. W. Verney, M.P.; Sir J. Bowen Bowen-Jones, Mr. Charles Bathurst, M.P.; Mr. William Field, M.P.; Mr. John Hinds, M.P.; Mr. G. R. Lane-Fox, M.P.; Mr. Richardson Carr, Major E. M. Dunne, Mr. E. E. Morrison, and Mr. E. M. Nunneley. Sir Ailwyn Fellowes was Chairman, and Mr. W. H. F. Landon acted as secretary, and all sign the report without any reservation or supplementary statement. The Committee exceeded the limits specified to the extent of including investigations concerning anthrax on the ground that infection in both cases may be carried through similar channels and be subject to the same preventive measures.

Evidence was heard from 32 witnesses, representing the veterinary profession, stockowners, and shipping firms. In addition to Sir John McFadyen and Mr. Stockman, Chief Veterinary Officer of the Board of Agriculture, and other prominent British veterinary authorities, Dr. Bang, Chief Veterinary Officer to the Minister of Agriculture in Denmark, and Dr. de Jong, who holds a similar appointment in Holland, gave evidence before the Committee. Among the agricultural witnesses were two of the farmers whose stock were affected by the recent outbreaks.—*The Times*.

London Cart Horse Parade Society.

The twenty-seventh parade was held in Regent's Park on Monday, May 27th. Although there were some misgivings as to the effect the carters' strike might have upon the function, there was in reality nothing to complain about on that score. Five hundred and ninety-one drivers, in charge of 696 horses, entered for competition, the numbers in the various sections being as follows:—Single horses (two wheels), 22; single horses (four wheels), 437; pairs, 74; teams of three, 23; teams of four, 5. This compares well with the 644 horses and 507 men who took part in last year's parade. The event was a splendid success. The great majority of the horses were in such first-rate condition that only one award—the red rosette—was possible, and blue and white rosettes were at a discount. Besides these there were special prizes given by the Shire Horse Society for the best horses, irrespective of breed, and by the Suffolk Horse Society, for the finest animals of the Suffolk breed. The whole turn-out, horse, van, harness, and general appearance—was taken into account in their award. A red rosette carried with it not only a substantial money prize, but a brass plate to attach to the harness, a certificate from the R.S.P.C.A. that the driver had treated his horse with especial care. Long service awards to the drivers were also made, and the veterans received a great ovation. Forty-five years with their respective firms were the records of John Spencer and William Hinton, forty-four years that of Dan Howe, and there were seventeen others who had served the same masters for periods ranging from forty years down to a quarter of a century.

On the same day the sixth annual parade of commercial motor vehicles took place in the neighbourhood of Grosvenor Road, when there were 275 entries, or 117 fewer than last year, when, too, in view of the Coronation, special inducements were offered. In point of merit, however, there was no falling away.—*Horse and Hand*.

Alleged Cruelty.—Contradictory Evidence.

Wm. Day, a market gardener, of Queen Hythe Farm, Jacobs Wells, was charged at the Borough Police Court, on Wednesday, with cruelty to a horse by working it when in an unfit state on May 28th.

P.C. Pinner deposed to seeing defendant with the horse attached to a cart in Chertsey Street on Tuesday morning. It was going very lame, and its hocks were very much swollen. When he charged defendant he replied: "I did not know it was lame and I was only leading it."

Inspector Bishop, of the R.S.P.C.A., said that the animal was in poor condition. The lameness was due to diseased hocks, and the animal was past work and only fit to be killed.

Mr. E. G. Robertson, veterinary surgeon, said it was cruelty to work the horse, which was suffering from bone spavin.

For the defence, Mr. W. R. Emery, veterinary surgeon, said he found no indication of heat or pain about the animal's hocks. It was only a little stiff in the joints, and in his opinion, was quite fit for work. There was no disease.

Alderman Baker: There are many horses in the same condition in the town which are working regularly?

Mr. Emery: Yes; scores of them.

The Mayor, after the magistrates had seen the animal, said they considered it a very bad case. He would be fined £1, and would have to pay the veterinary inspector's fee of 10/6. They ordered that the horse should be destroyed.

[Presumably this cutting is from a Guildford newspaper, since there is a Godalming advertisement on the back of it. The covering note is signed "A lover of animals, etc."]

We would call the sender's attention to the following notices, which have repeatedly appeared in our pages for years past:—

Original articles and reports should be written on one side of the paper only and authenticated by the names and addresses of the writers, not necessarily for publication.

SCRAPS which cannot readily be authenticated either as to origin or date, frequently give unnecessary trouble. A convenient method is to send the page of the newspaper containing the marked paragraph in an unsealed envelope. Postage $\frac{1}{2}$ d.

Chelmsford Town Council have appointed a veterinary surgeon at a salary of £150 a year, among his duties to be that of inspecting and examining all the cows and cowsheds in the borough, taking samples of milk from cows when considered advisable, attending the market, and acting generally as professional adviser to the Council in all matters relating to animals.—*East Essex and Halstead Times*.

ARMY VETERINARY SERVICE.

Extract from *London Gazette*.

WAR OFFICE, WHITEHALL, June 4.

TERRITORIAL FORCE. IMPERIAL YEOMANRY.

North of Ireland. Vet.-Lieut. J. M. Magill resigns his commission. Dated June 5.

Major Daniel C. Pallin.

We regret to report the death on 29th May, at Gillingham, Kent, of Major Daniel C. Pallin, retired pay.

Major Pallin was born on March 6th, 1850, graduated April 16th, 1874. Joined the Army April 21st, 1877,

and Gazetted to the Royal Horse Artillery, was transferred to 14th Hussars April 30th, 1879, and to the Army Veterinary Department in April, 1881.

He served in the South African War, 1881, Transvaal Campaign, and the South African War 1900 to 1901 as Senior Veterinary Officer 1st Division. Was present at the advance on Kimberley, including action at Magersfontein, Operations in Orange River Colony, May to November, 1900, including actions at Lindley (June 1st) and Rhenoster River. Queen's South African medal with three clasps.

OBITUARY.

ROBERT WM. POWELL, M.R.C.V.S., Sheffield, Beds.

Graduated, Edin: April, 1881.

Mr. Powell died on May 31st, from broncho-pneumonia supervening malignant growth. Aged 57 years.

Re CURRENT TOPICS.

Sir,

Greatly as one would deplore the extinction of one's *Alma mater*, there is much in Mr. Gray's indictment that cannot be contradicted, and at the recent discussion at the Central Veterinary Society a very poor attempt was made to vindicate the policy of the Royal Veterinary College. The College is undoubtedly guilty of underselling, and, what is even worse, of advertising its cheap practice, which, coming from so high a quarter, naturally attracts the public and takes the bread out of the mouths of her late students, ignoring the high ideals preached and insisted on by the R.C.V.S.

Why cannot the teaching schools accept the situation, which is an undoubted fact—that by the advent of motors and electric traction more than one-half of the earnings of the V.S. is gone, never to return, and that for some years to come there will be fewer and fewer students; let them reduce expenses, wait better times—times when we shall really be in a position to be considered worthy to occupy those posts now filled by medical men and others; in the meantime it would be only generous and fair for the teaching schools to confine themselves to teaching alone, combined with cheap practice gratuitously given to the really poor.

Bearing on the foregoing subject is that of unqualified assistants. I was much gratified to notice that at a recent Council meeting Sir John M'Fadyean spoke very strongly on this matter, emphasising the fact that had prominence been given in the forthcoming Bill to this question of unqualified assistantship, it might have met with more approbation. Of course it is difficult to limit the duties of the unqualified, but surely our Council is capable of drawing up a list of operations, etc., which the unqualified assistant should not perform. This question of the "unqualified" has another unfortunate aspect, the "unqualified" keep out the "qualified" from earning their due, and so increase the already overcrowded unemployed.

Apropos of reduction of horse-practice, I have within the last two years met men who have been in capital practices in London all their lives whose incomes have been reduced by more than one-third.

In conclusion, there are a few things in the Annual Report which will bear discussion (that of apprenticeship is important), and I do hope that our Irish members will show more enthusiasm in the yearly meeting than our English do, and show by their numbers that they take interest in the politics and welfare of the profession. In the balance-sheet I notice very large sums for law expenses, salaries, printing, sundries, etc.; with the troubled finances of the College, I should have supposed those might have been reduced, but of course I do not know, and plead being a bad "cashier." I must apologise for this letter, which, had I been in a position to have attended the Annual Meeting, I should not have troubled you with.—Yours, etc.,

HENRY DYER.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1249.

JUNE 15, 1912

VOL. XXIV.

REPORT OF THE DEPARTMENTAL COMMITTEE UPON FOOT-AND-MOUTH DISEASE.

This Report appeared with commendable celerity, and may now be obtained at the cost of 1½d. Veterinary surgeons will find it worth reading, especially with regard to the ultimate possibilities arising from some of its suggestions and recommendations.

A short history of foot-and-mouth disease in this country is given, and the present knowledge of the affection is very briefly sketched. Nothing new has been brought forward upon the latter subject, except that the Committee have received some evidence indicating that the virus may live longer outside the body than is usually supposed—a by no means unimportant point. The Committee emphasise the importance of gaining more exact knowledge of the disease; and here it is satisfactory to find a recommendation that the enquiry now being instituted in India should receive liberal aid from the Treasury.

A proposal to establish an experimental station to study the disease in this country or upon an adjacent island has been considered, and is condemned as constituting a permanent danger from infection. The next sentence deserves quotation in full. "The Committee, however, suggest that mutual benefit might result from the establishment elsewhere of an international experimental station fully equipped for research in diseases of animals, and they strongly recommend that continental, and possibly other, countries should be approached with a view to co-operation in this matter." Suggestions for international co-operation, indeed, form a feature of the Report. Further on the Committee urge that foot-and-mouth disease should receive serious consideration at the International Veterinary Congress of 1914, especially with a view to the institution of joint action by the Governments of infected countries.

No great immediate change of action against the disease itself is recommended. The introduction of preventive inoculation in the area around an outbreak, in order to lessen the number of animals slaughtered, is suggested as worthy of consideration by the Board of Agriculture, but not directly advised. The possible objections to such methods are recognised; and a further useful recommendation is added—that the Board should be empowered to supervise and if necessary to prohibit inoculations and experiments with dangerous viruses.

As regards the prevention of the importation of disease, the Committee have evidently been baffled by the old stumbling block—the prohibitive interference with trade that would result from the exclusion of all articles capable of being media of

contagion. A list of the articles most open to suspicion is given, and a variety of recommendations made with a view to minimising their danger.

Special attention is given to the sterilization of hides and skins, and here again international co-operation is suggested. The Committee propose that Great Britain should take the initiative in an attempt to devise and arrange methods of uniform international action, and suggest that the first steps to this end should be taken by the Board of Trade. Other diseases than foot and mouth, notably anthrax, are of course involved in this question of sterilization.

Towards the conclusion of the Report, we find some very important expressions of opinion upon veterinary inspection. The advanced pathological and epizootical knowledge necessary to a veterinary inspector is emphasized, and the Committee urge the speedy establishment of a post graduate diploma by the R.C.V.S. It is further strongly recommended that "the appointment of all veterinary inspectors of local authorities should be in accordance with uniform rules relating to qualifications to be laid down by the Board of Agriculture," and that whole time veterinary inspectors should be appointed throughout the country as chiefs of administrative areas to superintend the work of the local inspectorate. These whole time inspectors should command a salary "large enough to attract the best men in the profession," part of it paid by the Board of Agriculture, to whose sanction all appointments and dismissals should be subject.

Finally, after indicating approval of the Foreign Animals Order of 1910 and the amending Foreign Hay and Straw Order of 1912, the Committee conclude by expressing warm appreciation of the work of the Board of Agriculture. It is recognised that the freedom of this country in recent years from widespread epidemics is due to regulations so admirably carried out by the officers of the Board, and those of the local authorities"; and two or three sentences of emphatic praise conclude with the opinion that "every encouragement should be given to the Board to continue a policy which has proved successful." We shall all agree with this; but it is pleasant to see it in a Government report.

The Report is exceedingly interesting and suggestive. It is true that, so far as direct immediate action against foot-and-mouth disease is concerned, it leaves matters very much as they were. But it contains recommendations which, if they are acted upon, will potentially influence the control of foot-and-mouth, and many other diseases; and some of them will have a great bearing upon the conditions of veterinary work.

STOMACH STAGGERS.

In *The Veterinary Record* of March 2nd, an article appeared from the pen of Capt. Rainey, of Blomfontein, South Africa, in which he endeavoured to show that the presence of bots (*Gastrophilus equi*) in the horse's stomach produced the disease known in this country as stomach or grass staggers. This disease is generally thought by the farming community in this country to be caused by "bots" or "paapjies," as they are called by the Boer, and moreover, every abdominal complaint is put down to "bots."

Since I have been in this part of South Africa I have seen many cases of stomach staggers and have had unusual opportunities for making post-mortems. The lesions found are practically always similar, and the one condition which is always present is Cirrhosis of the liver. It was conclusively proved by Mr. Chase, M.R.C.V.S., Government Veterinary Surgeon, who was stationed at Molteno for the purpose of investigating the nature and cause of cirrhosis of the liver in stock, that the cause of stomach staggers in horses and "Molteno" disease in cattle was the ingestion of the weed called Ragwort (*Senecio latifolius*). Mr. Chase fed the plant to horses and cattle and invariably produced the disease in his experimental animals.

The lesions and microscopic appearances of the liver corresponded with the description given of the livers of cattle which have died of "Pictou" cattle disease in Nova Scotia. A similar disease known as Winton's disease exists in New Zealand, and Prof. Gilruth, in his annual report for 1904, showed how the Ragwort (*Senecio Burchelli*) produced this disease. It was Mr. W. Robertson who, in 1905, or thereabout, carried out some feeding experiments with Ragwort, and produced the well-known symptoms of stomach staggers in horses and "Molteno" disease in cattle.

Although the *S. Jacobius* and the *S. Burchelli* exist in this country, the *S. latifolius* is by far the most common. In Robertson's experiments the amounts of *Senecio* given to the cattle were—

Ox 64,	2oz. per diem for 31 days	3lb. 14oz.	
"	4oz. " 17 days	4	4
Total		8	2
Ox 65,	3oz. per diem for 31 days	5	13
"	4oz. " 17 days	4	4
Total		10lb.	1oz.

These amounts killed these oxen in 48 and 43 days respectively. The active principle of this weed has been isolated, and it seems when administered to exert a specific action on the liver, producing cirrhosis. It appears that the weed is eaten by stock when it is young and green (shortly after the veld has been burnt) and it may take years to produce the typical symptoms, which, once shown, are always fatal.

FRANK CHAMBERS, M.R.C.V.S.

Umtata, Tembuland, S.A.

GENERALISED MILIARY TUBERCULOSIS.

By HENRY B. EVE, M.R.C.V.S., Folkestone.

A valuable pedigree maiden bull bitch, aged two years and six months, a descendant of the well-known sire, "Rodney Stone," the property of a client.

History. Had been purchased for breeding purposes but had never properly come in oestrus. It had previously been used to an outdoor life in a kennel, but had always slept in the house since owner bought it, and lived on the best of everything, in fact had been coddled. It developed catarrh, which the owner treated for an attack of influenza. For a time it appeared to get better, and was sent into the country for a change of air, and returned home in due course.

Symptoms. The bitch showed the following symptoms: a dry husky cough at first, which was more noticeable in the early morning, later on it became looser, with excessive expectoration of phlegm and rapid emaciation, although the appetite was at first fairly good. Patient gradually became very weak, and had intermittent diarrhoea, which was at times tinged with blood. Temperature elevated, varied, generally higher at night. There was a profuse purulent discharge from the eyes, and excessive thirst. Auscultation of the chest revealed distinct râles and pain on percussion. Pulse accelerated, breathing hurried, occasional bleeding from both nostrils.

Suspected tuberculosis: decided to try tuberculin test. Prognosis unfavourable.

Treatment. Isolated and tested the animal with tuberculin, which gave a typical reaction. Followed on with medicinal doses of the reagent, combined with open air treatment. Bathed the eyes with boric acid sol.; applied ice to the chest and injected Adrenalin, to arrest the hæmorrhage. Quinine salicylas, tonics, etc., internally.

The diet was raw meat, tripe, fish, boiled milk, raw eggs, cream, Angiers petroleum emulsion, Virol, Larvins.

Animal improved for a time, and began to put on flesh; the cough and expectoration disappeared; the diarrhoea and discharge from the eyes diminished. Suddenly the animal was attacked with a violent fit of coughing, which was followed by extensive hæmorrhage and delirium. The animal was destroyed with chloroform as the case appeared to be hopeless.

Post Mortem. Liver, lungs, kidneys, lymphatic glands were all affected. The mouth showed lesions of stomatitis, and the skin was very red as though suffering from Eczema rubrum, especially noticeable about the legs, thighs and feet. Spleen only slightly affected at its apex.

Remark. Surprised at the reaction as the disease was so advanced.

ABSTRACTS FROM FOREIGN JOURNALS

CANCER OF THE BLADDER WITH RESULTANT HYDRO-NEPHROSIS IN A DOG.

Hydro-nephrosis is fairly common in the ox and pig; but is much more rare in the horse, and appears to be rather exceptional in the dog, judging by the small number of cases which have been described in that animal.

Hypertrophy of the prostate is a fairly frequent cause of hydro-nephrosis in the dog, as recorded by Liénaux and Leighton. Affections of the ureters should also be cited; and two interesting cases of this have been published by Almy and Ball respectively. Tumours of the bladder may have a similar effect. Suffran and Daille have described a case in which a tumour, the histological nature of which could not be exactly established, invaded the orifices of both ureters in succession and determined their obstruction. Other causes, such as calculi or perineal hernia of the bladder, may have the same effect of causing mechanical obstruction of the flow of urine.

E. Haynens, assistant at the Belgian Veterinary School, now records a case of a six-years-old male dog which was brought to him. The owner's account was that the animal had slowly wasted and passed blood in the urine for a period of a month and a half, after which the hæmaturia had ceased for a time, only to repeatedly recommence. It was in the course of one of these relapses that Haynens saw the dog for the first time.

When examined the general condition of the animal was bad. Emaciation was very marked, the coat was dull and stiff, and the eyes dull and sunken in their orbits. The dog remained lying down for the most part, and showed complete lack of interest in his surroundings. Progression was slow; and, despite all stimulation, it was impossible to make the animal run. Beyond this dulness, the nervous system did not appear affected; for the sensory and motor functions were intact.

The respiration was normal. The pulse was strong, and a little accelerated. The mucous membranes were pale, slightly yellowish, and appeared infiltrated. The pulsations of the heart were visible behind the left elbow. The cardiac sounds were normal, with the exception of a slight murmur. The area of cardiac dulness was more extensive than normal, and hypertrophy of the heart manifestly existed.

The appetite was bad, only pure water and a few pieces of meat being taken. There was no vomiting. The abdomen was hollow; and the fæces were normal, but scanty.

Micturition was frequent, very painful, and long-continued. Only a small quantity of urine was passed at a time, and attempts to micturate were not always successful.

The urine was blackish in colour, and had a strongly ammoniacal odour and an alkaline reaction. Chemically, it contained a rather large quantity of albumen. When centrifuged it yielded a deposit

composed of white blood corpuscles, desquamated cells of the bladder, and various microbes, but no red blood corpuscles, cylinders, or renal cells. The alkaline reaction and the ammoniacal odour indicated that the urine had undergone ammoniacal fermentation in the bladder, which was therefore infected. The red corpuscles had undergone hæmolysis in the strongly alkaline liquid, and their colouring matter remained dissolved in the urine.

The external genitals presented nothing abnormal, and rectal exploration showed the prostate to be of the usual size. Abdominal palpation, however, at once revealed the existence of a hard body the size and shape of a large fowl's egg, situated at the boundary of the abdominal cavity and the anterior opening of the pelvis, and mobile from side to side and from below upwards. This body could not be drawn forward towards the abdominal cavity, but could easily be displaced towards the pelvis. Evidently, therefore, it was connected with the bladder, and the alternative diagnosis of vesical calculus and vesical tumour suggested themselves. The symptoms accorded with either diagnosis, and laparotomy was therefore decided upon.

Under anaesthesia by chloroform, an incision was made upon the right side of the prepuce, revealing the bladder in its normal position. The organ was not enlarged, but was hard; and its surface was irregular and, at some points, blackish in colour. It was easy to recognise the existence of an extensive tumour occupying about two-thirds of the vesical wall.

The only efficient operation would have been complete extirpation of the bladder, which is practically impossible in animals on account of its disagreeable consequences. Destruction was therefore advised and carried out.

The lesions, when completely examined post-mortem, were very interesting. The tumour occupied the anterior extremity of the bladder, and extended in the superior wall as far as the trigonum vesical. The mucous membrane was ulcerated over a surface about the size of a two-franc piece, and at this place the tissue of the tumour showed a grey colour and an anfractuous surface, which was bleeding at several points. Upon section the neoplasm showed two aspects. For the greater portion of its extent it distinctly resembled a scirrhus cancer, showing a very considerable connective tissue stroma, in the midst of which small yellowish points, slightly softened, were observed. In other parts, on the contrary, and especially towards its external aspect, the tumour resembled an angioma.

Histological examination of different portions of the growth absolutely confirmed the macroscopical diagnosis. The case was one of primary carcinoma of the bladder. In the epithelial islands (which were rather rare in the scirrhus portion of the tumour and closely approximated together in the portion resembling an angioma) the characters of vesical epithelium were found.

The two ureters traversed the tumour; but, while the left one allowed urine to pass fairly well, the right one was completely obliterated and allowed no passage. The right ureter was considerably dis-

tended; it was the size of a finger, and its wall was thin.

The right kidney was triple its normal volume, and its surface was smooth and whitish. When incised it gave exit to a yellowish sticky liquid. The wall of the kidney was scarcely three millimetres thick, and the crest of the renal pelvis had completely disappeared.

The evolution of the lesions was easy to comprehend. The tumour had slowly invaded the periphery of the right ureter, causing its progressive obstruction, and finally leading to hydro-nephrosis.—(*Annales de Méd. Vét.*).

PARALYSIS OF THE ŒSOPHAGUS IN CATTLE.

P. N. Pedersen reports (*Maanedskrift for Dyr-læger*) that he saw about ten cows upon one farm affected with paralysis of the Œsophagus in the course of the summer and autumn. The body temperature of the patients was normal throughout, the fæces were rather darker in colour than is usual, the appetite was poor, and the power of swallowing was totally or almost totally suspended. Food, when taken up, remained lying in the mouth. When the mouth was opened, abundant saliva flowed from it. Neither swelling nor sensitiveness could be distinguished at any point. The animals lay a great deal, and the visible mucous membranes appeared pale.

Two of the affected cows died. In the case of one, post-mortem examination revealed a considerable inflammation of the small intestine. In the other, post-mortem examination showed no noteworthy divergences from the normal.

The treatment adopted (of which details are not given) was purely symptomatic. The author can throw no light upon the cause of this peculiar affection.—(*Berliner Tier. Woch.*)

COMMUNUTED FRACTURE OF THE SUPERIOR EXTREMITY OF THE RIGHT RAMUS OF THE INFERIOR MAXILLA—FOLLOWED BY PSEUDO-ARTHROSIS.

Lasserre records (*Rev. Gen. de Méd. Vét.*) the case of a mare which, for about six months, had shown a daily increasing difficulty in mastication and lost condition considerably, also presenting a unilateral catarrh upon the right side.

When seen by Lasserre the animal was extremely emaciated. Examination of the head showed a slight deviation of the inferior maxilla towards the left. The right orbital cavity appeared "filled up" and the eye showed a certain degree of exophthalmia. Upon the edge of the right branch of the inferior maxilla was a narrow, elongated, cold, indolent swelling, hard in consistence, which seemed connected with the bone, and ascended about as far as the temporo-maxillary articulation.

Diagnosis was reserved; and, despite a thorough examination of the animal and careful exploration of the buccal cavity, the author could only suppose the lesion to be a tumour situated in the temporo-maxillary region. In view of the gravity of the case, slaughter was advised.

Post-mortem examination revealed a lesion which had been quite unsuspected. The right branch of the inferior maxilla showed a fracture, the crescent-shaped superior fragment of which comprised the condyle and the coronoid process. The two fractured parts were maintained in contact, first by the external and internal masseter muscles, and then by a thick fibrous membrane, the superficial face of which was intimately blended with the deep muscular fibres. This fibrous ring was closed for the greater portion of its extent, but anteriorly it presented a cleft of from 4-5th inch to 1 1-5th inch, which put the seat of fracture into communication with the mouth. Incision of this fibrous membrane revealed a centre of osteo-myelitis, containing pus and numerous splinters of bone. The periphery of the seat of fracture was the centre of a hypertrophying osteitis.

The fracture had thus partially cicatrised in the form of a fibrous pseudo-arthritis. There was a history of the animal falling into a pit a year-and-a-half previously, and the author thinks that this had probably occasioned the fracture.—(*Annales de Méd. Vét.*).

EXPULSION OF UTERINE COTYLEDONS IN A COW.

Larrien reports (*Revue Vétér.*) the case of a cow which, at her first parturition, gave birth to two calves. The aid of the veterinary surgeon became necessary, but the delivery presented no serious difficulty, and was concluded in a quarter of an hour. The membranes were expelled spontaneously six hours after parturition.

The sequelæ of the parturition were nearly normal until the eighth day, when the animal suddenly began to strain. This resulted in the expulsion of about twenty cotyledons detached from the uterine mucous membrane. Larrien then explored the uterus, and extracted sixteen more cotyledons, which were freed from all adherence to the uterine walls. He followed this up by antiseptic injections, and the next day about ten more cotyledons were expelled spontaneously.

Larrien calls attention to the following points in this case—the parturition was accomplished in good conditions, the membranes were expelled early, and, finally, the cotyledons which were expelled were of considerable size, and appeared not to have undergone the rapid involution which customarily follows parturition. He thinks it logical to attribute the latter fact to an initial lesion of the uterine mucous membrane, which had entailed circulatory disturbances.

Upon this hypothesis, it is easy to conceive the possibility of a more or less considerable mortification of the mucous membrane and the cotyledons.—(*Annales de Méd. Vét.*)

W. R. C.

The full return of the voting at the Annual election of Council was:—M'Fadyean, 1245; Trigger, 1087; Garnett, 1072; Thomson, 934; Share-Jones, 928; Clarkson, 912; Pringle, 837; Price, 761; Burt, 759; Dewar, 671; Packman, 541; Spruell, 453.

Royal College of Veterinary Surgeons.

THE ANNUAL DINNER.

The Annual Dinner was held for the first time in Ireland, on Wednesday evening, 5th of June, in the Royal College of Surgeon, Stephen's Green, Dublin, and was attended by the Lord Lieutenant and a distinguished company. By kind permission of the President, Vice-President and Fellows of the Royal College of Surgeons, the spacious halls of the College of Surgeons were placed at the disposal of the guests for the occasion. Prof. A. E. Mettam, B.Sc., M.R.C.V.S., President of the Royal College of Veterinary Surgeons, presided.

Prof. Mettam received his Excellency, who was accompanied by his private Secretary, Mr. Max Greene and Capt. Forbes, A.D.C., in the Reception Hall, and presented the members of the R.C.V.S. Council.

The following names are taken from the seating plan of the tables:—The President R.C.V.S., supported on his right by His Excellency the Lord Lieutenant; on his left by the President Royal College of Surgeons, Ireland (Mr. R. D. Purefoy); and by Rt. Hon. Lord Mayor of Belfast, M.P.; President, University College, Galway (Prof. A. Anderson, M.A.); Rt. Hon. Jonathan Hogg; Rt. Hon. M. F. Cox, M.D., P.C.; President University College Dublin (Dr. G. J. Coffey, M.A., M.B.; Sir Charles Cameron, C.B.; President, Incorporated Law Society (Mr. Gerald Byrne); Mr. P. J. O'Neil, J.P.; Mr. R. E. Woods, F.R.C.S.I. (late President R.C.S.I.); Sir Jos. McGrath, Lieut. Col. Moore, P.V.O.; Mr. J. R. Campbell, B.Sc.; Rt. Hon. The Earl of Fingall, Prof. M'Weney, Mr. C. Allen, F.R.C.V.S.

At the cross tables, facing the President, J. H. Carter, supported by Mr. Fred Bullock, Registrar, and Mr. G. Thatcher, Solicitor; at the others, Messrs. R. Roberts, and G. A. Banham.

Dr. Burgess, F.R.C.S.; Mr. T. A. Arkins, B.A.; Private Secretary to His Excellency; A.D.C.-in-Waiting to His Excellency; Dr. W. S. Houghton, B.Ch., L.M.; Mr. J. N. Lamphier, P. M. Rath.

Fellows and Members: Messrs. J. V. Daly, F. W. Garrett, Prof. G. T. Dunne (F), W. H. Wilkinson, Prof. J. F. Craig, M.A.; J. J. Ross, J. A. Thompson, P. J. Howard, A. Dobbyn, J. Doyle; T. R. Mulcahy, J. J. MacCormack, E. C. Winter (F), Rd. Ebbitt, J. S. McCann, W. J. Ferguson, M. Quinn, F. Shearman, S. T. Groome, B. H. Mellon, D. S. Prentice, Jas. Græg, A. Watson, Lieut. Hon. G. A. V.C., W. Ashe King, J. Purdy, W. T. M. Browne, F. A. Heney, Sydney H. Slocock (F), J. F. Healy, F. Hobday (F), J. Share-Jones (F), J. A. Hewson, R. B. Freeman, J. McKenny, F. Kerr, A. J. Moffett, J. B. Hare, J. V. Mahony, T. F. Renshan, Prof. J. J. O'Connor; W. Cargill Patrick, W. J. O'Donoghue, E. McSwiney, G. H. S. Jarratt, Capt. Deacon, A.V.C.; Alex. Monro (F), A. A. Donnelly, H. W. Carbury, J. J. G. Keppel, J. D. Richardson, F. C. Ryan, J. B. Dunlop, W. Shipley (F), F. C. Mason, R. H. Lambert, L. M. Magee, P. D. Reavy.

Drs. Russell, L. V. Hunt, Benson Golding, Maginnis; Rev. A. Mitchell; also Messrs. R. Cantrell, L.S.O., J. Healy, J. Fogarty, J. Delaney, J.P.; J. Williams, S. T. Land, J. V. Coyle, A. Miller, J.P., Registrar R.C.S.I., and G. E. Haines, Registrar R.V.C.I.

On the call of the President the toast of "The King" was responded to with musical honours.

The PRESIDENT, in proposing the toast of "His Excellency the Lord Lieutenant and the prosperity of Ireland," said: "My Lords and gentlemen, this is indeed an auspicious occasion that we have as the honoured guest of the profession his Excellency the Lord Lieu-

tenant. (Applause). We, members of the Council, highly appreciate the presence of his Excellency here this evening, and wish it were possible he could be accompanied by his gracious consort, Lady Aberdeen (Applause) to whom Ireland owes so much for the initiation of that noble movement—the crusade against tuberculosis. A monument of their sojourn in Ireland would always be found throughout the country in that movement which is bringing health and happiness to so many homes. (Hear, hear). We, as a profession, recognise that great movement as a valuable factor in preventive medicine and we wish to show our appreciation of it. The National Health movement has indeed come to the rescue, if I may so term it, and is going to assist the movement for the provision of sanatoria for tuberculosis. They are going to show the County Councils of the country how to undertake certain lines of treatment to be followed by the people throughout the country, and the people will take advantage of the Insurance Act by the erection of sanatoria. I think this movement is scarcely sufficiently appreciated or brought home to the people generally. We, who are more or less associated with the study of medicine, appreciate the movement in its entirety and recognise the great value of the crusade against tuberculosis. (Applause). I have done what I could to assist their Excellencies in their efforts, and I wish to assure his Excellency here that they have the sympathy of the veterinary profession. (Applause). It is to be hoped that great good will accrue from what they have done and are doing.

Associated with his Excellency in the toast we have "the prosperity of Ireland." Do we not all hope for the prosperity of Ireland, and is not our very existence bound up with the prosperity of Ireland? (Applause.) How can the prosperity of Ireland be furthered better than by increasing the happiness of the people in the homes of Ireland, and I do not think we can better appreciate this than by saying how much their Excellencies are doing for the health and happiness of the people's homes. I ask you to drink a bumper to the health of Lord Aberdeen and his gracious consort Lady Aberdeen, wishing them more strength and all health and happiness in the great work they have undertaken for the welfare of Ireland. (Applause).

Lord ABERDEEN, who on rising to respond was enthusiastically received, said: This delightful and genial manifestation will I assure you be long remembered by me, and so far as in my power it will be faithfully transmitted to Lady Aberdeen. (Applause.) You will notice that the President with kindly discrimination alluded to that movement with which our names have been related, and referred to the health and happiness of the home. Surely this health movement is primarily and essentially concerned with the happiness of the home. (Hear, hear.) How can we have happiness in the home without health. The Viceregal Milk Commission is an example of the comprehensiveness aimed at in that movement. We all know what an important article of diet milk is, especially regarding the rising generation. Again I must express my thanks for the expression so gracefully and heartily offered from the chair and so well received by you. (Applause.) There are some people who do not like references to health—it is an insult to them; well, there is no accounting for tastes, for some people do not like horse-racing. (Oh! Oh! and laughter). I do not understand why some people do not like to hear about health, but I do not think that anyone having anything to do with this movement will have occasion to regret it. (Hear, hear.) But such a movement as that does not prevent the maintenance of interest in other important undertakings. In the prosperity of Ireland, for instance, the promotion of industries has played an important part. I may be allowed to allude to one department of those

industries—the Lace Depôt—an important department in our Irish industrial life. The Irish Lace Depôt in Molesworth Street, if I may divulge the fact, during the twelve years it has been in existence has passed £290,000 sterling into the pockets of the women and children of Ireland. (Applause.) That is the result of the Lace Industry as may be verified by a visit to the headquarters at 35, Molesworth Street.

Now I am sure that we all feel that we assemble under most auspicious circumstances: it is a delightful occasion. We are the guests here of this most important organisation, this Institution so vitally concerned with some of the most fundamental business interests of this country. But it is a genial, hospitable occasion and we are not overburdened with the scientific discussions of the subject. Do not be afraid, gentlemen, that I shall be rash enough to make allusion to scientific matters—it is very dangerous for a layman to do so. (Laughter.) That reminds me of a story. A man asked a friend: how his little horse was doing, and the friend said, "He is very bad indeed; he is suffering from a very bad attack of the 'vernacular.'" The friend replied, "Well I never heard of any four-footed baste with that complaint—at least not since Balaam's ass." (Laughter.)

I need not prolong my speech except to say that I heartily appreciate the kindly words spoken by your President. (Applause.)

Mr. F. W. GARNETT, J.P., M.R.C.V.S., proposed the toast of "Medicine," and said that medicine in the past offered many martyrs to science; that night she offered another, but, no martyr ever went more cheerfully to the stake than himself in proposing the toast. (Laughter.) Medicine in every branch was represented there and also every branch of surgery, veterinary surgery and preventive medicine, which had become the factor of all medical science. Looking to the past, where medicine came from, and to the future, where it is going, if there was one profession in the world which gained more by its faith it was the medical profession. From the beginning of history faith had caused medicine to divide into two great sections—the licensed and the unlicensed. There were few men in medicine who have not made something out of faith—certainly there were many patent-medicine vendors who have made a great thing out of faith. (Laughter.) The great epoch in medicine which opened the eyes of faith-curers began with the discovery of antiseptics by the great Lister. (Applause.) That showed people that there was something besides faith in medicine. At the same time and almost concurrent with it another great factor began to creep into the practice of medicine, and that was, very slowly and gradually, the development of preventive medicine. It was on that side that all medical practitioners should concentrate their thoughts, for whatever benefits medicine may have given to humanity in the past there were still greater benefits to be gained in the future and gained by the uprooting of the blind faith in potions and lotions, which were so fashionable with the highest practitioner and with the lowest vendor of patent medicines. "We want a missionary service to educate the public to what medicine has arrived at to-day," Mr. Garnett continued. The entire feeling, the whole aspect of medicine has totally changed, and the study of preventive medicine would bring more honour to the profession than anything that has taken place in the past. Ireland was never behind-hand in the forward march of the profession, and he had great pleasure in coupling with the toast the names of Sir Hawtrey Benson and Mr. R. H. Woods as representing medicine and surgery.

Mr. R. H. WOODS, M.D., ex-President R.C.S.I., responded. It was only last night he learnt that Sir Hawtrey Benson, who was to reply to the toast on behalf of medicine would not be present, so he found himself responsible for replying for both surgery and

medicine. Proceeding, Mr. Woods said the Royal College of Veterinary Surgeons was a young and vigorous body, and a body, judging by its short history, that had a brilliant career before it. (Applause.) He thought it had achieved work that any institution in this or any other country might well be proud of. There was one respect in which the purely medicine men envied the members of the veterinary profession who had a great advantage over them, in the fact that when they of the veterinary profession did make a mistake they had no one to tell them so. He presumed that they did sometimes make mistakes, for there is no surer sign of an impostor than a person who never makes a mistake. He thanked them very heartily for the kind way they received the toast. (Applause.)

In calling on the Right Hon. Dr. M. F. Cox, F.R.C., M.D., to respond on behalf of the medical profession in the unavoidable absence of Sir Hawtrey Benson, F.R.C., C.P.I., the Chairman said that Dr. Cox was a distinguished leader of medicine, a great friend of the veterinary profession, and the author of the only book on "The Horse" read in Ireland.

Dr. Cox alluded to the many Irish names famous in the medical profession, such as Corrigan, Graves, Stokes, Cruise and others who have now passed away, and he recognised the great names in surgery also which, like the British Army could accomplish the almost impossible. (Applause.) He had been connected with the Veterinary College as a member, and he certainly was one who wished well to their profession. He loved horses as much as any man, and like most of his audience he had been lucky enough to own horses. He had once (assisted by a friend present) "perpetrated" a little book on "The Irish horse," and it had the honour of being quoted by Ridgeway and other distinguished writers. (Applause.) The Irish horses were famous since the dawn of history. In the middle ages the Papal Chariot of the Duke of Ferrara's staff were horsed by Irish hobbies brought specially from Ireland. The day of the motor had now come, but the day of the horse was not yet done; when squadrons mustered for war, at hunting, which the noble Lord (Lord Fingall) present with them illustrated, at racing, as that Derby day showed, the horse was still to the fore. Horses no less than men have contributed much to the making of the world's history, and the men who devoted their energies to the alleviation of the sufferings of the thoroughbred or the farm horse deserved to be thanked. Therefore as a medical man, as a physician, and as member of the Governing Body of the College he (Dr. Cox) replied to the honour of the twin branches of medicine and surgery. He was proud to think that they had done no small share in improving the breed of the horse, and he wished them, the veterinary profession, all success in the work of alleviation of equine suffering and in equine medicine in England and Ireland. When they, the members of the Royal College of Veterinary Surgeons, were by their energy and ability seeking to improve the breed of horses in Ireland, they were doing a noble work in the interests of the country. (Applause.)

Mr. JAMES MCKENNY, M.R.C.V.S., proposed the toast of "Agriculture." They could not have drunk so heartily to that toast or dined so well were it not for the great industry of agriculture: the prosperity of agriculture supplied that admirable dinner and was the occasion of the joyous meeting. Agriculture must also be considered with the problem of disease in fruit, vegetables, and animals. Some people, through want of knowledge, stated things which were untrue, and a week ago a gentleman was foolish enough to say that the veterinary profession knew nothing of contagious disease. ("No, no.") That reminded him of an experience of his own. He attended a lady's dog and found the animal suffering from pneumonia: the lady assured him that nobody in

the family had the complaint. He prescribed for the dog and the next day he was surprised to find, and they would be surprised to know, that the animal was no better. (Laughter.) The lady, who he cautioned about contagion, said she never suffered from prevention of disease in her life. (Laughter.) Three days later he saw the announcement of the lady's death from pneumonia. That lady suffered from want of knowledge, too. (Laughter and applause.) Some people thought that all we have to say is "presto! begone!" that the patient would be cured, and that we are magicians, not practitioners.

Mr. J. R. CAMPBELL, of the Department of Agriculture, in replying to the toast of "Agriculture," said that farming was in a promising condition now compared with a generation ago. The late eighties and early nineties was a period of great agricultural depression. Foreign competition was keen, prices fell, and land went under pasture to an extent from which it has not yet recovered. At that time there was no provision for agricultural education in Great Britain except in the University of Edinburgh. State aid was not available, and agriculture was regarded as a purely commercial concern. But while other industries could get cheap food from foreign countries, public opinion soon began to realise that a rural population, however it was to be maintained, was essential to the vitality of the nation. One of the indications in the change of policy was the passing of the Agriculture and Technical Instruction Act, 1889, and in the following year what was known as the Whiskey Money became available for agricultural education. Then came the establishment of the Department in Ireland; later still the Development Commission; only a few weeks ago the Board of Agriculture in Scotland; and he understood a demand was now being made for a similar Board in Wales. The tendency at the present time was for legislation to speed up the work of these existing Boards and Departments. Already in Ireland there was a law to compel farmers to cut certain weeds; vendors of agricultural seeds had to supply samples of their goods and state their origin; and in various other ways a certain amount of pressure was being brought to bear on farmers all over the United Kingdom. The Butter Bill now before Parliament, and the demand for compulsory registration of stud animals were indications of a movement in the same direction. So long as these measures were self-imposed, that is to say, were agreed to by the farmers themselves, and wisely administered, there need be no fear of the results. Referring to the success of the Irish Veterinary College he said that the Edinburgh University had just passed an ordinance for degrees in Veterinary Science, and he hoped in the near future similar action would be taken in Dublin. The Development Commissioners' grant of £50,000 for agricultural research included provision for veterinary investigation. He hoped this was but an earnest of still better provision for the future.

His EXCELLENCY proposing the "Royal College of Veterinary Surgeons," said: The announcement of this toast by the Chairman reminds you that we have now arrived at the main toast of the evening, "The Royal College of Veterinary Surgeons." (Applause.) I may remark by way of reminder as there are so many visitors present that this College is the central body of the profession. The Charter was obtained in 1844. The importance of this is manifestly to the interests of the profession. There are the various Veterinary Colleges also in different parts of the Kingdom; the Royal Veterinary College of London, the charter of which dates back from the year 1795. It is a matter of special congratulation that that College in the comparatively brief period should have made its mark in such a conspicuous and magnificent manner. (Applause.) The Royal Veterinary College of Edinburgh was incorporated ten years

later, and is a comparatively new one. The Annual Meeting of representatives of the profession is, I believe, usually held in London. But this year for the first time in the history of the Institution it has been held in Dublin, which is certainly a tribute to the position and prestige of the profession in this country; and particularly a tribute to your esteemed President. (Applause.) I can say with reference to the status of the profession, that it is steadily growing in the due and proper estimation of the whole public; and the interesting illustration of that has just now been given by Professor Campbell, who alluded to the recognition of the profession on the part of the Universities. (Hear, hear.) He mentioned that the University of Edinburgh and the University of London now grant academic degrees for attainment in Veterinary Science. This is distinct from the granting of diplomas, which are given by the Royal College and which have more directly to do with Veterinary Practice. As you know, in this department the Royal College maintains a very high and strict standard. We find we have indirect testimony in this way also, as I am informed by the President that some of the youngest and perhaps most zealous Governments—the daughter Colonies and States of Great Britain, such as South Africa—are flying to your College for qualified men to be sent out to fill official positions for the promotion and maintenance of veterinary science. It is delightful to hear how worthily the Body has maintained their traditions and added to their reputation. As for Ireland, the testimony given to-night is most gratifying as to the maintenance of the profession as a whole. Professor Campbell has said a few words, very aptly, about the action of the Department and the work of veterinary science, and concluded his remarks by alluding to the fact that veterinary dispensaries had been established in various parts of the country in Ireland, where they were most needed; and subsidies have been granted to veterinary surgeons to carry on the work in those districts. An allusion made to-night apparently referred to had its bearing in the lack of recognition and appreciation in the sense that they required more facilities and more encouragement than they yet enjoyed throughout the country as a whole, for as we all know, they have a most excellent equipment in the Irish headquarters, the Royal College. This toast will be coupled with the name of the Principal of that College, Professor Mettam. (Applause.) His name in connection with the College, even apart from his other achievements, should evoke expressions of the warmest admiration. I allude to what he had to do with the creation of the College, not only the creation of it in the general sense but in the literal sense—of the very construction of the College. I believe that he, day after day, was supervising the construction and equipment, thus saving much expense and ensuring that everything was done to the best advantage. (Hear, hear.) When we remember that, together with this arduous work, he was giving numerous lectures we can imagine the enormous energy and brain-power exerted. (Applause.) I think we may congratulate him for one who is still comparatively young; he celebrated only his 46th birthday last Sunday and he looks young—long may he flourish, not only in his official capacity but in his all-round activities and personal attractions and valuable qualities which endear him to all with whom he comes into contact. We may conclude by saying that we wish him long life and happiness. He has been ably supported by his coadjutor-bishop so to speak, in arranging this admirable banquet and the annual meetings of this great society. (Applause.)

The PRESIDENT, R.C.V.S., who was received with applause, said that he wished to thank his Excellency for the very kind way he had proposed the toast of the Royal College of Veterinary Surgeons, and for the very able way in which he had referred to the efforts of the

members of the profession in following their profession in this country. He also wished to thank him for the very kind references he had made to himself personally. The Royal College of Veterinary Surgeons, as his Excellency had already stated, came into existence in the year 1844. Its objects were to assist in the future teaching, to establish examinations and generally to look after the welfare of the profession. Since that time the profession, he claimed, had advanced by leaps and bounds. (Applause.) Veterinary surgeons had done their share of the work, sometimes he thought they had done more than their share in the advancement of medicine and surgery. In this country—he was referring to the United Kingdom—they had to fight their way unassisted by the Government, and indeed unassisted by any funds other than those which the individual members of the profession themselves possessed. Veterinary science and veterinary research had been carried out at the expense of the individual; they never had any assistance in these matters from the Government. The assistance that they might have at the present moment had only been given within the last two or three years. Any research work they did had to be carried out in the interval between the arduous work of the teachers. They all knew that a teacher's work kept him well occupied, and they could understand the difficulties under which research work was carried out. The duties of a professor were not necessarily to teach. They were rather to direct and preside over the laboratories which he controlled, and see things through to an end. If they were to advance in medicine they could only do so by teaching the truths which they learnt in the laboratories. They now recognised the fact that the state had come to its senses, if he might be permitted to use those words, and to show their appreciation of the work done in veterinary surgery and to give the assistance in veterinary research which should have been given years ago. (Hear, hear.) Their work was connected with animals, and the great asset and national wealth of Ireland was in its equine and bovine population. If Ireland was to prosper it must be by her herds increasing and multiplying, and by those herds going to other countries. If Ireland was going to be successful in the advance in agriculture made along the lines indicated by Prof. Campbell, she must raise and breed stocks for consumption and for breeding purposes in other countries. In such advance they, the members of the Veterinary profession would have an important part, for they would have to look after the treatment of disease. They would also have to look to the prevention of disease. Preventive medicine is the medicine of the future.

He would like now to refer to the question of their domestic policy. They had struck hard times. They were in the position that their income did not in any way come within measurable distance of their expenditure. Their expenditure continued at the same high level. They had endeavoured to bring students and undergraduates into line. They had increased the stiffness of their preliminary examination—they all know what that means—when the standard was raised it meant the cutting down of a number of possible entrants into the profession. They did not despite the fact that they knew that it would cut off a considerable portion of their income, but they did it in order to raise the standard of the profession. (Applause.) Their source of income now was derived from what was saved out of the expenses in connection with examinations and other duties in connection with the College. The profession had risen to the occasion when they observed the state of affairs. A great majority of the profession had agreed to a voluntary tax. It was necessary in order to make that voluntary tax a question of law to obtain an Act of Parliament, so that they could enforce it on the others. They had a Bill for that purpose before the House of Commons for several years, but owing to the pressure of

business there they had never been able to get it beyond its first reading. It was one of the innocents that had been massacred. (Laughter.) He hoped that before the present Session of Parliament terminated the Bill would become an Act, and that then the Royal College of Veterinary Surgeons would have in hand sufficient money to carry on and continue its good work. (Applause.) The work which was done by the Council of the Royal College of Veterinary Surgeons was not solely for the benefit of the profession but was more for the protection of the public. Let him ask them who were the great opponents of medicine, and they would agree that it was quacks who practised with patent medicines. They wanted to protect the profession against those who were not up to its standard, and they wanted to protect the public against those men who practised as qualified men and yet who had never set foot inside a college. If they could get rid of that class of men it would be a benefit to the public as well as to the profession itself. (Applause.) He thanked them for the way they had responded to the toast. It was, as His Excellency had mentioned, the first time that their meeting was held in Dublin, and the first time that their annual dinner was ever held at this side of the channel. Only once before, he believed, was it held outside of London. He understood from those present at the meetings that the meeting in Dublin had been a success. (Applause.) There were two distinct features of their gathering that evening. The first was the presence of His Excellency. (Applause.) It was an honour that the profession would cherish for many years to come. It was the most flattered and cherished honour that they in Ireland could contemplate, they would cherish the memory of the fact that His Excellency, the representative of His Majesty the King, graced their dinner table there that night. (Applause.) There was one thing they regretted—that he was not accompanied by Her Excellency Lady Aberdeen. The second feature was the courtesy and hospitality of the President, Vice-President, and Fellows of the Royal College of Surgeons for giving them the use of their hall. He would assure the President and he would assure his Council that it was an honour that they highly appreciated. (Hear, hear.) He again thanked them for the kind way they had received the toast and for the kind way they had associated his name with it. (Applause.)

Lieut.-Col. MOORE, P.V.O., proposed the toast of "The Visitors," which was responded to by Sir Charles Cameron, C.B.

During the evening choice songs were rendered by, amongst others. Dr. W. S. Haughton, R.CH., L.M., Mr. J. S. MacCann, M.R.C.V.S., and Mr. S. T. Land, and a charming musical programme was discoursed by the Ladies' String Orchestra, conducted by Miss Archibald.

A Plea for Veterinary Research.

At the Twenty-first meeting of the Council of Agriculture (Ireland) held at Leinster House, Dublin, on 22nd ult., Mr. T. W. Russell, M.P., Vice-president of the Department of Agriculture and Technical Instruction, presiding.

INVESTIGATION OF ANIMAL DISEASES.

Mr. Thomas A. McClure, J.P. (Co. Armagh) proposed:—

"That, in the opinion of this Council, the Department of Agriculture and Technical Instruction for Ireland are not sufficiently alive to the fact that diseases, communicable from one animal to another, are annually on the increase with alarming rapidity in many parts of Ireland. That the stamping out of disease has already become an

absolute necessity in order that stock-raising and the production of milk and beef may continue as profitable to the agriculturists of Ireland as heretofore. That it is abundantly evident to the vast majority of the rural ratepayers of this country that funds which are finding their way into other live stock channels, would, in all human probability, be much more profitably employed in the conduct of veterinary research work. That it be a recommendation from this Council to the Agricultural Board when next allocating the funds at their disposal, to provide sufficiently for such, even should this necessitate curtailment in other directions."

He said he did not think that many would disagree with him when he said that diseases in cattle in this country were decidedly on the increase. The number of cases of Red water and Bloody flux, he believed, was increasing everywhere. In his district the number had gone up considerably, and instead of being in a certain season, the disease was now prevalent all the year round. Last year the graziers in the Counties of Tyrone and Armagh were very hard hit with Red water, and many finished the season with the balance on the wrong side of their account. This season the death-roll had gone up, and especially with milch cows. The Department had expended large sums of money in live stock schemes. But what had they done in veterinary research work? Absolutely nothing. Red water alone cost Ulster £200,000 a year, and it got leave to run its course unchecked. No preventive had yet been discovered, nor was any attempt being made, as far as he knew, in this direction. This was only one of the many virulent diseases prevalent in this county; Blackleg, Felon, and Bloody flux being the most common. The Department, in his opinion, should not risk the uncertainty of grants from the Development Commissioners or any other source, but should lay aside sufficient funds for a veterinary research station at once, even if it was necessary to curtail expenses in other directions.

The Vice-President said the Development Commissioners some time ago were understood to have recommended a grant, but it had never been paid. Mr. McClure's motion was one of the most important that could be placed on the notice paper. Ireland and England, and Scotland also, were sustaining enormous losses from diseases in cattle. Veterinary science knew little or nothing about those diseases. That was rather a humiliating thing to say, but it was time that the truth should be told about it. It was only quite recently that Parliament had done anything to foster veterinary research. Isolation was the only remedy that veterinary science had for Foot-and-mouth disease. Was there any veterinary scientist in Great Britain who could tell them the cause of contagious sterility in cattle or the remedy for it? They knew nothing about Swine fever. Isolation and sanitation was the remedy. Even if they had got £3,000 for veterinary research, which they had not, what was the use of £3,000 in face of the facts? The thing would have to be tackled on a very large scale. He felt the most extraordinary reluctance to talk about funds for this purpose. Ireland contributed her share of the money which the Development Commissioners dispensed, and they were entitled to get their fair share of it back. (Hear, hear.) He did not look upon funds from the Development Commission as any present or gratuity to Ireland. It was nonsense and an insult to the country to be talking about a grant of £3,000 for agricultural research in Ireland. He hoped the Council would take strong ground upon this subject. They should demand to have their fair share of the grant for these purposes, so that their farmers should not be allowed to go in ignorance of the diseases that were destroying their herds.

Mr. James G. Dooley said he had never lost a beast with red water owing to the remedy that he had applied. Milk fever could also be cured.

Mr. M. Slattery, J.P. (Tipperary), thought farmers should be prevented from selling cows that had slipped a calf.

Mr. Campbell said the Department's first demand on the Development Commissioners was for a very big sum and the Commissioners rejected it. They then made a modest claim for £7,000. The Commissioners said they would recommend the Treasury to give a grant of £5,000 if the Agricultural Board gave £2,500. They believed that the Commissioners recommended that to the Treasury, but the Department had got no reply from the Treasury, though they had approached it again and again.

Mr. H. T. Barrie, M.P., said the amount seemed utterly inadequate to the occasion. He thought the Council should make a new representation to the Development Commissioners. If the matter was pressed in Parliament on the Government there would be cordial co-operation from his side of the House.

The Vice-President said the Council ought not to pass Mr. McClure's resolution, which contained a reflection on the Department. The Department had been fighting for this money; they had been engaged in this matter for months and months, but had not got a sixpence yet.

Captain Loftus thought they should apply to the Development Commissioners for at least £10,000 to carry out scientific veterinary research. The work of the Department in Ireland in every branch of agricultural research had been such as to merit the approbation of all fair-minded men.

The Vice-President said the resolution from start to finish was a reflection on the Department not intended by Mr. McClure.

Mr. McClure: No.

The Vice-President said the money should be given for this purpose at once if it was given at all.

Mr. Field, M.P., denied that disease among cattle was increasing in Ireland. Ireland at the present moment was more free from all classes of animal disease than any other country in the world.

After some further discussion, the following resolution, proposed by Capt. Loftus, and seconded by Mr. McClure, was passed unanimously, in substitution for that proposed by Mr. McClure:—

"That this Council considers it a matter of urgent necessity that the Department should be enabled to carry out full investigations into the diseases of animals, which are causing loss to Irish farmers, and they urge that the Department should obtain an adequate sum from the Development Commissioners for the purpose of scientific research, the sum recommended by that body and not yet granted being, in the opinion of the Council, wholly inadequate."

—*The Freeman's Journal*.

Meat Inspection in the City of London.

In his last report, addressed to the Right Hon. the Lord Mayor, Aldermen, and Commons of the Corporation of London, Dr. Collingridge expressed his gratitude for the generous and unvarying support afforded him during the thirty-two years that he has had the privilege of serving as Medical Officer. The importance and responsibilities of the office have greatly increased, and will be heavier in the future, as the value of health conditions on the welfare of the people becomes more and more realised. The report goes on to say:—

"Many important changes have taken place, and in no direction have these been more apparent than in the increased care and attention paid to the food supply. Upon the City, as the Market Authority for nearly one-half of the country, this question has imposed heavy burdens. On the retirement of your late Chief Inspector, the opportunity was taken to appoint a Veterinary Inspector, Mr. T. Dunlop Young, to take charge,

under your Medical Officer of Health, of the arrangements in the various markets, and with his valuable assistance, the system has been remodelled and developed to meet modern ideas. It was found difficult to obtain sufficiently qualified Meat Inspectors, and the system was tried of taking young men, who had received good practical training in butchering and slaughtering, and appointing them on probation for a term of three years, during which time they were to obtain a knowledge of the markets and the meat inspection, and qualify as Inspectors under the Public Health Acts. When fully qualified such probationers are eligible for appointment as full inspectors. The experiment has proved most successful, and the city has now a well qualified staff of Meat Inspectors.

In addition to new and commodious offices, the Corporation has provided a laboratory, fitted with all appliances for bacteriological and microscopical work; a detention room for the examination of doubtful and suspected meat, and a museum for the reception of morbid specimens, for the purpose of instruction. These have all been found of the utmost value in carrying on the work of meat inspection.

EXAMINATION AT TIME OF SLAUGHTER.

Inspection at any stage is useful in protecting the public health, but the only real and scientific system is that which deals with the meat at the time of slaughter, when all the organs are present. The only slaughtering within the city is that carried out at Aldgate, and in order to ensure the inspection of all animals at slaughter it was necessary to modify the then By-laws. The introduction of a Bye-law restricting the hours of slaughter, except on due notice been given, permitted arrangements being made for the presence of an Inspector whenever killing was going on. While in only 40 cases during the last six months was notice given for slaughtering outside the fixed hours, the quantity seized as unfit for food during the year 1911 amounted to 219 carcasses, 120 pieces, and 5,294 organs, as compared with 117 carcasses, 52 pieces, and 1,684 organs in 1910. While the number of animals killed increased by 16.5 per cent., the total number of seizures increased by 203 per cent.

MEAT INSPECTION—"CHAOTIC CONFUSION."

The question of meat inspection cannot be considered as satisfactorily solved until some definite pronouncement binding uniformly with the force of law upon all

authorities is made by the Government. At present each authority interprets the recommendations of the Royal Commission according to its own ideas, the result being chaotic confusion. Science is never at a standstill, and the Royal Commission's advice as to pigs is now 15 years old, and no longer in accordance with the views held by the most advanced authorities in other countries. In no other country is the entire carcass of a pig destroyed on account of a speck of tubercle in one particular gland. This, however, is the course recommended by the Commission. Certainly in cases where the animal is inspected at the time of slaughter (when the evidence of the organs is present, and the Inspector is in a position to give a definite opinion), the existence of any degree of disease should be an indication of the necessity for further examination, and in such cases the backbone should be cut down and the kidneys and other glands throughout the body should be carefully inspected. If there is no further evidence of disease, it would appear to be perfectly safe to remove the part infected (usually the head) and to allow the rest of the carcass to be used for food.

ANTHRAX.

On the 24th May last, one of your Meat Inspectors, while examining some pig carcasses exposed for sale at the Central Meat Market, observed one, which in his opinion presented lesions suggestive of anthrax. Pending definite diagnosis the carcass was carefully isolated. Microscopical examination, conducted by your Veterinary inspector, revealed the presence of anthrax bacilli in considerable numbers, and a subsequent examination by the Assistant Pathologist at the Royal Veterinary College, confirmed this diagnosis, as also did the result obtained by the Veterinary Inspectors of the Board of Agriculture, to whom specimens were sent as required by the Anthrax Order, 1910. The usual precautionary measures were taken, and everything with which the carcass had been in contact was disinfected.

The value of the laboratory, recently established, as an adjunct to the Meat Inspectors' offices at the Central Meat Market, and the advisability of having available the services of a scientific advisor, has been demonstrated by this case, in which a definite diagnosis was made, and the necessary measures taken to prevent any danger of spread of the infection.

Recent investigations have shown that lesions in pigs, that have succumbed to anthrax, may be often so slight as to escape recognition without microscopical and bacteriological examination."

Department of Agriculture and Technical Instruction for Ireland, (Veterinary Branch), Dublin, June 3, 1912

NOTE.—The figures for the Current Year are approximate only.

* As Diseased or Exposed to Infection

Action on a Certificate of Soundness.

Before Mr. Justice Phillimore, at Oxfordshire Assizes on Saturday, June 8th, F. B. Lynch, Wardington, Banbury, sued Reginald Over, veterinary surgeon, of Rugby, for damages for negligence and lack of skill in certifying a horse as sound, which, in fact, was unsound.

Mr. Cecil Walsh was for plaintiff, and Mr. C. F. Vachell, K.C., and Mr. V. Graham Milward for the defence.

Mr. Walsh, in opening the case, said the horse was bought from a Mr. Newbury, of Byfield, his client having stated that he wanted one that would make a first class hunter, and be suitable for the Bicester and Warden Hill country. On December 4th, 1909, defendant sent a certificate stating that at the request of Mr. H. F. B. Lynch he had examined a chestnut hunter gelding, the property of Mr. Newbury. He further said: "The animal is, in my opinion, sound at the present time: there is a slight enlargement in the curb-place under the near hock, which I consider is a natural formation. I consider the horse has the making of a first class hunter, and one likely to stand work well. It will fill out more in twelve months, and having a short back and powerful quarters it may make 14 stone, but I should put it under rather than over. He moves well, and is a taking-looking horse." In fact, the horse turned out to have a curb, and went lame in consequence. His professional witness would say that there was no such thing as a natural enlargement in the curb-place, as spoken of in the certificate. Therefore, at the time of the examination, the horse was palpably unsound, and no veterinary surgeon should have passed it as sound. The horse, on defendant's certificate, was bought for £150. Plaintiff had since sold it for £36 15s.

Charles Wood Page, F.R.C.V.S., of Banbury, said a curb was an enlargement of the back of the hock upon a particular ligament. He first saw this horse on December 13th, 1909, when it was brought into his yard, and he noticed it had a curb on the near hind leg. On March 8th, 1910, he was professionally consulted, and the horse was then lame. A horse with a curb could not be described as sound. He did not think there could be a natural enlargement in the curb place.

By Mr. Vachell, K.C.: When he first saw the horse in December, 1909, it was being ridden by the groom, and he noticed it was lame then. From Wardington to Banbury would be a distance of about five miles. Witness had not treated the horse. If curb was treated in the early stages it nearly always yielded to treatment. The term used in the profession was "springing a curb," which meant that it came on suddenly.

Walter Green, bailiff in the employ of plaintiff, said when the horse came to the stables in September it appeared to be sound. He noticed a slight enlargement of the hock. The horse went back to Mr. Newbury to be trained, and when it was returned in December it was lame.

By Mr. Vachell, K.C.: During the first three weeks after the horse arrived it was ridden, and it might have been out cubbing.

John Henry Tuck, groom to Mr. Lynch at the time in question, said he remembered the horse being delivered. The morning after its arrival he noticed that it had a slight enlargement underneath the hock. Plaintiff rode the animal and found it very fresh to start with. He sent it back to Mr. Newbury to be properly schooled. When it returned in December he found the animal was very stiff, and the enlargement seemed to have grown. The animal afterwards went lame.

By Mr. Vachell: He did not inform plaintiff of the enlargement. A groom named Holland took charge of the horse on December 20th.

Professor James McCall, F.R.C.V.S., Principal of the Glasgow College, who said he had been in practice for 55 years, stated that he had not seen the horse in question, but he had seen the certificate.

Mr. Walsh: What do you say about it?

Prof. McCall: From reading it, and thinking it over, and also from the remark which Mr. Over has made himself, namely, that there is a very slight enlargement in the curb place of the near hock, which he considered to be natural formation, I formed the opinion that the horse had a curb, and that it had recovered from the strain at that time. It was a four year old horse. Proceeding, the witness, with the aid of a portion of the hock of a horse, explained to the Judge the difference between a curb and an enlargement of the metatarsal bone. A curb, he said, was a strain of the fibres of a particular ligament, and the seat of what was called the curb was at the head of the cuboid. That which caused the strain of the fibres was the tension produced upon the head of the os calcis, and the pull of that tord powerfully upon the ligament running to the cuboid. The enlargement of the metatarsal bone was not a curb; the curb was higher than that.

His Lordship: What do you say, sir, about this?

Witness: If the gentleman who wrote this certificate said there was an enlargement of the head of the external metatarsal bone, then the horse would not be unsound, if natural. That is not a curb.

His Lordship: You mean there cannot be any enlargement in the curb place which is not a curb?

Witness: Any enlargement of that ligament is what we call a curb, and an enlargement of the head of the metatarsal bone is an enlargement of the head of the metatarsal bone, which is not an extension of the ligament.

Mr. Walsh: And being a curb, that is unsoundness?—Undoubtedly.

Witness said that, as a rule, when a horse "springs a curb" he was lame the next morning, and there was a slight puffy swelling, a slight thickening of the ligament. If allowed to rest for a time the lameness would probably disappear and there would be a slight thickening of the ligament, due to the running together of the tissues. The horse might remain not lame for a length of time, and then just strain some fibres again, and that would add to the enlargement. If a horse was rested for six weeks after having sprung a curb, and was fired and blistered and turned out to grass, it would frequently come up perfectly sound and remain sound.

Mr. Walsh: The development of lameness may depend on the degree of work which the animal does?—It entirely depends on the number of fibres which may be torn or stretched at the time.

May it re-awaken?—Yes, especially if it has a curby formation of the hock. A well-formed hock runs in a straight line. A horse with a curby formation of the hock, although it is not a curb, is very apt to spring a curb.

It would be dangerous to certify a hunter as sound which has suffered in that way?—A horse might be fired and blistered, but would not be able to be entered legally as sound.

Cross-examined by Mr. Vachell, K.C.: Your opinion is based entirely on the language of the certificate?

Prof. McCall: It must be, because I have never seen the horse.

Because he says in his certificate that there is a very slight enlargement in the curb place on near hock, you therefore think it must and can only refer to a curb?—That is my opinion.

If he had said, as you say, that there was an enlargement of the head of the metatarsal bone, that would have put it quite clear?—If it had been an enlargement of the head of the metatarsal bone that horse would not have been lame.

Not from that, I quite agree. I daresay you agree that when you have been asked to specially examine a horse it is safer to mention it if there is such a thing?—I certainly would not mention it.

Do you think that when you are certifying, not, you know, to a veterinary surgeon or a professor, but to a country gentleman, do you think it would be any use talking of an enlargement of the head of the metatarsal bone?

His Lordship: He says he should not mention it.

Mr. Vachell: Practically, although it may be a little distance away from the curb place, practically, in popular language, you would say it was in the curb place would you not? Would you expect him to use the words "an enlargement of the metatarsal bone?"—Most assuredly. I would not have introduced the word "curb" at all; I should have said an enlargement of the metatarsal bone.

His Lordship: It is no use, in dealing with a country gentleman, to say that an arm means a leg.

Mr. Vachell: That is hardly a parallel, my lord.

Mr. Vachell: Is there such a thing as a natural formation in the curb place itself?

Witness: A curby formation of the hock is different to a curb.

His Lordship: Do you know of any other enlargement in the curb place?

Witness: None except that.

Mr. Vachell: Is there such a thing as natural enlargement in the curb place?—No.

John Varney, M.R.C.V.S., of Winslow, who said he had been in practice for thirty years, said he examined the horse in the presence of Mr. Wood Page on March 30th, 1910. He agreed that the horse had a well developed curb at that time, and was lame and unsound in consequence. He did not know that there could be anything else but a curb if there was "an enlargement in the curb place." He agreed that a veterinary surgeon, exercising due care, ought to recognise that and define such a symptom or indication.

Mr. Walsh: Ought he to pass such a horse as sound as a hunter?—In a four year old, I should say not.

Mr. Vachell: Did you search for any enlargement of the head of the metatarsal bone?—Yes.

Did you find it?—No, I did not.

Will you undertake to say there was not any such enlargement?—It was my opinion that there was not.

Harold O. Browning, clerk in the employ of Messrs. Warner, Sheppard, and Wade, of the Leicestershire Horse Repository, Belgrave Gate, Leicester, said the horse was sold on the 18th of June last as a horse in dispute with no warranty. The actual sale price was 35 guineas, and the net payment to Mr. Lynch was £34 4s. 3d.

Cross-examined by Mr. Vachell: There was no description whatever of the horse.

This concluded the case for the plaintiff.

THE DEFENCE.

Mr. Vachell said this was a very serious matter for the defendant, who was an experienced veterinary surgeon, and had been in practice in Rugby for a considerable number of years.

His Lordship: These charges should never be made lightly.

Mr. Vachell continued: It was admitted that the horse had a curb, but not at the time that his client examined it. When Mr. Over examined there was an enlargement of the metatarsal bone.

His Lordship: And it was, as possibly might well happen, a second and subsequent accident which brought about the curb?

Mr. Vachell: It was hunted for nine weeks, and there was plenty of opportunity for the horse to spring a curb.

His Lordship: It is what I may call the clumsiness of your certificate.

Mr. Vachell: That is so, but it was not intended for a gentleman who would understand the anatomy of a horse, and therefore to describe it in the way in which the Professor says it ought to have been described would have been useless. In popular language, it is the curb place, although really it is in the immediate vicinity.

Reginald H. H. Over, M.R.C.V.S., of Rugby, the defendant, said he had been in practice since 1894. He made a careful examination of the chestnut gelding, at the request of the plaintiff, at Mr. Newbury's.

Mr. Graham Milward: Was there in fact any enlargement on the curb place?

Defendant: In fact no; it was near the curb place. It was the external small metatarsal bone which was enlarged.

His Lordship: Why small?

Defendant: There are three metatarsal bones, my lord, and it might look to an ordinary man like a curb.

Mr. Milward: Why did you say in your certificate "a very slight enlargement in the curb place?"—To attract the purchaser's eye straight to the point.

His Lordship: What you ought to have said was "a little below the curb place."

Witness said it was to the outside, but the swelling would extend to the curb place.

Mr. Milward: Is that enlargement of the metatarsal bone unsoundness?—No.

Had the horse at that time any curb, or any sign of a curb?—Not the slightest sign of a curb.

His Lordship: It was an accident or a coincidence that the curb formed?—Yes.

Mr. Milward: Was your certificate true and accurate, to the best of your knowledge and belief?

His Lordship: It was not accurate, but not materially inaccurate.

Witness said that he met Mr. Lynch on subsequent occasions with reference to other horses, and he received no complaint at all about the horse in question being unsound. He had an extremely fussy sort of letter from him on October 22nd thanking him for his services. The first complaint he ever heard was the letter he received from Messrs. Stockton on April 8th, 1910. On April 15th he went and examined the horse in company with Mr. Henry Lepper, of Aylesbury who, unfortunately, was laid up now with a fractured arm and could not get to the Court. He found a slight curb there then, but the swelling of the metatarsal bone was quite plain. The horse was in poor condition, as if he had been worked a lot. On the 18th of June the horse was bought in for him at Messrs. Warner, Sheppard, and Wade's, and it was then going quite sound. The sire was a thoroughbred horse, and the dam was in the Hunter Stud Book.

His Lordship: Was the curb still showing?

Defendant: A trifle, my lord.

Mr. Milward: What did you do to the horse?—I fired it, I thought it was a valuable horse, and I did not think it desirable to miss any chance of making a good one of it. Defendant, continuing, said he fired the horse on June 25th, and on July 2nd it was sound. He sold the horse on July 6th to run as a steeplechaser for £90, and £50 in the contingency of winning its first race. On November 5th, 1910, he saw the horse again at Weedon, when it was the property of Mr. Poole. He had with him that day Professor Macqueen and Mr. Hunting. The animal was trotted and cantered on the road and he found the very slightest trace of curb. There were the firing marks, and the outer metatarsal bone still showed the same enlargement.

His Lordship: While it had a curb it was unsound was it not?—While it had a curb, of course.

Mr. Milward: I think it is quite clear that a curb can be sprung in a very short time!—Oh, yes, it can be sprung in a stable.

Cross-examined by Mr. Walsh: Having had a curb, and having been cured, you would still certify it as sound?—If the strain to the ligament is there still, I should not.

On that day when you examined it in the presence of Professor Macqueen and Mr. Hunting you would not pass it as sound?—I should have made a remark upon it.

It is a very curious coincidence, isn't it, that it should have sprung a curb?—I do not know that it is; it is an "unfortunate" coincidence.

Very unusual, isn't it?—Oh, dear, no. That winter was a very heavy winter, and I found four horses with curbs in one stable where a gentleman kept twenty-five horses.

Did you say there was a history of curb behind the horse?—I did not. Mr. Lynch sent such a precise letter that I thought I had better remark upon the very slightest points.

James Macqueen, F.R.C.V.S., Professor of surgery at Royal Veterinary College, Camden Town, who said he had had about thirty-five years' experience, stated that on November 5th, 1910, he examined the horse at Weedon. At that time the animal was "going sound." He paid particular attention to the hocks. On the left hock there was a prominence on the outer side close to the seat of curb. At first sight it looked like a curb, but on further examination he found it was due to an enlargement of the head of the metatarsal bone. He also found a trace of curb just within and slightly above the prominence at the head of the bone.

His Lordship: What do you say about the certificate?

Prof. Macqueen: I formed my opinion about the certificate a year ago or more; I formed the opinion that it might have been improved.

Mr. Walsh: Reading the certificate, without knowing anything else at all, the conclusion you would come to would be, would it not, that there was a curb?—My conclusion was that the certificate was referring to the prominence of the bone.

His Lordship: Yes, now that you know about the prominence. But, if you had got nothing before you but that certificate, what would you say; either the writer means the bone, or the writer means the curb, or the writer did not know how to express himself?—I concluded when reading the certificate that the writer meant the enlargement of the head of the bone.

His Lordship: Before you saw the horse?—Yes. If he had said "at the seat of curb" the description would have been good; it is as close to it that it is impossible to distinguish at a glance because the curb varies in size.

By Mr. Walsh: The distance from the enlarged head of the metatarsal bone to the curb would be a half or threequarters of an inch.

William Hunting, F.R.C.V.S., of 5 Halkin Place, Belgrave Square, S.W., examiner to the Royal College of Veterinary Surgeons, and a past-President of the Royal College of Veterinary Surgeons, said that he examined the horse on Nov. 5th, 1910, at the same time as Professor Macqueen. On the near hock, on the outside, he found a bony enlargement, and within that a trace of curb.

His Lordship: You are quite sure about the bony enlargement?

Witness: Quite. That is the first thing that struck me. Witness added that they had the horse trotted and ridden, and it was found to be sound in action.

Mr. Walsh: This bony enlargement was so noticeable that a man might overlook the curb?—Not if he put his hand on the curb; but if he used his eye merely and

stood a little bit forward he might have thought it was a curb.

His Lordship: If the man had got the idea that it was all bony enlargement, and did not put his hand, might he have thought that it was all bony enlargement when there was a curb?—Yes, he might have thought it was all bony enlargement.

William Dale, M.R.C.V.S., of Coventry, said that on May 18th, 1910, he examined the horse in the presence of Mr. Over, and he found a bony prominence on the outside of the near hock, due to an enlargement of the outer metatarsal or splint bone, and a slight curb.

Mr. Walsh: This was before it was sold?—Yes, I think so, on the 18th of May, at Wardington House.

You didn't point out to anybody the two enlargements? No.

Do you agree with the last witness that the whole thing might be mistaken for curb?—Well, there were two things that I saw quite distinctly.

A slight enlargement in the curb place you would understand to mean a curb?—Yes.

Mr. Vachell: What if you say "a slight enlargement in the curb place considered to be natural formation; does that point to a curb?—Well, no, I should not call natural formation a curb; this was a curb.

Charles Heywood, M.R.C.V.S., of Leicester, said that on April 6th, 1911, he examined the horse for a client who wanted it to go hunting on. He found the hock had been fired and to the outer side of the hock there was a slight bony development at the head of the metatarsal bone. It was rather an exaggerated prominence. There was no trace of curb whatever when he examined the animal.

Mr. Walsh: Still, you could not certify such a horse as sound?—Oh, yes, no curb, going sound. As I have mentioned he had been fired, but this was only in the nature of a blemish on him.

When a horse has had a curb it is liable to wake up again isn't it?—Not once in a hundred times, when a horse has been fired has a curb, I should say, come back again.

John Newbury, horse breeder, of Byfield House, Northants, who bred the horse, said he remembered the defendant coming over to his place to examine the horse for the plaintiff. At that time, as far as he knew, it was not suffering from a curb.

His Lordship: Had you ever known it to have a curb?—No.

Subsequently he had the horse in his possession again for 9½ weeks, and it was hunted, exercised, and schooled. At the end of that time it was re-delivered to Mr. Lynch, and, as far as he knew, when it left his premises to go back to Wardington it was absolutely sound. He did not get a single complaint until he met Mr. Lynch on Marylebone platform at the latter end of March or the beginning of April.

His Lordship: Mr. Wood Page says it was going very lame on December 13th?

Witness: Possibly it might be, but I was never acquainted with it.

Frederick William Sirett, who was in the service of Mr. Newbury from March, 1909, to April, 1910, said he had ridden the horse before it was sold and it was then perfectly sound. He remembered it being sent back again to Mr. Newbury's from Mr. Lynch's and it didn't go well then on its front feet, but after its shoes were altered it went perfectly soundly.

At the suggestion of his Lordship, another witness was called for the plaintiff, namely Mr. Arthur Stockton, Town Clerk and solicitor, of Banbury. In May, 1910, he said he had an interview, without prejudice, with the defendant, when the defendant's solicitor, Mr. Reddish, of Rugby, was present. Mr. Over never said anything about any enlargement except the curb.

His Lordship: When did you realise before to-day that they were going to say there was a bony enlargement?

Witness: I never heard it before, my Lord.

Mr. Vachell: You have come here prepared, have you not, to deal with the question about the enlargement of the bone?

Witness: No, I did not know that the question was to be raised.

His Lordship (to Mr. Vachell): I think it most unfortunate that your client gave the certificate in the way he did.

Mr. Walsh said that what Mr. Over had done in fact—and that was what he complained of—was, he had mistaken a curb for a natural formation, and had passed a horse which had a curb as sound.

JUDGEMENT.

His Lordship said he thought what he could safely decide in this case was that there was such an appearance in this animal's bones that many a competent person would say the horse had an enlargement at the head of the metatarsal bone. Therefore the defendant's explanation that he "meant" an enlargement of the head of the metatarsal bone was quite an impossible explanation, and all that could be said was that to a certain extent the defendant had brought this trouble upon himself by his silly attempt to use what he called popular language instead of something accurate and correct. The positive evidence for the defendant was that there was no curb; the positive evidence for the plaintiff was that there was something which 'Tuck, the groom, and Green, the bailiff, thought was in the nature of a curb when the animal first came into Mr. Lynch's possession. If there was a curb then he thought he would expect the horse to be lame. There was no reason to suppose that there was any visible curb except this slight swelling, and that slight swelling might or might not be that which brought on the lameness. By the time the animal came back to the plaintiff no doubt there was a curb, but that was long after the date when the defendant had certified. What he had to consider was whether there was any real reason to hold that on September 4th, when the defendant certified, there was a curb in the sense that a competent veterinary surgeon ought to have known. The plaintiff had got to make out his case, and he thought, having regard to all that had been said, that he had failed to do so. He thought the defendant had rather brought this upon himself by his carelessness, but he did not think that was a reason for depriving him of his costs.

V.S. Convicted of Fraud.

At Bedfordshire Assizes, Ernest Druce, who described himself as an author and a University man, Amos Wilkinson, a veterinary surgeon, and Ethel May Wilkinson, his wife, were each sentenced to nine months' hard labour for conspiring to acquire goods without paying for them. When the Wilkinsons were living at Newport Pagnell, Druce was known to take parcels of clothes to their house, and it was alleged that there was a conspiracy between the three to defraud tradesmen. Druce ordered goods to be sent to his house at Stantonbury, and when asked for a reference gave the telephone number of the Wilkinsons. In this way goods were supplied on credit at Rugby, Nuneaton, Cambridge, Bedford, Leicester, Luton, Leighton Buzzard, and Dunstable. Some of the articles were found in the house of the Wilkinsons at Nuneaton, where they lived after leaving Newport Pagnell.

In a new statement, Druce declared that he ordered the goods in the expectation of being able to pay for them. He was an author, and had published one book and had another nearly ready. His prospects were at one time very promising, as he expected to become Unionist candidate for Paisley.—*News of the World*.

Prosecution by the R.C.V.S.

At Llandilo on Saturday, June 8th, F. Emerson Thomas, farrier, was summoned by the Royal College of Veterinary Surgeons for unlawfully using titles stating that he was specially qualified to practice a branch of veterinary surgery.

Mr. T. H. Powell, for the prosecution, stated that in an action brought against the defendant in the County Court at Llandilo recently, the defendant filed a counter-claim, which was made out on one of his billheads, on which everything was in very bold type except the line, "No connection with the Royal College of Veterinary Surgeons of England." The heading read: "F. Emerson Thomas, D.V.D. (no connection with the Royal College of Veterinary Surgeons of England), Diploma, Doctor of Veterinary Dentistry: diploma of Veterinary Science U.S.A."

Mr. Hurley, for the defence, submitted there was no satisfactory evidence that defendant had published the billhead.

Deputy-chief-constable Evans said defendant was fined 25s. and costs on July 25, 1904, for falsely representing himself to be a qualified veterinary surgeon, and £5 and costs on April 2, 1906, on the same charge.

The Magistrates said they did not consider this a serious offence, and imposed a fine of £1 and costs, with 10s. 6d. advocate's fee.—*Western Mail*.

The Royal Veterinary College Athletic Sports

Dismal weather sadly marred the enjoyment of these annual sports, which were held at the Tuffnell Park Athletic Grounds on Wednesday. Rain fell persistently during most of the afternoon; and so much had fallen previously that the ground was in almost the worst possible condition for athletics. Two events—the high jump and the tug-of-war—were postponed on account of the difficulty of obtaining a foothold, and will be decided at a later date. Despite the unfavourable conditions, a good muster of students and friends of the College assembled, and succeeded in enjoying themselves wonderfully well. The programme, as is usual in these sports, was long and varied; and the heavy going, which made fast times out of the question, did nothing to lessen the keenness of the competitors. At the close Mrs. Woodruff presented the prizes, which were awarded as follows:

- 100 Yards Scratch Race.—Final heat: W. F. Poulton, 1; R. H. Stalker, 2. Time, 10 4-5ths. secs.
- Throwing the Cricket Ball.—K. S. Simpson, 1. Distance thrown, 95 yards, 6 inches.
- Putting the Weight.—P. R. Viljoen, 1. Distance, 30 feet, 9 inches.
- 220 Yds. Handicap.—W. F. Poulton, 1; E. W. Garry, 2. Time, 23 secs.
- Long Jump.—J. Daly, 1; W. F. Poulton, 2. Distance 18 feet.
- 120 Yds. Hurdles.—W. F. Poulton, 1; B. J. Nicholas, 2. Time, 20 1-5th. secs.
- Sack Race.—H. Chown, 1; R. H. Stalker, 2.
- One Mile Walk.—L. D. Housdan, 1; H. H. Curzon, 2.
- Half Mile Scratch.—K. S. Simpson, 1; S. W. Marriott, 2.
- Obstacle Race.—W. P. Hamlyn, 1; G. H. Bennett, 2.
- Quarter Mile Scratch.—W. F. Poulton, 1; O. Dixon, 2. Time, 56 2-5th. secs.
- One Mile Handicap.—L. D. Housdan, 1; W. P. Hamlyn, 2; E. W. Garry, 3.
- Ladies Race.—Mrs. Sabin, 1; Miss Reynolds, 2.
- Relay Race (inter-class).—Class D, 1; Class C, 2; Class B, 3.
- Consolation Race.—J. E. Barnes, 1.
- College Derby (donkey race).—W. L. Sheffield, 1; G. van de W. De Kock.

Dublin University.

During the last few weeks the attention of our members has been turned upon Dublin by the holding of our Annual Meeting there, and the following note on the antiquity of its educational institutions may be of interest to our readers. It is taken from a long account of Dublin University Medical College, which completed its second century last year, in *The British Medical Journal* of June 8.

"Trinity College was founded by Queen Elizabeth, but centuries before her day several abortive attempts had been made to establish a university in Dublin. As far back as the eighth century Ireland was famed throughout Europe for its schools. To Irish scholars has been ascribed the foundation of Paris and Pavia, and through Scotus Erigena, of Oxford. The ancient homes of Irish learning were laid waste by plundering Danes, and later by invading Anglo-Normans. Early in the fourteenth century an effort was made to rekindle the extinguished light of knowledge, and the first University of Dublin was founded by a Bull of Pope Clement V. in 1311. He established a *studium generale* in every science and lawful faculty, and enacted 'that such as might be thought worthy to be associated with the honour of doctors in any of the said faculties might obtain the licence of any of the said schools for that end.' This Bull would seem to have remained a dead letter, for in 1320 Pope John XXII. confirmed his predecessor's Bull and the statutes drawn up for the earlier foundation. But even then the university was little more than a name, and soon all trace of it was lost, as is

shown by the fact that in 1475 the Dominican Mendicant Friars obtained from Pope Sixtus the Fourth a Bull decreeing once again the foundation of a university in Dublin. The time was not yet ripe, however. But about the middle of the sixteenth century the scheme, which the leading citizens of Dublin had long had much at heart, began to assume concrete shape, and in 1590 a petition was presented by the Mayor and Corporation to the English Privy Council.

"In response to that petition, a charter was granted for a college that should be 'the mother of an university for the better education, training and instruction of scholars and students.' The lands and buildings of the Augustinian Priory of All Hallows, situated outside the city walls, which had become the property of the Corporation on the dissolution of the monasteries by Henry VIII., were chosen as a site, and an appeal for help was issued to all the Irish baronies. In this way funds to the amount of £2,000, equal to about £16,000 at the present day, were collected. The foundation stone of the College, *Sacrosanctae et individuae Trinitatis juxta Dublin*, was laid by the Mayor on March 16th, 1591, and in January, 1593, the College was opened for the admission of students. Born in troublous times, it had in its early years a fierce struggle for existence.

Queen Elizabeth helped it with a fresh endowment of £200 a year in 1598, and James I. endowed the College with land in Ulster, and settled upon it a pension of £400 a year. Its growing prosperity is shown by the fact that, whereas in 1596 the total receipts of the College were under £300, in 1616 they were something over £1,000."

OBITUARY.

JNO. RICHARD LEWIS, M.R.C.V.S., Inspector D.A.T.I.,
13 Upper Merrion Street, Dublin

Graduated, Lond : April, 1858.

Mr. Lewis died in May last, at the age of 76 years.

THOS. F. SEXTON, M.R.C.V.S., Kingstown, Co. Dublin.
Edin : Dec., 1911.

Death occurred last month.

THANKS TO ELECTORS.

Dear Sir,

I should be very grateful if you would kindly allow me a little of your valuable space in which to offer my sincerest thanks to all those members of the profession who by their votes and other assistance have returned me as one of their representatives on the Council of the Royal College of Veterinary Surgeons. During my tenure of office it will be my earnest endeavour to work for the general welfare of the profession and so to merit the confidence they have reposed in me.—Yours faithfully,

T. SALISBURY PRICE.

30 Brixton Hill, S.W. June 11

Dear Sir,

Will you kindly allow me through the medium of *The Record* to express my thanks to the Fellows and Members of the Royal College of Veterinary Surgeons for the honour they have conferred upon me in electing me to a seat on the Council. It will always be my endeavour to merit their confidence.—Believe me to remain, very faithfully yours,

JNO. T. SHARE-JONES.

The University of Liverpool,
Dept. of Vety. Anatomy, June 12.

(The following have been unavoidably held over.)

ESPERANTO.

Dear Sir,

In thanking you for your courtesy in reproducing several esperanto originals with translations, I would call the attention of the Committee of the forthcoming International Veterinary Congress in London to the value of Esperanto as a means of international intercommunication, and I would suggest to them the advisability of utilising it as one of the languages for use during the congress and for reproducing the transactions, as it is largely used by veterinary

surgeons in France, Spain, Germany, Austria, Hungary, Russia, India, China, Australia, and other countries, many of whom are unacquainted with either of the present officially recognised languages. It has come into general use in many international scientific associations, and in some the enormous expence of reproducing their transactions in polyglot form has been very materially reduced by the use of esperanto instead.

A timely announcement by the Committee that Esperanto would be recognised as an official language would largely increase the interest of foreign veterinary surgeons in the congress, and also allow ample time for any one who wished to, to learn it before the Congress takes place.—Yours faithfully,

Adelaide, S.A. April 4.

FRAS. EVELYN PLACE.

VETERINARY CINEMATOGRAPHY.

Sir,

I have been interested to read the criticisms on my letter in last week's issue by those two writers who have taken it seriously, as it was intended, and not tried to pervert its meaning. It has apparently been slightly misunderstood. My proposal for Veterinary cinematography was not intended as a substitute for practice and study—which I fully appreciate are first essentials—but as an additional means of impressing methods on the mind in an original and entertaining way, and giving far more illustrations than could be obtained by anyone from text books. It would probably imbue the student with more enthusiasm. I do not suggest that I have given a complete scheme as to how it should be managed either financially or otherwise; the whole thing is an idea in embryo, but personally I am fully convinced that the cinematograph has a large future as an aid to all branches of education. My contemporary student has either utterly misunderstood my article on all points, or his density is affected, with the purpose of scoring at my expense. Taking his points *seriatim*, my article might have been suggested by pictures of bacterial life I saw exhibited as early as 1908, but the report referred to unfortunately escaped my notice. However, that it should have been used by the medical profession seems to be a point in my favour. As regards expense, I agree that there are difficulties; it is always harder to obtain money for intellectual purposes than for those that appeal more directly to the senses! His next question is, I think, absurd. Would any man with a grain of sense ever expect a student to be "Competent in practice" from merely witnessing films? I am very pleased it was only Mr. Reynolds' suggestion and not mine. But I do think the witnessing of such films would be an immense help to a student who had not previously tried the practical part.

Concerning his statement that "the pictures I mentioned mostly illustrate the text books," is not that just the desired object? Only my method would prove to be an accentuated illustration of them, rendering them more life-like and intelligible!

Regarding the "extraction of teeth," the idea of a living picture of the operation would not be to show the actual tooth (which the surgeon himself rarely sees when extracting), but to illustrate the methods of holding the patient and of manipulating the instruments, etc. Then when a student was called upon to do the operation he would mentally see the picture he had previously witnessed, and remember ways and means a great deal easier than he would from lectures on the subject. He next says "from the amusement point of view, twelve out of thirteen pictures I mentioned can be seen at picture shows for the moderate outlay of 3d." Evidently Mr. Reynolds has more experience of threepenny seats than I have; and further, he has apparently forgotten that one is not sure of the kind of picture he will see at a public hall, and that other comic and dramatic pictures have to be witnessed whether one likes them or not.

In conclusion, my humble advice to Mr. Reynolds is to try and criticise in a fair way—looking at both sides of the question.—Yours truly,

HAMILTON KIRK.

Canine Distemper.

PROPHYLAXIS

CANINE DISTEMPER VACCINE PROPHYLACTIC, P.,D. & Co.

A polyvalent vaccine prepared from cultures of several strains of *Bacillus bronchisepticus* (Ferry)—the specific micro-organism of canine distemper.

This vaccine is administered subcutaneously as an immunising agent against canine distemper. It is supplied in sets of three bulbs, which provide a series of graded doses sufficient for one dog.

Price, 4/0 per set.

TREATMENT

CANINE DISTEMPER VACCINE COMBINED (Curative), P.,D. & Co.

Prepared from several strains of *Bacillus bronchisepticus* (Ferry), *Staphylococcus pyogenes* (albus and aureus), and *Streptococcus pyogenes* of canine origin.

This vaccine is administered subcutaneously in all forms of canine distemper and its sequelæ. It is supplied in sets of six bulbs, which provide a series of graded doses for one case.

Price, 7/6 per set.

Further particulars will be sent on request by

PARKE, DAVIS & CO., 50, Beak Street, **LONDON, W.**

Orders for single copies by post, or short subscription (4 weeks (1/2) etc.), should reach this office by first post on FRIDAY MORNING.

The Record is posted to Subscribers on Friday, usually in time for the 5 p.m. collection. The normal issue consists of 16 pages of literary matter but this is varied to 20 or to 12, as may be required.

DISINFECTANT.
NON-POISONOUS.
NON-CORROSIVE.

More powerful than corrosive sublimate.
Tested by any Standard it is the best.

Does not corrode instruments or injure the operator's hands.

One in 800 destroys *Staph. pyogenes aureus* in five minutes.

Samples and Reports free to the Profession.

Newton, Chambers & Co. Ltd.
THORNCLIFFE, nr. SHEFFIELD

Guard for the Eyes for Pit Ponies.

PATENT APPLIED FOR.

To meet the requirements of the Coal Mines Act 1911, coming into operation on July 1st this year, I have made an attachment that can be fixed to existing bridles.

I consider it an essential that the animal's vision should not be obstructed in the forward and backward view, and as little as possible at the side—to avoid accidents. My guard has been designed for this purpose, leaving a clear anterior and posterior view; further, the strands are arranged at a correct angle and made of material that cannot injure the eye if banged on to it, and, like electric cable wire, can be put back to shape again with the hand. Complete weight 3 lb.

Arrangements can be made for one's own saddler to make.

W. J. FLETCHER, M.R.C.V.S.,
51 Chester Street, Wrexham.

THE 'RECORD' PRECISION SYRINGE.

The FINALITY of Hypodermic and Serum Syringes.

"The **"Record"** Precision Syringe is a piece of delicate mechanical workmanship well deserving its name. It meets **all requirements as regards aseptic conditions and accuracy and it is always ready for use.**

It consists of **metal and glass** only. The glass barrel is ground inside perfectly true to cylindric form. The Nickel vacuum piston is "ground in" into the glass barrel by precision machinery so as to fit hermetically, it slides smoothly, yet tightly, **without any lubricant.**

The cover is fixed on the cylinder with a **bayonet-fastening**; for the purpose of **thorough cleaning** it is provided with a segmental incision, by means of which it can be detached from the piston-rod by sliding it off side-ways. When **completely** taken apart the Record Syringe **forms 3 parts only: cover, piston and barrel.**

The **Needles** are provided with the original "Progressive" flat mounts. By this arrangement a good hold is afforded to the operator.

The fixing of the needle itself in the mount, by means of a smooth longitudinal guide arranged above the screw threads prevents the needle from breaking off in the mount.

EVERY SYRINGE IS GRADUATED BOTH IN C.C. AND MINIMS.

Price with 2 Steel Needles in Metal Case—20c.c. 21/- 10c.c. 17/6. 5c.c. 15/- 2c.c. 10/- 1c.c. 9/-

PRACTICES FOR DISPOSAL

GOOD AGRICULTURAL PRACTICE returning about £600 per annum. Estab. 30 years. House contains 2 reception, 4 bedrooms, etc., garden about one acre, good stabling, etc., situated in Eastern County. The practice and freehold property will be sold complete for £1150. Easy terms can be managed. Quote No. 13 V.

IRELAND. Practice returning £1200 per ann. Good contracts produce over £400 per ann. Vendor would sell the whole or a half-share of the practice.

LARGE MIDLAND TOWN. Genuine mixed practice, returning £850 per annum, and shoeing business returning £750 per annum. Books audited by accountant certified profit £600 per ann. Very convenient premises Rent £50. Large modern house, rent £100, optional. Capital required about £1250.

WEST OF ENGLAND. Very profitable practice, returning nearly £1200 per ann. Contracts produce over £250. Experienced assistant will remain with purchaser if desired. Large convenient house would be sold with the practice, price £800. Premium for practice £1500. Profits are exceptionally large for the income.

IMMEDIATE. Small practice in Scotland returning £350 per ann. Purely agricultural district. In present hands 3 years. House contains: reception and two bedrooms, kitchen and bathroom, h. & c. Good stable. Rent £28. Premium £100 and small valuation, including furniture.

LONDON, N. Very old-established practice returning about £1200 per annum. Good house and thoroughly convenient premises, rent £90. The practice is principally horse. Receipts are increasing. Premium one years purchase. This practice is well-known to us and can be recommended

SOUTH COAST. Country practice returning about £835 per annum, including appointments producing about £70. In present hands 24 years. The practice has been worked by an assistant who would remain if desired. Convenient house, rent £21, larger available if required. Premium £800.

GOOD-CLASS practice in the West of London, returning £600 per annum. Well-situated house, rent £70. A partnership might be entertained with a suitable gentleman, but vendor would prefer to sell the whole practice.

SOUTHERN COUNTY. Easily worked practice returning £650 per annum. Convenient house with good yard, stabling, kennels, etc. Rent £85 or would sell freehold if preferred. Premium one years purchase, valuation optional. The vendor is well-known to us and the practice can be thoroughly recommended.

PURCHASERS are requested to send full particulars of their requirements as we have a number of practices and partnerships for sale which have not been advertised.

90th SESSION.

**The only endowed Veterinary College
in Great Britain.**

The Teaching Facilities have been further increased to meet modern requirements.

Full courses of instruction are given in preparation for the examinations for the Diploma of Membership of the Royal College of Veterinary Surgeons (M.R.C.V.S.), and the Degree of Bachelor of Science (B.Sc.) of the University of Edinburgh.

An EXAMINATION IN GENERAL KNOWLEDGE for intending Students will be held on 5th, 6th, and 7th September.

**Next Session commences
early in October.**

Further particulars may be obtained on application to

ROBERT ANDERSON, S.S.C., Sec.
37 York Place, Edinburgh.

NATIONAL VETERINARY ASSOCIATION,

President: WM. WOODS, F.R.C.V.S., Wigan.

The Annual Meeting will be held at the
TOWN HALL, MANCHESTER,
Wednesday and Thursday, July 24th & 25th
Annual Banquet on the evening of Wednesday, July 24th.

The Provisional Committee have arranged for the following papers:—

Veterinary Education (pre and post-graduate) Maj. Gen. F. SMITH, F.R.C.V.S.

Discussion opened by Prof. SHARE-JONES.

Phalangeal Ostitis,

WM. HUNTING, F.R.C.V.S.

Discussion opened by Prof. MACQUEEN.

Bovine Tuberculosis,

Prof. DELÉPINE

Discussion opened by Prof. AINSWORTH WILSON.

Abdominal Surgery in Veterinary Practice,

Prof. WOODRUFF

Discussion opened by Prof. O'CONNOR.

On the 26th the members are invited by the Lancashire Veterinary Association to an Excursion and Picnic at Rudyard Lake in Staffordshire.

DRUGS, INSTRUMENTS, ETC. Those desirous of exhibiting should apply at an early date, stating space required, to—

G. H. LOCKE, *Hon. Sec. Provisional Committee*, Grosvenor St., Manchester

Royal Veterinary College, London.

(**Founded 1791.**)

Principal and Dean : Professor **SIR JOHN M'FADYEAN, M.R.C.V.S., M.B., B.Sc.**

Membership Diploma of the Royal College of Veterinary Surgeons :

Complete Courses of Instruction are conducted in all the Subjects of the Examinations for this Diploma. The facilities, etc., afforded for the Practical Training of Students are unrivalled.

Bachelor of Science Degree, University of London.

The Professors of Chemistry, Biology, Anatomy, Physiology, Hygiene, and Pathology, are Recognised Teachers of the University, and conduct in their respective subjects courses which qualify for the Science Degree (B.Sc.), which may be taken concurrently with the above Diploma.

POST GRADUATE COURSES.

These Courses in Veterinary Pathology and Bacteriology are conducted under the supervision of the Principal and are specially adapted to the requirements of officers of the Army Veterinary Department, Colonial Veterinary Surgeons, Veterinary Inspectors under the Contagious Diseases of Animals Acts, and Candidates for the Fellowship Diploma of the Royal College of Veterinary Surgeons.

The number of places for these Courses is limited and early application must therefore be made to prevent disappointment. The next Course will begin on Monday, October 7th, and terminate on Friday, November 29th, 1912.

The College Calendar, containing full particulars, will be forwarded on application to

The Secretary,

Royal Veterinary College, Camden Town, N.W.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1250.

JUNE 22, 1912

VOL. XXIV.

THE INTERNATIONAL VETERINARY CONGRESS.

Incidentally the Departmental Report upon Foot-and-Mouth Disease, which we noticed last week, furnishes us with an additional reason for supporting the International Veterinary Congress of 1914. The Report mentions the Congress but once to recommend that it should consider foot-and-mouth disease, and should do so with especial regard to the possibilities of joint international action against it. But the Report also advances several other suggestions for international co-operation against animal disease, and some of these are by no means confined to foot-and-mouth disease. If the various Governments seriously contemplate any such united action, the International Veterinary Congress will be an aid lying ready to their hands—perhaps even as an executive instrument, and certainly as a valuable advisory body.

John Gangee, an Englishman in advance of his time, founded the Congress nearly fifty years ago. His primary object in doing so was to obtain an interchange of views amongst the leading veterinarians of different countries regarding the great animal scourges which were then devastating Europe. Various developments have since taken place. The Congress itself, from a purely veterinary point of view, has greatly expanded and grown. Its large membership now represents all that is best in the profession throughout the world; its range of subjects has been extended to include every department of veterinary work; and its recommendations are already of international weight. With the growth of the Congress to some extent, though far from wholly, as a result of it—has come an increasing recognition by all civilised peoples of the economic importance of veterinary science. Further, there is now a strong and growing tendency towards international conference and co-operation in many directions. It is quite possible, then, that the year 1914 may find many Governments considering schemes of concerted action against animal epidemics. In that event, the deliberations of the International Veterinary Congress may assume an importance such as they have never possessed before. It does not seem impossible that the Congress may receive some permanent function in international co-operation. It is certain that in all preliminary consideration of such co-operation the Congress will have a powerful voice. The next Congress will probably be the largest ever held. It may also be the most momentous one in its effects upon agriculture and commerce; and that possibility adds one to many other reasons why we should support it freely.

PEPTONE POISONING.

Whilst immunising cattle against East Coast Fever last September, in Western Pondoland, I noticed that after receiving an injection of vaccine some of the cattle exhibited most unusual symptoms. Peptone is added to the injection (10 cc. of an emulsion of spleen and lymphatic gland into the Jugular vein) to bring about a positive leucocytosis, thus helping to bring about the development of the specific organism in the animal to be immunised. Some of the cattle immediately after receiving the injection became uneasy, and in two or three minutes fell down. Respirations were hurried, and the membranes were cyanotic. The pulse was very feeble, and violent purging soon made its appearance. The skin above the eyes was puffed and wrinkled, and swellings appeared on various parts of the body, especially were they evident in the region of the vulva in the cows that were affected. There was much skin irritation, the animals after getting up scratched themselves, rubbed against the walls of the kraal, and they evinced a great desire to escape into the Bush.

I could not, at the time, account for the curious symptoms exhibited, and thought they were due to the interference with pulmonary circulation. The symptoms certainly resembled the ordinary form of Urticaria commonly met with in cattle.

Sir Almroth Wright, at a meeting of the T.M.A. held in Johannesburg on Nov. 16th, 1911, discussing Anaphylaxis in man, went on to describe some experiments which had been carried out in connection with the injection of peptone into dogs.

In the early days of Antidiphtheritic Serum, whilst experimenting with some serum at Netley, Prof. Wright found that on the eighth day after the injection the coagulability of the blood was much lowered, and on the tenth day after injection Urticaria developed. This sequence led Wright to recommend the use of Calcium chloride in the treatment of Urticaria.

It has been shown in a paper from Metchnikoff's Laboratory that after an injection of Antidiphtheritic serum the leucocytes increased in cases in which the event was favourable up to the eighth or ninth day, on or about which there was a sudden drop. Wright says that it was this sudden drop in the leucocyte count which led him to look for a parallel decline in the coagulability of the blood.

In certain experiments which have been carried out in regard to the intravascular injection of peptone into dogs, Wright considers there is a good deal in common in the symptoms of peptone poisoning and those of Anaphylactic shock. If the Peptone is run in slowly nothing happens, whilst if

it is run in more rapidly (3 gms. per kilo in one minute), after an interval of two to three minutes the dog begins to suffer from dyspnoea, diarrhoea of a most acute kind sets in, and the blood pressure is found to be so low that the blood only trickles from a severed carotid. If the dog be a white one, a rash is sometimes seen over the anterior aspect of its belly, very like Urticaria, and the blood is found to have lost its coagulability. This loss of coagulability is due to some changes produced by the peptone in traversing the liver, for if peptone be injected into the portal vein and blood is collected from the hepatic artery, it is found to have acquired the power of preventing the coagulability of blood *in vitro*.

We cannot get anaphalaxis with bacterial toxin, so the injection used in the process of immunising cattle against East Coast Fever may be excluded. The curious behaviour of the inoculated animals must have been due to the peptone. A somewhat larger quantity of peptone than usual was added to the injection on this particular day, owing to the peptone having caked in the bottle, and in adding a quantity to the vaccine a large lump fell in and was included in the mixture.

FRANK CHAMBERS, M.R.C.V.S.

OBSCURER CAUSE OF DEATH IN SHETLAND PONY.

A short time since, a pedigree yearling pony, bred by my wife on this farm, was noticed to be showing symptoms of sub-acute abdominal pain; the filly had been depastured, with several others, on some rough ground which was formerly woodland, and it was thought probable that the coarse herbage or the presence of parasites might have occasioned the trouble, though none of the other ponies appeared to be affected.

Treatment accordingly; a full dose of castor oil, followed by 6 dr. Colodyne in warm milk, at intervals of 3 to 4 hours, which appeared to relieve the pain, but death supervened within about 30 hours.

Post mortem examination disclosed no abnormal conditions, except in the mucous membrane of the Colon, which was very extensively ulcerated, the lesions, in outline somewhat ovoid, varying from one-third to one-twelfth of an inch in size. No perforation could be discovered.

In the museum of the Royal Veterinary College there is a specimen of similar lesions from the horse's colon which was placed there by Sir J. M'Fadyean, who considers the causal agent to be the *Bacillus of Necrosis*. I am indebted for the latter information to Professor Wooldridge, to whom I forwarded a part of the colon, and he tells me these are the only two cases he has known.

If any other members have met with similar cases, it would be, I think, of interest if they will record them, as a possible way to the discovery of the source of infection and consequent prevention.

THOS. A. HUBAND, F.R.C.V.S.

Kingsdown, near Sevenoaks.

FRACTURE OF THE OS PEDIS.

Subject.—A six-year-old roan van mare.

When I first saw the mare she was walking lame near hind, the result of having made a false step while at work. The lameness was not then acute, and the mare was able to pull the empty van back to the stable, a distance of a mile.

Next morning she was suffering great pain, and was practically unable to take any weight on the affected limb. The foot was examined and found to be tender about an inch in front of the point of the frog. In the course of a day or two pus formed in this position, and was given vent. Later there was a slight slough of sensitive laminae, but a discharge, smelling distinctly of caries, persisted for some time after this. Eventually the wound healed, but the mare continued to be lame from a low ring-bone which was forming.

Treatment was on the usual lines, the mare being given a loose-box with plenty of peat-moss, of which she took full advantage.

After about three months she was put to light work, which she did well, and latterly she was pulling loads of 30-35 cwt. daily on London streets. I frequently saw the mare at work, and, except for a slight tendency to go on the heel, there was nothing amiss with her action.

After some six months work she one day ruptured her heart while in harness, and I was able to obtain the ever-instructive post-mortem.

J. F. MACDONALD, M.R.C.V.S.

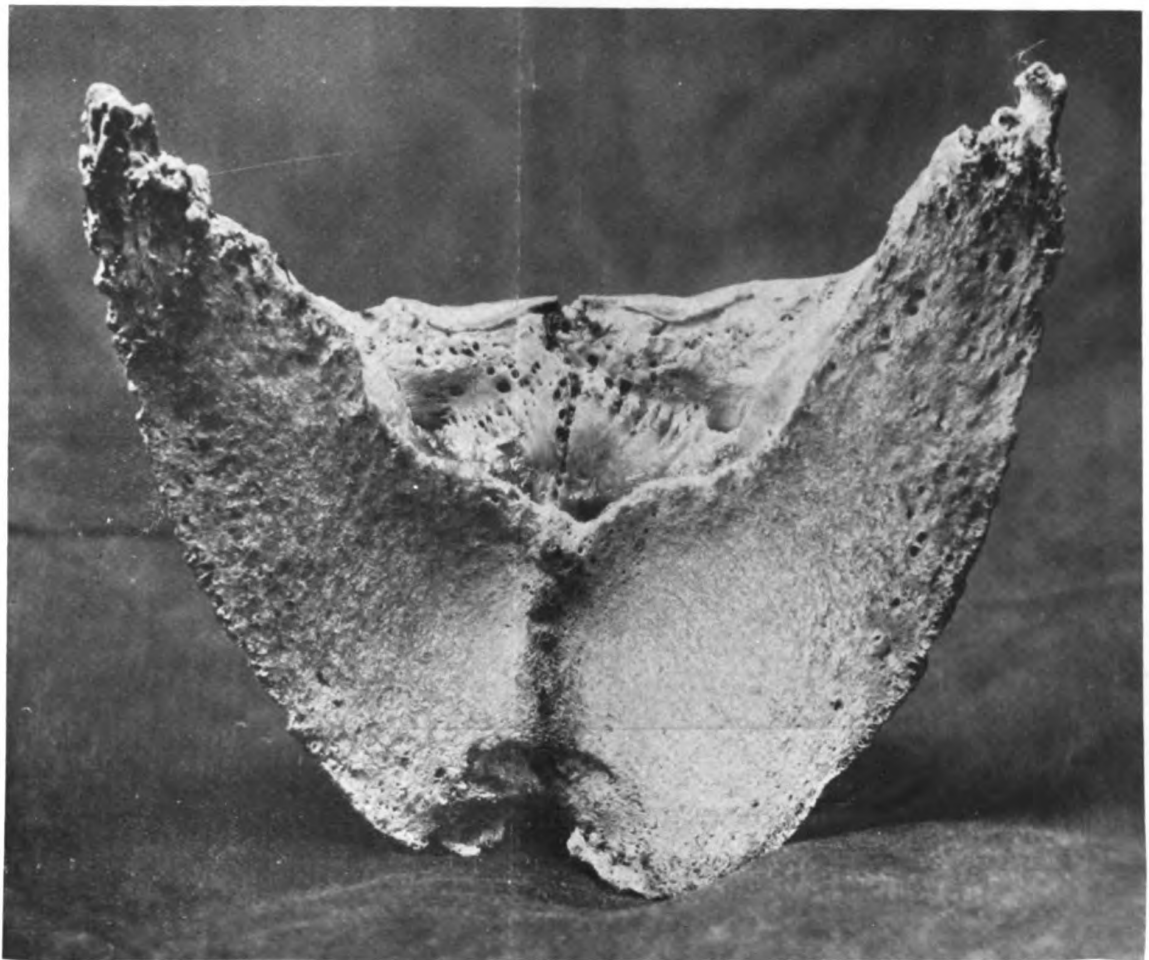

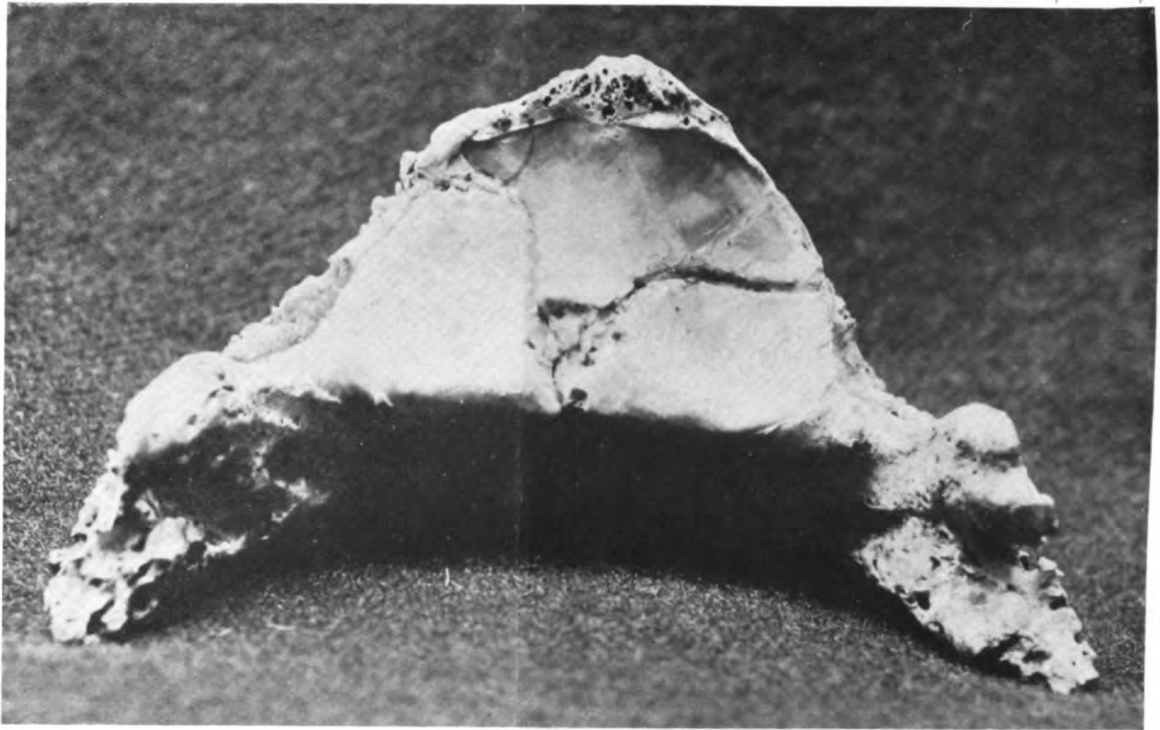

HUMAN TUBERCULOSIS AND ITS RELATION TO TUBERCULOUS MILK.

In placing the following tables before the readers of *The Veterinary Record*, I hope that they may have the same effect on them as they have had on me, namely, to stir them to greater activity, both in the search for and weeding out of the herds of cows with tuberculous udders, and in educating the general public to the dangers of tuberculous milk—and therefore to the necessity of efficient veterinary inspection of dairy cows.

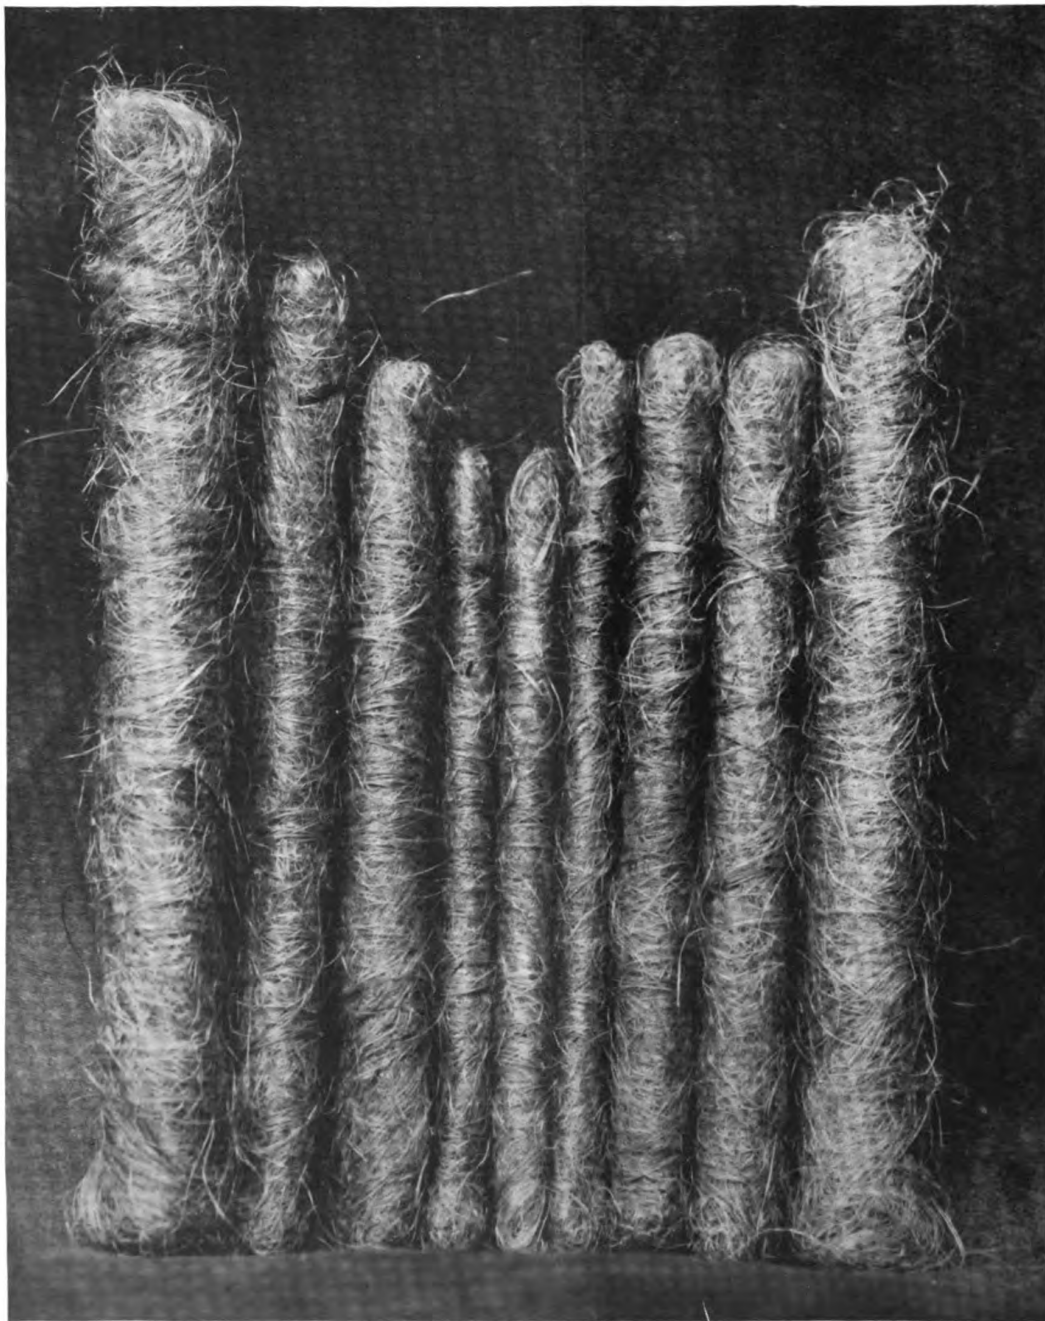

It is said by some people that even if the danger from tuberculous milk is a real one, which they deny, so small a percentage of cases can be traced to that source as to be practically negligible, but I maintain that if only one child per 1000 dies in Great Britain annually from *Tabes mesenterica*, and the source of that infection is Bovine, it is our duty to do all in our power to free our milk from this disease.

I agree with Dr. Leslie Mackenzie, that in the campaign against consumption we must not neglect any of the contributory causes: housing, working conditions, food supply, etc., all must be brought to the nearest state to perfection. "To every man that wants to live, we would offer the chance to live." The following tables are taken from the Report of the Medical Officer of Health of the City of Sheffield for the year 1910.

Other forms of Tuberculosis	40	32	57	72	48	38	48	40	48	39	36

Examination of cows for Tuberculosis of the Udder in following up Tuberculous mixed samples.

	1901	1902	1903	1904	1905	1906	1907	1908	1909	1910
Country cows	—	75	622	170	231	279	783	544	451	760
Tuberculous	—	2	6	1	9	10	15	13	18	29
City Cows	1067	2264	672	1774	1521	1434	8808	13,587	13,958	9573
Tuberculous	5	7	3	8	4	2	29	34	42	22

It will be noticed that although the deaths from phthisis have not materially decreased during the period, there has been a steady decline in the number of deaths from Tabes mesenterica, while there has been a steady increase in the number of cows examined, and the number of tuberculous udders found.

It may be coincidence, but it is rather striking that in 1906 there were 24 deaths from Tabes mesenterica, while in 1907 there were only 10 deaths from the same cause, and this fall coincided with the large increase in the number of cows examined in 1907 as compared with previous years, and the great increase in the number of cows found affected in the udder from 12 in 1906 to 44 in 1907.

I am not prepared to go so far as to say that the eradication of the tubercle bacillus from milk will bring the number of deaths from Tabes mesenterica down to zero, but I am satisfied that every cow with a tuberculous udder taken away from the milk supply will help in gaining that desired end.

ERNEST J. BURDRED, M.R.C.V.S., D.V.H.
Sheffield.

VICTORIA VETERINARY BENEVOLENT FUND.

The fourteenth annual meeting was held in Dublin on the 5th June, immediately after the annual meeting of the Royal College of Veterinary Surgeons. Mr. S. H. Slocock, F.R.C.V.S., Vice-President, occupied the chair, and there was a large attendance.

CORRESPONDENCE.

The Hon. Sec. (Mr. W. Shipley, F.R.C.V.S.) read a letter from Mr. J. J. O'Connor, Hon. Sec. of the Veterinary Medical Association of Ireland, stating that circulars relative to the Victoria Veterinary Benevolent Fund were brought before the meeting of Council of the V.M.A.I. The circulars were distributed among the members present, and the following resolution was passed, to be approved of at the general meeting of their Association:—

“The Council of the Association recommends that in future, and until the resolution be rescinded, a sum of two guineas be subscribed annually to the Victoria

Veterinary Benevolent Fund. The Council further wishes to direct the attention of the members of the profession in Ireland to the aims and work of the Benevolent Fund, and to recommend the Fund to their charitable consideration. (Applause).

A letter from Mr. M. Hedley of the Department of Agriculture and Technical Instruction for Ireland (Veterinary branch) nominating Prof. Mettam as a candidate for election on the Council of the Benevolent Fund. He thought that it might be of advantage to the Fund if the system of election of candidates could be transferred to the general body of the members, as done in other associations. He believed that cases might be stated, and it would not be necessary to mention the name of the person who is candidate for any benevolence, but all the circumstances connected with the claim might appear on the voting paper. He was inclined to give a life vote for the benefit of the President of every Association contributing a lump sum of £10, and an annual vote for every half-guinea subscribed. This scheme would admit of extension. The payment of a half-guinea per annum, without having any interest in what took place subsequently, kept contributors more or less outside the Association, and his suggestion was that their interest should be kept alive in the Fund by giving them something to do, such as voting for whom they considered the most deserving candidate, or the largest number of deserving candidates that the Fund would be prepared to assist in connection with any particular election.

The CHAIRMAN said the next business was to consider the Council's report, and in introducing that, he wished to say that they held the meeting there that day because they wanted to have as big a gathering of veterinary surgeons present as possible. They particularly wished to come to Ireland so that members of the profession in Ireland might get to know of the work done by the Fund. They wanted increased membership, increased subscriptions, and increased good work. They, in England, are conversant with the traits of the Irish character, and one of them is benevolence. They were sure that the Irish veterinary surgeons were anxious and desirous that the widows and orphans of their profession should be provided for to some extent. The position of Hon. Sec. and Treasurer was well filled by Mr. Shipley, and everyone would admit that since Mr. Shipley undertook those duties the Fund had done splendid work. (Applause). Mr. Shipley availed himself of every opportunity of increasing the membership

and the subscriptions. Of course, with that they had increased expenditure, but one great recommendation he had heard Mr. Shipley make, and he (the Chairman) was pleased that Mr. Garnett was in accordance, was that they should spend more money. They then wanted increased subscriptions, and they wanted the members to be more enthusiastic in the cause. In the case of Ireland the membership was very poor at the present moment, but he would like to say that even if they had no subscribers in Ireland and a case came forward it would be treated just the same as any other. (Hear, hear). It was new members and greater enthusiasm that was required.

Mr. HOWARD proposed the reception of the report, which was seconded by Mr. Banham, and passed.

The report was then adopted.

[For details of Annual Report, see our issue of June 8, p.p. 776 and 778].

Mr. HENNEY (Dublin) said as yet he was not a member of the Fund. He thought they had not paid attention to recruiting members, and that they should form a small committee here to advise them. It would be better for their objects if they had the balance on the other side of the account. He thought a charity never progressed unless it was in debt, and the bigger the debt the more subscriptions they would receive—(Laughter)—and the greater the efforts made by those interested to take them out of it. (Applause).

Mr. McKENNY said he thought that really the subscriptions were the first thing to be considered, and he did not agree with Mr. Henney about running into debt. He was of the opinion that it was a very deserving cause, and that they all should support the fund. Their first duty was to get subscriptions and not so much members, as was said.

Mr. SHIPLEY, who was received with applause, said he would like to refer to the balance-sheet and the balance being on the wrong side. He wished to say that that was the first year he had been secretary to the Fund. There was a ridiculous way in which the balance-sheet used to be prepared, and he wanted to point out that the balance of £72 which was at their credit side would have to last them this year. He had to make it last nine months, so that on the 31st December they would be in debt again. Of course they must keep a little balance in hand, for, now and then, they had to write a cheque for £10 or £20. At the present time they had 220 members, but then their expenditure had increased as they would see to £153. If they could, they would like to give their pensioners a sum of 10s. a week each, but then they would need £360 a year. What they want now was to have sufficient subscriptions so as they need not rely on their invested funds, which might be used for other things as they cropped up. In Ireland in a comparatively short time the subscribers had increased from four to seven. They were now spending over £50 a year in Ireland, which indicated they should have many subscribers there alone. Letters were being constantly received stating that the writers had only just heard of the Benevolent Fund. He earnestly appealed to all members of the profession to help. Of course they wanted subscriptions, and it was nonsense to think that one man could do the work unless the other persons took an interest in it. He trusted that their visit to Ireland would result in many Irishmen joining. (Applause).

ELECTION OF OFFICERS.

Council.—The following were re-elected: Messrs. F. W. GARNETT, F. L. GOOCH, T. G. HEATLEY, F. HOBDAV, H. A. McCORMACK, Sir JOHN M'FADYEAN, and W. J. MULVEY. Prof. METTAM was elected in the place of Prof. J. Macqueen who had retired.

Trustee.—Mr. F. W. GARNETT was elected in the room of the late Mr. E. Coleman, on the motion of Mr. Roberts, seconded by Mr. Banham.

Auditors.—Messrs. Joseph Woodger, M.R.C.V.S., and Albert E. Lark, chartered accountant, were re-elected for the ensuing year.

The CHAIRMAN said it was proposed to make the financial year end at the 31st of December instead of March, so as to coincide with the period for which subscriptions are paid. The subscriptions were due on the 1st of January and the balance-sheet made out on the 31st of March; by altering it he believed it would bring the matter into line for the twelve months.

Mr. ROBERTS proposed a resolution effecting this alteration and said it was purely business matter.

Mr. SUMNER seconded, the motion was adopted.

The CHAIRMAN said the next business was to delete Order 5 in Rule 15. It was not necessary to elect a Trustee annually. By deleting that Order they would save a lot of money.

Mr. GARNETT proposed a motion deleting Order 5, the "Election of Trustees," from the order of business at the annual meeting.

Mr. ROBERTS seconded; the motion was passed.

The CHAIRMAN said it was proposed to make Rule 11 clearer by inserting after the word "subscription" the words "or is a life member," so as the Rule would read as follows: "Any member of the Society having paid his current subscription or is a life member shall be eligible for election to the Council."

A resolution embodying this alteration was passed on the motion of Mr. Howard, seconded by Mr. McKenny.

The CHAIRMAN said the last alteration was in Rule 29, to delete the word "May" and add in its place "April," so that the accounts could be placed before the Council before the annual meeting.

This was proposed by Mr. Roberts, seconded by Mr. Banham, and passed.

Prof. METTAM proposed a vote of thanks to the Chairman. Mr. Banham seconded and it was unanimously passed.

This concluded the business of the meeting.

VETERINARY MEDICAL ASSOCIATION OF IRELAND.

The quarterly meeting was held in the XL Café, Dublin, on Wednesday night, May 15th, when the President, Mr. Patrick J. Howard, occupied the chair, and the attendance included Lt. Col. J. Moore, F.V.O., Prof. A. E. Mettam, Messrs. J. B. Dunlop, J. McKenny, P. D. Reavy, W. Cargill Patrick, A. Watson, J. B. Hare, L. M. Magee, J. S. McCann, F. C. Ryan, W. H. Wilkinson, J. Doyle and Prof. J. J. O'Connor (Hon. Sec.) Visitors, Major Higgins, A.V.C., Capt. Deacon, A.V.C., and Lt. Hogg, A.V.C.

The minutes of the last meeting were taken as read and were adopted on the proposition of Mr. O'Connor, seconded by Mr. McKenny.

NEW MEMBER.

Mr. T. BOUCHIER HAYES, of Rathkeale, Limerick, was unanimously elected a member of the Association.

Letters regretting inability to be present at the meeting were received from Col. Steel, Sir Chas. Cameron, Prof. Craig (Hon. Treas.), Prof. Perroncito, Messrs. A. Dobbey, J. A. Thompson and Chambers.

PRESIDENT'S ADDRESS.

P. J. HOWARD, M.R.C.V.S., Ennis.

Gentlemen,—Custom has ordained that it is my privilege, as your newly-elected President, to inflict you with an address, and custom has further happily arranged that you are not allowed the privilege of a grumble. It is not my intention to abuse the privilege either by neglecting it or by trespassing too much on your patience.

First of all, permit me to offer you my very sincere thanks for the honour you have conferred on me by electing me President of this important Association. It is the greatest compliment the Association can pay to any member, and I assure you I thoroughly appreciate that compliment, for I am fully aware of my own incapacity for such a position, and it is only with your kind indulgence and co-operation that I can hope to discharge the duties of President. I may claim that as a humble country member I have endeavoured to do my little part towards the Association, and now I take it as a great honour and a great compliment to be called on to fill that post which has already been adorned by distinguished men—men whose names will ever stand out in the history of the veterinary profession. I am proud to receive that honour, and especially proud to be the second country practitioner elected President of this Association.

But, gentlemen, I am a little anxious as to the responsibility of the position, and I would earnestly ask each and every member to do his level best to make this year a successful one for our Association. You can do so by making an effort to attend the meetings by providing matters for discussion and by taking part in the discussions; and further by inducing new members to join. I hold that it is the duty as well as the right of every member of the profession to take an interest in the life and welfare of the profession, and the easiest and surest way for him to do so is by being a member of a Veterinary Association. Somehow, I feel sorry for those men who, either from absolute carelessness or sometimes from an exaggerated notion of their own importance, will not be members of an association. This Association offers many advantages; and not the least that of making and meeting friends. The meetings are arranged at convenient times, and are always a source of knowledge to those who attend. The man who thinks he has no more to learn is a fool, and the man who really has a lot of useful knowledge ought to have the courage to come and give his brethren in the world the benefit of it.

Now the Associations here have already done good work for the profession, but much more remains to be accomplished. I feel rather optimistic about the future of our profession in Ireland. Happily we can observe that in matters agricultural the country is steadily progressing. Cattle and horses are as valuable as ever, in fact more valuable than they have been for years. There is greater attention being paid to the breeding and rearing of live stock, the people are better informed and better educated on such matters, and the result must inevitably be that they will avail more of expert help. Through the medium of the Veterinary Dispensaries in the West of Ireland the very poor are being encouraged to avail of veterinary aid.

The veterinary surgeon himself should take every opportunity of educating his clients and the public to understand that his help is valuable. He should endeavour at all times to adopt scientific methods in dealing with his patients, and in this connection I would like to see the use of anaesthetics become more general in our work. I am convinced it will do more to eradicate quackery than a special Act of Parliament.

With the spread of education there will be many appointments in connection with Public Health, and if for no other reason than to organise for the purpose of securing such appointments as are ours by right, every member of the profession should be a member of an association. In this connection we must fight for our rights. We have already been humbugged by that moribund Institution the Local Government Board, which, true to its historical traditions, has broken the promises made to us in connection with the working of the Dairies order. Thank heaven there appears to be some

hope that the L.G.B. will soon get a turn in the steriliser from which it is likely to emerge ridden of those pernicious affections that have long rendered it a curse rather than a blessing to the country.

Latterly there has been some shuffling with the educational standard, and the course of studies for students. I think it a retrograde step to refrain from adopting the highest standard of education. We want the best brains and the best men if we are to keep pace with the times and if we are to uphold our claim to recognition with the medical profession.

There are many other matters of importance that I would like to refer to, but time will not permit, and I know you are anxious to have Col. Moore's paper. There is just one matter that I must refer to, and that is the annual meeting and dinner of the R.C.V.S., which takes place next month for the first time in Ireland. I have already said that the Associations on this side have done much for the profession, and this will be an opportunity to do more. Every V.S. who can should attend the meeting and dinner, and endeavour to make it a success.

Permit me again to offer you my thanks for the honour you have done me, and to again express the hope that with your co-operation my year of office may be a successful one. I congratulate our new secretary on his choice of meeting place, and I hope I have not tried your patience too much with my remarks.

Prof. METTAM proposed a vote of thanks to the President for his address. He said that what they had heard was stimulating and interesting, and he hoped that in the fulness when the Local Government Board "went through the steriliser" that the veterinary profession would receive its due merits.

Mr. PATRICK seconded the motion which was carried with acclamation.

The PRESIDENT acknowledged the vote of thanks.

ACCOUNTS.

The following accounts were passed:—Printing, £1 11s. 6d.; Subscription Veterinary Benevolent Fund, £2 2s.; Reporter's fee, £2 2s.; Room in XL Café, 5s.

MINUTES OF COUNCIL MEETING.

A meeting of the Council of the Veterinary Medical Association of Ireland was held in the Royal Veterinary College of Ireland on Wednesday, April 17th, at 5 p.m. Present: Mr. Howard (President) in the chair; Prof. Mettam, Prof. Craig, Prof. O'Connor; and Messrs. Lambert, Dunlop, Holland, McKenny, Healy, Wilkinson, and Hedley.

The minutes of the Council meeting held in January, 1912, were read, confirmed, and signed.

Letters were read from: Mr. T. Bouchier Hayes, of Rathkeale, Co. Limerick, seeking election.

From Mr. W. Shipley, Hon. Sec. to the Victoria Veterinary Benevolent Fund, enclosing circulars relative thereto, and after some consideration Prof. Mettam proposed, and Mr. Mr. J. F. Healy seconded, that "The Council of the Association recommends that in future, and until this resolution be rescinded, a sum of two guineas be subscribed annually to the Victoria Veterinary Benevolent Fund. The Council further wishes to direct the attention of the members of the profession residing in Ireland to the aims and work of the Victoria Veterinary Benevolent Fund, and to recommend the fund to their charitable consideration. This was carried unanimously.

Apologies for non-attendance were received from Col. Steel and Messrs. Reavy, Chambers, and W. C. Patrick.

After some discussion it was decided that three members of the V.M.A.I. and the Hon. Sec. be delegated to represent the effective members of the V.M.A.I. on the

Council of the National Veterinary Association, viz.:—Mr. Howard (President), Prof. Craig (Hon. Treas.), and Mr. J. McKenny.

The date of the general meeting was decided for May 15th at 7 o'clock. The place of meeting and selection of reporter to be left in the Secretary's hands. It was announced that Col. Moore, P.V.O., would read a paper on "Wind-sucking and crib-biting."

The following accounts were passed for payment. Gresham Hotel, 15s.; reporter, £2 2s.; and the Treasurer was instructed to pay accounts of Messrs. Carlyle and Dungan, solicitors, £4 9s. 8d. and £6 8s. if after investigation he finds that they have not been paid.

Mr. T. B. HAYES was proposed by Prof. Craig and seconded by Prof. O'Connor for election at the next meeting.

Prof. Mettam mentioned that the annual dinner of the Royal College of Veterinary Surgeons would be held in Dublin this year, and requested that a Committee be formed to make arrangements in connection therewith. The following were elected:—Messrs. Hedley, Daly, Kerr, McKenny, Allen, R. H. Lambert, Dunlop, Healy, Moffett, Jordan, and Winter.

ROYAL COLLEGE OF VETERINARY SURGEONS ANNUAL DINNER.

Prof. METTAM, speaking with regard to the dinner of the Royal College of Veterinary Surgeons, said that everything promised a successful meeting. At the present time they had about 60 members of the profession coming, and about half of these had promised to bring guests, which meant 90, and there would be at least a dozen or more guests of the profession. In round numbers there would be at least a hundred, and probably there would be 120 or so, because there would be a contingent from across the Channel. Another point of interest was that the previous Wednesday he saw the President of the College of Surgeons and asked if it was possible to hold the dinner in the hall of the College of Surgeons, which would be preferable to holding the dinner at an hotel. He was received very cordially, and was told that there was no doubt at all so far as he was concerned. He expected to hear officially from the College of Surgeons that they had acceded to the request. He hoped the profession would appreciate the honour they had done them in granting permission to hold the dinner there in the spirit it was given, because they had been met admirably. He hoped the annual meeting in Dublin and the dinner would be highly successful. He had approached the Lord Lieutenant to see if he would come, and he had said he would be only too happy to do so. (Applause). Everything pointed to their having an interesting meeting, and he would be sure it would be to the honour and welfare of the profession. (Applause).

"CRIB-BITING" AND "WIND-SUCKING."

By Lieut.-Col. J. MOORE, P.V.O. Irish Command.

Mr. Chairman and Gentlemen,—I perhaps must apologise for bringing before you a paper on such an apparently simple subject as "crib-biting" and "wind-sucking," but I do so for two reasons. First it serves as a good field for discussion in these our periodical gatherings, and second, it is so prevalent in the Army that, in addition to the opinions of veterinary officers in this Command, I am desirous of outside opinions on it with a view to its mitigation if possible.

I am afraid I have nothing particularly new to adduce with regard to the subject, and I must, necessarily, approach it from an Army standpoint.

It is unnecessary for me to explain what these two forms of vice are. It will suffice to say that the terms

"crib-biting" and "wind-sucking" are practically analogous. Both might be included under the term "wind-sucking," and be grouped into three classes according to manifestation, viz.:

- (a) Wind-sucking where the animal catches hold of the crib or manger or other article with its teeth (true "crib-biting").
- (b) Wind-sucking by laying the chin on the manger.
- (c) Wind-sucking pure and simple, without any of the complementary expedients mentioned in (a) and (b).

It seems extraordinary that we should meet with so much of it in the Army at home. I am convinced that it is more prevalent in Army horses of the United Kingdom than in horses in civil life. It is proportionately more common at home than in our Army in South Africa, and very much more so than in our Army in India, where in British Service units with a total average strength of over 20,000 horses, only one case has been recorded from 1908 to 1911. We do not appear to meet with it amongst mules of our Army abroad, and I cannot call to mind a case in that animal, nor in the ass.

This variation of incidence in respect to different countries rather foreshadows some particular cause or circumstance under which it is contracted, and it is cause or circumstance which I especially wish to probe this evening.

In the Irish Command, out of a total strength of about 4500 horses, 31 horses were cast for this vice during last official year ending 31 March, 1912, and we have a record of 135 serving subjects of it.

Some time ago I instituted enquiries to determine the reason of its prevalence in such numbers, and I have had excellent opinions and have received great help from the officers serving under me towards elucidating the cause. I shall be very pleased to gain further enlightenment from you, and the benefit of your experience will be much appreciated. I may say that I have already elicited the interest of Prof. Mettam, Prof. O'Connor and Prof. Craig in the matter, and have shown them some fair specimens of wind-suckers of different types.

For purposes of discussion, I propose to place the subject before you under the following headings, dilating on each as I go along:—(a) Cause of the vice; (b) if indigestion is a cause or result; (c) if heredity plays any part in cause; (d) if wind is swallowed or not; (e) to what extent one animal learns it from another; (f) what relation stable noises bear to it; (g) what can be done to prevent or minimise it; (h) if more frequent feeding, or a different system of feeding will prevent or minimise it; (i) what stable devices can be adopted to check it; (j) any information gained from your experience of it.

I have had copies of these headings printed so that they may readily be referred to in consideration.

Cause of the vice. Here is the crux of the whole matter. Opinion as to the real cause is very indefinite and varied. If ideas of cause were more certain, we should be better able to defeat the vice, and in this connection it must be remembered that in the Army at least it is much more important to prevent the occurrence of disease and disability than to remedy what has occurred.

There can be no doubt that *Idleness* greatly predisposes to the habit, and to this the greater number of cases in Army horses over horses in civil life may be rightly attributed. During the winter Army horses have little work to perform; at other times of the year training and work are chiefly done in the morning. There is therefore a long period of the 24 hours of the day passed in the stable. A daily diet of 10 lb. of grain and 12 lb. of hay, and particularly the manger diet consisting of grain and perhaps a very little chaffed hay, is soon consumed. Tied up by the head against a blank wall, the

rest of the time is to the majority of animals monotony and boredom, and

"Satan finds some mischief still for idle hands to do."

More or less intimately associated with the vice in the stable is the crib or manger, which must not pass without consideration. It is popularly believed that in moments of idleness, mischief, or during grooming, especially in young horses, the manger is played with or bitten, and that the seeds of crib-biting and wind-sucking are thus sown. But I need not tell you that the manger or other article to catch hold of is not an indispensable factor in the cause, or that it is essential in the role of a wind-sucker to be first a crib-biter. The purpose of the manger is to make the act easier. In Army stables at home the manger is 3 feet 7 inches from the floor, and the height is most convenient for the act.

It is instructive to note that in India where the vice is much less common the managers are of mud, and they are usually lower than in this country. A factor of actual crib-biting is therefore removed. Added to this the stables in India are open and bright, horses see more of, and have more intercourse with each other, the dullness of "the long, long Indian day" being thus to a great extent relieved.

It is usual to find more wind-suckers in units of small military stations where less work is performed than in large stations, and we have less of the vice in Cavalry than in Artillery. Castings for the vice have a bearing on the variance in individual stations and units to some extent, but still it is generally conceded that under circumstances of more regular work and less time spent in the stable, fewer wind-suckers are to be found.

Some of my Officers have sent me notable instances of idleness as a cause, and I cannot do better than quote them:—

Captain Conder says: "I have myself owned two bad wind-suckers. The first, an English hunter took to the habit whilst idle on account of lameness. I had owned the horse three months, and whilst doing his three days a fortnight regularly he showed no signs of wind-sucking. The horse could not have learned the habit from another, as he was in a box by himself. When he came into regular work again, although he occasionally wind-sucked, he would often go for several days without anyone seeing him do it. A neck strap was used in this case, it was difficult to keep in place.

"The second, a Waler pony, was the worst case I have ever seen. When I purchased it, it was in a shocking condition, and did nothing but wind-suck. I placed the bit previously mentioned (hollow bit with holes in the tube) in its mouth, and after a period of four months was able to discontinue using the bit, and during the time—about three months—I continued to own the pony it never again wind-sucked. The pony is now in perfect condition and doing regular work. The previous poor condition was due to improper treatment after recovery from Biliary Fever, aggravated by wind-sucking. The man I sold the pony to informed me that it took to wind-sucking again during the 'rains,' due I think to the fact that there was no polo and the pony was idle. This pony was kept with four others, none of which developed the vice. There was no history of the pony having ever been near a wind-sucker."

Captain Hodgkins remarks: "No further proof is needed than the comparison between Army horses and a large body of industrial horses, *e.g.* Railway Companies, amongst which latter there are few cases."

Lieutenant Hogg mentions the occurrence of it amongst pit ponies thrown out of work when pits are closed down.

Concomitant with idleness, *Imitation* is generally ascribed to be a cause, or at least to be a commencement of the vice, which once learnt is continued by the

subject. We all know how prone some horses are to follow a lead given by one of their kind. For instance, I remember at a halt during manoeuvres many years ago, the horses of a whole Cavalry Brigade blowing their noses; beginning in a few horses of the Regiment to which I was attached, it was passed on to the whole brigade.

While fully acknowledging, therefore, the possibility of one animal learning the vice as a trick from another animal, and with due deference to what has been written on the matter from remote times, I cannot say that my experience of it in the Army altogether bears this out. It is not usual to find two animals affected with the vice standing side by side. I have never seen this myself. Subjects are usually widely separate in a stable. If a roll of wind-suckers is called in a unit they are usually found to come from different sections in Artillery and different squadrons and troops in Cavalry, and often from different stables. Indeed, this rather tends to disprove the imitation theory of cause, or at least, appears to show that imitation is more likely to happen through sense of hearing than by sense of sight, as is generally supposed. The sound of the peculiar grunt is most penetrating. It can even be heard through a brick wall in an adjoining stable, and it is our common experience on entering a stable to detect a wind-sucker by hearing the grunt before we see the subject.

I am not satisfied in my own mind that in Idleness and Imitation as causes we have got to the root of the evil. I consider that we must look further afield for the actual or principal reason.

The worst associates of the vice are, as we know, digestive disorders and poor condition, and it seems to me that if we search amongst these companions we are in a strong position to put our finger on the fundamental cause. I come therefore to the consideration of the question:—

If Indigestion is a cause or a result. There is no doubt that indigestion and digestive trouble of varying degrees result from wind-sucking. Veterinary History Sheets, on which the ailments of every horse in the Army are recorded, clearly demonstrate this, and it is the experience of civil practice. So this part of the question may be dismissed without further comment.

But can we shut our eyes to the probabilities of the other side of the picture? Digestive disorders are very prevalent both in and out of the Army—in the Army perhaps more particularly so. They are brought forcibly to our cognizance in the shape of Colic, Impactions, Ruptures, etc., but there are minor degrees of disorder and upsets which are apt to pass unheeded, or of which little account is taken. Habitual dung eating, licking the walls in front of the mangers, eating woodwork of standings, are evidences that something is wrong, be it faulty digestion or food unsuitably or insufficiently supplied.

Let us see what assistance in this direction can be derived from Veterinary literature.

Major-General F. Smith, late Director-General, Army Veterinary Service, makes no allusion to defect of diet or digestion in his account of Wind-sucking at page 750 of his *Veterinary Hygiene*, and he very indefinitely concludes the subject of cause as follows: "In whatever way the vice is acquired there is only one thing of which we can be positively certain—that it is contracted as a result of idleness. Hard-worked horses seldom crib-bite. It may also prove to be hereditary."

I may however quote another and very significant paragraph from his valuable book. At page 143 he remarks:—

"It is impossible to keep up vigour and condition on concentrated foods alone, a certain amount of bulk is needed by the bowels for the due performance of

digestion; without it the horse becomes 'tucked up.' Stewart believed it to be a common cause of wind sucking and crib-biting."

Williams in his *Veterinary Surgery* summarily disposes of the cause as follows: "These vices arise from or cause indigestion, induce colic, tend to lower condition and to depress the vital powers." And again: "Want of work, indigestion and the irritation of teething are generally the causes of these vices."

The excellent book on Animal Management published by the War Office makes no attempt to define the cause, except to state that "horses are prone to learn these two vicious habits from their neighbours."

Old time writers perhaps attached more importance to the vice than we do at the present day, and it is interesting to hear what Youatt says. He remarks: "The causes of crib-biting are various, and some of them beyond the control of the proprietor of the horse. It is often the result of imitation, but is more frequently the consequence of indigestion." And with regard to wind-sucking he adds: "It arises from the same causes."

The opinion of Veterinary Officers in the Irish Command are partly for and partly against a digestion and dietetic theory of cause. Personally I cannot get away from a deep-rooted belief in it. It seems quite natural to suppose an origin of wind-sucking in this direction, but I regret that I am quite unable to attach any tangible proof of it. It is, at all events, a line which will bear investigation, and particularly dieting with relation to idleness and long periods spent in the stable.

In support of this view I wish to place before you certain facts met with in the Army in addition to the great frequency of digestive disorders of different kinds. The daily diet as I have previously remarked is 10 lb. Oats, 12 lb. hay, that is 22 lb. all told; and in times of little or no work, as in winter, the grain ration is usually cut down in quantity to save for the more strenuous times of summer training. The daily amount is considerably less in bulk than what animals in civil life usually receive, and a question arises: "Is this daily total amount of food sufficient in bulk for the Army horse, particularly for the bigger and heavier Artillery horse, and is it possible that certain horses, to create the necessary distention of the digestive organs for proper alimentation, make up the deficiency by sucking in and swallowing wind?" Gentlemen, I offer this for criticism. Then, again, there is very little variation of diet in the Army. It is practically oats and hay day in and day out, often without even a bit of salt to give it savour or to promote digestion. The oats, too, are usually uncrushed or unbruised and in great part they pass out of the animal after having traversed 90 feet of intestine in the whole or apparently whole condition in which they were ingested. Furthermore, the usual system of feeding in the Army is grain in the manger, either alone or with a minimum of chaff, and long hay in the rack. The grain is liable to be much too rapidly consumed under these circumstances, errors of digestion ensue, and it is practically safe to assume that wind-sucking follows in the train.

If Heredity plays a part in cause. We have no means of determining this in the Army, but the consensus of opinion is against it. Perhaps you can throw a little enlightenment in this direction. Lieut. Hogg has informed me that he knows of several crib-biting stallions belonging to Scottish Border farmers, and to his knowledge, covering several years, the stock has remained free. On the other hand, Friedberger and Fröhner mention that 45 descendants of an Anglo-Norman stallion were all crib-biters.

If wind is swallowed or not. Most observers consider that air, more or less, is swallowed. It is curious to note that Williams in his *Veterinary Surgery*, 10th edition, is of opinion that in crib-biting gases are eructated, whilst in wind-sucking air is swallowed. I

cannot quite reconcile this. Personally I believe that air is swallowed. The repeated attacks of colic attended with flatulency and borborygmus point to this. I cannot say truly that I have observed air passing down the œsophagus, nor have I seen a wind-sucker blowing himself out to a tremendous extent, as described by Williams and others.

To what extent one animal learns it from another. Under the heading of imitation as a cause, I have already more or less commented on this. I there remarked that while fully acknowledging the possibility of one animal learning the vice as a trick from another, my experience was not altogether in accordance with the generally accepted view that imitation plays a fundamental part. The common experience in the Army is that near neighbours are not affected, and that subjects are widely scattered in a unit. In any case there is nothing to warrant the statement mentioned by one author (Youatt) that "it is a trick said to be exceedingly contagious," nor the remark mentioned by a recent author (Major-General Smith) that "it is said the lesson may be imparted in a few minutes."

It is interesting to hear what some of my officers say in the matter. Capt. Ryan, a very observant officer, remarks:—"Out of a number of cases I have never known a horse acquire the habit of wind-sucking from his stable companion, although indeed most writers of to-day declare the vice to be the result of imitation. I know of one case where a bad wind-sucker has been in a stable with nine other horses for five years and no other horse has learnt it from him." And again:—"There is a case here (Ballincollig) under my notice for the last 17 months of a bad wind-sucker standing in a stable with eleven other horses, none of which have as yet learned the vice from him. Though I don't think it impossible, I think it is very improbable that horses learn it from one another, and I have noticed that when asking Commanding officers to keep their wind-suckers together, that it was a case of bringing horses from different parts of the same stable or individual horses from different stables."

Capt. Conder, Cahir, says: "The popular belief that one horse learns it from another is certainly well established. I have, however, never met with any cases tending to prove this, and I do not believe that it takes place. None of the horses here given (e.g., 10 cases in the Brigade R.F.A., Cahir) have been standing in the same stable."

Capt. Hodgkins, Dundalk, says:—"The recorded cribbers (eight in number) are well scattered through the brigade, and no two are in the same section of the battery."

Capt. Nicol, in command 4th Hussars, Curragh, says: "Except in case of young horses, one troop horse seldom learns it from another."

Capt. Fisher, in command 5th Dragoon Guards, says: "I do not think as much as is generally supposed, or there would be more of them."

Major McDougall, in command 5th Lancers, Dublin, says: "A small percentage of cases may be the result of seeing other horses wind-sucking."

What relation stable noises bear to it. I have put this down as a question, as the noise in Army stables, from rattle of head-collar chains through rings or holes in iron mangers, is often considerable, and it might be conceived that noise by increasing irritability in certain animals might have a bearing on cause. The consensus of opinion is that it has no influence on the origin of it whatever.

What can be done to prevent or minimise it?

If more frequent feeding or a different system of feeding will prevent it.

What stable devices can be adopted to check it?

These headings all aim at prevention and mitigation, so I will consider them together. Speaking with

particular reference to Army horses, and taking idleness as the basis of the evil, it is obvious that a system of horse management permitting fuller employment and a more open air existence is the guiding principle in prevention. Measures that would tend to bridge over the dull monotony of a long day and night spent in the stable and the miserable existence of being so long tied up to a manger and facing a blank wall, should be the first thought of the horse-master. How can this be accomplished? I mention the following:

- (1) A regular complement of work.
- (2) When circumstances do not permit of or necessitates work, a proper mead of exercise to be given; not the half hour or one hour walk to take the stiffness out of the animals' legs, but a rational system of exercise admitting of a reasonable time spent in the open air, and carried out twice daily whenever possible.
- (3) A system of "liberty" in times when little or no work is required of animals. This is done by certain units of Cavalry and Artillery in the Irish Command during the winter. A portion of a troop stable is railed off, peat moss is laid down, a certain number of horses are turned loose into this enclosure, they are allowed to go rough and their shoes are taken off. Their diet is arranged for in accordance with their condition and the fact that no work is being performed, a saving in cost of feeding being usually effected. It is a procedure that has merit in it for certain horses, and it would be quite possible in many stations, by means of a series of corrals hygienically kept, to extend the system to the proximity of the stables, giving the animals the benefit of the open air. I have just looked up an old diary containing a visit in March, 1904, to a cavalry barracks in the United States, and I find I make the following remark, which shows what expedients in horse-management other people adopt: "Between each block of stabling there is an open space where horses can be tied up to a strong wire rope placed about six feet from the ground. They are not heel shackled, and learn not to kick each other. Or they can be turned loose. In my opinion this is a good plan. Only exercise is done in winter." Weather and circumstances permitting we might do likewise in our Army. I am sure if the horse's opinion was taken he would say it was a consummation most devoutly to be wished.

With regard to animals affected with the vice the usual procedure is to cast them, or to place them apart from other animals, for which latter purpose a specially constructed stall in each modern troop stable is now arranged for. It is however not desirable that they should be retained in Army service at all. By early casting and sale, imitation by other animals and the disability which inevitably arises from loss of condition, colic, etc., is avoided. They usually bring a very good price in the market, as they do well in private ownership.

Should the exigencies of army service not permit of their dismissal, or if for any reason they are retained, they should be collected, and form a coterie of their kind apart from other animals. They should be placed in loose boxes or in a stable by themselves. Loose boxes should have bare walls, no mangers or anything for a crib-biter to make use of, and feeding should be from the ground. However, loose boxes are not ordinary provisions of troop stables, and it remains therefore to make use of a stalled stable. Subjects are turned round in the stalls, they are tied up by means of short head-collar chains to sliding rings on the heel posts. The chains must be adjusted to prevent the animal from catching hold of anything with his teeth. Feeding is from a slung blanket. This measure is only of real benefit in the case of crib-biters. With wind-suckers pure and simple it is of no avail.

There are numerous patent inventions, but their cost usually precludes their general use in army service.

Moreover, what is suitable in one case is often of no use in another. For instance, a muzzle with two parallel iron bars front to back through which the animal can feed is effective in the case of a crib-biter that catches hold of the manger with his teeth, but is of no use for a wind-sucker that lays his chin on the manger, or one that is solely a wind-sucker. Then, again, a broad strap fitting tightly round the top of the neck with a projecting plate at the gullet prevents both forms of the vice as long as discomfort to the animal is sufficient. A special hollow bit with holes in the tube will prevent the swallowing of air, and from inability to close the mouth and thus exert proper suction the animal will sometimes, at least for a time, give up the attempt at wind-sucking.

When all is said and done, the fact remains that once a wind-sucker always a wind-sucker. The habit once contracted is never forgotten: it is incurable. It may be counteracted for a time, but it recurs. Even turning out to grass proves only a respite or of no absolute good.

And now I come back to the possible alimentary causes of the vice, and a consideration of prevention from that standpoint. If there is no connection, nothing more remains to be said, but it is the common experience that digestive disorders, poor condition and wind-sucking are so intimately associated in practice that we must look to like means in each for avoidance or prevention. It really resolves itself into a matter of diet and dieting.

Under the heading of cause I indicated the manner in which digestive and dietetic causes were possible, and it remains therefore for me to state my case for prevention.

Be the horse master private or Government, I think it is extremely necessary he should in the first place keep a careful watch on the total daily bulk of food his horses are getting. In times of saving it may be possible to cut down the amount for the majority of animals, but the individual idiosyncrasies of others will not admit of it with impunity. It is, for instance, quite common in horse-management to hear such remarks as these:—"Oh, that horse wants a lot of food," or "this horse will get fat on nothing." Any tuckered up appearance or lightness of belly should therefore be looked upon as a danger signal of trouble, and guarded against.

To avoid the quickly induced digestive trouble liable to arise from a rapid consumption of a solid, or more or less solid grain ration, an admixture of a considerable amount of chaffed hay with the grain ration is advisable. It is largely followed in industrial horse companies; it is correct in principle, and it proves a saving in material. I am glad to say it is a practice that is finding favour in army horse management, and I trust that with better facilities for chaffing and larger mangers to hold the mixture it will become the usual method of feeding. I am certain that if at least 8lb. of the hay ration was chaffed and mixed with the grain ration, and the balance of the hay given loose, there would be an improvement in condition and less dietetic disease. The practice would entail an increase in the number of times of feeding per day, but here also is advantage, as it approximates nature's rule of little and often, as the small stomach of the horse indicates.

Also I do not agree with the principle of sticking so closely to one kind of grain, such as oats, in feeding. I think much better value is got out of a mixture of several grains, and certainly ringing the changes whenever circumstances of season, work, or cost permit or necessitate, is advantageous and health promoting.

Furthermore, I think grains should as a rule be bruised or crushed. It is even more necessary that this should be done when they are fed as an admixture diet with chaffed hay than otherwise.

Lastly, all horses should receive a ration of salt. I

do not mean rock salt in the manger, but a regular ration of say half an ounce per day. This is the usual custom in India.

Col. Moore was loudly applauded at the conclusion of the reading of the paper.

DISCUSSION.

The PRESIDENT said he was sure they had all been delighted with the excellent paper by Col. Moore, and he was sure there were many present who had opinions on the subject, which was fairly common, so he hoped they would start the discussion at once and keep it going until they had to be turned out. (Laughter).

Mr. McKENNY said they would one and all agree that they had heard a very able paper—(Applause)—and Col. Moore must have given the subject much thought. A great deal that had been said he thoroughly agreed with. In the early parts of the paper the remarks tended to prove, from the various authors that had been quoted, that "Imitation" had very little to say to the matter. It was his experience that it had a great deal to do with it, especially in young horses. It was strange if the former opinion was held by the military authorities—in dealing with it they either sold the horses or separated them—which showed that some other experience had taught them that "Imitation" did play an important part. But as crib-biters and wind-suckers in the Army were sold or separated from the other horses, it would be perfectly correct to state that in the Army the vice was not contracted by "Imitation"—no opportunity was allowed! With regard to the cause of the vices—"Idleness, Indigestion, Imitation, or Poor Condition." Idleness and Indigestion should be considered together, as want of exercise and overfeeding caused Indigestion, which was the absolute cause of the vice, and not the mere idleness.

Referring to "Imitation," Mr. McKenny said he believed horses did imitate, and that was seen frequently in racing stables where there were young animals kept. The poor condition; that indigestion was a frequent cause of the vices, but as the pernicious habits were frequently contracted by imitation, and wind-sucking was a cause of indigestion, it would often be difficult to ascertain whether the indigestion caused the vices or the vices caused the indigestion. They could scarcely separate them; it might be one or the other.

As to heredity, a well-known stallion named "Pliny" was a terribly great eater, and nearly all his offspring were the same; a great many of them were crib-biters and wind-suckers—he scarcely knew one which was not a dirty feeder and ate its own droppings. He had two at the present moment and a third, a stallion, and it was amazing to see that horse; he had him tied up, and he would absolutely turn round and dung in the pot and eat it in preference to his oats. He suffered badly from Tympany; some days he would be well and in good spirits, and some days he would not travel at all.

He (Mr. McKenny) had a patent, and he hoped they would not consider it an advertisement if he showed it; he felt certain from watching horses that they could and did swallow wind. In the matter of stable noises he agreed with the Colonel. Now came the important subject and he could dismiss the rest, "the Cure and Prevention." This consisted in the use of his invention. (Laughter and applause.) Mr. McKenny showed his patent bit, which consisted of two nickel plates hinged together and made to fit the mouth, with slots, to which a headgear was attached; when this was adjusted the plates opened and closed, simultaneously with the opening and closing of the mouth, so that all objects the horse attempted to eat were received between the plates and could not be swallowed. The corners of

the lips could not be closed, therefore air could not be passed into the gullet. He said it had not at all met with the success in sales that he thought it would, the objections to it, with a great many, were when they saw it on the horse it looked an abominable thing. Animals frothed from the mouth and it caused great inconvenience apparently, but from the time it was put on a horse previously in bad condition got fat with less food. He had proved it over and over again. There were no springs to it, but the horse could not close the lips and could not swallow air or food.

Col. MOORE: If you take that off he would wind-suck again the same as with other bits?

Mr. McKENNY: I only take it off when feeding. It is not for sake of advertisement, but I would like you to test the bit, and please accept it from me.

Col. MOORE: I would like to try it, although we have plenty of other inventions.

Mr. McKENNY: Horses suffering from Tympany you will find will be cured if my bit is used.

In reply to Col. Moore, Mr. McKenny said the bit should be left on all night. (Applause).

Mr. MAGEE congratulated Col. Moore on his interesting paper on this important subject—a subject, he thought, they did not give enough consideration to except on occasions like that, when they had to form opinions hurriedly with regard to the many points that Col. Moore had so well tabulated for them. The essayist had brought a commonplace subject before them in a very interesting manner. (Hear, hear.) His impression with regard to the cause of wind-sucking was that idleness was the principal factor in developing the vice. He did not think imitation or indigestion had anything to do with it. If the former played a part in its development there would be far more horses affected than there were, and they scarcely ever found two wind-suckers side by side. Indigestion was popularly supposed to be the principal cause. His reason for thinking that it was not was that when wind-suckers got a good run at grass they remained wind-suckers, but if a horse suffering from indigestion was not cured when turned out to grass he did not know what would cure him. Besides, as far as he could see, wind-suckers did not suffer from the usual symptoms of indigestion, such as capricious appetite, or loss of it altogether, dullness, etc. The tympany which often does occur was, in his opinion, due to the air swallowed by the animal and not to the fermentation of indigestion. His belief was that in wind-sucking air was always swallowed by the animal. A characteristic noise was made, and the thing to find out was what was the cause of it. The noise undoubtedly occurred in the neighbourhood of the pharynx, and he believed it was due to the vibration of the commencement of the oesophagus in forcing the air down the tube to the stomach. If wind was eructated they would call it in the human subject "belching." The way to prove that a wind-sucker did not belch gas was to call to mind a case of gastric tympany, where eructation of wind certainly did occur, and the noise gave one the impression of air escaping up a tube from an empty barrel. He, therefore, thought there was not any eructation in the act of wind-sucking. For preventing or minimising the vice, he agreed with Col. Moore that it would be well, if possible, to place the horse, when not working, under such conditions that he would have something to occupy his mind as it were. This could be done by letting horses out at times into open spaces where they could walk about, or "dust," or talk with their fellows about the latest scandals in the horsey world. The stable devices that could be adopted to check the vice had been very fully enumerated by Col. Moore in his excellent paper. (Applause).

Mr. PATRICK said they all agreed that it was an excellent paper, but as to elucidating the causes he was doubtful if they were going to clear up the points or

decide what conditions were necessary to engender the habit. Col. Moore had mentioned most of the supposed causes—the understood causes of the trouble, and he thought indigestion had been looked upon for quite a long time as one of the causes of it. He would subscribe to that view. When they had stomach disorder accompanied by depraved appetite they had an unnatural craving, and that might be given as a habit of licking objects, etc., for more salt. That was a craving of nature, and would lead to the habit. They often saw young horses with dental trouble when getting incisors, they licked the cold iron manger or a stone. It became a force of habit after a time. Many horses were large feeders, and in the attempt to look for food by licking up refuse from the manger and floor, they more or less engendered the habit. He would think that was a predisposing cause. Heredity, he thought, had a good deal to say to it, for the reason that he had known cases of brood mares having foals so affected. He knew a dam at present suckling that was a wind-sucker, and the foal became the same. He thought it was imitation from seeing the dam do it. He did not think the gas was eructated. He had watched these cases, and the horse wanted to swallow the wind as a rule. He would like to see a horse swallowing wind before he would say he was a wind-sucker. He knew a horse that played with his lips and he had to watch it for two hours until he saw it make the gulp characteristic of wind-sucking before he made out that it was a wind-sucker. As Mr. Magee had said, it was a sound produced high up in the throat, but the exact position was a different matter. Once the sound was heard they could not forget it. As to stable noises at feeding time, it was possible a horse would do it then. Often when a horse was pleased he did it. Stable noises might to a certain extent affect him.

With regard to what they could do to prevent it, he did not think he could offer any opinion, beyond removing all stable fittings, and using Mr. McKenny's bit. With regard to the strap Mr. Magee spoke of, he had found it very efficacious in some cases. It was decidedly useful, and he thought it was because the strap was across the mouth and they could not make the same vacuum in the mouth. He had no special device to offer, but he wished to add his thanks to Col. Moore for his paper.

Mr. HARE asked Col. Moore to explain a point. He (Col. Moore) had said that wind-sucking and crib-biting was much less in India. He would like Col. Moore to state if there was any difference in the ration the horses received in India as against the horses at home.

Col. MOORE said the ration for horses in India was usually mixed gram, bran and barley. The parts were: barley about 5 lb., bran 2½ lb. and 2½ lb. gram, and half-an-ounce of salt. They got 20 lb. of grass. At home they only gave 12 lb. of hay. Sometimes the horses got *banasa*, which was straw trodden by bullocks. They had to consider that perhaps cases were not so much recorded in India as in this country, but all the same, he did not think the prevalence was so great. The horses were in the stables during the day, but at night they were in the open. There was no noise and they certainly saw more of each other. The ration was absolutely different. Barley, gram and bran was an excellent diet really better than oats by itself. It was a well-balanced ration, and a good practical ration. He thought a similar diet would be good for this country also. Of course, barley was used because it was the staple grain.

Mr. WATSON associated himself with the previous speakers, having special regard to the way in which the paper had been presented to them. Col. Moore had made a perfect index of his subject, the precis was so lucid that the "man in the street" could listen to him, and although the man in the street was not a scientist, yet he could be with them that evening and learn much.

There was a strong similarity between dyspepsia in the human subject and the cause or result of wind sucking in the horse. In other words the condition of the stomach of the dyspeptic and the stomach of the wind-sucker bore a strong similarity. Both had a faculty for making wind. He remembered hearing the question put, How do you spell dyspepsia? and the answer was "wind," and it was undoubtedly a strong factor in both affections. He believed that some abnormal condition of the stomach was the cause of wind-sucking. It was his belief that good stomachs and bad stomachs in horses and men were hereditary. There was much truth however in the saying that in their youth they abused their stomachs and in their old age their stomachs abused them. Of course abuse by bad feeding or irregular feeding would produce changes which would result in chronic indigestion. Chronic indigestion always produced dilatation of the stomach, and invariably such stomachs were always distended with gas. The act commonly spoken of as belching in the human being and wind-sucking in the horse was an effort to get rid of this distention. Mr. Magee says in belching they get rid of the gas in the stomach. Many medical authorities of distinction say that this is not so and that the vacuum caused by belching is immediately filled with air from the outside. He remembered making a post mortem on a bad wind-sucker once; he found the stomach enormously distended, and the coats of the stomach greatly attenuated. These changes could only come after the chronic indigestion, having an existence for a very prolonged period. Not being a practitioner he had not any intention of criticising the paper, but he could not allow the opportunity to pass without his thanks to Col. Moore for his very interesting paper.

Prof. A. E. METTAM said that he had been out of practice for so many years that he would scarcely know a wind-sucker. (Laughter.) He had enjoyed the paper. He thought in the first place they were apt to lose sight of the anatomy of the horse and its physiology. The horse's stomach was small, and therefore it required feeding frequently and in small quantities. While Col. Moore was reading his paper the question occurred to him as to how the horse fed under natural conditions. How often did one see a horse resting from feeding when he was turned out? He grazed nearly all the time he was out. Usually he was fed three times a day at intervals of about six hours. For twelve hours he was doing nothing. The method of feeding the horses in the stables was artificial, and it required overlooking and changing.

He did not think that heredity had anything to do with the subject. He thought that wind-sucking was probably the fault of indigestion. The explanation might be that the food they gave horses was too concentrated. A horse required a certain amount of what he might call "ballast." They required material over and beyond what was necessary for maintenance. An animal suffering from not getting sufficient material to give him that repleteness which was necessary to perfect digestion would endeavour to bring in that repleteness by other means. He had seen wind-suckers pass what was a "bolus" along the oesophagus—he believed it was not air pure and simple, but air mixed with saliva. It was not a question so much of the animal swallowing air, but it was more saliva, or a mixture of the two. The animal found he got comfort and relief from swallowing saliva, and there might be an abnormal acidity of the stomach, and alkaline saliva would abate that somewhat and assist in the conversion of the carbohydrates of which the horse's diet consisted into the sugars, which were more easily assimilated. He thought the tympany they were familiar with was not so much the tympany due to the swallowing of the air as to tympany due to the fermentation of the food in the alimentary tract. With regard to an animal having a morbid appetite, it indi-

cated indigestion. It was likely that animals that ate bedding and dung suffered from a form of dyspepsia and indigestion; that supported the contention that indigestion was probably the fundamental cause of the whole thing.

The suggestion that it was more frequent in the Army than in civil life he rather doubted, for the reason that in the Army they had a more clear conception and a better history of the cases. They were under the view of some officer of the Veterinary Service every day, and they knew everything that occurred to the animal. In civil life they had not the history of such a collection of horses. Even in a city like Dublin, if every horse was under the charge of the profession they would not be under the charge of one individual who would know what was going on in all the horses. A veterinary surgeon could only get an idea of the horses under his view, and so far as he (Prof. Mettam) was concerned he was convinced that it was not less frequent in civil life than in the Army.

The reference to India was very interesting to him, because it rather supported what had been his contention—that it was due to the artificial way horses were treated. They had been told that animals were going back nearer to nature, and were treated more naturally in India than here. When they were treated more naturally they found fewer cases and less possibility of wind-sucking. A horse might wind-suck in the stable, but would not on grass, but would resume it when he came back. He agreed to a certain extent with Mr. Magee that the medicine of the green field would give relief to indigestion, but the cure might be only of a temporary nature. It was held by physiologists that it was impossible for a horse to eructate. The relation of the oesophagus to the stomach would forbid it to bring up food or wind. If a horse vomited it was contended there was a serious lesion of the stomach. (Applause).

Mr. REAVY said they could all congratulate Col. Moore on the able paper he had given them. He thought he would hear some discussion as to whether crib-biting and wind-sucking were separate diseases. He agreed that indigestion had a great deal to do with it. With regard to the quality of food being a cause, as a practitioner in the country he knew a farm on which the owner paid little attention to his horses. In fact they were kept in the yard, and the principal food was hay, and it was bad hay, and his stud was reduced to keeping one horse only, and the strange thing was that for the last two years he had had four separate horses, and every one of them was a wind-sucker. Could they attribute that to the bad hay causing indigestion and making them wind-suckers?

Col. MOORE: I should think that is highly probable, and it is proof that indigestion is a cause of wind-sucking.

Mr. J. B. DUNLOP, having thanked Col. Moore for his paper, said he would not like to say that crib-biting and wind-sucking were the direct results of indigestion. He felt certain, however, that it was a cause of indigestion. The reason he thought so was that when horses were prevented from wind-sucking they improved very much. He believed a horse swallowed wind, and they all knew well it was very unnatural for air to be in the stomach when digestion was going on. Nature had made provision to close the oesophagus and prevent air getting down. Whether crib-biting was a cause or the result of indigestion, he always considered it an unsoundness, because indigestion itself is an unsoundness and should be condemned. Prof. Mettam said it was a mixture of saliva and air. That might be so; he had not heard of the saliva theory before. There was no question about tympany being a result. He had often seen horses regularly filled up. Then, with regard to dirty feeders, he attended to eleven horses to "keep his hand in," and

he had a horse under his charge recently that was a dirty eater, and he could scarcely prevent him from eating dirty food, and the result was he broke out in a sort of rash (acne pustulosa) all over the body. But when he succeeded in preventing him eating that food his skin became beautiful, and he was now in excellent health. It was all very well to say that horses were not fed naturally. Convenience and economy had to be studied. A few years ago hay was reduced owing to scarcity, and he never saw the horses in better condition than when they did not get too much hay. No doubt idleness and monotony was a cause of crib-biting, and he had no doubt it was bad to have a manger about three feet high. One reason occurred to him why it was not so prevalent in India. The horses were not idle because there were a great many flies. If they gave a horse plenty to do he would not wind-suck and crib-bite—which were only different methods of doing the same thing. Of course it was difficult to cure wind-sucking unless they got Mr. McKenny's apparatus. He could not quite understand about the pit ponies. If they were turned out to grass during the strike they would not acquire the habit there, but underground he would think they became crib-biters. He had peculiar ideas of indigestion. He believed it was an effort of nature to clear the body of poison, and anyone subject to indigestion scarcely ever suffered from bronchitis or asthma. Indigestion was often accompanied by acidity and rather tended to prevent flatulence. There might be something in imitation, but he could not give an opinion to whether or not that was a cause of crib-biting.

Prof. O'CONNOR said he had nothing to add with regard to this condition of crib-biting and wind-sucking, but he wished to say how much he appreciated Col. Moore's paper. He listened to it with great pleasure—it was so lucidly written and so interesting in every way. With regard to the cause of the vices he had nothing really to say, except to offer conjectures, the same as most people. He thought idleness of itself would not be a cause, because horses at grass did not suffer from wind-sucking. The primary cause would appear to be the housing of animals, and Col. Moore struck the keynote when he said the environment of the animals had a lot to do with it—the monotony of the horses' lives. When they had more liberty and lived under more natural conditions they did not suffer from the disease. Every horse affected with wind-sucking and crib-biting was affected with indigestion as well, and they knew many horses affected with indigestion but not wind-sucking, so if indigestion were the cause of wind-sucking, the vice should be more prevalent than it is. Horses often had colic from indigestion and did not as a consequence suffer from wind-sucking. A combination of causes would appear to be necessary to produce the disease. Keeping animals under natural conditions as far as possible would seem to be the best preventive.

He wondered whether the disease was as common on the Continent as in the British Isles. It was interesting to hear that it was so rare in India. On board ship he had never noticed it in horses. He had had charge of some 5000 horses going to South Africa during the war, and although he observed them constantly it never struck him that one of them was wind-sucking or crib-biting. Most of them came from Russia, down through Austria, and they were rather rough horses, which had been in the open all their lives. It might have escaped his notice, but if anything was wrong he thought he would have observed it.

He did not know if heredity played any part in it, but if indigestion was a cause he would think it was hereditary. He thought air was swallowed when a horse was wind-sucking or crib-biting. Col. Moore had proved that it could not be learnt by mere imitation.

There was no doubt about that. He thanked Col. Moore for bringing the paper forward.

The PRESIDENT, after thanking Col. Moore for his paper, said it would be the means of starting a good many people to pay more attention and observe more the history of the animals they found suffering from those vices. Personally he thought there was very little use in holding much distinction between wind-sucking and crib-biting. As regarded the causes of the disease, he thought indigestion was undoubtedly the cause, but it was also a result, and it was hard to differentiate at which time it was the cause and which the result. They would find if a young horse picked up these vices he would eventually suffer from indigestion as a result, but in such case one could scarcely say he had begun the vice from the fact of his suffering from indigestion in the first case. He was satisfied the disease was spread among young animals, not so much by the watching of others at the mischief as by hearing them at it. He would like to ask Col. Moore whether he had any record as to the ages at which they found horses to be more prone to this particular mischief. In his own experience he did not remember to have seen a horse start the trouble in his old age. In the majority of cases he had found horses rather young—four up to seven or eight years—and even younger, and he was certain he had seen at least three colts that had never been in a house, had been fed on grass, and were confirmed wind-suckers at three-years-old. He had the misfortune to own a valuable thoroughbred recently that was a confirmed wind-sucker at two years old, and before it was weaned from its dam, but the dam, he found, was a wind-sucker. He did not suppose anyone would put forward the idea that the vice itself was hereditary, but the conditions which gave rise to the vice were undoubtedly hereditary. He did not know that the noises that were made in Army stables would have anything much to do with the spreading of the affection. He believed the vice would not be found to anything like the same extent in stables where the animals were kept in loose boxes as compared with those in which they were kept tied. He thought if one could get the entire history from early life of animals found to be subjects of these vices there would be more to learn. Idleness has been referred to as a cause. Idleness had something to say, but not much. For years he had had under observation a number of stallions at stud. For nine months of the year they lived an idle life, and he could hardly recall a case in which he had seen a stallion a confirmed wind-sucker. He had seen some, but considering the number of stallions he had had under observation, he did not think the affection was prevalent among them. If idleness alone was a great cause of the mischief, surely that class of animal would be found more often subject to it. It was fairly well recognised now by people who had to feed, that they had a better return in every way from giving crushed corn than whole corn. As regarded the devices that might be used, anything in the shape of Mr. McKenny's bit—simply an ordinary leather with a bit of tin nailed on and strapped, would have almost the same effect. It hung between the teeth and prevented him fixing his mouth in the fashion in which he could carry on the vice. With regard to the definite statement of Prof. Mettam that eructation in the horse was more or less impossible, he may have been wrong, but he was rather of opinion that he remembered on several occasions he had seen horses suffering from gripe or colic, or when tympany was present, making definite attempts at getting rid of something in the shape of gas, and he was more convinced of that, because sometimes a little more than gas would come from the stomach, and in all cases they got well. (Hear, hear.) Prof. Mettam also said he thought in those cases of crib-biters and wind-suckers there was a good deal of saliva. If they watched a wind-sucker carefully they would change their minds on that matter,

because when he started to practise the vicious habit there was no sign whatever that he had any amount of saliva present in his mouth. Watching the horse ordinarily described as a crib-biter, they would see it would be impossible for him to have saliva in his mouth without having some outside his mouth. He did not think he could have a lot of saliva, as the action was so quick. He also thought the appearance of something going down the oesophagus was sometimes only an appearance, and was the natural contraction of the oesophagus after the action of swallowing had been attempted. Again he would offer Col. Moore his best thanks. (Applause).

Mr. MAGEE said he would like to make a few remarks on what Prof. Mettam had said as to his belief that horses could not eructate gas from the stomach. He (Mr. Magee) was certain they could. In gastric tympany he had adopted the treatment advised by Caulton Reeks, in his excellent book "The Common Colics of the Horse"—the administration, when cool, of Ferri sulph. and Liq. ammon. fort in boiling water. He had seen a horse that was in pain and belching gas for hours instantly relieved of both as soon as the mixture entered his stomach. Prof. Mettam said he could not see why the horse would not pass the gas along through the bowel sooner than eructate it. In a case of dilation of the stomach with gas the reason was that the duodenum formed an S shaped curve at the back of the stomach, and when the stomach was distended with gas it pressed back on the duodenum and closed the trap, thus preventing the exit of gas in a backward direction. It then escaped involuntarily in small quantities by the oesophagus.

Mr. DUNLOP said he would like to emphasise what the Chairman said in his remarks.

Col. MOORE, in replying, thanked those present for the discussion that had taken place. So much had been said that he did not quite know where to begin in reply, but he had noted one or two points as headings. The first was as regards age. He was interested to hear from Mr. Patrick of a foal two months old being a wind-sucker, and so young a subject as the seventeen months old colt mentioned by Mr. Howard was also interesting. A few days ago Capt. Deacon, A.V.C., had asked him regarding teething and age in relation to the vice, and he had wired to officers for recorded ages of wind-suckers in the various units, and the figures were as follows:

Wind-suckers in Irish Command. Showing recorded ages and number at each age addicted to vice.

3 years	...	0	12 years	...	8
4	...	1	13	...	11
5	...	9	14	...	11

130

Officers had instructions to record cases as soon as they observed them. He was pleased to hear so many of them agreed to the indigestion theory of the cause. Personally he felt rather strong on it. He was more or less diffident in advancing that theory, but he was pleased to think that he was backed up by almost everyone present. There was, without doubt, an association between wind-sucking and depraved appetite. He instanced a unit of cavalry that two years ago was in bad order. The horses were rather poor, and many were dung-eaters. They have had a considerable number of wind-suckers in the unit. It was a common experience to find that a wind-sucker was a dirty-feeder. He placed great value in what Prof. Mettam said about air being mixed with saliva when swallowed. He knew

it was so recorded in books, but he had never satisfied his own mind on that point. He was inclined to agree with Mr. Howard that what they saw passing down the oesophagus was vermicular movement only. Horses would crib-bite with the mouth full; it was not infrequent. It was the common experience of post-mortems on inveterate crib-biters and wind-suckers to find dilatation of the stomach. Mr. Magee mentioned about turning horses out to grass. It might cure indigestion but it would not cure the habit. He thought at one time that it would do so, but he was now convinced that it was of no lasting good. He noted the remarks about heredity: there was no reason why predisposition should not be extended to indigestion and even to dirty feeding.

The scale of diet in the Army had been mentioned. Well, it appeared little, but it must be remembered that the scale was a standard one for all the year round. Commanding officers were supposed to save in the winter to have more in the training season. There was little margin, and Commanding officers were good horse-masters to make ends meet. The wonder was that they did not have more trouble. If a horse was 16 hands he got two pounds of grain extra, and the same was done if he had special work. On active service it was again increased.

With regard to pit ponies, it was understood the ponies were down in the pit when they took to wind-sucking, and not when brought to the surface. That made all the difference.

With regard to the frequency in civil life as compared with the Army, they must remember that many of the wind-suckers in civil life had been cast for the vice from the Army.

The infrequency in India was considerably due to the more open air life or more natural life, as Professor O'Connor remarked, and there was a good deal in the remark about the flies keeping their minds occupied, as Mr. Dunlop said. Crushing corn in the Army was done more now than formerly. If peas and beans were used for food they would be crushed undoubtedly.

In conclusion, he again thanked them for their discussion. It was a subject in which he was very interested, and one which he meant to pursue.

Mr. WATSON remarked that at present the Public Health Department were pursuing the fly to kill it. Would he tell Sir Charles Cameron to stop it, or they would have an increase of wind-sucking. (Laughter.)

Votes of thanks to Col. Moore for his paper, and to the President for his conduct in the chair, concluded the meeting.

Prosecution by the R.C.V.S. at Llandilo.

A short note on this case appeared last week, p. 798. We are asked to reprint the following:—

Mr. Powell: The Section of the Act upon which the prosecution is based is: "If after the 31st day of December, 1883, any person other than a person who, for the time being, is on the Register of Veterinary Surgeons, or who at the time of the passing of this Act, held the veterinary certificate of the Highland and Agricultural Society of Scotland, takes or uses the title of veterinary surgeon, or veterinary practitioner (Mr. Powell did not suggest defendant did either of these) or any name, title, addition or description stating he is a veterinary surgeon, or practitioner of veterinary surgery or of any branch thereof, shall be liable to a penalty of £20." Where defendant had offended was in taking an addition, stating that he was a practitioner of veterinary surgery, or of some branch thereof, and was specially qualified to practise the same.

They charged him with using title, and that he was not a member of the College of Veterinary Surgeons,

and had been practising as a veterinary surgeon. There were plenty of people who were doing veterinary surgery work well and honourably, and perfectly legitimately, against which the College would never think of bringing a charge. Whether the defendant had got these foreign diplomas he (Mr. Powell) neither knew nor cared; it did not affect the case one way or the other, nor did it make the slightest difference to the charge brought against him. He had no connection with the Royal College of Surgeons. Mr. Powell quoted the case of the College v. Collinson, in which the respondent, who was not a member of the College, and not on the Register, and didn't hold the veterinary certificate of the Highland and Agricultural Society of Scotland, exhibited outside his residence a board on which were displayed the following words: "M. Collinson, Canine Specialist, dogs and cats treated for all diseases." He submitted that case was practically on all fours with the present one. Defendant was an unqualified person, whatever his foreign diplomas might be, and he had no right to take any title saying he was practising veterinary science or any branch thereof.

In another case, R.C.V.S. v. Robinson, an unqualified person displayed over the door of his forge and on his billheads, "J. Robinson, veterinary forge," and he was held guilty of an offence under this Section. The present case, Mr. Powell thought, was infinitely stronger than the two cases he had quoted.

The defendant had a perfect right to practice, but he must not take any addition to his name. There were instances of persons, highly respected in the town, who practised, and against whom there could not be a breath of suspicion that they were breaking the law, as in their case they only used their own name.

Mr. H. Jones Thomas: This is not a fraud, because he states that he has no connection with the College.

Mr. Powell: We don't charge him with fraud, or with pretending or endeavouring to mislead the people that he has any connection with the R.C.V.S. What we say is he has offended against this Section in taking after his name a title, addition, or a description, stating that he has the practice of a veterinary surgeon. He had "canine specialist" on his bill-head for one thing, and the fact that he stated "no connection with the Royal College of Surgeons" did not permit him to override the Act of Parliament.

Mr. E. C. Jones, Llandilo, stated that a short time ago he had an action in the County Court against defendant, and in the course of the action he received a counter-claim from the defendant. He got it through the court, and a duplicate through the post. The defendant appeared in court against him in support of the counter-claim.

Cross-examined, he thought he had received a thing of the same kind from defendant before, but would not swear to it. He could not swear defendant delivered the bill read to the court, but it was through the court he got it. It was possible anyone might have put the particulars on the bill without defendant's knowledge. He had not engaged defendant; his wife gave defendant a cat, he did not. He had never verbally held out that he was a veterinary surgeon, only on paper. He knew defendant's writing, and the writing on the billhead was his. He could not swear to it, but he had some other correspondence from him.

Mr. H. Herbert: Didn't I understand Mr. Powell to say defendant appeared in court in support of this bill?

The Clerk: How did you get hold of his if it was in court?

Witness: It was sent with my summons, and given me by a bailiff.

A clerk named John, from the County Court Office, said the bill was handed in by defendant. Asked by Mr. Hurley had he remembered this particular case, he replied that the defendant came to the office and said he

wanted to bring a counter-claim, and he was told he would have to get particulars. He went away and came back with the billhead.

Mr. Hurley : Do you positively say you know all the persons who hand in particulars of counter-claims to you ?

Witness : If you mention a particular case perhaps I would.

Mr. Powell : The defendant is well-known : he is a resident in the town.

Mr. Hurley : It is all very well for a person to swear he can remember a particular person.

The Clerk : Do you suggest he is swearing that without knowing what he is swearing ?

The Chairman : We take it for granted the defendant is well known to the witness.

THE DEFENCE.

Mr. Hurley for the defence, submitted there was no satisfactory evidence before the Court as to whether the defendant had delivered or published the billhead on which he was prosecuted. Evidence had been given that the billhead was delivered to the prosecutor, E. C. Jones, through the County Court, but of course he couldn't swear on oath that it was delivered by the defendant.

Mr. Powell : E. C. Jones is not the prosecutor, but the Royal College of Veterinary Surgeons.

Mr. Hurley, continuing, said the only thing Jones could say was that he received it from the County Court bailiff, and with regard to the other witness, who stated he remembered the defendant handing in these particulars of counter-claim, although he did not suggest he was stating what was untrue, he asked their worships to consider very carefully his evidence, because he received numerous particulars of claim and counter-claim from time to time, and it was really very difficult for him to say who the individual was who delivered them. Dealing with the merits of the case, the defendant was charged with holding himself out as a practitioner of veterinary surgery or any branch thereof. Their worships would observe from the billhead—

The Chairman : You don't deny that ?

Mr. Hurley : We don't admit it ; it is for the prosecution to prove.

The Chairman : You suggest that is not published by the defendant ?

Mr. Hurley : I say nothing whatever ; it is for the prosecution.

The Chairman : It is quite clear that it was delivered in the County Court on behalf of the defendant.

Mr. Hurley said the fact that defendant appeared in Court in support didn't prove that the billhead was published by him. Someone else might have filled it up, and he appeared in support of the counter-claim. Defendant did not say in any way he was a veterinary surgeon. He said "Doctor of Veterinary Dentistry," and with respect of this he could, if required, produce certificates from a college in the U.S.A.—two diplomas which had been granted to him.

Mr. Powell : I don't care a bit if he is a member of a dozen colleges.

Mr. Hurley said by these documents defendant didn't hold himself out as practitioner of veterinary surgery. All he said was "Doctor of Dentistry and Veterinary Science, U.S.A." He stated where they were granted from. Having quoted a case, *R.C.V.S. v. Groves*, in which the defendant, who was not convicted, described himself as a pharmaceutical and veterinary chemist, Mr. Hurley replied that defendant only described himself as a doctor of veterinary dentistry, and he submitted that was distinct altogether from veterinary surgeon.

The Clerk : A chemist is not a surgeon.

Mr. Powell : That is a totally different case.

Mr. Hurley said that in view of that case he would ask their worships, even if they were satisfied that

defendant had published that particular bill-head, to hold there had been no infringement of Section 17 of the Act ; or if they had any doubt to give the defendant the benefit of that doubt.

In reply to the magistrates, he said he was not going to call the defendant.

Mr. Powell having again addressed the magistrates, the Clerk read the case of "*Groves*," and said it did not touch the present case.

The Chairman said they considered that defendant had infringed Section 17, whereupon Mr. Powell said he was instructed to press for a heavy penalty.

The Deputy Chief Constable stated that on the 25th July, 1903, defendant was fined 25s. for falsely representing himself to be a qualified veterinary surgeon, and on the 2nd April, 1904, under the same charge, was fined £5 and costs.

Mr. Hurley said in this case defendant had certain certificates granted by a college in the U.S.A., and he made an innocent use of them. If he had infringed the section, it was unintentional ; he (Mr. Hurley) therefore asked the magistrates to be lenient in view of the nature of the case.

The Chairman said they did not consider it a serious offence ; but still they must impose a fine of £1, including costs. An advocate's fee of 10 6 was allowed. —*The Herald*, Carnarvon.

Board of Agriculture.—The allocation of Development Fund Grants.

Though indeed the work of the President of the Board of Agriculture is of an unostentatious quality, Mr. Runciman is by no means an idle man, as a memorandum just issued from his department abundantly testifies.

The memorandum shows first the purpose for which advances have been made to the Board of Agriculture from the Development Fund ; and, second, certain advances made through the Board of Agriculture. In the first of these sections grants were made for the improvement of Light Horse Breeding, for Agricultural Research, Farm Institutes, the Development of Forestry, Agricultural Co-operation, and Fishery Development.

Among the various grants we note the following :—

* * *
Royal Veterinary College.—£1390 for investigations in respect of vaccination against tuberculosis and other investigations.

(b) Animal pathology. The Royal Veterinary College and the Board's Veterinary Laboratory.

ARMY VETERINARY SERVICE.

Extract from *London Gazette*.

WAR OFFICE, WHITEHALL, June 14.

REGULAR FORCES. ARMY VETERINARY CORPS.

Lieut. A. Hodgins to be Capt., with precedence next below Capt. V. C. Leckie.

June 18.

REGULAR FORCES. ARMY VETERINARY CORPS.

The following notification to be substituted for that which appeared in the *Gazette* of June 14 :—

Lieut. A. Hodgins to be Capt. with precedence next below Capt. V. C. Leckie. Dated Feb. 13.

His Majesty the King held a Levée on June 13, at St. James' Palace.

The following presentations to the King were made,

* * *
Capt. H. E. Gibbs, A.V.C., by the Inspector General of the Home Office.

The Wheatley Challenge Cup.

This Cup is awarded to the competitor obtaining the greatest number of marks at the R.V.C. sports, and thus constitutes the championship prize. The winner this year, as on several previous years, was W. F. Poulton.

CLAIMS OF VETERINARY SURGERY?

Sir,
Enclosed is a cutting from the *Western Morning News* of the 7th inst. which might be of interest to the profession. In view of the fact that the finances of the College are in a precarious condition, overtures should be made by the Finance Committee to the Trustees of the late Sir Julius Wernher for sums of money out of the residuary estate. The Royal College is surely an Educational institution and would doubtless benefit if proper representation of facts were made.—Yours, etc.,
JAS. FORBES.

Trafalgar Square, Truro, 13th June.

"Sir Julius Charles Wernher, who died on May 21st, left Estate provisionally sworn as under the value of £5,000,000.

Sir Julius also gives to his trustees a discretionary power to pay out of his residuary estate such sums as they should think fit, not exceeding £100,000, to such charities or charitable or educational institutions in England or elsewhere."

JOHNE'S DISEASE.

Sir,
I was very much interested in two recent contributions to *The Record* re Johne's Disease. Last year I had a case under observation with nothing remarkable about it except that the chief symptoms manifested themselves during the nineteenth week of pregnancy, viz., uncontrollable colliqu-

ative diarrhoea, capricious appetite, great thirst, and muscular wasting. In spite of every combination of astringents and tonics, this cow aborted in the twenty-sixth week of pregnancy, and died a month later.

At present I have another cow, four years old, under treatment at the same farm. She calved some weeks ago, and soon presented alarming symptoms—diarrhoea (faeces covered with air bubbles), muscular wasting, partial anorexia and thirst. I tested her with tuberculin, but obtained no reaction. I am experimenting with this animal, and lately have tried intravenous and hypodermic injections of Chinol-sol without any benefit.

If any of your readers know of any palliative treatment, let us hope they will record it.—Yours faithfully,

L. L. STEELE.

Beckermat, Carnforth.

INSPECTORSHIPS B. OF A. AND POST GRADUATES.

Sir,
I read in your editorial last week of the possibility of inspectorships created under the Board of Agriculture, with salaries "large enough to attract the best men in the profession." How will these posts be filled? I would suggest by competition by a written examination for which any man, within reasonable age limits, holding the M.R.C.V.S. diploma, should be allowed to enter. Our Council would only be doing their duty if they insisted that the fact of a man having acquired his knowledge of the twists in the tail of *Trypanosoma Theileri* from this or that post-graduate course, should not be allowed to count in his favour against a man with a practical knowledge of swine fever or bovine tuberculosis gained by practical experience in a country practice. Failing this, the parents of would-be students at our schools should be told when entering their sons that the diploma will qualify them to potter round a country district or officiate at a dog show, but not for any position under the Government.—Yours, etc.,
SENEX.

Guard for the Eyes for Pit Ponies.

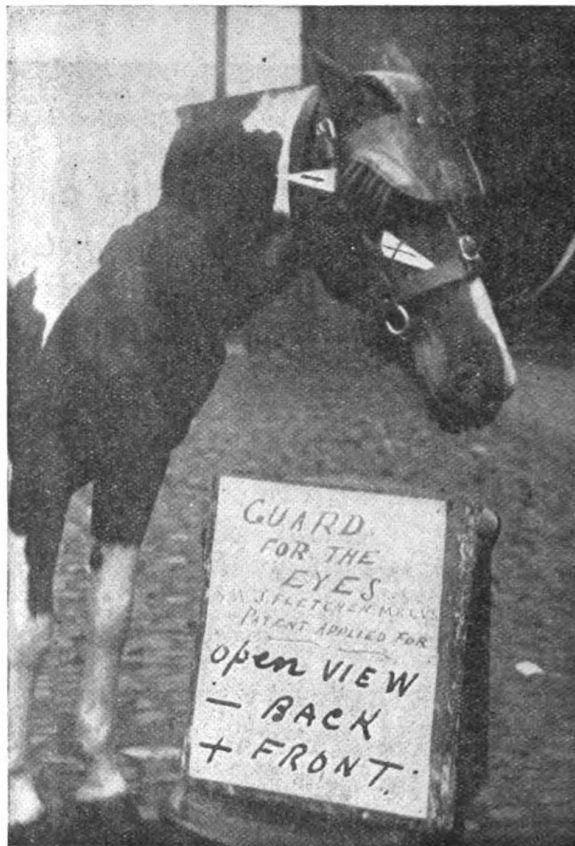

PATENT APPLIED FOR.

To meet the requirements of the Coal Mines Act 1911, coming into operation on July 1st this year, I have made an attachment that can be fixed to existing bridles; two special guards, small cost, to be easily attached to existing bridle fronts having round eyes.

I consider it an essential that the animal's vision should not be obstructed in the forward and backward view, and as little as possible at the side—to avoid accidents. My guard has been designed for this purpose, leaving a clear anterior and posterior view; further, the strands are arranged at a correct angle and made of material that cannot injure the eye if banged on to it, and, like electric cable wire, can be put back to shape again with the hand. Complete weight 3 lb. Kindly recommend to proper quarters.

Arrangements can be made for one's own saddler to make.

W. J. FLETCHER, M.R.C.V.S.,

Professional Advertisements.

These will be received up to Thursday morning.
Five lines or under 2/6 (exclusive of heading): for two insertions 4/-; for three 5/-; after three 1/- each.
Each line above five—first insertion 6d; after first 3d.
Average—seven words in a line.

These Advertisements will not be inserted unless prepaid, and if replies are to be received at this office an extra sixpence must be included.

The Central Veterinary Society

A GENERAL Meeting will be held at 10 Red Lion Square, W.C., on Thursday, July 4th, at 7 o'clock. Agenda. Routine business: Morbid specimens, (Fellows are specially requested to contribute): To consider circular letter from the South Eastern V.M.A., re Kent County Council Inspectors' Fees. Impromptu discussion.
HUGH A. MACCORMACK, Hon. Sec.

South Africa

THE UNION GOVERNMENT of South Africa invites applications for a Lecturer in Veterinary Science at Potchefstroom Agricultural College, Transvaal. Applicants must be Members of the Royal College of Veterinary Surgeons and in addition to being capable of teaching Veterinary Science should have experience in Veterinary practice. Age not over 30. Commencing salary £350 per annum and quarters. Three years agreement. Free passage to South Africa. Apply, stating age, qualifications, etc., to "The Secretary," High Commissioner for the Union of South Africa, 32, Victoria Street, Westminster.

Qualified Assistant Wanted

THOROUGHLY practical, for country practice, to act as assistant and manage branch. House provided and salary. (Married, and abstainer preferred.) Address, 5063 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

WANTED for an extensive practice in London, a fully qualified assistant. Preference given to an abstainer. Salary to a competent man £200 per ann. to commence. Sign usual bond. Address, enclosing copies of testimonials, 5062 V.R. 20 Fulham Road, s.w.

For Fortnight in August

VETERINARY practice in fashionable sea-side resort. Golf, boating, tennis, etc. Nice residence, on moderate terms, in exchange for services rendered by a qualified M.R.C.V.S. Address, Brown, Vet., Ramsey, Isle-of-Man.

Locum Tenens

CLASS D. student (Xmas) wishes position as locum, free during July. Experienced, good references. Address, "Spatula," Glengower, Craigellachie.

As Locum or Assistant

CLASS C student wishes situation as above, free July 16th. Has seen much practice. Good references. Address, "L.R.," Royal Vety. College, Camden Town, London, N.W.

Mallein and Tuberculin

MEMBERS of the Profession may obtain Mallein and Tuberculin on application to the Principal, Royal Veterinary College, Camden Town N.W., on the following terms: In bottles, 6d. per dose; minimum quantity supplied, two doses. In hermetically sealed tubes, containing one dose each (specially suitable for use abroad), 1s. per dose.

G. H. PICKWELL, M.R.C.V.S.,

Locum:

73 Victoria Mansions,
South Lambeth Road, S.W.

HUGH R. SINGLETON, M.R.C.V.S.

by Stockport.

Improver

CLASS D student requires situation as above in country practice for summer vacation, August 1st to October 1st, experienced in town practice. Address, "Izal," c/o Veterinary School, University, Liverpool.

For Disposal

DEATH vacancy, old established country practice in South of Scotland, average yearly returns about £400. Ample opportunity for considerable increase. Address, 5064 V.R., 20 Fulham Road, London, S.W.

Wanted

YOUNG qualified assistant for a few months in Scotch practice. State references, experience and lowest terms, live in. Address, 5065 V.R., 20 Fulham Road, London, S.W.

All communications respecting advertisements should be addressed to

H. & W. BROWN, 20 Fulham Road, London, S.W.

Wanted at Once

CANINE practice in London, or South. £750 spot cash. Strictest confidence observed, and all communications answered by return of post. Address, 2506 V.R., 20 Fulham Road, London, S.W.

As Locum or Assistant

EDINBURGH student, age 23, requires position as above during summer vacation. Excellent references, town or country practice, not afraid of work. Address, 1506 V.R., 20 Fulham Road, S.W.

Wanted

FINAL years student for Scotch practice. One with some experience preferred. Board etc., in return for services or small remuneration if suitable. Address, 5069 V.R., 20 Fulham Road, London, S.W.

Assistant or Improver

WANTED, a young qualified man as junior assistant or improver, in country practice, live in. Apply, stating age, height, weight, salary required, etc. to Fred W. Watchorn, F.R.C.V.S., Newtown, Montgomeryshire.

Student to Assist

WANTED by Yorkshire M.R.C.V.S., with B.A. and C.C. inspectorships, student who has seen practice, to assist for a few weeks. Address, stating experience and giving references, to 5067 V.R., 20 Fulham Road, London, S.W.

Pupil or Improver

VACANCY for pupil or improver, mixed country practice, live in. Somerset. Address, 5066 V.R., 20 Fulham Road, London, S.W.

To Veterinary Surgeons

CLASS C student, up in July, desires experience in good country practice during summer vacation. Services for board and lodging. Willing, obliging and not afraid of work. Address, A.X., Royal Vety. College, London, N.W.

For Immediate Disposal

GENUINE old established lucrative city and country practice in wealthy district. Would entertain letting in its entirety as a going concern, inclusive. Personal interview invited. Address, 5068 V.R. 20 Fulham Rd., London, S.W.

Locum or Assistant

EX-STUDENT, 20 years practical experience in town and country, is open for re-engagement until Aug. 24th. Well up in all branches, excellent testimonials, moderate terms: reliable and temperate. Address, X.Y.Z., 8 Powis Terrace, London, W.

As Assistant

WANTED by M.R.C.V.S., post in busy practice, with view to partnership or succession. Large experience and excellent references. Address, 4066 V.R. 20 Fulham Road, London, S.W.

For Sale.

NEGLECTED practice in fashionable seaside resort, now doing £200 (capable of being doubled in two years with young practitioner. Very small premium to immediate purchaser. Address, 4069 V.R., 20 Fulham Road, London, S.W.

Victoria Veterinary Benevolent Fund

President:

W. F. BARRETT, Esq., Fountain Court, Temple, E.C.

FUNDS are urgently needed to enable the Society to extend its relief to distressed Members of the Profession, or to widows and orphans of deceased veterinary surgeons. Annual subscriptions, or donations will be gratefully acknowledged by the Hon. Sec. and Treas.

W. SHIPLEY, Southtown, Great Yarmouth.

As Assistant.

CLASS C student (up in July) hard worker, and careful dispenser, desires post in busy country practice during the summer vacation. Former experience and good references. Free July 25th. Address, R. G., Royal Vet. College, London, N.W.

Wanted

A second assistant during the holidays, a qualified man, from Aug. 7th, to Sept. 10th. State age, terms and references. Address, 4061 V.R., 20 Fulham Road, London, S.W.

For Sale

OLD established country practice which owner is obliged to sell for satisfactory reasons, nearest position 8 miles, C.C. appointment. Rent £24. Last year's returns nearly £400. Price to an early purchaser £200, drugs and fixtures at valuation. Address, 3068 V.R. 20 Fulham Road, London, S.W.

Wanted

RECENTLY qualified or young assistant in large mixed practice. Light weight, able to ride. Address, 4065 V.R., 20 Fulham Road, London, S.W.

Locum

J. B. TAYLER, M.R.C.V.S., will act as Locum, town or country. Disengaged. Address, Shawlands House, by Larkhall, Lanarkshire.

Locum

A N experienced M.R.C.V.S., who has acted for many town and country practitioners, is always open to engagement when not actually filling a post. "Locum," 59 Gascony Avenue, Hampstead, London, N.W.

Wanted

RELIABLE qualified locum, beginning of August, for about a fortnight. Young man preferred. State terms (live out). Good references indispensable. Address, 3063 V.R., 20 Fulham Road, London, S.W.

Chlorodyne

FOR SALE, a large quantity of Chlorodyne, full strength, B. P. 1885, at 2/- per pound. H.J. Pratt, Wholesale Druggist, Cleckheaton.

To Vendors.

WANTED Veterinary Practices and Partnerships. Surgeons wishing to sell the whole or a share of their practices are invited to communicate with Messrs. Peacock & Hadley, Veterinary Transfer Agents, 19, Craven Street, Strand, W.C., who will be pleased to introduce likely purchasers. No charge whatever made unless a sale be effected.

NATIONAL VETERINARY ASSOCIATION,

President: WM. WOODS. F.R.C.V.S., Wigan.

The Annual Meeting will be held at the
TOWN HALL, MANCHESTER,
Wednesday and Thursday, July 24th & 25th
 Annual Banquet on the evening of Wednesday, July 24th.

The Provisional Committee have arranged for the following papers:—

Veterinary Education (pre and post-graduate) Maj. Gen. F. SMITH, F.R.C.V.S.

Discussion opened by Prof. SHARE-JONES.

Phalangeal Ostitis,

WM. HUNTING, F.R.C.V.S.

Discussion opened by Prof. MACQUEEN.

Bovine Tuberculosis,

Prof. DELÉPINE

Discussion opened by Prof. AINSWORTH WILSON.

Abdominal Surgery in Veterinary Practice,

Prof. WOODRUFF

Discussion opened by Prof. O'CONNOR.

On the 26th the members are invited by the Lancashire Veterinary Association to an Excursion and Picnic at Rudyard Lake in Staffordshire.

DRUGS, INSTRUMENTS, ETC. Those desirous of exhibiting should apply at an early date, stating space required, to—

G. H. LOCKE, *Hon. Sec. Provisional Committee*, Grosvenor St., Manchester

Non-Poisonous,
 Non-Corrosive,
 Soluble in Cold Water.

CHINOSOL

Active Antiseptic,
 Strong Deodorant,
 Powerful Germicide.

Practical experience for years past proves that Chinosol in solution or ointment readily penetrates diseased tissue, thoroughly cleanses and keeps healthy all kinds of wounds, favours granulation and speedy healing, mostly without a scar, and promotes the growth of hair. Chinosol is supplied in

POWDER.

THE VETERINARY RECORD

A Weekly Journal for the Profession.

EDITED BY WILLIAM HUNTING, F.R.C.V.S.

No. 1251.

JUNE 29, 1912

VOL. XXIV.

THE SIGNIFICANCE OF THE COUNCIL ELECTION.

The Veterinary Surgeons' Bill is still awaiting its dubious chance of consideration during the present Parliamentary session; and we are forced to recognise that the Government's crowded programme renders it only too likely that we may have to wait another year before our measure obtains a hearing. In the meantime it may be useful to point out how completely the profession, at the recent election of Council, expressed approval of the Bill and its initiators.

Quiet as the election was, it was definitely fought upon the Bill. There were nine vacancies; and nine of the twelve candidates issued a joint circular asking for election in support of the Bill. All nine were elected; and thus, at first sight, the profession's approval of the Bill is made clear. But it becomes still more clear when we examine the political records of some of the nine elected candidates, and compare the votes received by elected and non-elected alike with those gained by the same men in former years.

Sir John McFadyen was President of the R.C.V.S. when the Bill was drafted, has supported it wholeheartedly from the first, and is now Chairman of the Annual Fee Committee. At this election he heads the poll with the highest number of votes recorded since 1896. Mr. Trigger, the originator of the idea of an Annual Fee, comes a good second. Mr. Garnett, who brought the matter to a head in 1907, was the first Chairman of the Annual Fee Committee, and has often been styled the "Father of the Bill," is third with over a thousand votes. Major-General Thompson, a supporter of the Bill from the first, and a member of the Annual Fee Committee from its inception, is fourth. Of the nine successful candidates, then, the four who are most closely associated with the promulgation of the Bill are placed at the top of the poll. Is it possible to imagine a more distinct mark of the profession's approval of the Bill, or a more emphatic vote of confidence in the men who brought it forward?

On the other hand, we find two opponents of the Bill—Prof. Dewar and Mr. Spreull—amongst the unsuccessful candidates. Each has previously contested an election against the Bill—in 1908 and 1909 respectively—and a comparison of their present with their past polls is instructive. Prof. Dewar was returned in 1908 with 936 votes. This year his figure is reduced to 671, and he is rejected. Mr. Spreull was one of the eight candidates who unsuccessfully opposed the Bill at the election of 1909. On that occasion he polled 630 votes, but this year he only secures 453; and this low figure of 453 has a further significance. In 1909 the

lowest vote recorded against the Bill was 539; and that total was obtained when the votes were spread over sixteen candidates. This year an opponent of the Bill is again at the bottom of the poll, but though the votes were divided amongst twelve candidates only he obtains but 453.

All these figures point unmistakably to one conclusion—that the opposition to the Bill is declining. Probably the main reason for this is an increasing recognition by the opposition that the Bill is really unavoidable—that no alternative method of securing the financial stability of the R.C.V.S. can be found. In the days when the Bill was a centre of controversy no effective alternative to its principle of compulsory contribution could be advanced; and naturally, as this became clearer, and at the same time the state of the College finances became more obvious, the opposition began to die away. The election just over proves finally that the Bill has ceased to be a controversial matter within the profession, and a close examination only emphasises the proof. The overwhelming majority of votes given to the Bill and to so many of its chief promoters is significant enough, and perhaps the quietness and complete freedom from excitement that marked the election is more significant still.

WHAT IS A CURB?

The above query is suggested as the result of perusing the expert evidence given in a recent Law case. Some of the experts spoke of curb as a disease affecting a "particular ligament." If this view was generally accepted, it would give to curb a more serious significance than it is justly entitled to, and it would be difficult to understand how the affection occurs in some instances in the absence of the usually accepted causes.

Any practitioner who has experience in examining young horses at shows must observe the number of cases of "slight curbs" that occur in animals that have never been handled or worked. So slight is the defect that in some instances a doubt may exist in the mind of the examiner as to the existence of the affection. The slight enlargement feels soft to the touch, and shows no heat or tenderness, and no lameness is present. Experience, however, teaches that such cases if untreated and put to work generally develop the ordinary curb, especially if the hock is of the formation known as "curby."

Now anyone considering the subject must doubt the view that curb depends on strain of the calcaneo-cuboid ligament. It is a well-known fact that many of these slight curbs, if treated, recover perfectly, and no evidences of the defect remain.

It would be interesting to inquire if the ligament has been actually found affected on post mortem examination, or whether this view of the pathology of curb is a purely theoretical one. Percivall (Hippo-pathology) appears to have made a special study of the subject, and points out that considerable wavering of opinion existed respecting the pathology of the affection, admitting at the same time that opportunities are seldom given to examine such cases post mortem. He regarded curb as due to "effusion into, or thickening of, the sheath of the flexor tendons," and drew attention to the anatomy of the parts concerned, pointing out that the perforatus tendon at the back of the hind leg was "clothed by cellular tissue, and by means of it connected with the parts around, and thus is confined in its place. In front of the tendon, in the midst of this enveloping tissue, is a serous bursa; while behind it, between its cellular investment and the skin, is a tendinous band to which has been given the name of annular ligament, whose glistening fibres are seen traversing the tendon, evidently for the purpose of binding it down, and so in action contributing not a little to its power and effect."

"Now if we, bearing this anatomical sketch in view, revert to the seat of curb, we shall find that the site of the tumour is directly opposite to the bursa in front of the perforatus tendon. Through this bursa or thecal cavity runs the perforatus tendon, and it is the play the tendons enjoy at this particular part, in consequence of the existence of the bursa and the looseness and paucity of their attachments, that causes sprain or laceration to be seated here; the part sprained or lacerated being neither the tendon nor the ligament, but the cellular sheath of the tendons." . . . "Effusion takes place . . . and probably pervades cellular tissue and bursa together. . . . What ultimately takes place in curb, and in fact constitutes the disease in the ordinary, inveterate or permanent form—being the consequence of interstitial deposit—is a hard, callous condition of the tumour, and this is the state in which horses are brought to us after inflammation has departed. It consists in a thickened and indurated condition of the cellular sheath of the tendons." Percivall gives an excellent plate, showing the dissection of a hock affected by curb, and the abnormal condition of the sheath of the tendons above described. He also admits that other morbid appearances might occur, due to a continuation, or a return, or a reproduction of the diseased action. In one case of apparent curb which he examined post mortem he discovered a thorn, half-an-inch in length, sticking in the substance of the perforatus tendon, precisely in the seat of curb.

I have ventured to give the above quotations from Percivall at some length, because they explain some important points in connection with the subject of curb. The small "soft" curb, so common in young horses, would appear to be due to effusion into the bursa mentioned. In fact it feels exactly as if this was the case, and certainly does not give one the idea of a lesion of the ligament. Moreover, the latter would not be so likely to disappear even with any form of treatment.

As regards the etiology of curb, if we accept the view of Percivall, it is easy to understand how the affection may occur in the absence of hard galloping or leaping. Sprain or rupture of the cellular sheath and bursa of the perforatus tendon is surely more easily induced than sprain of the calcaneo-cuboid ligament. Percivall records two instances where horses "threw out curbs" in the course of walking exercise, probably, as he points out, due to the animals being fresh and jumping about.

I met with an instance lately in which a 5-year-old huntress was sent to my infirmary for treatment for a simple ailment, and after being in the stall for a few days she threw out a curb. The owner could not understand it, but I pointed out that it was an example of how easily such affections may occur, and that had I examined the animal for soundness prior to her arrival, nothing would have convinced him but that she was unsound prior to purchase.

Is an enlargement on the seat of curb always due to curb? Certainly not if it arises from an injury such as is of common occurrence in hunters.

Apparent enlargements in the postero-external aspect of the hock, due to well-developed prominences on the bones, are frequently mistaken for curb, even by those who pride themselves in their horsey knowledge. Very often it is the candid friend, who after lunch on a Sunday is taken to see the new purchase, and points out that the animal has a curb; he may even say that he detects evidences of blistering. The result is that the horse is sent to the V.S. who has examined him, with an irate letter complaining of negligence. This is not an uncommon occurrence, so that it is certainly advisable to point out to the purchaser any peculiarity in the formation of the hocks, and so prepare him for the opinions of the horsey critic.

Similar remarks apply to the question of "coarse" hocks.

I should much appreciate a discussion on the etiology and pathology of curb, especially if those who give their views have had the opportunity of examining specimens of hocks affected with this disease. If it be the case that curb exists in various forms, it would be interesting and useful to obtain definite information on the matter.

E. WALLIS HOARE, F.R.C.V.S.

PARALYSIS IN THE DOG, CAUSED BY HEART DISEASE.

History.—The subject was a ten-year-old Dandy Dinmont terrier, which according to its owner had been quite well and bright up to the time of its seizure. Within an hour-and-a-half of his last seeing the dog apparently well, it was reported to him as unable to stand, and dragging its hind quarters.

I was asked about the dog. Advised a purge, and expressed a desire to see the animal. It was brought to me on the third day of its illness for my decision as to the value of treatment.

Symptoms.—The dog was completely paralysed behind a point corresponding to the 11th Dorsal vertebra. The pulse was slow and regular. Temperature 101° F. Mucous membranes injected and bluish. External temperature of paralysed parts was slightly raised. Urine was seen dripping involuntarily from the prepuce, and on manipulating the abdomen the bladder was found extremely distended. It was easily evacuated by pressure. No impaction of the bowel could be felt, and was not expected, because I was informed by the owner that the purge (castor oil) had been very effective.

Considering the dog's age, and the generally chronic course of these disturbances, I advised destruction.

Post mortem examination.—All organs were apparently healthy except the heart, spinal cord, and prostate gland.

The pericardium was normal. The heart was not enlarged. The myocardium of the left heart, just below the Coronary groove, showed a light, buff-coloured spot, denser in consistence than the rest of the wall. On section of the wall the buff spot was found to extend through its thickness. It was tendinous in consistence, circular in outline and the size of a halfpenny.

The mitral (Bicuspid) valves were inflamed, thickened and showing on their edges proliferations of a pinkish colour, resembling granulation tissue. The largest was the size of a horse-bean. The Tricuspid valves showed similar but more extensive lesions than those of the mitral. The semilunar cusps of the Aortic valve were inflamed but showing no new growths. Here was evidently an endocarditis passing into the chronic state. There were no lesions of interest in the other organs, except an enlargement of the prostate gland.

Spinal Cord. The cord was removed from about the 6th Dorsal vertebra to its termination. The vessels (veins) were found extremely injected. The cord itself was very soft and pulpy, the posterior part almost creamy in consistence. A portion of the lumbar cord was intensely inflamed for about an inch of its length. The paralysis was then most probably due to changes in the cord brought about by venous hyperæmia of the spinal medulla. The hyperæmia of the cord was caused by dilatation of the heart following on valvular defects.

Dundalk.

ABSTRACTS FROM FOREIGN JOURNALS.

TUBERCLE BACILLI IN THE GALL OF TUBERCULOUS ANIMALS.

Joest and Emshoff report (*Zeitschr. f. Infektionskrankh. u.s.w. d. Haust.*) a series of observations they have made to determine the presence or otherwise of tubercle bacilli in the gall of tuberculous animals. Fifty-seven tuberculous animals were examined (26 cattle and 31 pigs), and the galls of

these were tested by inoculations into guinea-pigs and by examination of smear preparations. Most of the cattle and pigs observed were suffering from generalised tuberculosis; and in all cases either tuberculosis of the liver or at least a tuberculosis of the portal lymphatic glands was present. Altogether the presence of tubercle bacilli in the gall was demonstrated in fourteen cases (= 24.5 per cent. of the subjects observed). Six of these fourteen cases were in cattle and eight in pigs, the percentages of cattle and pigs respectively thus being 23 and 25.8. As in no case could a tuberculous affection of the mucous membrane of the gall bladder or of that of the larger excretory ducts be demonstrated, the bacilli in the gall must have passed out into it from the liver—that is, from tuberculous lesions in the latter organ.

The presence of tubercle bacilli in the gall naturally ends in their excretion into the intestine, and thereby into the open air. *Tuberculosis of the liver is therefore, in many cases, an open tuberculosis.* The significance of open hepatic tuberculosis in the dissemination of infection to other animals and to milk is equal to that of open intestinal and pulmonary tuberculosis.—(*Berliner Tier. Woch.*).

CONGENITAL DIAPHRAGMATIC HERNIA OF THE STOMACH AND SPLEEN IN A HORSE.

Lesbougries records (*Revue Vétérinaire*) a case of a horse which showed symptoms of influenza, with pulmonary obstruction upon the right side. Auscultation revealed borborygmus upon the same side. Despite treatment, the animal died three days after the commencement of the illness.

Post mortem examination revealed the following lesions. The opening of the thoracic cavity permitted the escape of a considerable quantity of alimentary material. The stomach and the spleen were found under the right lung. These two organs had become totally prolapsed into the thorax, forming a diaphragmatic hernia. An *ante-mortem* rupture, about 2 to 2½ inches long, was found upon the lesser curvature of the stomach. In the centre of the aponeurotic portion of the diaphragm was a circular opening of eight inches in diameter, regularly rounded in almost all its circumference except to the left, where it was torn. Its edges were smooth, thin, and pearly white in colour.

The author advances the following view as the most acceptable hypothesis to account for the lesions found. The horse had been affected with congenital hernia of the stomach, and was therefore particularly predisposed to contract a gastric indigestion. The stomach, the peristaltic action of which had already been enfeebled by the effects of influenza, had become surcharged. From its weight, it had fallen further forwards into the thoracic cavity, forming an acute angle with the duodenum which arrested the passage of aliment.—(*Annales de Méd. Vét.*).

W. R. C.

[Nothing is said of the age or the previous history of this horse.—*Transl.*].

CENTRAL VETERINARY SOCIETY.

A meeting was held on Thursday, June 6th, 1912, Mr. R. J. Foreman, President, in the chair. The following members signed the attendance book:—Messrs. B. Gorton, Wm. Hunting, P. W. Dayer Smith, R. Bryden, J. Willett, N. Almond, Alex. Crabb, J. F. Macdonald, W. Perryman, H. D. Jones, J. W. McIntosh, Prof. G. H. Wooldridge, G. Gordon, A. Neish, R. F. Wall, F. O. Parsons, G. H. Livesey, Wm. Willis, J. Rowe, G. Upton, Prof. J. Macqueen, and Hugh A. MacCormack, Hon. Sec.: as visitors, R. W. Williams, E. S. Farebrother, and F. Ware.

The minutes of the previous meeting were taken as read and confirmed.

A letter was read from Mr. Coleman suggesting that in connection with the discussion to take place on the fees allowed by the War Office for veterinary surgeons might be included the fees paid by County Councils to the veterinary inspectors under the Contagious Diseases (Animals) Act.

The SECRETARY said he had written to Mr. Coleman saying he did not see how both subjects could be taken together, and asking Mr. Coleman to bring the matter forward as a proposition for the next meeting.

MORBID SPECIMENS.

Mr. H. D. JONES exhibited some dorsal vertebrae from a horse which had slipped down and broken its back in the region of the lumbar vertebrae. On examining the spine he found the condition shown, which might be either a simple exostosis, a malignant growth, or tubercular.

Mr. MACDONALD showed the bones of the hind foot of a van mare with the following history. The mare brought the van home one evening, but the next morning was found on three legs, and in a few days pus formed in the sole, about an inch in front of the frog, and later on the discharge became distinctly carious. After about three months treatment she became sound again, and went to work for another six months, when she suddenly dropped dead in the street of ruptured heart, and he had the chance of getting the foot. The fracture of the pedal bone extended into the articular surfaces, of which there was ulceration.

The evening was devoted to impromptu discussions, the first being a point raised by Mr. Hunting on

WHAT IS THE SIGNIFICANCE OF A LONG STRIDE ON A LAME LEG?

Mr. HUNTING said as a rule when a horse was lame he stepped shorter with the lame leg, but there were a few cases in which a horse took a long step with his lame leg. He remembered one horse who took a long step with a front lame leg, and two others who took long steps with a hind lame leg, and one of the latter had now developed a distinct ringbone on the coronet. He thought the worst position for that horse would be when he put his weight upon his leg, and therefore merely taking a short step would not avoid it so well as taking a long one, where the heel came to the ground first. It was a very rare symptom, and he really did not know the significance of it, but he thought a meeting of practical men might possibly give some explanation. The late Prof. Williams distinctly mentioned a long step as a symptom of ringbone in the hind limb.

Mr. ALMOND had not noticed a long step in the fore limbs, but had frequently noticed them in the hind limbs, and usually associated with it lameness in the foot. If a horse was very lame in the foot of a hind limb he always put it very forward before he placed it on the ground.

Mr. WILLIS had noticed a long stride in the hind limb constantly associated with lameness in the front part of

the foot, or at any rate below the fetlock. A ringbone, or sandcrack, or horn tumour in that region would give rise to a long stride. In the fore limb he had noticed a long stride after recovery from dropped elbow or radial paralysis. He thought it also occurred in cases of destructive arthritis of pedal joint—most markedly when hind foot was affected.

The PRESIDENT said most cases he had seen had been in Keratomas: buttress foot and sand-crack, and it had been more pronounced in the latter than anything else, or at any rate the animal tried to make the long stride, making the attempt and drawing back the foot before putting it down.

Mr. PERRYMAN thought the expression long stride was a little misleading. The forward stride he had always looked upon as the evidence of the animal trying to throw the weight of the body on to the back parts of the limb, which was characteristic of some anterior lameness. He would rather put the question: Is the stride longer, or does the horse start further forward with his stride? He should like to know if Mr. Hunting had measured the stride to see whether there was really a longer stride than with the other limb.

Mr. HUNTING said he did not think he could have been deceived from the observation of his eye.

Mr. PERRYMAN said the horse started the stride with the limb well underneath the body and the stride appeared to be longer, but his impression was that it was only an appearance.

Mr. HUNTING said it was questioned by some pathologists whether the horse could take a stride with one limb longer than with the other.

Mr. WILLIS said it was a crab-like movement if the animal took a longer stride on one side than the other. If the horse moved with longer strides on one side than the other it would be really going in a circle.

Mr. NEISH said every horse that was lame behind, if it had any pain in the foot, would naturally take a longer stride with the lame foot than with the sound one, for the simple reason that when he had the weight on the lame foot he quickly put the other one down to lessen the pain.

Prof. WOOLDRIDGE asked whether Mr. Hunting had formed any views for himself.

Mr. HUNTING said he had not.

Mr. WALL thought the action of the forelegs prevented the animal going in a circle such as Mr. Willis mentioned.

Prof. WOOLDRIDGE said that the only step that was in reality a long step or a short step was the first step taken from the stationary position, both feet being level at the moment of starting. If it was a short step the horse must of necessity bring the leg further forward next time to compensate for a short step, otherwise he must go round in a larger or smaller circle, or leave that leg behind, an obvious absurdity. The whole thing was an optical illusion with regard to the relative positions of the two legs when they were on the ground. The actual steps after the first one being of equal length.

The PRESIDENT said the easiest way would be to measure on soft ground the steps of the next lame horse seen.

OCULT SPAVIN.

The subject of occult spavin was drawn, and opened by Mr. Almond, who said he had met with a good many lamenesses in the hind limb which he had attributed to that cause, and had always found them extremely intractable. There were various theories as to the origin of occult spavin but he had nothing original to add to them. He had usually come to the conclusion that he had an occult spavin to deal with when the lameness had been more or less continuous in the hock and the pain was greater after exertion. In ordinary spavin a moderate amount of exercise was generally attended with

an improvement in the gait of an animal, but as a rule a horse with occult spavin was just as lame after exercise as he was before. The ordinary spavin with external exostoses he had usually found to respond to rational treatment, but the same could not be said of ulceration of the articular surfaces of the hock joint, which might be the gliding joints.

Mr. WILLIS said the treatment of spavins, whether ordinary or occult, in his hands had been pretty well unsuccessful. He did not think any treatment of occult spavin in the ordinary way was of any use; it was simply a question of putting the animal at such work as he could do. He remembered driving such a horse as a trapper. The animal had ulceration in both hock joints and he drove it for six or eight months in light work, and then it became so sound that he worked it for another three years in a bus. In that animal he did not believe there was a gliding joint in the hocks that was not ulcerated. The worst thing that could be done was to work such a horse hard one day and then hang him up another day. He believed the diagnosis of occult spavin was soundness after a period of rest. He had a notion he could diagnose occult spavin, but he could not explain how it was done.

Mr. Upton had noticed that spavin cases were more or less hereditary, and he looked upon ulceration of joints as rheumatoid. He thought the tendency in the system might be bred out. He had a mare now that was always lame in the hock, and she had a colt two years old showing the same affection, although the father was one of the best horses. He admitted that extra strain would cause trouble, but believed that if the cause of the ulceration of the cartilages could be found it would be discovered that the tendency was bred in the animal.

The next draw for a subject resulted in

FOUL MOUTH IN THE DOG.

Mr. ALMOND said he had a great difficulty in dealing with such a condition. He had often found it associated with deposits on the teeth, loose teeth, ulcerated gums, ulcerated tongue, etc., but when all those conditions were removed, in a great many cases the foul mouth still existed, notwithstanding the great variety of washes, deodorisers, disinfectants, and other agents used. The condition was sometimes found in young dogs, two years old. He should like to know whether the foulness arose from the mouth or the stomach, or from both.

The PRESIDENT had had a number of cases which it had been absolutely impossible to do anything with at all, and the condition had not been due to the teeth. Very often he had found it in conjunction with a cough which he took to be a stomach cough. Bismuth, and that kind of thing did not seem to have any effect. He thought the breath itself was offensive because when the animal coughed the condition was generally worse. A course of stomach alteratives was about as good a thing as anything after the mouth had been seen to. But even after the mouth had been cleaned out there was still the odour, so that he thought it must come from the stomach.

Mr. MACCORMACK said in his experience if an animal's gums were not ulcerated nor the teeth bad, and the offensive breath was present, one could not do better than give some ordinary willow charcoal in 5 to 10 grain doses once a day. He had several cases a short time ago in which by that treatment the disease disappeared after giving half a dozen powders. Of course a little aperient medicine must be given, but dependence should be placed on the powder.

The PRESIDENT said he had tried the charcoal treatment in two cases but had given it up.

Mr. J. WILLETT said there was no doubt in his mind that it was stomach derangement. It was never found in a dog with clean teeth, and was found mostly in the

toy dog. It seemed to him chronic indigestion, and the trouble could not be stopped without stomachics. He found bismuth and soda tabloids, if continued long enough, got rid of the condition. In small dogs the teeth were seldom used in mastication, everything being prepared for them, and accordingly they bolted the food without using the teeth.

Prof. WOOLDRIDGE thought in the majority of cases the condition was due to tooth trouble, but in some cases it was not so, and he agreed with Mr. Willett in regarding many of those cases as due to indigestion or gastric catarrh. If one looked carefully at the teeth a little deposit, not exactly tartar, but a very soft furry substance, such as was found on the tongue, would be discovered, and he thought it was usually associated with that condition. The treatment Mr. Willett had indicated was the one he generally practised, giving in the first instance a dose of calomel and following it up with carbonate of bismuth and bicarbonate of soda, and using a mouth wash consisting sometimes of boracic and glycerine in water, and sometimes hydrogen peroxide in water. Attention to the diet was very necessary, and especial attention should be paid to mastication and the flow of secretions in the mouth.

Mr. ALMOND said he found excessive saliva in such cases, and attributed the collection of tartar upon the teeth very largely to that fact. The cases he had referred to were not those relieved by the treatment suggested, but cases which persisted month after month and year after year, and which nothing would relieve. There were no symptoms of indigestion in such cases.

Prof. MACQUEEN said he knew a little about bad breath in the dog, and in his experience the majority of the cases were due to local changes in the mouth. He was not quite so sanguine of success in treating mouth cases as Mr. Almond, who must be able to restore the condition of the dog's mouth very quickly. What he should like to know was how Mr. Almond managed to restore a dog's mouth to health by attending to the accumulation of tartar on the teeth and the extraction of a few loose teeth. In his experience the disinfection of an old dog's mouth was never successful. It would be necessary to extract all the teeth and to fill all the empty alveoli, and pursue treatment for a long while. He was sceptical as to offensive odours arising from the stomach owing to indigestion; it was a convenient way of explaining a difficult position, but by no means satisfactory to say that if a dog had an offensive breath it arose from indigestion. If the odour was due to the generation of gases in the stomach perhaps someone would name an offensive gas that proceeded from the dog's stomach. The complaint made by the owner of the dog was that the breath was abominably offensive, and that was not due to indigestion but to changes either in the mouth or in the throat. He suggested that an examination should be made of the dog's throat, because in some instances he thought a material would be obtained from the mucous lining of the throat which would prove to be the cause of the offensive smell.

Mr. JONES asked whether it was possible that the odour might come from the lungs.

Prof. WOOLDRIDGE had noticed that a very large number of cases of acute gastritis in the dog began with pharyngitis and a cough. Pharyngeal trouble in no way negated the presence of gastric trouble.

Mr. WALL said it was a most difficult matter to treat, but he had had great success from the use of aniodol. The teeth were properly cleansed, and the mouth put in good condition, and once or twice a day the teeth were brushed over with a solution of aniodol. It was a powerful deodorant and antiseptic, and had a very wonderful effect.

Mr. ALMOND also referred to malodorous skin in an otherwise healthy dog, which he had treated with a considerable amount of success by small doses of sulphur

twice a day. He thought the secretion from the skin decomposed and emitted an offensive odour.

Prof. MACQUEEN asked what was the secretion from the skin.

Mr. ALMOND said they differed under varying circumstances: there was perspiration for one thing from the sweat glands, and there were also sebaceous glands which discharged on to the skin.

Prof. WOOLDRIDGE asked whether there was any particular odour Mr. Almond regarded as being diagnostic of mange.

Mr. ALMOND said there was.

Mr. J. WILLETT said he had always been given to understand there were no sweat glands in the skin of the dog, that the dog perspired really from the tongue.

Prof. MACQUEEN asked whether it was a fact that the dog perspired from the tongue.

The PRESIDENT said he had seen one or two cases where there had been a dew on the hair of the dog, and was under the impression they were rather painful cases.

Prof. WOOLDRIDGE said his knowledge of the histology of the dog's skin was not very great, but he knew of no sudoriferous glands in the dog's skin. The generally accepted view is that dogs perspire from the pads of the feet and from the muzzle. He did not see why indigestion should not be blamed for the cutaneous odour in the same way as for odour of the mouth. The vast majority of cases were due to a skin lesion, and the next most common trouble was with the kidneys, and then the alimentary canal.

Votes of thanks having been passed to those who had brought forward morbid specimens, the meeting adjourned.

HUGH A. MACCORMACK, Hon. Sec.

SOUTH DURHAM AND NORTH YORKSHIRE VETERINARY MEDICAL ASSOCIATION.

A meeting was held in the Imperial Hotel, Darlington, on Friday, June 7th. Mr. W. Awde, Stockton-on-Tees, President, in the chair. There were also present: Messrs. G. R. Dudgeon, Sunderland; A. C. Forbes, Bishop Auckland; W. H. Blackburn, South Hetton; C. G. Hill, and J. H. Taylor, Darlington.

It was proposed by Mr. Hill, seconded by Mr. Dudgeon, and carried unanimously that the minutes of the previous meeting be taken as read and confirmed.

A letter was read from Mr. Blackburn which intimated that on account of removing to South Hetton he was afraid that he would not be able to attend the meetings, and that he would have to resign his membership of the Association.

General regret was expressed by those present, and Mr. Blackburn stated that although it was difficult for him to attend he would, however, still continue his membership and attend as many meetings as he could.

A letter was read from Mr. P. B. Riley, of Barnard Castle, regretting that he could not be present at the meeting, but that he hoped to attend the next meeting, and would be pleased to become a member of the Association.

The SECRETARY reminded the members that the meeting of the Royal Sanitary Institute took place at York from July 29th to August 3rd at which meeting the Association were to be officially represented by the President.

The SECRETARY presented the report and accounts of the Victoria Veterinary Benevolent Fund, and said that it came as a surprise to him that so much distress occurred amongst old members, and amongst the widows and children of veterinary surgeons. Although the

Association gave £2 2s. each year he hoped that individual members might be inclined to subscribe to so good an object.

Mr. P. B. RILEY, M.R.C.V.S., Barnard Castle, was nominated a member of the Association, on proposition of the Secretary, seconded by Mr. Blackburn, and unanimously carried.

CLINICAL CASES, ETC.

The SECRETARY produced the heart and pericardium of an Irish terrier which he had recently had under treatment. The patient was first seen by him about Christmas last year, when it was brought to the surgery suffering from a cough of an asthmatical character; the respirations were not much altered, and the pulse and temperature were about normal.

The dog was much improved after treatment in a week or so, and was not seen again until about March, when a message was received that the dog was worse. It appeared that the dog had not seemed so well for a few weeks, the cough having returned, and the breathing had gradually become hurried.

On examination the dog appeared to be suffering from asthma, the pulse was about 90, and the temperature 103 F. As time went on the breathing became worse and assumed the boat-like character seen in hydrothorax, the pulse became much quicker, and the dog commenced to lose flesh. On careful examination no fluid could be detected in the chest, and there were no oedematous swellings in any part of the body. In a few days the dog became much worse, the heart beats were quicker and smaller in character, and the dog would prop himself up against a chair or table leg and go to sleep, being unable to lie down in comfort. Recovery appeared hopeless, and the dog was destroyed.

On post-mortem a good pint of fluid was found in the heart sac, which showed well marked pericarditis, and the lungs were emphysematous, but there was no fluid in the chest cavity.

Mr. HILL said that he had recently had a case of hydrops pericarditis in a dog, which had followed the removal of an infective growth from the penis. In spite of all care which he had exercised in the operation, septic trouble commenced, and fluid formed in the pericardium. In this case, however, the presence of fluid was suspected, as oedematous swellings commenced to form about the throat, prepuce, sheath, and legs.

Mr. BLACKBURN showed two calculi taken from the bowels of an aged pony, 17 to 18 years old, which died after being ill only a few hours. The pony had had colic once or twice, but these attacks had soon passed off when treated.

Mr. FORBES said that he had taken three very large calculi from the bowels of a horse which had shown no pain until a few hours before its death. This animal had been ill for a week and beyond having no appetite and appearing dull, presented no other symptoms.

Mr. AWDE showed a curious specimen of a young pig which had two bodies with four legs each, but only one head. The bodies were joined together, but the legs were free; the bodies were those of females. He had come across the specimen when making a post mortem on a sow which had died, and had been reported as a suspected case of swine fever. The cause of death was septic metritis.

Mr. Awde also showed the pisiform bone of the off knee of a six-year-old horse which had been bred by himself. It was a particularly promising animal, and had won prizes in the show ring, but when three years old was kicked on the knee. All treatments were tried to check exostosis, such as blistering, firing, and all kinds of so-called bone absorbents, but no good resulted, and although after rest and treatment the horse went sound for a little time, lameness soon appeared. The horse was destroyed and a post mortem made, which

resulted in finding the pisiform bone much enlarged from new formations.

SEPARATION OF COLON AND RECTUM IN A MARE.

Mr. HILL said that he had recently had a very uncommon case in a mare. She foaled on the Monday quite normally and seemed all right until the following day, when she had a little pain and he was sent for.

On arrival he was informed that she had not passed any faeces, and he found on examination that there was a small tear in the vagina, but otherwise she seemed all right. On passing his hand into the rectum he found his hand in a large sac, and it was with much difficulty that he found the entrance to the floating colon; when he had passed his hand through the opening it closed upon it, and in withdrawing his arm the bowel closed tightly round his wrist. The bowel was drawn out through the anus, and he had to liberate his hand by gradually pushing away the bowel with the other hand. The mucous coat of the bowel was a deep purple in colour. The mare groaned a good deal and seemed to have pain when this was done. He left some chlorodyne to be given if the mare had pain, and nuxvomica, ammon. carb. and sodæ bicarb. to be given if she was easy.

The mare lived for a week and during that time took a little mash and grass daily, but excepting a few small lumps passed no faeces. She had no pain of any consequence, and was eating up to a short time before she died, although towards the end of the week her pulse became rather rapid, but the visible mucous membranes kept a good colour all the time.

On post mortem, all the organs were healthy except the colon and rectum, which were separated from each other, the ends of the bowels being free and gangrenous. He thought that the mare when straining at the time of foaling had caused an intussusception of the bowels, and as time had gone on sloughing had taken place at that part.

Mr. FORBES thought this a most interesting case and illustrated once more that pulse and temperature were little to guide one in bowel cases, for whereas text books usually associated colic with a fairly good pulse and no increase in temperature, and enteritis with a bad pulse and high temperature, here we had a case where at sometime during the illness there must have been enteritis, and yet the pulse and temperature were very little altered.

He had a somewhat similar case in a cart horse about 17 h.h. The message he received was that the horse was very bad with inflammation. He took the necessary medicines, found the horse standing perfectly quiet, and on inquiry found that he had not had any pain, but would not eat. The pulse, temperature, and respirations were normal. He diagnosed the case as one of indigestion, and administered a physic ball on the Thursday. He was surprised to receive a post-card to say that the horse was dead. He went to the knacker's to make a post mortem, but unfortunately all the organs had been destroyed excepting a portion of the large bowel, which was black from mortification, similar to what one might get in a twist. It certainly seemed strange that an animal should show such post mortem lesions, as when he saw him only twelve hours before he died he was in the condition he had described. Of course something else might have been wrong, but the knacker assured him that, with the exception of the bowel, all was in order.

Mr. HILL said that he was called to a mare foaling, between four and five the other morning, when it was raining heavily, which was not a pleasant job so early in the day. He got the mare into a box, and found the foal's head was a little turned backwards, and it had a foot turned back. It was a simple case, and delivery was accomplished in a few minutes; the mare seemed

perfectly right afterwards and commenced eating a mash. This was about 7.30 a.m., and she kept all right up to noon, and was left eating, and to all appearances well. But on the men coming to the box an hour later the mare was dead. He had not an opportunity of making a post mortem, but it was a very disappointing case.

Mr. BLACKBURN had recently had rather an interesting case in a pit pony which had been ill some time. It had been passing blood in the urine for months, and had been treated with many remedies before he saw it. As recovery did not seem probable he had the animal destroyed. He found on post mortem malignant disease of the bladder of a septic character, the disease having affected the perineum, so that slaughter in this case was quite justified.

ELECTION OF OFFICERS.

President. Mr. W. AWDE, F.R.C.V.S., Stockton-on-Tees. Proposed by Mr. Hill, seconded by Mr. Blackburn.

Vice-Presidents. Mr. C. G. HILL, M.R.C.V.S., Darlington, and Mr. J. M. WALKER, F.R.C.V.S., West Hartlepool. Proposed by Mr. Blackburn, seconded by Mr. Forbes.

Secretary and Treasurer. Mr. J. H. TAYLOR, F.R.C.V.S., Darlington. Proposed by Mr. Awde, seconded by Mr. Dudgeon.

Auditors. Mr. W. N. DOBBING, M.R.C.V.S., Darlington, and Mr. C. G. HILL, M.R.C.V.S., Darlington. Proposed by Mr. Dudgeon, seconded by Mr. Blackburn.

Mr. DUDGEON said that he had a very important matter to mention in that he wished to know whether there was going to be another picnic this year. He hoped that there would be, for he was certain that although the one held last year was the first held in connection with the Association, it was a great success, and speaking for himself he could say that he never enjoyed a day more in his life.

The SECRETARY remarked that at the last picnic he thought the then President, Mr. Dudgeon, had suggested that they should take the Yorkshire Dales in turn each year, and that both Swaledale and Wensleydale were within easy reach. He might remind the members that the ladies who went last year expressed the hope that there would be a picnic each year, and if one was held this year he would be pleased to help in any way.

All the members present being in favour of a picnic, it was proposed by Mr. Dudgeon, seconded by Mr. Forbes and carried unanimously that one be held this year, and that Messrs. Dobbing, Hill and Taylor be appointed a committee to make the necessary arrangements.

The members subsequently had tea together in the hotel.
J. H. TAYLOR, Hon. Sec.

NORTH OF IRELAND VETERINARY MEDICAL ASSOCIATION.

The quarterly meeting was held in their Rooms, Davenys Chambers, North Street, Belfast, on Thursday, 30th May, at 7 p.m. The President, Howard McConnell, M.R.C.V.S., Armagh, occupied the chair. The following members were present: Messrs. F. R. McRoberts, J. Ewing Johnston, W. C. M. Smith, J. J. Ross, J. McLean, J. A. Thompson, J.P., Henry Gibson, James Hughes, James Gregg, John L. Orr and J. A. Jordan.

The minutes of the previous general and special meeting having been read and confirmed were signed by the President.

CORRESPONDENCE.

A letter from the successors of Messrs. John Clarke and Co., Ltd., Belfast, Surgical Instrument Makers and Chemists, stating that they wished to acquaint the members of the fact that they specially catered for the members of the veterinary profession, and that they

would be glad if the members of the North of Ireland would grant them a share of their patronage.

From Capt. J. Nicholas, A.V.C., informing the Association that as he was under orders to sail for India, he very much regretted having to tender his resignation. The resignation was regretfully accepted.

From Mr. Gofton requesting the Association to elect its representatives on the Council of the National Association and to forward their names and addresses to him at an early date.

The matter was referred to Council.

From the Secretary of the Victoria Veterinary Benevolent Fund, Mr. W. Shipley, F.R.C.V.S., Great Yarmouth, drawing attention to the objects of the Fund, and requesting the members of this Association to give their individual support, and to help in every way in their power to further the objects set forth.

Mr. W. C. M. Smith proposed that those members who were in arrear with their subscription to the Association for three years be struck off the list of members. This was seconded by Mr. McRoberts and after discussion passed unanimously.

PRESIDENT'S ADDRESS.

HOWARD McCONNELL, M.R.C.V.S., Armagh.

Gentlemen,—My first duty is to acknowledge my sincere thanks to the members of this Association for the great honour they have conferred in electing me to the highest position they have in their power to bestow. As a comparatively junior member of the profession, and as one in the ranks of the country practitioners, I am fully conscious of how small my claim is to such a position of honour. I accept my office as a grateful recognition of the small but earnest part I have taken in endeavouring to promote the welfare and successful organisation of this Society, which it has now become, filling a long-felt want, beneficial to the veterinary profession in the North of Ireland. At the same time our Society should be much stronger both numerically and financially.

Several advantages are derived from a Society such as this. In the first place it creates a feeling of good-fellowship amongst its members. Men anxious to get on in life meet together for mutual improvement; peculiarities are toned down, rough edges are smoothed, and a higher standard of manners and morals is created, thereby raising the level of thought and opinion amongst those who compose the memberships.

Secondly, a society encourages the habit of reading and thinking. If you have a subject or topic proposed for speech or essay the members present endeavour to say something that is correct and comprehensive about it: they acquire an accuracy of opinion upon that particular topic which may be most useful. At times, as the result of such discussion, they forward recommendations to those quarters where they may take effect, therefore the habit of thinking and reading is cultivated and strengthened. Then again you have the acquirement of ready speech. I trust the members will endeavour to attend, as the best recompense your officials can receive is a full attendance at all our quarterly meetings. I know it is often difficult to get away, but there can be no excuse for continued absence year after year. I say, without doubt, that members meeting at an Association such as ours is most beneficial—not only to the members themselves but to the profession. It makes us all meet as colleagues and not as opponents. It is customary, but I do not propose to say much on veterinary politics. We all deplore the financial state of our corporate body, although we in Ireland as far as my knowledge goes have not derived any benefit from that body. We are opposed in our daily practice by men holding foreign diplomas, by unqualified assistants doing work which

should be entirely in the hands of qualified members, and above all qualified members are allowed to outstep the bounds of all professional etiquette and go about lecturing upon all diseases and their treatment, on the application of the tuberculin test, and even so far as to instruct the farmer how to perform certain operations. Does our Council consider this proper conduct? Or is there one law for the rich and another for the poor? Such lectures to my mind are only creating quacks and handicapping the qualified man, as often the professional man is not called in until the poor animal has been subjected to all forms of quackery and torture, and is either dead or dying. Lectures confined to veterinary hygiene would benefit a locality, more particularly where the small farmers are not within reach of veterinary aid, but lectures and demonstrations upon subjects such as Hernia, Abscess formation, Disease of bones, etc., delivered in districts where veterinary surgeons are within 4 or 5 miles radius, are to my mind a burden on the rates, no benefit to the farmers, and only laughed at by the medical profession.

The amalgamation of our various societies is practically accomplished, and to my mind it is a step in the right direction, as the veterinary profession can now present a more solid front for or against all things affecting its interest. In the branches of all professions and trades the tendency of to-day is strongly towards co-operation, and to my mind there never was a time in the history of our profession when there was a greater need for absolute unity; I ask you to look back and see what the veterinary profession has done in eradicating contagious diseases from Great Britain, and more particularly from the shores of Ireland; could this have been done without the co-operation of the local veterinary inspector reporting to the proper authorities and immediately isolating the infected area.

Concealment and not having the courage to face a calamity undermines that which all civilised nations are now striving after, namely, health stability: more precious than financial or commercial stability. Should there be a weak spot in the sanitary organisation of any country, the policy of to-day is to strengthen it, and it is the only policy compatible with commercial progress. Concealment, whether in individuals or communities, leads invariably to the disease smouldering and spreading, and to an ultimate conflagration; then the final results are infinitely worse than the expenditure of the little firmness and moral courage necessary at the outset. This has been the invariable experience of larger communities when face to face with threatened epidemics. Boldly notify the first case, and let the sanitary organisation be so armed that implicit reliance can be placed upon it, and in all probability the first case notified will also be the last one. How can these words be acted upon without the co-operation of all officials connected therewith.

In relation to State and municipal hygiene—especially the latter—and in order to guard the interests of the public health, co-operation between the veterinary and medical officer is essential for the necessity of placing the inspection of both meat and milk on an organised basis, and under properly trained experts.

I trust some of our members will come forward and assist both by papers for discussion, specimens and notes on cases, etc., and above all by a regular attendance at our meetings.

A hearty vote of thanks to the President for his interesting address was ably proposed by Mr. J. B. Dunlop, seconded by Mr. J. Ewing Johnson, and passed by acclamation.

The PRESIDENT thanked the members for the hearty manner in which they had received his address.

HEREDITY IN RELATION TO DISEASE.

J. B. DUNLOP, M.R.C.V.S., Dublin.

Mr. President and Gentleman,--It affords me much pleasure to visit the progressive City of Belfast once more, to observe so many new buildings, to see so many old familiar faces, and to meet the sons of those whom I once knew so well. I feel grateful to you for having called a special meeting to hear my last paper read, and I may say it was the first paper I have ever read on veterinary medicine.

In the natural course, I ought to have read the last paper before the Veterinary Medical Association of Ireland, of which I have the honour to be a member and a vice-president. Being one of the oldest members of the profession, I had hoped at one time that I might have the privilege of discussing this burning question at the school where I graduated, but somehow an opportunity did not present itself.

Thirty years ago, glanders broke out amongst a few hundred horses belonging to the Belfast Street Tramways Co. At that time the mallein test was not in use, and I prevented the spread of the disease by the use of exclusive buckets and other means similar to those now advised for the prevention of tuberculosis.

An article of mine on a pure milk supply, and the eradication of tuberculosis appeared in a Dublin paper about three years ago, but unreasoning fashion was against me.

As practical men and men of science, I consider it to be our duty to lead public opinion and not to follow it, and always to keep an open mind where the public interest and safety are concerned.

At the last meeting some of your members invited me to read a paper on rheumatism. I intended complying with the request, but seeing that no criticisms on my previous paper had been offered in the veterinary press, and feeling that the matter was one of supreme national importance, I thought it my duty to bring the subject before you once more, but in a less restricted sense.

Ever since man was able to reason, every person must have noticed that children, as a rule, resemble their parents in many particulars, and that they often bear a striking resemblance to one or more of their grandparents: it may be in their stature, form, gait, voice, teeth, hair, skin, eyes, or in one hundred and one other characteristics. The transmissibility of inborn characters of structure and function, both of body and mind, normal and abnormal, has been proved all along the line.

Medical men say there is no doubt that a tendency to gout, rheumatism, cerebral hæmorrhage, heart disease, neurotic ailments, ataxy, asthma, hæmophilia, and obesity are capable of being transmitted.

Smith (Veterinary Physiology) says: "Of the influence of heredity in disease there is no possibility of doubt." Robinson's investigations have shown that in horses, roaring, sidebone, shivering, and a tendency to ruptured blood vessels follow the law of Mendelian inheritance.

Although the fact of heredity has been recognised in all ages, there is still some difference of opinion as to the mode of transmission. The Darwin theory of the origin of species was based on the fact that there are variations or differences between parent and offspring, and in the struggle for existence the fittest survive. It was laid down that the differences between parent and immediate offspring were very slight, and that changes, however great, were slow and gradual. Some have held that the differences between species arose suddenly and were the result of great variations, or what are known as sports.

The application of Mendelian principles to animals is

as yet limited, and can only apply to the crossing of breeds of decidedly opposite characters.

Few people will contend that performance and capacity are not transmissible. In Scotland there has been a marked improvement in the milking qualities of Ayrshire cattle, which has been attained by breeding only from the deepest milkers. "It has been possible, by proper mating, to transfer the power of yielding milk of high quality from animals possessing that power to any number of animals, or to any breed which did not possess it." The Ayrshire owe their beautiful horns to a drop of West Highland blood. It is well known that the egg-laying capacity of poultry is transmissible, the proper and regular feeding, cleanliness, comfort, freedom from dampness, draughts, etc., are, of course, powerful factors. I have known good breeders to select from a brood of chickens, by form alone, what they considered would be the best layers, and I must say they were fairly successful, but this may have been a coincidence.

Breeders are, as a rule, well informed, and many of them highly educated. They usually are supplied with abundance of statistics, and each in his own line is familiar with pedigrees and performances. They can tell which classes of animals are prepotent. The success of the practical breeder has been marvellous. The improvement he has effected in the domesticated animals has been truly wonderful. He has moulded the pigeon into all sorts of fantastic forms, and has actually been able to make it tumble in the air.

At a meeting of a Veterinary Medical Association a gentleman asked, "What is the relationship of heredity to disease?" and said, "Before attempting to make an answer to the question it was necessary to decide exactly what is meant by disease." No doubt there are cases of functional albuminuria which may be intermittent or orthostatic, and these symptoms need not prevent the adolescent from being accepted for life assurance at ordinary rates. Cases are on record where a gentleman, his son, and grandson, on reaching similar ages, expired suddenly from functional heart disease, and on post-mortem no lesions were discovered. The same type of pulse may be normal in one individual and abnormal in another. These peculiarities are, no doubt, inherited. Their existence neither hinders scientific men from considering "heredity in relation to disease" nor prevent the breeder improving his stock, and they offer no valid excuse for continuing to breed from diseased herds.

There seems little doubt that the great majority of nervous disorders have their root in some germinal defect, and are therefore in various degrees transmissible.

Perhaps one of the most fascinating and important of studies is the one appertaining to the more obscure inherited functions of the skin in relation to disease and as affecting the various internal organs.

There seems no very secure reason for believing that acquired characters are transmissible, but possibly they may in some instances be transmitted. When the body of a parent suffers from the effects of starvation, or from malnutrition, or becomes soaked with a poison or a toxin, such as alcohol, the germ cells as well as the body cells may be impaired, and consequently the offspring may suffer. The progeny of the young and immature are said to be less vigorous than the progeny of the mature, and there are grounds for believing that long-continued effects of climate may give rise to a germinal variation that may become part of the inheritance of a race. It is said that the dwellers in large cities would die out in three generations but for the importation of fresh blood from rural districts.

There are three or four recognised modes of inheritance, such as the particulate, the blended, and the inclusive, but these modes in reality seem to overlap one another, and their study may tend to lead to some con-

fusion of thought. I shall, therefore, lay before you a few well-known facts which I hope will make this matter quite clear.

It has been said that exceptional parents do not necessarily produce exceptional offspring, because of an innate tendency towards the mean. Although it has been shown that there is a tendency to return to the mean, it should be understood that this refers to the offspring of exceptional parents, and this is most definite where there is a considerable difference between the two parents.

There is another side to this question, and it is always well to look at both sides. Limiting our ancestry, say, to 500 years—15 generations—and supposing there were no linking of ancestral lines, each person now living could claim to be the descendant of 32,767 ancestors, and notwithstanding all this mixing and intermixing we still have with us the philosopher and the idiot, the genius and the imbecile, the tall and the short, the brunette and the blonde, the alcoholic and the moderate, the consumptive and the sound, the rheumatic and the agile, and "typhoid Mary."

One would naturally think that the marriage of different types of people (the usual custom) would eventually procure a perfect blend, but we know that on the whole there is no tendency to return to the mean, and therefore we must believe that there is some prevailing force or law (Mendelism) in operation tending to prevent blending of the race; otherwise, there would be a general sameness all over, and one person would be indistinguishable from another.

A number of inherited characters may remain latent or partially suppressed for one or two generations, and only develop, or re-appear, or become intensified in individuals when both parents possess similar characters, either latent or apparent. This may be the reason why individual peculiarities are maintained and not completely blended or effaced.

If two opposite types, say the tall and the short, were not to intermarry, obviously the people would soon be sharply divided into two types, the very tall, and the very short. The medium would gradually be merged in the extremes. These facts, I think, show that the general mode of inheritance is compound particulate with a tendency to variations, otherwise exceptional individuals would not be perpetuated.

I knew a gentleman of strong build and of exceptional intelligence who married a lady of slight build that suffered agony after partaking of anything containing an egg. They had a son and a daughter. The son bore a striking resemblance to the mother, but had the father's stomach. The daughter was like the father, but inherited the mother's stomach. This is, I think, a typical example of mixed particulate, but not blended inheritance.

Some people would define a hereditary disease as one which is present at birth—congenital—and they would exclude all diseases due to infection. The exact definition is unimportant so long as animals exceptionally prone to a serious disease are not used for breeding purposes.

The constitutional predisposition to some bacterial diseases is certainly hereditary, and all these diseases are not necessarily congenital. Some authorities are of opinion that rheumatism is infectious, and it is generally considered by the faculty to be due to a specific microbe—the diplococcus of Poynton and Payne. Medical men believe that some families are more prone to this affection than others.

A congenital disease inherited from the mother is not necessarily hereditary. The offspring may be affected with syphilis before birth, but infection is not inheritance.

A learned gentleman said recently, "It was because of a lack of sufficient and reliable statistics that 'genetics' (scientific breeding) could speak with so little assurance

regarding many points of heredity as it affected domestic animals. Farm stock, moreover, offered difficulties inasmuch as there were so few sharply defined characters and such a diversity of latent strains."

I have quoted the gentleman's exact words as reported, but I fail to comprehend their meaning. Every pure breed has sharply defined characters of its own, and cannot have much diversity of latent strains, otherwise no pedigree stock would breed true.

The breeder sees no difficulty in the existence of latent strains. He knows that every individual—man or animal—is possessed of some latent characters without which there could be no such thing as atavism.

The same gentleman is reported to have said that "there could be little question that breeders and others attach undue and dangerous importance to individual cases." I fail to see the danger of testing and selecting disease-resisting animals for breeding purposes. An awful responsibility rests on those in authority if they are by neglect ushering thousands of children prematurely into their graves. I do not think it is fair to charge breeders with attaching undue importance to individual cases.

For sixty years I have noticed exhibition animals gradually changing their coats, colours, and shapes, like a lady of fashion. The changes of the former, however, were more real and not quite so sudden as that of the latter.

We owe all our statistics to individual breeders, and we owe them an everlasting debt of gratitude for all they have done in the past. So far the professors of genetics have failed to give any information of the slightest value to the breeder. Up to the present they have added nothing to the volume of statistics we already possess.

No practical breeder or educated person attaches undue importance to individual cases; he only views each case as additional evidence of the universal existence of well-known laws of inheritance.

A practical breeder would not for a moment entertain the idea of acquiring knowingly a bull having an abnormal character. He knows the character is certain to appear in some of the progeny. He cannot determine how many of the offspring will inherit the character. That can only be determined approximately by long experience. The bacteriologist cannot assist him. The microscope has failed to reveal any differences between man and animals in their earliest stages of development. Life is a mystery, and function is still concealed in structure.

Invaluable work is being done in the laboratory day by day, and chemical, physical, and biological problems of extraordinary difficulty are being solved, but that does not assist us in formulating correct theories regarding "heredity in relation to disease."

A few zealous, well-meaning bacteriologists, in responsible positions, with comparatively little outside experience, took upon themselves the duty of instructing experienced and skilled physicians, as well as veterinary surgeons of great experience. Unfortunately they succeeded in biasing the minds of the young and inexperienced, and the followers of fashion, and the result has been nothing short of a calamity to the human family.

The following four paragraphs are taken from Munro's *Manual of Medicine*, University Series, third edition, 1911. It is a standard work and fairly represents the opinions of the faculty:—

"Of late years it has been fashionable to minimise the importance of inherited predisposition; and cases that seem to exemplify it have been explained on the hypothesis of a very long incubation period extending possibly over years. Such a theory, however, is not sufficient to account for the facts. No doubt the predisposition in the case of phthisis is sometimes partly attributable to the form of the chest; but even in the

case of scrofula there is an extraordinary tendency on the part of some families to suffer. Similar facts are well known in connection with the exanthemata. The seed is essential, but the soil is scarcely less important."

"As with phthisis so with tuberculosis of lymphatic glands; there may be a very marked family tendency even among those in excellent social circumstances."

"Lichen Scrofulosum.—Though the patient is seldom suffering at the time from tuberculosis of the lungs or other viscera, there is generally a family history pointing to this tendency, and not uncommonly the patient himself shows signs of scrofula."

"Nathan Raw considers that the bovine type of bacillus is the cause of tuberculosis of bones, joints, lymph glands, urinary organs, meninges, and skin, while the human type is the cause of tuberculosis of the lungs and larynx; and he urges the use of tuberculin from the bovine source for diseases caused by the human type of bacillus" and *vice versa*.

When two undoubted cases of consumption occur in near relatives of an applicant for life insurance this is an absolute bar to acceptance, even though the applicant may appear healthy.

The American investigators, Park and Crumwood, as recently reported, found that six to ten per cent. of all the deaths from tuberculosis occurring in man were caused by the bovine type of bacillus.

Notwithstanding all these unvarnished facts, now and heretofore adduced, despite the overwhelming mass of evidence produced by practising physicians (doctors make a practice of inquiring into the family history of their patients)—in face of a universal law of heredity making itself manifest wherever we go, we still find people denying, without data, the hereditary nature of one disease, and that the most common, the most serious, and most manifestly hereditary of all diseases. We all want pure milk. The children demand pure raw milk; they are perishing in large numbers for the want of it.

The best and most reliable authorities estimate 18½ as the average percentage of reactors in Ireland.

It is a curious thing how little the public mind being killed so long as it is done gradually and by a regular process. If we could ascertain the annual death rate in the United Kingdom due to the bovine type of bacilli alone, it would be incomparably more appalling than the greatest marine disaster ever heard of.

Now, let us look calmly at the question of heredity in relation to the most serious disease affecting man and animals, and consider what is being done. At agricultural shows horses are carefully examined for roaring, spavin, and other affections believed to be hereditary, and no prize is awarded to any unsound horse; but no cow or bull is tested by the veterinary surgeon for tuberculosis. The shrewd foreigner comes to our shores and pays an enhanced price for pedigree cattle, every one of which must stand the tuberculin test, and unless we take means at once to put a stop to the propagation of diseased animals at home, the consumer will, in the near future, have no choice but to give preference to foreign meat.

Dairy cattle should be tested, and the few that would react should be prepared for the butcher and carefully examined (as they are at present) at the abattoir. When a carcass looks sound, with the exception of a local lesion, the affected portion should be removed and the butcher compensated. When the lesions are not localised the whole carcass should be condemned and compensation awarded; but only in cases where the animal had been apparently sound before being slaughtered. The general practice in dairies is to allow the few affected cows to remain in contact with the many healthy for a length of time (the cows being kept in an unnatural state, getting no exercise, the life's blood being drained out of them, and often not allowed sufficient fresh air, they are in a fit state to receive any infection to which

they may be exposed), and the result is so many become affected that the country cannot afford to do justice to the respectable butcher.

There does not appear to be any danger of tuberculosis being transmitted to human beings through the medium of cooked meat; even in the centre of a large joint the temperature is reckoned to be raised to 185° F., which is ample to kill all tubercle bacilli. It may be argued that raw meat juice is sometimes given to the sick, but the nurse would not be justified in buying anything but the best, and that from a respectable butcher. Moreover, the specific bacilli are not to be found in clean muscle. They are found only in cancellous tissue or cavities. In any case, the public are well protected by our system of inspection as carried out at our abattoirs.

It seems an extraordinary thing that there is a noxious weeds Act, but no noxious animals Act. There is no law to prohibit the use for public service of diseased or inferior animals. If we continue to breed from diseased animals, the result will be disease.

The Agricultural Department is expending about £13,000 per annum in "growing trees," but so far as I am aware it is not spending one penny towards establishing disease resisting breeds of cattle required for the general production of pure raw milk, which is a necessity for the "growing" of healthy children.

I am not aware that the Department is doing anything in order to eradicate or diminish tuberculosis in poultry, except advising cleanliness and ventilation. Needless to say, the poultry and egg industry is an important one for Ireland.

There are other infectious animal diseases which do not come within the scope of this paper, and which would require the combined counsel of the wise and experienced, but they are quite insignificant when compared with tuberculosis.

Referring now to one aspect only of the most serious of all hereditary diseases transmissible to man, let us neglect for the present the great monetary loss to the nation. Thousands of children are being ushered into their graves by the consumption of impure milk, not to speak of the consequential sufferings and deformities of child and adult. People are being encouraged to marry into consumptive families, and the danger is that the young and the thoughtless may be induced to embark on a sea of lifelong trouble. The leading members of the medical profession are speaking out with no uncertain sound. Our profession has always been to the front in advocating and initiating effective measure for the eradication of animal diseases. Practical veterinary surgeons agitated for years before the Government would take steps to stamp out pleuro-pneumonia, a disease not transmissible to man. How much more is it our duty to urge the importance of taking effective measures for the eradication of a disease which is not only causing a great monetary loss to the nation, but is imperilling the lives of many human beings.

Women as a rule are shrewd in many ways. They do not like to see their children or friends marrying into consumptive families. I honestly believe if we had women in Parliament they would not allow our authorities to rest on their oars. They would not fold their arms and listen to perishing children calling for pure raw milk. The heart of Dublin Castle is sound, and most sympathetic towards every good movement.

The Veterinary Department for efficiency is second to no other similar organisation, and every official has experience and commonsense enough to know that it is wrong to breed from diseased animals, and I am sure they are not only willing to assist but to take the lead in this grand movement.

The Agricultural Department of Ireland, from its inception up to the present, has been second to no other like institution, and it is to be hoped it will lead in this

crusade against an animal scourge which, like the poor, is always with us.

The question of the eradication of tuberculosis is an urgent one. The problem to be solved is a simple one. All is plain sailing, children are perishing. Practical men must take hold of the oars and go the rescue. The sea is calm, the night is not dark. There is no danger of being swamped. You may be laughed at by a diminishing number of inexperienced followers of fashion, who do not take the trouble to observe for themselves; that is all.

Whatsoever you sow, that shall you also reap. Sow diseased cattle and you shall reap diseased cattle, and impure milk with all its dire results.

We must keep this matter before the public, and continually urge the necessity of reducing the risks of infection to a minimum, of improving hygienic conditions, and, above all, the necessity of breeding only from cattle that have stood the tuberculin test after due exposure to the risks of infection.

I know this paper is not well prepared, but surely the subject is one of sufficient importance to merit a discussion. I rather like to hear the opinions of those who differ from me. It sets one a-thinking. If there were no differences of opinion there would be no progress.

Mr. JORDAN congratulated Mr. Dunlop on his most excellent paper, and suggested that, as it contained so much that might be considered controversial the discussion should be adjourned until our next meeting, when he hoped Mr. Dunlop would again honour them with his presence.

This was proposed by Mr. J. J. Ross, seconded by Mr. James Gregg, and passed unanimously.

Mr. SMITH proposed a hearty vote of thanks to Mr. Dunlop for his kindness in coming to the North to treat the members of the Association to a paper on such an interesting subject, which was seconded by Mr. Thompson.

Mr. DUNLOP suitably replied, and there being no further business the meeting closed.

J. A. JORDAN, Hon. Sec.

Foot-and-Mouth Disease.

OUTBREAK IN THE LAKE DISTRICT.

The following was issued to the daily press (*but not to us*) on Monday:—

"Foot-and-mouth disease was reported yesterday (Sunday) to exist at Belmont, near Penrith, Cumberland. One of the veterinary inspectors of the Board was at once instructed to visit the suspected premises, which remained under strict police supervision pending his arrival. He reported this morning that he found 16 cows affected with the disease. There are 49 cattle and 92 sheep in all on the farm. The Board have given instructions for the immediate slaughter of all these animals, and have issued an order prohibiting the movement of all animals over a wide area around the affected premises.

"Local authorities throughout Great Britain have been warned that the disease has again appeared in this country."

PARLIAMENTARY.

FOOT-AND-MOUTH DISEASE OUTBREAK NEAR PENRITH.

In the House of Commons, on Monday, June 24.

Mr. RUNCIMAN, replying to Sir Harry Verney, said: One of the veterinary inspectors of the Board proceeded to Penrith last night, and has this morning reported by telegram that the animals are affected with typical symptoms of foot-and-mouth disease. There are 49 cattle and 92 sheep on the farm, and 16 milking cows are affected. Two cows had been recently moved on to the farm, and one cow was sold about three weeks ago. On receiving the report of suspected foot-and-mouth disease the police imposed restrictions on the movement not only of the animals on the farm itself, but also as regards those on two adjoining farms, pending further veterinary examination. They also arranged with the proprietors of the Penrith Auction Mart that no cattle or sheep from the district where the suspected outbreak of disease had been reported should be allowed to pass through their auction mart on Monday.

The Determination of Sex.

Dr. Andrew S. McNeil, of Liverpool, has sent the following account of the opinion entertained by an experienced breeder of Shire horses. He writes:—

"Three or four years ago I attended the manager of a large Shire stud farm for a serious accident. During his convalescence we often inspected the horses together, and it was on one of these occasions that he proposed the following axiom—namely, that if a stallion were put to, say, six mares in one day, the first two mares would throw colts; numbers three and four mares would throw colts probably, if the stallion were fresh, and had not been "used" for some days, but if he were aged or stale through "use," then they would probably be fillies; numbers five and six mares (especially number six), he "could gamble would throw fillies, if they threw anything" (that is, if they became pregnant at all). This man did not believe the mare had anything at all to do with deciding the sex of the foal. He believed that fillies were conceived when there were "few seeds" in the sire's sperm—for example, at the end of a day "in use." I may mention that he was a very intelligent man, and, like his father before him, had been all his life among Shire stud horses; among other notable horses, he was in charge of the Shire "Hareld" when he won the championship.

The point would appear to be easily capable of proof, at any rate; but until his ideas are proved or disproved, I think (emanating as they do from a man who has made of this subject a life study) they should not be lightly put aside. If his observations are correct, it would appear that when there are vigorous mature spermatozoa in the semen, one of these in the struggle for existence amalgamates with the ovum to the exclusion of any weaker immature ones, and so begets a male. When, however, there are only immature forms in the semen a female is produced.—*British Medical Journal*.

[About a dozen years ago, in the course of one of the perennial discussions on the subject, in, I think, the pages of *The North British Agriculturist*, where a farmer was maintaining that he was able to control sex by regulating the feeding of the sire and dam, Prof. Cossar Ewart, F.R.S., who was working then on hybridisation with his zebras, pointed out that spermatozoon and ovum has each a "life" *per se*—a period of development and a period of decadence. He suggested that a difference in the "age" of the respective elements at the time of their union might well account for several of the phenomena of generation. The conclusions of the breeder quoted above are along the same line.]

James Fraser, F.R.C.V.S.

Mr. James Fraser, an Ex-President of the Royal College of Veterinary Surgeons, died at Sheffield on June 19th from angina pectoris. He had retired from work owing to the state of his health, but will be remembered in connection with St. Albans, where he practised many years. Mr. Fraser started his professional career at Newbury, Berks. Then he went to Bromley, Kent, and from there to St. Albans. He was nominated a Vice-President in 1891, elected a member of Council in 1892, and was made President in 1899. His age was 65 years.

Mr. Fraser was a Canadian, and graduated from Edinburgh in 1869 taking the Fellowship in 1881. During the South African War he displayed his patriotism by serving the Government in Canada in the collection of horses.

On the Council Mr. Fraser played a prominent part in all of the controversial subjects which occupied attention during his 20 years of office. He was a man of a serious philosophical turn of mind, thinking things out and forming his convictions firmly. Once convinced he was not easily converted to other view. Although not aggressive in addressing the Council Mr. Fraser was a remarkably fluent speaker, and at the opening of the Royal Dick Veterinary College performed a *tour de force*, speaking without notes, never at a loss for a word, and yet producing a well ordered, logical and clearly expressed address.

Mr. Fraser was interred at Fulwood Cemetery, Sheffield, and Mr. Joseph Abson, attended as a representative of the profession over which the deceased was once President. Mr. Fraser leaves a widow and three children.

ARMY VETERINARY SERVICE.

The Annual Dinner was held at the Hotel Metropole, on Friday, June 21st. There were present:—

Major-Generals K. Pringle, C.B., D.S.O.; F. Smith, C.B., C.M.G.; H. Thomson, C.B.

Vet.-Colonel Sir F. Duck, K.C.B.

Colonels L. Blenkinsop, D.S.O.; E. H. Hazelton, C. E. Nuthall, A. E. Queripel, W. B. Walters, C.B.

Lieut.-Colonels J. Moore, J. Reilly, R. Rowe, G. Taylor. *Majors* W. O. Dawson, W. B. Edwards, A. England, E. E. Martin, C. Rose, H. T. Sawyer, W. D. Smith, A. G. Todd, G. M. Williams, F. W. Wilson.

Captains E. P. Argyle, J. A. Bosley, T. E. Burridge, G. Conder, W. J. Dale, H. E. Gibbs, P. J. Harris, A. L. Horner, H. Kirby, K. M. L. McKenzie, R. W. Mellard, H. S. Mosley, J. S. Nimmo, W. W. Neale, A. Olver, F. C. O'Rourke, W. H. Simpson, J. Steeven-son, F. W. Thomas, A. J. Thompson, E. J. Wadley, E. C. Webb, H. M. Williams.

Messrs. D'A. S. Beck, B. R. Body, T. E. Campey, G. A. Kelly, W. St. J. MacArtney, E. Nicholl, H. Stephenson.

About a Gamekeeper and a Bishop.

The gamekeeper is usually a puzzled man with many things to worry him. There was one who was in the habit of looking after parties of shots when they came for sport on his rich master's preserves. He knew the ropes tolerably well. He understood that a duke was to be addressed as "Your Grace," and a common baron—I have known some horribly common barons—as "My Lord." One day a Bishop arrived, and this proved exceedingly disconcerting. A bird rose and the prelate seemed a trifle confused. "Fire, fire, you silly old fool!" exclaimed the gamekeeper excitedly—"go on! 'It im! 'It im! Dot 'im on the nut, your Oliness!"

To quote his own words, "And then I knew I 'ad addressed him wrong, by the way he looked at me."—*Horse and Hound*.

Personal.

ANDERSON—ROWE.—At Wellington, Somerset, on June 14th, by Rev. G. W. Joyce, William Anderson, M.R.C.V.S., Pittehween, Fife, to Clara, younger daughter of W. P. Rowe.

Mr. W. F. HOUSTON, M.R.C.V.S., was one of the judges of the Light Horse Class at the Stirling Agricultural Society's Show on Friday, 14th inst.

R. J. McMORDIE, Esq., M.A., M.P., (Lord Mayor of Belfast) was the guest of the members of the North of Ireland Veterinary Medical Association at the Annual Dinner of the Royal College of Veterinary Surgeons in Dublin.

Prof. Lanfranchi, Director of the Medical Clinic of the Higher School of Veterinary Surgery of Parma, lately contracted trypanosomiasis from a dog on which he was investigating the results of infection with the *Trypanosoma brucei*. The diagnosis was confirmed by Professors Bertarelli and Castellani and by the Pasteur Institute of Paris. *Il Policlinico* says: "This is the first known case of transmission to man of the parasite which causes such ravages among cattle in South Africa."

We are pleased to be able to add that Prof. Lanfranchi is said to be on the way to recovery.—B. M. J.

Capt. W. C. B. REVILL, M.R.C.V.S., Inspector of the Board of Agriculture for the Continental traffic in decrepit horses, has been awarded the gold medal of the Royal Antwerp Society for the Prevention of Cruelty to Animals, "for his untiring efforts to improve the conditions of this trade, which have had such excellent results."

The best thanks of the whole Clydesdale world are due to Mr. ROBERT BRYDON, Seaham Harbour, for sending such an excellent representative as his Clydesdale stallion, Robin Adair, to lead the procession at the International Horse Show at Olympia.

OBITUARY.

JAMES FRASER, F.R.C.V.S., late St. Albans.

Graduated, Edin: April, 1869: Fellow, March, 1881.

J. T. POTTER CARTER, M.R.C.V.S., Malvern, Worc.

Lond: May, 1895.

Mr. E. Brassey, held an inquest at Chester Town Hall, on Monday 24th inst, concerning the death of Joseph Thos. Potter Carter, aged 39, veterinary surgeon, who resided at Malvern, and who was found dead on the bank of the River Dee, at a place known locally as Billy Gamon's Rough, on Saturday morning.

Mr. J. S. Potter Carter, deceased's brother, of Middlesborough, said he had not seen deceased for eight years, he having been mostly at sea during that time. He had heard that deceased had been drinking heavily lately.

Mr. W. J. R. Baker, of Malvern, said he had known deceased for the past seven or eight years. Deceased had had financial troubles, and made a composition to his creditors about six weeks ago of 10/- in the £. His sister had guaranteed that, and it had been paid. Deceased never showed signs of lunacy, but he was very erratic and eccentric. For the last three months he had been more or less under the influence of drink.

Dr. Harrison, police surgeon, who stated that death was due to the division of a blood vessel on the right side of the neck, added that the wound was inflicted by an "artist," the man having selected a vital spot. The wound was undoubtedly inflicted by the man himself.

Cyril Farren, a boy residing in Linenhall Street, deposed to finding the body near the water when fishing.

P.C. Price deposed that a blood-stained pocket-knife was found near the body. There was no money in deceased's pockets. On an envelope were written the words, "Bag and dressing case at station," and there was a left luggage ticket in his pocket.

The jury returned a verdict of "Suicide whilst temporarily insane.—*The Liverpool Courier*."

CORRESPONDENCE.**WIND SUCKING.**

DEAR SIR,

After reading in the *The Veterinary Record* the interesting thesis delivered by Lt. Colonel J. Moore, at the Veterinary Medical Association of Ireland on "Crib-biting and Windsucking," I should deem it a great favour if you would allow me space for a few remarks on this subject.

Windsucking and Crib-biting can be defined as a psychopathological condition of the horse, characterised by a distinct physical action resulting from a mental impression associated with the early period of the animal's life. In severe cases it is invariably accompanied with digestive derangement.

It is well known to psychologists that in the human subject a complex in the adult can invariably be traced back by psycho-analysis to a mental impression attained in the days of infancy.

I am strongly of an opinion that the vice of windsucking in the adult horse is *not* acquired by "imitation" but that the seed of the mischief is sown when the animal is a foal.

Yet, it is possible the sense of hearing or seeing an affected horse windsucking, in a neurotic horse may awaken and stimulate the mental impression that it attained as a foal and thus, linking up the present with the past, the habit may be acquired.

This primary mental impression may be attained either as Mr. Patrick states by the foal hearing its mother or other horses windsucking, or the impression may be associated with the physiological act of sucking.

I think one is justified in saying the horse is naturally a neurotic animal, the balance of mind, the power of control are lacking; watch him in a carriage accident, or cast in his stall; his only thoughts are to free himself, irrespective of the pain he is enduring by his struggles. A runaway horse imagines the only danger is behind him, from which he must escape; some horses working in the ranks will become debilitated through the excitement of being in company, others will fret when leaving the ranks. I have known horses show great signs of nervousness when taken out on an open plain, the unaccustomed surroundings and the vastness have struck terror into them. We all know the foolish acrobatic display that sometimes occurs when a piece of paper is lying in the road.

Naturally some horses are more affected than others, and it is in these one must expect a psycho-pathological condition especially in horses descended from parents with a neurotic temperament.

It is this neurotic temperament—this obscure pathological condition of the mind in the parent—which, handed down to the animal's progeny, has established the theory that windsucking is hereditary. It is not the actual habit of windsucking that is hereditary—it is the mental disorder.

The illustration given by Mr. McKenny with reference to the stallion "Pliny" and his offspring is of great psychological interest.

I knew a weedy thoroughbred Waler which was a wind-sucker of the very worst type; he performed the habit on every possible occasion either in the stable or at work, a momentary halt at work was instantly followed by windsucking.

The horse had a very neurotic temperament—very nervous, never carried any condition, and suffered from indigestion—an animal that could be classified as a typical weed, and I am certain where there is a deficiency in physical development in the horse it is invariably accompanied with a deficiency of mental development.

Lately, in making observations of this affection, it is interesting to relate that in a cavalry brigade 66.6 per cent. of the windsuckers are mares. I think there is a psychopathological condition which is very closely associated with the sexual organs, and I even go further in saying that the pleasure obtained in windsucking is a form of mental masturbation.

From the above it would seem that the removal of the sexual organs has a controlling effect, but I do not wish to imply that the loss of function destroys the desire. I think mares are naturally more neurotic than geldings. The neurosis undoubtedly aggravated by the artificial life led by the animals in civilisation compared to their wild state.

In Arab entires masturbation is very common, and I have detected in Arab geldings conditions of expression and appearance very similar to the entire performing the vice, and although the physical function was lost there is every reason to believe that mental masturbation was taking place.

There is no doubt idleness and artificial existence experienced by the equine play a very important factor in the aggravation of this disease.

Troop horses before being issued to the units generally spend their lives in the open pastures, but after joining the units before a blank wall, and during their long monotonous hours the mental picture must flash across their minds of the days of freedom—especially in the neurotic subject, and it is during this imaginary picture the act of sucking as a foal associated with circumstances of delight, the primary mental impression is stimulated, the act is initiated, which giving mental pleasure becomes a habit as we know it.

I do not think indigestion is a cause of the trouble, but that windsucking is the cause of indigestion, not so much because of the air swallowed, as windsucking being a mental affection, the indigestion is a form of nervous dyspepsia.

Treatment.—All treatment allays only the symptoms, there is always a chance of recurrence. Mechanical implements prevent the air being swallowed, but this does not cure the seat of trouble.

I think the treatment adopted is one of purely hygienic principles—work, open air, and a careful diet. As the state of the body becomes healthier so will the mind.

Prof Mettam's remarks that the air is swallowed with saliva is interesting, because in India the disease is known as Hawá peena ("to drink air").—Yours truly,

H. S. MOSLEY, Capt. A.V.C.

Aldershot, June 26th.

PEPTONE POISONING.

SIR,

Referring to Mr. Chambers' interesting note in last week's *Record*, this, as far as the present writer is aware, is the first published record of the observance of toxic phenomena in the course of the immunisation of cattle against East Coast Fever by Theiler's method—a method in which one understands an emulsion of spleen and lymph glands (containing "Koch's bodies") is mixed with peptone and injected intravenously into the animal it is intended to immunise—the object of the peptone being to excite a leucocytosis.

Mr. Chambers says: "We cannot get anaphylaxis with bacterial toxin, so the injection used in the process of immunising cattle against East Coast Fever may be excluded."

As a matter of fact certain present day authorities regard the reaction which follows the inoculation of tuberculin into a tuberculous subject as being in the nature of a manifestation of super-sensitiveness (anaphylaxis) exhibited by the infected animal to the toxin in question (tuberculin)—the tissues of the animal having been sensitised to the latter in the course of the infection. The same view is also held with regard to the mallein reaction in glandered subjects, and the conjunctival reaction in typhoid—the infected animals being super-sensitive to the toxic products of the *B. mallei* (mallein) and *B. typhosus* respectively.

True, there are certain objections to the acceptance of the reactions referred to as typical manifestations of anaphylaxis, but at all events it was noticed long ago that anaphylactic phenomena occasionally followed the inoculation, after a definite interval, of a second and minute dose of diphtheria and tetano-toxin (not serum in this case be it noted) into guinea pigs—the second dose being but a fraction of the minimal lethal dose for these animals.

We hold, therefore, that Mr. Chambers' assertion that "we cannot get anaphylaxis with bacterial toxin" is incorrect, and would substitute for it the following statement by one well-known authority on the subject:—

"The substances which have been found to have the property of calling forth this condition (*i.e.* super-sensitiveness or anaphylaxis) are of various kinds, including bacteria and their toxins, animal poisons, and a great many foreign proteins, *e.g.* those of serum, milk, egg albumin, etc., and it is to be noted that they belong to the group of substances which can act as antigens. 'Probably' no body of known chemical constitution develops super-sensitiveness, and, just as tolerance, say to drugs, is to be distinguished from immunity, so accumulative action is to be distinguished from super-sensitiveness."—Yours, etc.,

"ANAPHYLACTIN."

MEDICAL MEN GIVING TESTIMONIALS TO THE UTILITY OF QUACK VETERINARY MEDICINES.

If anybody will take the trouble to peruse the advertisement columns of the canine fancy press they will without a shadow of doubt come across some containing testimonials given by medical men. Is this permissible?

I understand the medical profession has *practically* stamped out quackery within its own body, and is desirous of putting down quackery from without. Also with this latter object in view it is sending representatives, like the veterinary profession, to lay its views and to give evidence before the Committee inquiring into patent, etc., medicines.

I am firmly of opinion the Royal College of Veterinary Surgeons should communicate with the General Medical Council and lay a complaint against those members of the medical profession who do not do unto others as they would wish others to do to them.

To support my statement I enclose one or two pages of advertisements, which have now been appearing for some years.

"JUSTICE."

VETERINARY SURGEONS AND SHOWS.

Should veterinary surgeons be allowed to act at dog, cattle and horse shows where stalls for the sale of quack medicines and instruments are exposed for sale? I think decidedly not. But have the Council of the R.C.V.S. sufficient moral courage to enforce the disciplinary byelaws against those members of the profession who should act in future at shows where quack medicines, etc., are vended. *Vis unita fortior* is our motto, and why not act up to it? We have the power, why not use it against such quackery? To preach against one form of quackery and to aid and abet the worse form by acting at such shows is certainly illogical to my simple mind. Let not the profession be like a flock of silly sheep but act as a powerful bull with great courage.

"ACTION, NOT IDLE WORDS."

Canine Distemper.

PROPHYLAXIS

CANINE DISTEMPER VACCINE

PROPHYLACTIC, P.,D. & Co.

A polyvalent vaccine prepared from cultures of several strains of *Bacillus bronchisepticus* (Ferry)—the specific micro-organism of canine distemper.

This vaccine is administered subcutaneously as an immunising agent against canine distemper. It is supplied in sets of three bulbs, which provide a series of graded doses sufficient for one dog.

Price, 4/0 per set.

TREATMENT

CANINE DISTEMPER VACCINE

COMBINED (Curative), P.,D. & Co.

Prepared from several strains of *Bacillus bronchisepticus* (Ferry), *Staphylococcus pyogenes* (albus and aureus), and *Streptococcus pyogenes* of canine origin.

This vaccine is administered subcutaneously in all forms of canine distemper and its sequelæ. It is supplied in sets of six bulbs, which provide a series of graded doses for one case.

Price, 7/6 per set.

Further particulars will be sent on request by

THE 'RECORD' PRECISION SYRINGE.

The FINALITY of Hypodermic and Serum Syringes.

"The **"Record"** Precision Syringe is a piece of delicate mechanical workmanship well deserving its name. It meets **all requirements as regards aseptic conditions and accuracy and it is always ready for use.**

It consists of **metal and glass** only. The glass barrel is ground inside perfectly true to cylindrical form. The Nickel vacuum piston is "ground in" into the glass barrel by precision machinery so as to fit hermetically, it slides smoothly, yet tightly, **without any lubricant.**

The cover is fixed on the cylinder with a **bayonet-fastening**; for the purpose of **thorough cleaning** it is provided with a segmental incision, by means of which it can be detached from the piston-rod by sliding it off side-ways. When **completely** taken apart the Record Syringe **forms 3 parts only: cover, piston and barrel.**

The **Needles** are provided with the original "Progressive" **flat** mounts. By this arrangement a good hold is afforded to the operator.

The fixing of the needle itself in the mount, by means of a smooth longitudinal guide arranged above the screw threads prevents the needle from breaking off in the mount.

EVERY SYRINGE IS GRADUATED BOTH IN C.C. AND MINIMS.
